14 Z. CAPE'NSIS (Pers. ench. 2. p. 317.) leaflets 3-4, oblong, rather acute, dotted beneath; bracteas semisagittate at the base, but ovate at the top; legumes 4-jointed, reticulately scabrous. ⊙. G. Native of the Cape of Good Hope, in the interior of the country. Hedýsarum tetraphýllum, Thunb. nov. act. ups. 6. p. 44. t. 3. fl. cap. 595. Z. heterophýlla, Smith, in Rees' cycl. no. 5.

Cape Zornia. Fl. July, Aug. Clt. 1824. Pl. ¼ to ½ foot.

Cult. See *Myriadènus*, p. 279. for culture and propagation.

CXLVIII. STYLOSA'NTHES (from στυλος, *stylos*, a style, ανθος, *anthos*, a flower; in allusion to the flower having a long style). Swartz, prod. 108. act. holm. 1789. p. 296. fl. ind. occ. 1280. t. 25. Lam. ill. t. 627. D. C. prod. 2. p. 317.

LIN. SYST. *Monadélphia, Decándria.* Tube of calyx very long and slender, with a 5-parted limb; the lobes unequal. Corolla inserted in the throat of the tube of the calyx. Keel minute, bifid at the apex. Stamens monadelphous, having the tube or sheath cleft in front. Ovary sessile. Style filiform, very long and straight, crowned by a capitate, hispid stigma. Legume having 2 1-seeded joints, the upper joint acuminated and hooked at the apex from the permanent base of the style.—Small herbs or subshrubs, with branching stems, trifoliate leaves, having the middle leaflet almost sessile. Stipulas adnate to the petioles. Spikes of flowers terminal, dense, imbricated by the stipulas and bracteas. Flowers small, yellow.

1 S. PROCU'MBENS (Swartz, in act. holm. l. c. t. 11. f. 1. fl. ind. occ. 3. p. 1282.) stem suffruticose, procumbent, clothed with adpressed pubescence at the apex; leaflets oblong, acute, glabrous, lined; spikes many-flowered. ♄. S. Native of Jamaica, St. Domingo, Porto Rico, and Guadaloupe, in waste grassy fields.—Sloan. hist. 1. t. 119. f. 2. Hedýsarum hamàtum α, Lin. spec. 1056. Onònis cerrifòlia, Reichb. in Sieb. pl. exsic. seneg. no. 37.

Procumbent Stylosanthes. Fl. June, Aug. Clt. 1821. Sh. pr.

2 S. ERE'CTA (Beauv. fl. d'ow. 2. p. 28. t. 77.) stem erect, glabrous; leaflets ovate-oblong, glabrous, as well as the stipulas; spikes many-flowered, elongated. ⊙. S. Native of tropical Africa, on the western coast.

Erect Stylosanthes. Fl. July, Aug. Clt. 1825. Shrub 1 ft.

3 S. VISCÒSA (Swartz, in act. holm. l. c. t. 9. f. 2. fl. ind. occ. 3. p. 1285.) shrubby, erect; branches clothed with clammy hairs; leaflets elliptic, mucronate, ciliately serrulated, hairy; spikes few-flowered. ♄. S. Native of the south of Jamaica and Mexico, in sandy mountainous places.—Sloan. hist. 1. t. 119. f. 1. Hedýsarum hamàtum β, Lin. spec. 1056.

Clammy Stylosanthes. Fl. July, Aug. Clt. 1818. Sh. 1 ft.

4 S. MUCRONA'TA (Willd. spec. 3. p. 1166.) stem suffruticose; branches pubescently hairy; leaflets oblong-ovate, pubescent beneath, ciliately serrulated; spikes few-flowered; bracteas ciliated. ♃. S. Native of Ceylon and Tranquebar, in sandy places.—Burm. zeyl. t. 106. f. 2. Hedýsarum hamàtum, Burm. ind. 167. Aràchis fruticòsa, Retz. obs. 5. p. 26., but the stems are said to be erect, but in the specimens which have been examined they appear to be diffuse, but according to the description of Burmann, they are procumbent.

Mucronate Stylosanthes. Fl. July, Aug. Clt. 1817. Pl. diff.

5 S. RÍGIDA (Spreng. syst. 3. p. 310.) stem shrubby; branches straight; leaflets almost sessile, oblong, mucronate, coriaceous, shining above, rather tomentose and reticulately wrinkled beneath; spikes short, few-flowered; bracteas ovate, minute. ♄. S. Native of Brazil.

Stiff Stylosanthes. Shrub 1 to 2 feet.

6 S. HU'MILIS (H. B. et Kunth, nov. gen. amer. 6. p. 506. t. 594.) stems tufted and somewhat dichotomously branched, and marked with a hairy line; leaflets oblong, and are as well as the calyxes ciliated; stipulas hispid, falcate, subulate at the apex; flowers axillary, sessile; legumes ending in a hooked awn, reticulated, hispid. ♄. S. Native of South America, on the Orinoca, near Carichana, in very warm places.

Humble Stylosanthes. Shrub procumbent.

7 S. GLUTINÒSA (H. B. et Kunth, l. c.) plant procumbent and clothed with clammy hairs; leaflets spatulate or obovate-oblong; flowers axillary, solitary, sessile: stipulas ovate-lanceolate, 4-nerved. ♃. S. Native of Mexico, near Acapulco, in sandy places. Flowers red.

Glutinous Stylosanthes. Pl. procumbent.

8 S. TENUIFÒLIA; stem erect, branched; leaflets linear, acute, stiff; flowers numerous, disposed in terminal spikes. ⊙. S. Native of Maranham.

Fine-leaved Stylosanthes. Pl. 1 foot.

9 S. ELA'TIOR (Swartz, in act. holm. l. c. t. 11. f. 2.) stem herbaceous, erect, with one side pubescent only; leaflets lanceolate, glabrous; spikes few-flowered; bracteas lanceolate, ciliated. ♃. F. Native of North America, from Pennsylvania to Carolina, and of Guadaloupe.—Pluk. alm. t. 447. f. 7. Trifòlium biflòrum, Lin. spec. 1088. Aràchis aprica, Walt. carol. 182. S. híspida, Michx. but not of Rich.

Taller Stylosanthes. Fl. July, Aug. Clt. 1816. Pl. 1 to 2 ft.

10 S. GRA'CILIS (H. B. et Kunth, l. c. t. 596.) stem erect, marked with a pubescent line, rather hispid at the apex; leaflets linear, puberulous; young stipulas and bracteas hispid; flowers disposed in terminal glomerate heads, which are involucrated with bracteas; legumes glabrous, ending in a hooked mucrone, and having a few glandular tubercles at the apex. ⊙. H. Native of Mount Turimiriquiri, in the province of New Andalusia.

Slender Stylosanthes. Pl. 3 to 4 feet.

11 S. HI'SPIDA (Rich. in act. soc. h. n. par. 1792. p. 112.) stems herbaceous, glabrous, diffuse; leaflets lanceolate, mucronate, hispid; stipulas and bracteas ciliated, hispid; spikes many-flowered. ♃. S. Native of Cayenne.

Hispid Stylosanthes. Pl. diffuse.

12 S. GUINEE'NSIS; plant suffruticose, much branched, ascending; leaflets small, oblong-lanceolate, mucronate; stipulas sheath-formed, mucronate; pedicels short, 1-flowered, axillary. ♄. S. Native of Cape Coast.

Guinea Stylosanthes. Shrub 1 foot.

13 S. GUIANE'NSIS (Swartz, in act. holm. l. c.) stem herbaceous, erect, hairy; leaflets lanceolate, pubescent, longer than the petioles; stipulas and bracteas hispid; spikes many-flowered. ⊙. S. Native of French Guiana, in meadows, and near Mariquito, in New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 508. Trifòlium Guianénse, Aubl. guian. 2. p. 776. t. 309.

Guiana Stylosanthes. Fl. July, Aug. Clt. 1820. Pl. 3 ft.

Cult. This genus contains plants of no beauty, and are therefore not worth cultivating, unless in botanical gardens. The annual species should be treated like the species of *Zórnia.* The shrubby and perennial herbaceous kinds like other stove plants. They are all most easily increased by seeds.

CXLIX. ADE'SMIA (from α, priv. and δεσμος, *desmos*, a bond; in reference to the stamens being free). D. C. ann. sc. nat. 4. p. 94. jan. 1825. legum. mem. vii. prod. 2. p. 318.

LIN. SYST. *Decándria, Monogýnia.* Calyx 5-cleft, with the segments acute and nearly equal. Corolla papilionaceous. Vexillum complicated above the rest of the petals when young. Keel curved and truncate at the apex. Stamens distinct, approximate. Legume compressed, transversely many-jointed, having the upper suture straight and thickish, but the lower suture is sinuately lobed; joints 1-seeded, nearly orbicular, at length separating from each other. Seeds compressed, reniformly orbicular.—South American herbs, with lanceolate stipulas, abruptly pinnate leaves, ending in a bristle, axillary, 1-flowered pedicels, or the flowers are disposed in something like racemes at the tops of the branches, in consequence of the upper leaves being abortive. Dr. Hooker's arrangement of the species of this genus is here adopted.

SECT. I. A'NNUÆ. Annual herbs, having the lower flowers axillary, solitary, and pedicellate, but the upper ones form a panicle at the tops of the branches, in consequence of the upper leaves being abortive. Flowers yellow. The plants contained in this section have the habit of *Smíthia.*

1 A. MURICA'TA (D. C. in ann. sc. nat. 4. p. 94. jan. 1825.) stem decumbent, scabrous from glands; leaves with 5-7 pairs of obovate, emarginate leaflets, having scabrous margins; pedicels axillary, and also disposed in terminal racemes; legumes with 6-8 muricated joints. ⊙. H. Native of Patagonia. Hedýsarum muricàtum, Jacq. icon. rar. t. 568. coll. 5. p. 145. Æschinómene Patagónica, Hortul. Patagònium hedysaroìdes, Schranck. in munch. denschr. 1808. p. 91. Hedýsarum pimpinellæfòlium, Poir. dict. 6. p. 447.

Muricated-podded Adesmia. Fl. June, July. Clt. 1793. Pl. decumbent.

2 A. Smíthiæ (D. C. l. c.) stems decumbent, pubescent: leaves with 5 pairs of cuneate, emarginate, pubescent leaflets; pedicels axillary, 1-flowered, shorter than the leaves; joints of legume 4-8, pilose. ⊙. S. Native of South America. Like *A. muricàta*, but the down on the stems is soft, not glandular, and clammy, and the pedicels are all axillary. Habit of *Smíthia*.

Smith's Adesmia. Pl. decumbent.

3 A. hispídula (D. C. l. c. t. 48.) stems diffuse, puberulous, and with the petioles and peduncles scabrous from a few retrograde spines; leaves with 4-6 pairs of oblong, obtuse leaflets, which are a little toothed at the apex and pilose on the margins; pedicels axillary, 1-flowered; joints of legume 4-8, furnished in the centre with feathery bristles. ⊙. S. Native of Peru. Æschinómene hispídula, Lag. nov. gen. et spec. p. 22. no. 297. Hedýsarum péndulum, var. β, Poir. dict. 6. p. 449. ex Desv. Hedýsarum uniflòrum, Domb. herb.

Hispid Adesmia. Pl. diffuse.

4 A. tene'lla (Hook, in Beech. voy. p. 19.) plant pubescently-hairy, glandless; stems procumbent, simple; leaves with 3-4 pairs of obovate, obtuse, or retuse leaflets, and sometimes furnished with a terminal one; pedicels axillary, 1-flowered, lower ones equal in length to the leaves; calycine segments ovate-lanceolate; legume with 2-3 muricated joints, equal in length to the calyx. ⊙. H. Native of Chili, on hills near Valparaiso.

Tender Adesmia. Pl. procumbent.

5 A. angustifòlia (Hook, in Beech, voy. p. 19.) plant pubescently hairy, glandless; stems procumbent; leaves with 4-5 pairs of remote, linear, bluntish leaflets; pedicels 1-flowered, lower ones shorter than the leaves; calycine segments lanceolate; legume 5-6-jointed, beset with a few plumose stiff bristles, twice the length of the calyx. ⊙. H. Native about Valparaiso.

Narrow-leafletted Adesmia. Pl. procumbent.

Sect. II. Pere'nnes. Perennial herbs, with very long, terminal leafless racemes, and panicles. Flowers yellow. Plants with the habit of *Onobrýchis*.

6 A. denta'ta (D. C. in ann. sc. nat. 4. p. 94. jan. 1825. legum. mem. t. 49.) stem erect, beset with glandular pubescence; leaves with 4-5 pairs of obovate, truncate leaflets, which are deeply serrated at the apex, when young rather villous; joints of legume 4-8, muricated. ♃. S. Native of South America. Æschinómene dentàta, Lag. nov. gen. et spec. p. 22. no. 296.

Toothed-leafletted Adesmia. Pl. 1 to 2 feet.

7 A. bícolor (D. C. l. c.) stems prostrate; leaves with 9-12 pairs of lanceolate, acute, entire, pubescent leaflets; stipulas conforming to the leaves; racemes very long, opposite the leaves; joints of legume 6-8, rounded in front, and clothed with very short pubescence. ♃. S. Native of Monte Video, on rocks by the sea-side and in the sand. Hedýsarum bicolòrum, Poir. dict. 6. p. 448. Pedicels 6-8 lines long. Flowers rather large, red on the outside but yellow on the inside.

Two-coloured-flowered Adesmia. Pl. prostrate.

8 A. pe'ndula (D. C. l. c.) stems diffuse, hardly pubescent; leaves with 7-9 pairs of oval-oblong, entire, pubescent leaflets; racemes elongated; lower flowers distant; legumes pendulous, with 7-8 rather hispid joints. ♃. S. Native of Monte Video and Buenos Ayres. Hedýsarum péndulum, Poir. dict. 6. p. 449. var. α. Flowers yellow, but reddish on the outside.

Pendulous-podded Adesmia. Fl. June, July. Clt. 1825. Pl. diffuse.

9 A. puncta'ta (D. C. l. c.) stems procumbent, beset with glandular pili; leaves with 9-12 pairs of linear, obtuse, entire, rather mucronate, pubescent, ciliated leaflets; racemes spicate, crowded with flowers; joints of legume 4-8, oblong, hairy, and dotted with black. ♃. S. Native of Monte Video and Buenos Ayres. Hedýsarum punctàtum, Poir. dict. 6. p. 447. Calycine segments linear-subulate. Flowers apparently purplish on the outside.

Dotted-podded Adesmia. Pl. procumbent.

10 A. pappòsa (D. C. l. c. with a figure) stem ascending, leafy and villous at the base; leaves with 8-10 pairs of obovate, retuse, mucronate, entire, rather pilose leaflets, when young pubescent beneath; racemes terminal, compound, very long, glabrous, pedunculate, many-flowered; calyx glandless; base of vexillum with a tuft of hairs; legume with 2 joints, beset with soft plumose bristles. ♃. G. Native of Chili. Æschinómene pappòsa, Lag. nov. gen. et spec. p. 23. no. 298. Hedýsarum pappòsum, Lher. ined. Flowers small, with a reflexed vexillum. Stamens probably only 5. Habit almost of *Oxýtropis defléxa*.

Downy-bristled Adesmia. Fl. Ju. Jul. Clt. 1823. Pl. asc.

11 A. longise'ta (D. C. l. c.) plant decumbent, villous; leaves with 6-7 pairs of obovate, mucronulate leaflets, which are villous on both surfaces; racemes almost terminal; flowers distant, on long pedicels; calyxes glandular; legumes 2-jointed, beset with long, plumose stiff bristles. ♃. S. Native of South America. Herb almost with the habit of *Anthýllis montàna*, the flowers of *Onònis*, the legumes of *Onobrýchis*, and the stamens of *Sophòra*.

Long-bristled-podded Adesmia. Pl. decumbent.

12 A. confe'rta (Hook, in Beech. voy. p. 20.) plant ascending, pubescent; leaves with 6 pairs of obovate-oblong, retuse, mucronate leaflets; racemes terminal, compound, beset with black glands, many-flowered; fructiferous pedicels deflexed; calycine segments ovate; legume 3-4-jointed, muricated, and glandular. ♃. G. Native of Chili.

Crowded-flowered Adesmia. Pl. ascending.

13 A. fruticulòsa; stem decumbent, pilose, as well as the petioles; leaves with numerous pairs of small, lanceolate, mucronate leaflets; peduncles few-flowered, shorter than the leaves; legumes 3-4-jointed, hairy, and muricated. ♃. S. Native of Mexico. Æschinómene fruticulòsa, N. E. herb. Lamb.

Fruticulose Adesmia. Pl. decumbent.

14 A. mimosoìdes; plant procumbent; branches and petioles villously pubescent; leaves with numerous, linear, alternate, sessile, obtuse, mucronate leaflets, which are oblique at the base; pedicels short, 1-flowered. ♃. S. Native of Mexico. Æschinómene mimosoìdes, N. E. in herb. Lamb.

Mimosa-like Adesmia. Pl. procumbent.

Sect. III. Spinòsæ. Stems shrubby, spinose. There are numerous unpublished species belonging to this section in Dr. Gillies's herbarium.

15 A. microphy'lla (Hook, in Beech. voy. p. 19. t. 9. Lodd. bot. cab. 1691.) stem shrubby, much branched; branches striated, pubescent, divaricate, spinose; leaves with 6 pairs of small, orbicular leaflets, on short petioles, pubescent; racemes of flowers somewhat capitate, terminal, simple, spinescent; bracteas orbicular; legumes 3-jointed, covered with long plumose bristles, which are stiff and naked at the base. ♄. G. Native of Valparaiso. Plant dichotomous, resembling furze. Stamens and petals free.

Small-leaved Adesmia. Fl. summer. Clt. 1826. Sh. 1 to 2 ft.

16 A. glutinòsa (Hook, in Beech. voy. p. 19.) stem shrubby, branched; branches spreading, beset with glandular, glutinous hairs, spinose; leaves with about 3 pairs of elliptic, hairy leaflets; racemes elongated, terminal, simple, spinescent, and are as well as the linear bracteas clothed with white hairs; legumes

3-jointed, very long, clothed with plumose bristles. ♄. G. Native of Chili, about Coquimbo.

Glutinous Adesmia. Shrub 1 to 2 feet.

SECT. IV. FRUTICÒSÆ. Plants shrubby, unarmed.

17 A. BALSAMÍFERA (Hook, in Beech. voy. p. 20.) plants densely beset with resinous glands; stem much branched; leaves with usually 10 pairs of cuneate-oblong leaflets, usually ending in an odd one; legume 6-jointed, silky when young. ♄. G. Native of Chili, where it is called *Jarilla*. Mimòsa balsámica, Feuill. chil. 1. p. 134. The plant, besides being of great beauty, yields a balsam of a highly agreeable odour, which is perceptable at a great distance, and is found to be of great efficacy in healing wounds.

Balsam-bearing Adesmia. Shrub.

18 A. FLORIBU'NDA; plant erect, shrubby; branches pubescent; leaves with numerous pairs of lanceolate-oblong, mucronate, villous leaflets, which are obtuse at both ends and villous beneath as well as the petioles; peduncles axillary, few-flowered, aggregate, short, forming a panicled raceme at the tops of the branches, in consequence of the upper leaves being abortive. ♄. G. Native of Mexico. Æschinòmene, spec. nov. N. E. in herb. Lamb. An elegant shrub.

Bundle-flowered Adesmia. Shrub 2 to 4 feet.

Cult. The annual species should be treated in the same manner as that recommended for *Myriadènus*, see p. 279. The shrubby and perennial kinds will grow well in a mixture of loam, peat, and sand, and they may be propagated either by young cuttings, planted in sand, with a hand-glass placed over them; those of the stove species in heat, or by seeds, the latter mode is to be preferred.

CL. ÆSCHYNO'MENE (from *αισχυνω*, *aischuno*, to be ashamed: in reference to the leaves of some of the species falling on the slightest touch, like those of the sensitive plant). Lin. gen. 888. Lam. ill. 629. Beauv. fl. d'ow. 1. p. 88. R. Brown, in hort. kew. ed. 2. vol. 4. p. 336. Desv. journ. bot. 3. p. 124. t. 6. f. 26. D. C. prod. 2. p. 320, but not of Jaum.

LIN. SYST. *Diadélphia, Decándria.* Calyx 5-cleft, bilabiate, upper lip bifid, lower one trifid or tridentate. Corolla papilionaceous. Stamens 10, joined into 2 equal bundles or sets. Legume compressed, transversely articulated, straight, and exserted. Seeds compressed, solitary in the joints.—Tropical herbs and shrubs, with impari-pinnate leaves, having many pairs of leaflets, semisagittate stipulas, axillary racemes of yellow flowers, each furnished with 2 opposite bracteas just under the calyx.

1 Æ. A'SPERA (Lin. spec. 1060.) stem herbaceous, erect, terete; leaves with 30-40 pairs of linear leaflets, which are smooth as well as the legumes; racemes compound; peduncles, bracteas, calyxes, and corollas hispid. ♄. S. Native of the East Indies and Cochin-china. Æ. lagenària, Lour. cochin. p. 446. Æ. paludòsa, Roxb. Æ. lagenàrium, Roxb. hort. beng. p. 57. Breyn. cent. 51. t. 52. Stipulas ending in a long acumen each. The centres of the joints of the legume are scabrous from tubercles.

The substance known by the name of rice-paper is the produce of *Æ. áspera*; when held between the eye and the light its beautiful cellular tissue is discoverable. Dr. Livingstone first brought from China to Europe a quantity of this substance, which he presented about 26 years ago to Miss Jane Jack, who was celebrated for the beauty and accuracy of her artificial flowers. Formed of rice-paper they obtained additional celebrity, fetched very high prices, and were eagerly sought for by persons of the greatest rank and most acknowledged taste. For a bouquet which Miss Jack presented to the late Princess Charlotte of Wales, she received the regal present of 70*l*. When Dr. Livingstone first procured the rice-paper from the Chinese, the pieces did not exceed 4 inches square; they were dyed of various shades and colours, and cost about 6*d*. each square. Since that time the price has been much reduced, and the size of the pieces increased, so as to be upwards of a foot long and 5 inches across. The tinted pieces are employed by the Chinese for their artificial flowers, and the plain white for making drawings upon. Now this material is so much esteemed in Europe, that it is in request with people of all nations who visit Canton. The same substance is also known in our possessions in the East Indies, where it grows abundantly in the marshy plains of Bengal, and on the borders of the jeels, or extensive lakes in every province between Calcutta and Hurdwar. The plant is perennial and of low growth, and seldom exceeds a diameter of 2½ inches in the stem. It is brought to the Calcutta bazaars in great quantities in a green state, and the thickest stems are cut into laminæ, from which the natives form artificial flowers and various fancy ornaments to decorate their shrines at Hindoo festivals. The Indians make hats of rice-paper, by cementing together as many leaves as will produce the requisite thickness; in this way any kind of shape may be formed, and when covered with silk or cloth the hats are strong and inconceivably light. It is an article of great use to fishermen; it forms floats of the best description to their nets. The slender stems of the plant are bundled into fascines, about 3 feet long, and with one of these under his arm, does every fisherman go out to his daily occupation. With his net on his shoulders he proceeds to work without a boat, and stretches it into the deepest and most extensive lakes, supported by his buoyant faggot.

The cutting the material into laminæ is performed vertically round the stem. The most perfect stems are selected for this purpose, but few are found sufficiently free from knots to produce a cutting of more than 9 or 10 inches in length. The Bengalee name of the plant is *Shola*, commonly pronounced *Sola*, *Kath-shola*, and *Phool-shola*.

Rough Æschynomene. Fl. June, Jul. Clt. 1759. Sh. 6 to 8 ft.

2 Æ. SENSITI'VA (Swartz, fl. ind. occ. 3. p. 1276.) stem shrubby, smooth, terete; leaves with 16-20 pairs of linear leaflets; legumes and racemes glabrous; peduncles branched, few-flowered; joints of legume 6-10, nearly quadrangular, smooth in the middle, but rather pilose at the upper suture. ♄. S. Native of Jamaica, Martinico, and Brazil, in sandy places, and on the banks of rivulets. Leaves falling on being touched. Flowers white.

Sensitive Æschynomene. Fl. June, July. Clt. 1733. Sh. 3 to 6 feet.

3 Æ. MACRO'PODA (D. C. prod. 2. p. 320.) stem herbaceous, terete, scabrous at the apex as well as the branches, peduncles, and petioles; leaves with 10-12 pairs of linear leaflets; peduncles few-flowered; joints of legume 5-7, smooth, the stipe 3 times the length of the lower joint. ⊙. S. Native of Senegal. Stamens monadelphous at the base, but easily separated into 2 bundles, even in a dried state. Stipulas small.

Var. β, *Belvìsii* (D. C. prod. 2. p. 320.) leaves with 10 pairs of glabrous leaflets; peduncles branched, few-flowered, clothed with glandular pubescence; joints of legume 4-6, scabrous in the middle. ♄. S. Native of Prince's Island, on the western coast of Africa. Æ. sensitiva, Beauv. fl. d'ow. 1. p. 89. t. 53.

Long-footed-podded Æschynomene. Shrub 2 to 3 feet.

4 Æ. SULCA'TA (H. B. et Kunth, nov. gen. amer. 6. p. 530.) arborescent; branches striated from furrows, rather flexuous, glabrous, when young hispid as well as the peduncles; leaves with 17-21 pairs of linear, mucronate leaflets, which are glabrous as well as the calyxes; bracteas ciliated; joints of legume 7-9,

glabrous. ♄. S. Native of New Andalusia, near Bordones, in shady woods.

Furrowed-stemmed Æschynomene. Shrub 10 to 12 feet.

5 Æ. HISPI'DULA (H. B. et Kunth, nov. gen. amer. 6. p. 530.) arborescent; branches striated and rather flexuous; rachis, peduncles, and legumes hispid from tubercles; peduncles few-flowered; leaves with 15-20 pairs of oblong-linear, somewhat mucronulate leaflets, which are glabrous as well as the calyxes; stipulas and bracteas ciliated. ♄. S. Native of South America, on the banks of the river Magdalena, near Badilla.

Hispid-legumed Æschynomene. Shrub 6 to 10 feet.

6 Æ. I'NDICA (Lin. spec. 1061.) stem herbaceous, erect, terete, glabrous as well as the leaves; leaves with 15-20 pairs of linear leaflets; peduncles few-flowered; legumes glabrous, dotted; joints 10-12, straight on one side and rounded on the other. ⊙. S. Native of the East Indies and Guinea. Hedýsarum, Neli Tali. Roxb. hort. beng. 57.—Rheed. mal. 9. t. 18. Flowers yellow.

Indian Æschynomene. Fl. June, Jul. Clt. 1799. Pl. 2 to 3 ft.

7 Æ. GLABE'RRIMA (Poir. suppl. 4. p. 76.) stem erect, terete, glabrous as well as the leaves; leaves with 30-35 pairs of linear leaflets; peduncles few-flowered; legumes glabrous, dotted, having 10-12 joints, which are straight on one side and rounded on the other. ⊙. H. Native of Carolina, where it is perhaps spontaneous.

Quite-smooth Æschynomene. Pl. 2 to 3 feet.

8 Æ. AMERICA'NA (Lin. spec. 1061.) stem erect, terete, hispid; leaves with 10-20 pairs of linear, mucronate, rather ciliated leaflets; racemes simple, few-flowered; legumes glabrous, dotless, having 4-8 joints, which are straight on one side and rounded on the other. ⊙. S. Native of the West Indies. Lam. ill. t. 629. f. 2.—Sloan. jam. 1. t. 118. f. 3. There is a variety of this plant having a dwarfer, almost glabrous stem. Flowers brownish-yellow.

American Æschynomene. Fl. Jul. Aug. Clt. 1732. Pl. 3 ft.

9 Æ. GUAYAQUILE'NSIS; shrubby; plant hispid; leaves with numerous pairs of linear, obtuse, mucronate, smooth leaflets, which are serrated at the apex; peduncles few-flowered, shorter than the leaves; bracteas ovate, cordate, cuspidate, ciliately serrated; joints of legume 6-8, smooth, straight on one side and rounded on the other; stipulas semisagittate. ♄. S. Native of Guayaquil. Æschynómene species, Guayaquil, Ruiz et Pav. in herb. Lamb. along with the two following.

Guayaquil Æschynomene. Shrub 2 to 3 feet.

10 Æ. PLURIARTICULA'TA; plant herbaceous, smooth, erect; leaflets linear, obtuse, glabrous; peduncles few-flowered; joints of legume 14-18, smooth; bracteas large, serrated. ⊙. S. Native of Guayaquil. Stipulas large, semisagittate.

Many-jointed-legumed Æschynomene. Pl. 2 to 3 feet.

11 Æ. SCA'BRA; plant herbaceous, hispid; leaves with numerous pairs of linear leaflets, which are obtuse at both ends; peduncles few-flowered; bracteas serrated; joints of legume muricated in the centre. ⊙. S. Native of Guayaquil.

Scabrous Æschynomene. Pl. 2 to 3 feet.

12 Æ. PA'TULA (Poir. suppl. 4. p. 78.) stem suffruticose; branches spreading, hispid at the apex; leaves with 10-15 pairs of glabrous, linear, obtuse, hardly mucronulate leaflets; racemes simple, few-flowered; joints of legume 4-5, semi-orbicular, puberulous. ♄. S. Native of the Mauritius. Perhaps a variety of *Æ. Americàna.*

Spreading Æschynomene. Fl. July, Aug. Clt. 1826. Shrub trailing.

13 Æ. PU'MILA (Lin. spec. 1061.) stem herbaceous, smooth, rather diffuse; leaflets linear, obtuse, mucronulate, 10-15 pairs; racemes few-flowered; legumes glabrous, having a few joints which are straight on one side and rounded on the other, and scabrous in the centre. ⊙. S. Native of the East Indies.—Rheed. mal. 9. t. 21.

Dwarf Æschynomene. Fl. July, Aug. Clt. 1818. Pl. ½ ft.

14 Æ. PLEURONE'RVIA (D. C. prod. 2. p. 321.) stem terete, almost erect, clothed with adpressed pubescence, as well as the petioles and nerves; leaves with 20 pairs of semi-lanceolate leaflets, having almost a lateral nerve; stipulas lanceolate, striated, not produced at the base; racemes few-flowered, almost terminal; legumes pubescent, with a few distinct joints, which are straight on one side and rounded on the other. ⊙. ? S. Native of St. Domingo. Smíthia Domingénsis, Balb. herb. In some specimens of this plant the stamens are monadelphous, but in others they are diadelphous.

Side-nerved-leafletted Æschynomene. Pl. 2 to 3 feet.

15 Æ. DIFFU'SA (Willd. spec. 3. p. 1164.) stem herbaceous, smooth, diffuse; leaflets linear, obtuse; peduncles hispid, 1-flowered; joints of legume straight on one side and rounded on the other, and scabrous in the centre. ⊙. S. Native of Tranquebar. Stem branched much at the base.

Diffuse Æschynomene. Pl. 1 to 2 feet.

16 Æ. SUBVISCÒSA (D. C. prod. 2. p. 321.) stem herbaceous, erect, scabrous from small tubercles and pili, which are tipped with glands; leaflets linear, obtuse, glabrous; peduncles usually 2-flowered, and are as well as the legumes beset with glandular hairs. ⊙. S. Native of the East Indies. Æ. viscídula, Roxb. hort. beng. in Willd. enum. 776. but not of Mich. Æ. Roxbúrgii, Spreng. syst. 3. p. 322. Flowers having the vexillum streaked and spotted with red, the wings of a dirty-yellow colour, and the keel violaceous at the apex.

Rather-clammy Æschynomene. Fl. July, Aug. Clt. 1816. Pl. 1 to 2 feet.

17 Æ. GLANDULÒSA (Poir. suppl. 4. p. 76.) stem shrubby, beset with glandular hairs; leaflets linear, mucronate; peduncles few-flowered; joints of legume 4-5, semiarticulated, furnished with small prickles in the centre. ♄. S. Native of Porto Rico. Very like *Æ. Americàna.*

Glandular Æschynomene. Shrub 1 to 2 feet.

18 Æ. VILLÒSA (Poir. suppl. 4. p. 76.) stem suffruticose, terete, villous; leaflets linear, obtuse, nearly glabrous; racemes axillary, divaricate; legumes clothed with glandular pili. ♄. S. Native of Porto Rico. Corolla small, white. Perhaps not sufficiently distinct from *Æ. glandulòsa.*

Villous Æschynomene. Shrub 1 to 2 feet.

19 Æ. HÍSPIDA (Willd. spec. 3. p. 1163.) stem herbaceous, erect, hispid; leaves with 20-25 pairs of linear obtuse leaflets; racemes simple, 3-5-flowered; legumes distinctly stipitate, 6-9-jointed, hispid. ⊙. H. Native of North America, from Philadelphia to Carolina. Hedýsarum Virgínicum, Lin. ex Pursh. Flowers yellow, veined with red. Nutt. gen. amer. 2. p. 111. The hairs on the legume are scattered, and tubercularly glandular at the base.

Hispid Æschynomene. Fl. Aug. Clt. 1803. Pl. 2 to 3 ft.

20 Æ. LATIFÒLIA (Spreng. syst. 2. p. 322.) leaflets oblong, mucronate, glabrous; racemes many-flowered, bracteate, and are as well as the legumes hispid. ⊙. S. Native of Monte Video.

Broad-leaved Æschynomene. Pl. 1 to 2 feet.

21 Æ. PUBE'RULA (D. C. prod. 2. p. 321.) stem, leaves, and peduncles beset with scabrous down; leaves with 10 pairs of elliptic-linear, obtuse, mucronate leaflets; racemes short, branched, crowded, many-flowered; stipulas linear-subulate, striated; legumes with few joints. ♄. S. Native of South America. Branches terete, and probably suffruticose. Calyxes and bracteoles small.

Puberulous Æschynomene. Shrub 1 to 2 feet.

22 Æ. HY'STRIX (Poir. suppl. 4. p. 77.) stem terete, and is as well as the petioles and peduncles rough from long, yellow bris-

tles; leaves with 10 pairs of oval-linear, obtuse, mucronate leaflets; peduncles compound, many-flowered, shorter than the leaves; pedicels recurved; legumes glabrous, having few joints. ♄. ? S. Native of Cayenne. Æ. cassioìdes, Desv.

Porcupine Æschynomene. Shrub 1 to 2 feet.

23 Æ. PAUCI'JUGA (D. C. prod. 2. p. 321.) stem terete, beset with bristly, rather glandular hairs, as well as the petioles, peduncles, and bracteas; leaves with 4-5 pairs of obovate, obtuse, rather mucronate leaflets, which are hardly pubescent; racemes many-flowered, compound; stipulas and bracteas ovate, acute, striated; legumes smoothish. ♄. ? S. Native of Cayenne.

Var. β, subscàbra (D. C. l. c.) legume scabrous from short stiff down. Native of South America.

Few-paired-leafletted Æschynomene. Shrub 2 to 3 feet.

24 Æ. MICRA'NTHA (D. C. prod. 2. p. 321.) stems herbaceous, procumbent, pubescent; leaves with 2-4 pairs of small obovate-roundish, rather mucronate leaflets, which are scarcely pubescent; pedicels axillary, 1-2-flowered, length of leaves; joints of legume glabrous, compressed, nearly orbicular. ♃. S. Native of Madagascar. Hedysarum micrànthos, Poir. dict. 6. p. 446. Leaves impari-pinnate.

Small-flowered Æschynomene. Pl. prostrate.

25 Æ. VISCI'DULA (Michx. fl. bor. amer. 2. p. 75. but not of Willd.) plant clothed with clammy pubescence; stems herbaceous, slender, prostrate; leaves with 3-4 pairs of obovate leaflets; peduncles 1-2-flowered; legumes pubescent, with 2 oval-roundish joints. ⊙. H. Native of Florida and Cumberland Island, in sandy places. Nutt. gen. amer. 2. p. 111. Æ. prostràta, Poir. suppl. 4. p. 76. This plant has very much the habit of a species of *Smíthia*.

Viscid Æschynomene. Fl. July, Aug. Clt. 1816. Pl. pros.

26 Æ. FALCA'TA (D. C. prod. 2. p. 322.) stem much branched, villous; leaves with 2-3 pairs of obovate, cuneated, villous leaflets; peduncles usually 2-flowered, elongated; legumes falcate, with roundish pubescent joints.—Native of Brazil, at Rio Janeiro. Hedysarum falcàtum, Poir. dict. 6. p. 448.

Falcate-podded Æschynomene. Pl. 1 foot.

27 Æ. BRASILIA'NA (D. C. prod. 2. p. 322.) stems diffuse, clothed with glandular pili; leaves with 5-6 pairs of ovate-elliptic, pubescent, rather ciliated leaflets; racemes divaricate, loose; joints of legume rather inflated, hispid, and clammy.—Native of Brazil, at Rio Janeiro. Hedysarum Brasiliànum, Poir. dict. 6. p. 448.

Brazilian Æschynomene. Pl. diffuse.

28 Æ. MICROPHY'LLA (Desv. ined. in herb. mus. paris. D. C. prod. 2. p. 322.) stem terete, clothed with stiff villi; leaves with 20-30 pairs of pubescent, oblong, obtuse, much crowded, small leaflets; racemes much longer than the leaves; legumes glabrous, having 1-2 semi-ovate joints.—Native of Brazil. Bracteas 3, permanent at the origin of the pedicels, and 3 times shorter than them. Bracteoles 2, adpressed under the bilabiate calyx.

Small-leaved Æschynomene. Pl. 1 foot.

29 Æ. E'LEGANS (Schlecht. et Cham. in Linnæa. 5. p. 583.) plant herbaceous; stems diffuse, weak, terete, beset with spreading pili at the apex; leaves with 5-8 pairs of elliptic, obtuse, mucronate leaflets, which are clothed with adpressed pili; stipulas lanceolate, ciliately-serrated; racemes 5-7-flowered, much longer than the leaves; legume on a long stipe, which is one-half the length of the legume, puberulous, and usually with 6 joints. ⊙. S. Native of Mexico, on hills near Jalapa, and at Hacienda de la Laguna. Æ. mimosoìdes, Sesse et Moc. mss. Stems rather flexuous.

Elegant Æschynomene. Pl. 3 feet.

30 Æ. FASCICULA'RIS (Schlecht. et Cham. in Linnæa. 5. p. 584.) shrubby, erect, clothed with somewhat strigose, adpressed, cinereous down; branches angular; leaves with 20 or more pairs of linear, acute, mucronate leaflets, which are almost glabrous above; racemes short, axillary; flowers in fascicles, on short pedicels; legume on a short stipe, 4-jointed. ♄. S. Native of Mexico, between La Laguna verde and Actopan. Leaves small. Legumes large. Stipe of legume hardly exserted from the calyx. Stipulas lanceolate, acuminate, nerved. Flowers yellow.

Fascicular-flowered Æschynomene. Shrub 2 to 3 feet.

† *Little known or doubtful species.*

31 Æ. DIVI'SA (Nees et Mart. in nov. act. bonn. 12. p. 31.) stem shrubby, smooth; petioles strigose; leaves with 12-15 pairs of linear acute leaflets; peduncles 2-3-flowered, shorter than the leaves; joints of legume semi-orbicular, hispid; vexillum of 2 petals. ♄. S. Native of Brazil. The vexillum is said to be obcordate, and constantly composed of 2 petals, which is a circumstance not to be found in any other papilionaceous flower, but perhaps the vexillum is only profoundly bipartite, or perhaps the flower is resupinate, and the 2-petalled keel has been taken for the vexillum.

Divided Æschynomene. Shrub 2 to 3 feet.

32 Æ. HONE'STA (Nees et Mart. l. c. p. 32.) branches hispid at the apex; leaves with 10-11 pairs of linear, obtuse, glabrous leaflets; legumes disposed in something like a corymb, when young clothed with hispid pubescence, but glabrous in the adult state; vexillum broad, entire. ♄. S. Native of Brazil. Said to be nearly allied to *Æ. sensitìva*. Flowers yellow.

Honest Æschynomene. Shrub 2 to 4 feet.

33 Æ. SCOPA'RIA (H. B. et Kunth, nov. gen. amer. 6. p. 532.) plant diffuse; branches elongated, twiggy, straight, angular, and are, as well as the calyxes, clothed with silky-silvery down; leaves with 10-14 pairs of oblong, mucronulate, half-cordate leaflets, which are clothed with adpressed down on both surfaces; peduncles axillary, twin, few-flowered; legumes puberulous, usually 3 jointed. ♄. S. Native of Peru, near Guancabamba. Flowers yellow.

Broom Æschynomene. Shrub diffuse.

34 Æ. MOLLI'CULA (H. B. et Kunth, l. c.) suffruticose; branches elongated, clothed with yellowish-silky down; leaves with 18-20 pairs of oblong-linear, mucronate, semi-cordate leaflets, which are pubescent on both surfaces, as well as the rachis and calyx; peduncles axillary, short, few-flowered; legumes falcate, 1-6-jointed, pubescent. ♄. S. Native of South America, in the province of Jaen de Bracamoros. Flowers yellow.

Soft Æschynomene. Shrub 2 to 3 feet.

35 Æ. PILÒSA (Poir. dict. 4. p. 450.) stem herbaceous, pilose, compressedly tetragonal at the apex; leaflets oval, retuse, mucronate, glabrous; racemes hairy, many-flowered; joints of legumes scabrous in the centre. ⊙. S. Native of the East Indies. Nerves of leaves blackish.

Pilose Æschynomene. Pl. 1 to 2 feet.

36 Æ. PUBE'SCENS (Poir. dict. 4. p. 451.) stem herbaceous, glabrous; branches spreading; leaflets elliptic, retuse, mucronate, pubescent; racemes terminal, glabrous, many-flowered; calyx 5-cleft; joints of legume rather scabrous. ⊙. ? S. Native of the East Indies.

Pubescent Æschynomene. Pl. 1 to 2 feet.

37 Æ. BREVIFÒLIA (Poir. dict. 4. p. 451.) plant glabrous, and dwarf; stems filiform; leaves with 2 pairs of roundish, mucronate, glaucous leaflets; peduncles 1-2-flowered; calyx 5-toothed; legumes on long stipes; having 3-4 rather remote joints.—Native of Madagascar. Flowers small, yellow.

Short-leaved Æschynomene. Pl. ½ foot.

38 Æ. HIRSU'TA (D. C. prod. 2. p. 322.) stem scabrous and

hairy; racemes 3-flowered: bracteas ciliately serrated; legumes hairy. ⊙. S. Native of New Spain. Æ. hírta, Lag. nov. gen. et spec. 22. but not of Lam.

Hirsute Æschynomene. Pl. 1 foot.

39 Æ. HI'RTA (Lam. ill. 629. f. 1. Poir. dict. 4. p. 450.) plant hispid in every part; stem herbaceous; branches terete; leaves with 7-9 pairs of oval-linear mucronulate leaflets; racemes terminal, many-flowered; calyx 5-parted, having the lobes nearly equal, and subulate at the apex; legumes hairy, with the joints tumid and tubercled in the centre. ⊙. S. Native of the East Indies.

Hairy Æschynomene. Pl. 1 to 2 feet.

40 Æ. ARBÒREA (Lin. spec. 1060.) stem arboreous, smooth; joints of legume semi-cordate, glabrous. ♄. S. Native of the East Indies. Flowers large, copper-coloured. Perhaps a species of *Desmòdium*. Perhaps *D. Mauritiànum*.

Arboreous Æschynomene. Shrub 6 to 7 feet.

41 Æ.? HETEROPHY'LLA (Lour. cochin. p. 446.) shrubby; branches tomentose; lower leaves ternate, with ovate leaflets, superior ones impari-pinnate, with roundish leaflets; peduncles many-flowered; calyx 4-toothed; stamens monadelphous; legumes pilose, with cordate joints. ♄. G. Native of the north of Cochin-china. Flowers small, white. This plant ought certainly to be removed from the present genus.

Variable-leaved Æschynomene. Shrub 7 to 8 feet.

42 Æ.? CRE'PITANS (Jacq. fragm. 37. t. 42. f. 2.) stem arboreous; leaves glabrous, young ones decompound; legumes stipitate, glabrous, linear, the seeds intercepted by cellular substance; the sutures prominent, but retaining the joints. ♄. S. Native of Caraccas. Perhaps a species of *Mimòsa*.

Rattling Æschynomene. Tree.

Cult. The species of this genus require more than an ordinary degree of heat to preserve them through the winter, so that they are seldom kept alive through the winter in this country, and consequently never grow to a flowering state. Rich loam suits them best, and cuttings may be rooted in sand under a hand-glass in heat; however, they are not worth growing except in botanical gardens.

CLI. SMI'THIA (in honour of the late Sir James Edward Smith, M.D. F.R.S. and P.L S. founder of the Linnæan society, and possessor of the Linnæan herbarium; author of English Botany, English Flora, Flora Britannica, and the botanical part of Rees' cyclopædia; died in 1829, in the 69th year of his age). Ait. hort. kew. ed. 1. vol. 3. p. 496. ed. 2. vol. 4. p. 336. Lam. ill. 627. Desv. journ. bot. 3. p. 121. t. 4. f. 12. D. C. prod. 2. p. 323.

LIN. SYST. *Diadélphia, Decándria.* Calyx bipartite. Corolla papilionaceous. Stamens divided into 2 equal bundles. Legume transversely articulated, plicate, inclosed in the calyx. This genus is nearly allied to *Æschynómene*, but is distinguished from it in the legume being inclosed with incumbent joints. The calyx, stamens, and habit are that of *Æschynómene*, but the pods are that of *Loúrea*.

1 S. SENSITI'VA (Ait. l. c. t. 13. Sal. par. lond. t. 92.) lips of calyx entire; racemes pedunculate, 3-5-flowered. ⊙. S. Native of the East Indies. Petagnàna sensitìva, Gmel. syst. p. 1119. Coronílla Surattensis, Garc. in herb. Burm. confused with Galèga senticòsa, Burm. fl. ind. 172. Leaves with many pairs of small leaflets. Plant trailing. Flowers yellow.

Sensitive Smithia. Fl. July, Sept. Clt. 1785. Pl. procumbent.

2 S. CONFE'RTA (Smith, in Rees' cycl. 33. no. 2.) lips of calyx toothed at the apex; racemes sessile, shorter than the leaves. ⊙.? S. Native of New Holland, within the tropic. Smíthia capitàta, Desv. l. c. Flowers yellow.

Crowded-flowered Smithia. Fl. July. Clt. 1820. Pl. proc.

3 S. GEMINIFLÒRA (Roth. nov. spec. 352.) lips of calyx entire; racemes pedunculate, 2-flowered. ⊙. S. Native of the East Indies. Flowers probably purple. Calyxes or bracteas ending in a setose mucrone. On the pagina of the leaf the supine bristles or hairs are more copious than in *S. sensitìva*.

Twin-flowered Smithia. Fl. July. Clt. 1810. Pl. proc.

† *A doubtful species.*

4 S. SPICA'TA (Spreng. neue entd. 2. p. 160.) spikes of flowers on very short peduncles, secund, distich, very hairy; leaves impari-pinnate: stem shrubby; stamens monadelphous. ♄. S. Native of Senegambia. In every particular this plant differs from *Smíthia*, but its legitimate genus is unknown.

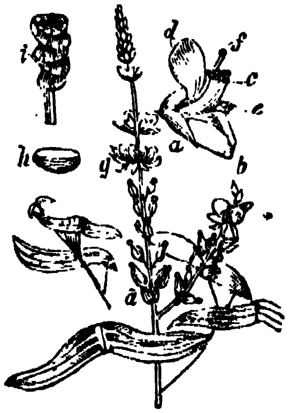
Spike-flowered Smithia. Shrub.

Cult. See *Loúrea* for culture and propagation.

CLII. LOU'REA (the meaning of this name is unknown to us, but it is apparently the name of some person). Neck. elem. no. 1318. Desv. journ. bot. 3. p. 122. t. 5. f. 18. D. C. prod. 2. p. 323. but not of Jaum.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, permanent, 5-cleft (f. 43. *a.*), with equal spreading lobes, when in fruit inflated and conniving at the apex. Corolla papilionaceous, with an obcordate vexillum (f. 43. *d.*), and an obtuse keel (f. 43. *b.*). Stamens diadelphous (f. 43. *c.*). Legume with 4-6 flat 1-seeded joints (f. 43. *i.*), bent backward into plaits (f. 43. *i.*), which nestle within the calyx —Erect Indian plants, with setaceous stipulas, simple or trifoliate leaves, and long terminal racemes of purple or white flowers.

FIG. 43.



1 L. VESPERTILIÒNIS (Desv. l. c.) lateral leaflets wanting or very small, terminal one large, transversely and falcately oblong, 10-times the breadth of the length. ⊙. S. Native of Cochin-china. Hedýsarum vespertiliònis, Lin. fil. suppl. 331. Jacq. icon. rar. 3. t. 566. Chrístia lunàta, Mœnch. suppl. 39. Corolla white, spreading. Leaves crescent-shaped, 4 lines long, and 2 inches broad, variegated with yellow, red, and green (f. 43.).

Bat-wing-leaved Lourea. Fl. July, Sept. Clt. 1780. Pl. 2 to 4 feet.

2 L. OBCORDA'TA (Desv. l. c.) leaves rather pubescent; lateral leaflets small, ovate-obcordate, rarely wanting, terminal one shorter than broad. ⊙. S. Native of Java and Timor. Hedýsarum obcordàtum, Poir. dict. 6. p. 425.

Obcordate-leafletted Lourea. Pl. 2 to 4 feet.

3 L. RENIFÓRMIS (D. C. prod. 2. p. 324.) leaves simple, transversely-reniform, others trifoliate, with the lateral leaflets smaller and oval; racemes opposite the leaves, and longer than them. ⊙. S. Native in the suburbs of Canton. Hedýsarum renifórme, Lour. coch. p. 447. exclusive of the synonymes. Hedys. Lourèirii, Spreng. syst. append. p. 292. Flowers violaceous. Very like the first species.

Reniform-leaved Lourea. Fl. Jul. Aug. Clt. 1818. Pl. proc.

Cult. The species of *Loúrea* have a rather singular appearance from their kidney-shaped painted leaves. Being annuals their seeds should be sown in pots, filled with a mixture of peat and sand, with a little loam, and placed in a hot-bed, and when the plants have grown 2 inches high, they should be planted into separate small pots, and afterwards shifted into larger ones as they grow.

CLIII. URA'RIA (a name not explained by its author). Desv. journ. bot. 3. p. 122. t. 5. f. 19.—Doòdia, Roxb. hort. beng. p. 99. but not of R. Br.—Hedýsarum species of Lin. and others.

LIN. SYST. *Diadélphia, Decándria.* Calyx profoundly 5-cleft, with setaceous segments. Corolla papilionaceous. Stamens diadelphous. Legume with a few ovate 1-seeded joints, bent back into plaits, nestling within the calyx.—Herbs, rarely shrubs, with impari-pinnate, ternate, or simple leaves, stipellate leaflets, lanceolate membranous acuminated stipulas, which are striated lengthwise, the upper ones answering the purpose of bracteas to the flowers, but soon falling off. Pedicels 1-flowered, rising in pairs from the axils of the bracteas, forming long, dense, simple, many-flowered racemes.

* *Leaves impari-pinnate, with 2-4 pairs of leaflets.*

1 U. PI'CTA (Desv. l. c.) stem shrubby, erect, velvety; leaves with 2-4 pairs of long lanceolate leaflets, which are smoothish above, and blotched with white, but pubescent and reticulately-nerved beneath; racemes very long and spicate; bracteas ciliated; segments of the calyx setaceous, and very hairy. ♄. S. Native of Guinea, among grass all along the coast, and of the East Indies. Hedýsarum píctum, Jacq. icon. rar. 3. t. 567. coll. 2. p. 262. Flowers purple.

Painted-leaved Uraria. Fl. July, Aug. Clt. 1788. Shrub 2 to 3 feet.

2 U. COMÒSA (D. C. prod. 2. p. 324.) stem shrubby; branches and petioles villous; leaves with 3 pairs of linear-lanceolate glabrous leaflets; racemes elongated, cylindrical; bracteas villous; segments of the calyx setaceous, and very hairy. ♄. S. Native of the East Indies. Hedýsarum comòsum, Vahl. symb. 2. p. 84.

Tufted Uraria. Fl. July, Aug. Clt. 1818. Shrub 2 feet

3 U. CRINI'TA (Desv. l. c.) stem shrubby, erect; leaves with 2-3 pairs of oblong leaflets; racemes elongated; pedicels hispid, recurved; the 3 largest segments of calyx pilose and reflexed; legumes smooth. ♄. S. Native of the East Indies. Hedýsarum crinìtum, Lin. mant. 102. Burm. ind. p. 169. t. 56.

Hairy-calyxed Uraria. Fl. July, Aug. Clt. 1780. Shrub 3 to 4 feet.

* * *Leaves trifoliate, the terminal leaflets stalked.*

4 U. LAGOPOÌDES (D. C. prod. 2. p. 324.) stem shrubby, rather velvety; leaflets ovate, mucronate, almost naked; racemes oblong, about the length of the common petiole; segments of calyx setaceous, and very hairy. ♄. S. Native of the East Indies and China. Hedýsarum lagopodioìdes, Lin. spec. 1057. Lespedèza lagopoìdes, Pers. ench. 2. p. 308.—Burm. ind. p. 168. t. 53. f. 2. Flowers purple.

Hare's-foot-like Uraria. Fl. June, July. Clt. 1790. Sh. 2 ft.

5 U. LAGO'PUS (D. C. in ann. sc. nat. 4. p. 100.) stem shrubby, very hairy at the apex; leaflets ovate, obtuse, mucronate, clothed with soft velvety pubescence beneath; racemes cylindrical, twice the length of the petiole; segments of the calyx setaceous, and very hairy; bracteas hairy on the back. ♄. G. Native of Nipaul. Flowers purple.

Hare's-foot Uraria. Fl. June, July. Clt. 1824. Sh. 2 to 4 ft.

6 U. ARBÒREUM; arboreous; leaflets oval, retuse, and are, as well as the branches, very hairy; stipulas cordate, stem-clasping, cuspidate; racemes elongated, bractless, densely clothed with stiff hairs; calycine segments lanceolate, feathery; legumes 3-seeded, plaited within the calyx. ♄. G. Native of Nipaul. Hedýsarum arbòreum, Hamilt. in D. Don, prod. fl. nep. 243. Erythrìna arborèscens, Roxb. hort. beng. p. 52. ?

Tree Uraris. Tree 12 feet.

7 U. LAGOCE'PHALA (D. C. prod. 2. p. 324.) stem herbaceous; leaflets roundish, pilose beneath; panicle terminal, contracted, bracteate; peduncles and calyxes very pilose; calycine segments long and linear; legumes deflexed, glabrous, 3-jointed. ♃. S. Native of Brazil. Hedýsarum lagocéphalum, Link. enum. 2. p. 248. Flowers yellow.

Hare's-headed Uraria. Fl. July. Clt. 1824. Pl. 1 to 2 feet.

* * * *Leaves simple.*

8 U. CERCIFÒLIA (Desv. l. c. f. 19.) leaflet solitary at the top of the petiole, furnished with 2 stipels, roundish, and rather velvety beneath; racemes oblong, dense, terminal. ♄. S. Native of the East Indies. Hedýsarum cercifòlium, Steud. nom. 392.

Judas-tree-leaved Uraria. Shrub 2 to 3 feet.

9 U. CORDIFÒLIA (Wall. pl. rar. asiat. p. 33. t. 37.) leaves simple, broadly ovate, cordate, villous on the under surface as well as the branches; racemes terminal, panicled, elongated, hairy; legume 2-3-jointed, villous, inclosed in the calyx; bracteas ovate, acuminated, clothed with silky pili. ♄. S. Native of the Burman Empire, near Prome and Meaong, on the banks of the Irawaddi. Flowers small, of a whitish-rose colour.

Heart-leaved Uraria. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand will answer the species, and young cuttings will root in sand under a hand-glass in heat, but the species are more easily propagated by seeds.

CLIV. NICOLSO'NIA (in honour of M. Nicolson, author of Essai Sur L'Histoire Naturelle de Saint Domingue, 1 vol. 8vo. Paris, 1776). D. C. legum. mem. vii. prod. 2. p. 325.—Perrotètia, D. C. ann. sci. nat. jan. 1825. p. 95. but not of Kunth.

LIN. SYST. *Diadélphia, Decándria.* Calyx 5-parted, with lanceolate, subulate, bearded segments. Corolla papilionaceous, shorter than the calyx. Stamens diadelphous. Legume straight, exserted, constantly composed of numerous, compressed, semi-orbicular, 1-seeded joints, which open at the convex suture.—American herbs, with pinnately trifoliate leaves, the leaflets oval or oblong, and stipellate. Stipulas distinct from the petioles, rather scarious. Bracteas like the stipulas, but broader. Pedicels twin in the axils of the bracteas. Racemes terminal, crowded, almost constituting a panicle. Flowers small, bluish-purple. This genus differs from *Urària* in the legume being straight and exserted, and from *Desmòdium* in the calyx being 5-parted and bearded.

1 N. BARBA'TA (D. C. l. c.) leaflets elliptic-oblong; calyx closed after flowering; legumes glabrous. ♃.? ♄.? S. Native of Jamaica and St. Domingo, in arid sandy places. Hedýsarum barbàtum, Lin. spec. 1055. Swartz, obs. 287. Flowers bluish-purple.

Bearded-calyxed Nicolsonia. Fl. June, July. Clt. 1818. Pl. procumbent.

2 N. CAYENNE'NSIS (D. C. leg. t. 51.) leaflets elliptic-obovate; calyx spreading after flowering; legumes smoothish. ♃. S. Native of Cayenne. Flowers bluish-purple. Racemes looser, and the pedicels are longer than the first species, but very similar.

Var. β, laxiúscula (D. C. prod. 2. p. 325.) leaflets elliptic-obovate, and a little more villous beneath than the species; legumes rather scabrous; stamens monadelphous. ♃. S. Native of Cayenne. Perhaps a proper species.

Cayenne Nicolsonia. Pl. procumbent.

3 N. VENU'STULA (D. C. prod. 2. p. 325.) stems suffruticose, erect, and are, as well as the petioles, clothed with adpressed pubescence; leaflets oblong-elliptic, clothed with silky, glaucescent pubescence beneath; racemes terminal, short, sessile; calyx pilosely bearded; legumes with 1-3 semi-orbicular hairy joints. ♄. S. Native of Cumana, on the declivity of mount Turimiquiri. Hedýsarum venústulum, H. B. et Kunth, l. c.

Pretty Nicolsonia. Shrub 2 feet.

4 N. VILLÒSA (Schlecht. et Cham. in Linnæa. 5. p. 584.) plant herbaceous; stems erect, clothed with rusty spreading hairs; leaflets elliptic, silky and glaucous beneath, but almost glabrous above; legumes puberulous, 3-jointed. ♃. G. Native of Mexico. Axillary branches bearing the flowers at the apex, hardly longer than the leaves. Flowers disposed in dense racemes.

Villous Nicolsonia. Pl. 3 feet.

Cult. For culture and propagation see *Urària*, p. 287.

CLV. DESMO'DIUM (from δεσμος, *desmos*, a band; in reference to the stamens being connected). D. C. legum. mem. vi. prod. 2. p. 325.—Desmòdium and Hedýsarum, Desv. journ. bot. 3. p. 122. t. 5. f. 15 and 22. H. B. et Kunth, nov. gen. amer. 6. p. 516 and 527.—Hedýsarum species of Lin. and others.

LIN. SYST. *Diadélphia, Decándria.* Calyx bibracteolate at the base, obscurely bilabiate to the middle, upper lip bifid, lower one 3-parted (f. 44. *a.*). Corolla papilionaceous, with a roundish vexillum (f. 44. *b.*) and an obtuse keel (f. 44. *c.*), which is shorter than the wings. Stamens diadelphous (f. 44. *d.*), with the filaments almost permanent (f. 44. *f.*). Legume of many 1-seeded, compressed, membranous or coriaceous, hardly dehiscent joints (f. 44. *g.*), which separate at maturity.—Herbs or small shrubs, for the most part natives within the tropics, with pinnately-trifoliate leaves, sometimes the lateral leaflets absent altogether, or very small, then the leaves in such cases are called simple. Stipels 2 at the base of the terminal leaflet, and one at the base of each lateral leaflet. Racemes of flowers terminal, usually loose. Pedicels filiform, 1-flowered, rising singly, but usually by threes from the axils of the bracteas. Flowers purple, blue, or white, smaller than those of *Hedýsarum*. The plants belonging to this genus are not well defined.

SECT. I. EUDESMÒDIUM (from *eu*, good or well, and *Desmòdium*; this section contains the genuine species of the genus). D. C. legum. vi. prod. 2. p. 325. Joints of legume coriaceous, indehiscent, rather elliptic and somewhat truncate at both extremities. Leaves pinnately-trifoliate. Peduncles axillary, shorter than the petioles. Flowers disposed in corymbose umbels.

1 D. UMBELLA'TUM (D. C. prod. 2. p. 325.) stem shrubby, branched, terete, smooth; branches pubescent; leaflets ovate, obtuse, glabrous above, but canescent beneath from short down; peduncles axillary, shorter than the petioles, bearing umbels of flowers at their apexes; legumes clothed with adpressed villi. ♄. S. Native of Malacca, Ceylon, Javà, and Madagascar. Hedýsarum umbellàtum, Lin. spec. 1053. Burm. ind. 166. Jacq. hort. schœnbr. 297.—Rumph. amb. 4. t. 52. Flowers white.

Var. β, hirsùtum (D. C. prod. 2. p. 326.) branches and petioles hairy; leaflets ovate, rather glabrous above, but hairy beneath; racemes shorter than the petioles, umbelliferous; legumes hairy. ♄. S. Native of the East Indies.

Umbellate-flowered Desmodium. Clt. 1801. Sh. 3 to 6 feet.

2 D. AUSTRA'LE (D. C. prod. 2. p. 326.) stem shrubby, branched, terete, glabrous; branchlets pubescent; leaflets elliptic, acute, glabrous above, but canescent beneath from short down; peduncles axillary, shorter than the leaves, somewhat umbelliferous; legumes smooth. ♄. S. Native of New Caledonia, and the island of Tanna. Hedýsarum umbellàtum, Forst. prod. no. 274. but not of Lin. Hedýsarum austràle, Willd. spec. 3. p. 1183. Very like the preceding species.

Southern Desmodium. Shrub 2 to 4 feet.

3 D. LUTE'SCENS (Desv. l. c.) stem terete, pubescent; leaflets obovate-roundish, pubescent; racemes terminal, and are as well as the legumes clothed with velvety villi. ♄. G. Native of China. Hed. lutéscens, Poir. dict. 6. p. 417. Zórnia lutéscens, Steud. nom. 900. Flowers yellowish.

Yellowish Desmodium. Shrub 2 to 3 feet.

SECT. II. PLEUROLÒBIUM (from πλευρον, *pleuron*, a side, and λοβος, *lobos*, a lobe; in reference to the joints of the legumes being rather convex on one side). D. C. legum. vi. prod. 2. p. 326. Joints of legume membranous, nearly square, the lower side rather convex, and at length dehiscent. Leaves furnished with one leaflet, or pinnately-trifoliate, the lateral leaflets very small. Perhaps a proper genus.

* *Pterópoda* (from πτερον, *pteron*, a wing, and πους ποδος, *pous podos*, a foot; in reference to the footstalks of the leaves being winged). *D. C. prod. 2. p. 326. Leaves having only one leaflet. Petioles winged; wing drawn out into a tooth on both sides at the apex.*

4 D. AURICULA'TUM (D. C. legum. mem. vi.) stems erect, glabrous, triquetrous; leaves ovate, acute, glabrous, 4 times longer than the winged petioles; legumes quite glabrous, and rather coriaceous. ♄. G. Native of the island of Timor. Pterolòma auriculàtum, Desv. in herb. mus. par. Joints of legume 4 or 5, easily separating at maturity.

Auricled-leaved Desmodium. Fl. July, Aug. Clt. 1819. Shrub 3 to 6 feet.

5 D. TRI'QUETRUM (D. C. prod. 2. p. 326.) stems erect, smoothish, triquetrous; leaves ovate-lanceolate, rather cordate, acuminated, 3 times longer than the winged petiole; legumes nearly sessile, hairy. ♄. S. Native of the East Indies. Hedýsarum tríquetrum, Lin. spec. 1052. Burm. ind. t. 52. f. 2. zeyl. t. 81.? Flowers purple.

Triquetrous-stemmed Desmodium. Fl. July, Aug. Clt. 1802. Shrub 3 to 6 feet.

6 D. PSEUDOTRI'QUETRUM (D. C. in ann. sc. nat. 1. p. 100. legum. mem. vi.) stems ascending, rather hairy, triquetrous; leaflets ovate-lanceolate, rather cordate, acuminated, twice the length of the winged petioles; legumes glabrous, but ciliated on both sutures with adpressed villi. ♄. G. Native of Nipaul. Flowers purple.

False-triquetrous-stemmed Desmodium. Fl. July, Aug. Clt. 1820. Shrub 3 to 6 feet.

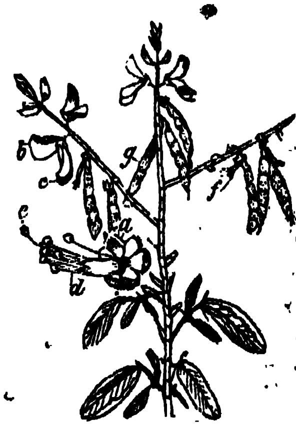
7 D. ALA'TUM (D. C. legum. mem. vi.) stems erect, somewhat tetragonal, glabrous; leaflets lanceolate, acuminated, 8 times longer than the petioles; legumes glabrous, membranous. ♄. S. Native of the East Indies, at Cawnpore. Hedýsarum alàtum, Roxb. hort. beng. 56. Joints of legume 5-6, sometimes irregularly triangular. Flowers purple.

Winged-petioled Desmodium. Fl. July, Aug. Clt. 1817. Shrub 3 to 6 feet.

* * *Gyràntia* (from *gyro*, to whirl). *D. C. prod. 2. p. 326. Leaves pinnately-trifoliate; petiole wingless.*

8 D. GY'RANS (D. C. prod. 2. p. 326.) plant glaucous; leaflets 3, elliptic-oblong, terminal one very large, but the lateral ones are very small; racemes numerous, disposed in a panicle; legumes pubescent. ♂. S. Native of Bengal. Hedýsarum gýrans, Lin. fil. suppl. 332. Jacq. icon. rar. 3. t. 562. Flowers violaceous. The singular motion with which the lateral leaflets of this plant are endued is thus described in Linnæus's supplement. " This is a wonderful plant on account of its singular motion, which is not occasioned by any touch, or irritation, or movement in the air, as in *Mimòsa O'xalis*

FIG. 44.



and *Dionæ'a;* nor is it so evanescent as in *Amórpha*. No sooner had the plants raised from seed acquired their ternate leaves than they began to be in motion in every direction; this movement did not cease during the whole course of their vegetation, nor were they observant of any time, order, or direction; one leaflet frequently revolved, whilst the other on the same petiole was quiescent; sometimes a few leaflets only were in motion, then almost all of them would be in movement at once; the whole plant was very seldom agitated, and that only during the first year. It continued to move in the stove during the second year of its growth, and was not at rest even in winter." In our climate the lateral leaflets move up and down, either steadily or by jerks, particularly if the house in which it is growing be shut up very warm. This motion is most evident when the sun's rays are on the plant, it therefore appears to us that it is the action of the sun's rays upon it which occasions the motion of the leaflets. For further particulars see Brouss. mem. acad. scienc. paris, 1784. p. 616. Silvestr. bull. philom. 1. p. 67. t. 5. (f. 44.)

Var. β; lateral leaflets almost wanting. ♂. S. Native of Nipaul. Wallich. Hedys. gỳrans, Roxb. hort. beng. p. 57.

Moving Plant or Whirling Desmodium. Fl. July, Aug. Clt. 1775. Pl. 1 to 3 feet.

9 D. GYROI'DES (D. C. legum. vi. prod. 2. p. 326.) leaflets 3, elliptic, the terminal one large, and the lateral ones small; racemes numerous, disposed in a panicle; legumes hairy. ♄. S. Native of the East Indies, in Silhet. Hedýsarum gyroìdes, Roxb. hort. beng. 57. The legume is very like that of *D. tríquctrum*, but hairy. The plant is hoary in every part.

* *Gyrans-like* Desmodium. Clt. 1817. Pl. 3 to 5 feet.

10 D. TIMORIE'NSE (D. C. leg. mem. vi. prod. 2. p. 327.) leaflets 3, rhomboid, canescent from villi beneath, and with a few scattered hairs above; lateral ones one-half smaller than the terminal one; racemes numerous, disposed in a panicle; legumes short, pubescent. ♂: S. Native of the island of Timor.

Timor Desmodium. Pl. 2 to 4 feet.

SECT. III. CHALA'RIUM (probably from χαλαω, *chalao*, to loose; from containing a loose heterogeneous mass of plants). D. C. prod. 2. p. 327. Joints of legume membranous, indehiscent, oval or orbicular, rarely oblong, convex on both sides, or with the superior side straightish, tapering to both ends.—Leaves simple or pinnately-trifoliate. Racemes loose, elongated, with 3 pedicels rising from each bractea.

§ 1. *Leaves simple, that is, only having one leaflet.*

11 D. GANGE'TICUM (D. C. prod. 2. p. 327.) stem erect; leaflets ovate, acute, clothed with adpressed silky pubescence beneath; stipulas 4 times shorter than the petiole; legumes puberulous, having 5-6 semi-orbicular joints. ♄. S. Native of the East Indies. Burm. zeyl. t. 49. Hedys. Gangéticum, Lin. spec. 1052. Æschynómene Gangética, Poir. Hedys. ochroleùcum, Mœnch. Flowers dirty purple?

Var. β, Neaìa (D. C. prod. 2. p. 327.) leaflets ovate-lanceolate, acuminated, silky beneath; stipulas exceeding half the length of the petioles. ♄. S. Native of the Philippine islands. Perhaps a distinct species.

Ganges Desmodium. Fl. July, Aug. Clt. 1762. Pl. 2 to 3 ft.

12 D. MACULA'TUM (D. C. prod. 2. p. 327.) stem erect, herbaceous; leaves ovate, obtuse or rather acute, spotted with white above, and clothed with adpressed pubescence beneath; legumes rather puberulous, having 5-6 semi-orbicular joints. ☉. S. Native of the East Indies. Hedys. maculàtum, Lin. spec. 1051. Æschynómene maculàta, Poir.—Dill. hort. elth. 1. t. 141. f. 168. Flowers pale violet, or red and yellow. (Mill.)

Spotted-leaved Desmodium. Fl. July, Aug. Clt. 1732. Pl. 1 foot.

13 D. RENIFÓRME (D. C. prod. 2. p. 327.) stem erect; leaves roundish-reniform, very blunt; joints of legume semi-orbicular. ☉. S. Native of the East Indies. Hedys. renifórme, Lin. spec. 1051. Burm. ind. t. 52. f. 1. Lower flowers solitary in the axils of the leaves. Flowers purple. Habit of *Eleiòtis monophýlla*, but the legume is very distinct.

Reniform-leaved Desmodium. Fl. Jul. Aug. Clt. 1820. Pl. 1 ft.

14 D. RU'BRUM (D. C. prod. 2. p. 327.) stem suffrutescent; branches nearly erect; leaves ovate, ciliated; racemes terminal, spicate; legumes arched, scabrous. ♄. G. Native of Cochinchina. Orníthopus rùber, Lour. coch. p. 452. Branches red. Flowers pale.

Red-branched Desmodium. Shrub 2 feet.

15 D. TERMINA'LE (D. C. prod. 2. p. 327.) stem tall, shrubby at the base; leaves large, rather tomentose; panicle loose; outer joint of legume sterile and dilated. ♄. S. Native of Guiana. Hedys. terminàle, Rich. act. soc. hist. nat. par. p. 105. Flowers purple.

Terminal Desmodium. Shrub 2 feet.

16 D. PERROTTE'TII (D. C. legum. mem. vi. prod. 2. p. 327.) stem terete, erect, scabrous from short curved hairs; leaves ovate, rather acute, puberulous beneath, but villous when young, nearly glabrous above; panicle terminal; joints of legume ovate, equal, velvety. ♄. S. Native of Guiana. The leaves appear to be spotted with white in the dried specimens.

Perrottet's Desmodium. Shrub 1 to 2 feet.

17 D. ORMOCARPOÌDES (D. C. prod. 2. p. 327.) stem suffrutescent, erect, glabrous; leaves ovate, acuminated, glabrous; racemes nodding; legumes hairy from short down, with elliptic, elongated, compressed joints. ♄. S. Native of Java. Hedys. ormocarpoìdes, Desv. in herb. Desf. Hedys. adhæ'rens, Poir. suppl. 5. p. 15. but not of Vahl. Perhaps this plant is referrible to the first section.

Ormocarpum-like Desmodium. Shrub 2 to 3 feet.

18 D. SAGITTA'TUM (D. C. prod. 2. p. 327.) leaves oblong or linear-lanceolate, cordately-sagittate, on very short petioles; flowers solitary, axillary, on long pedicels.—Native of the East Indies. Hedys. sagittàtum, Poir. dict. 6. p. 403. The legume is unknown. Flowers red. Stem triquetrous, glabrous.

Sagittate-leaved Desmodium. Fl. July, Aug. Clt. 1807. Pl. 1 to 2 feet.

19 D. LINEARIFÒLIUM (D. C. legum. mem. vi. prod. 2. p. 327.) stem herbaceous, terete, glabrous at the base; leaves linear, mucronate, glabrous, on short petioles; racemes terminal, puberulous; legumes puberulous, with 4-6 compressed, roundish-elliptic joints.—Native country unknown.

Linear-leaved Desmodium. Pl. 1 to 2 feet.

20 D. DENUDA'TUM (D. C. legum. mem. vi. prod. 2. p. 328.) stems terete, suffruticose, glabrous; branches twiggy, puberulous, bearing leaves only at the base; leaves oblong-lanceolate, acutish; stipulas and stipels setaceous; racemes elongated, naked; pedicels usually twin. ♄. S. Native of St. Domingo, in dry pastures. Flowers purple.

Naked-branched Desmodium. Shrub 1 to 2 feet.

21 D. ANGUSTIFÒLIUM (D. C. prod. 2. p. 328.) shrubby; branches twiggy; leaves linear-lanceolate, mucronate, puberulous beneath, and with the margins scabrous; racemes solitary; bracteas ciliated, with stiff hairs; joints of legume 1-6, roundish, hairy, with rather hispid margins. ♄. S. Native of Mexico. Hedýsarum angustifòlium, H. B. et Kunth, nov. gen. amer. 6. p. 517. Flowers minute, purple.

Narrow-leafletted Desmodium. Fl. June, Aug. Clt. 1824. Shrub 2 feet.

22 D. VELUTI'NUM (D. C. prod. 2. p. 328.) stem shrub terete, pubescent; leaves ovate, clothed with velvety on both surfaces, mucronate; racemes terminal and axil calyx 5-parted, villous; legumes clothed with villous tomentum, having oblong compressed joints. ♄. S. Native of South Ame

rica. Hedys. velutìnum, Willd. spec. 3. p. 1174. Flowers small, violet. Perhaps a species of *Urària*.

Velvety Desmodium. Shrub 2 to 3 feet.

23 D. latifòlium (D. C. prod. 2. p. 328.) stems shrubby, terete, when young clothed with rufous velvety down, but at length becoming smooth; leaves broad, ovate, rather cordate, mucronulate, and repand, clothed with velvety villi on both surfaces; stipulas cordate at the base, cuspidate; racemes terminal and axillary; legume hairy, with 3-5 semi-orbicular joints. ♄. S. Native of the East Indies and China. Hedys. latifòlium, Roxb. hort. beng. p. 57. Ker. bot. reg. 356. Horn. hort. hafn. suppl. 152. Roth. nov. spec. 355.—Pluk. alm. 432. f. 3. ? Flowers purple.

Broad-leafletted Desmodium. Fl. Aug. Clt. 1818. Sh. 3 ft.

24 D. lasioca'rpum (D. C. prod. 2. p. 328.) villous in every part; stem shrubby, terete, when young clothed with rufous velvety down, but glabrous in the adult state; leaves broad, ovate-lanceolate, mucronulate, rather repand, clothed with velvety villi on both surfaces; stipulas subulate, hairy; racemes long, spike-formed, terminal, and axillary, forming a panicle; legumes hispid, with 3-4 semi-orbicular joints. ♄. S. Native of Africa, in the kingdoms of Waree and Benin, and plentiful in the island of St. Thomas in the gulf of Guinea. Hedys. lasiocàrpum, Beauv. fl. d'ow. 1. p. 32. t. 18. Poir. suppl. 5. p. 15. Hedys. deltoìdeum, Poir. suppl. 5. p. 15. Flowers small, red.

Woolly-fruited Desmodium. Fl. June, Aug. Clt. 1823. Shrub 3 to 6 feet.

25 D. ela'tum (H. B. et Kunth, nov. gen. amer. 6. p. 527.) stem erect, shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucescent; racemes panicled; legumes hairy. ♄. S. Native of New Andalusia, near Caripe. Flowers purple. Allied to *D. áspera*.

Tall Desmodium. Shrub 3 to 6 feet.

§ 2. *Trifoliàta* (the plants contained in this division have trifoliate leaves). *Leaves pinnately trifoliate, the terminal leaflet the largest.—This section contains a great number of species which are very nearly allied to each other, but which are very difficult to extricate, or to place into any kind of order, and therefore they are here arranged geographically.*

* *Boreàli-Americàna* (the species contained in this division are all natives of North America). *Hedysari species foliis ternatis, Michx. fl. bor. amer. 2. p. 72. Pursh. fl. amer. sept. 2. p. 482. Nutt. gen. amer. 2. p.* 108.

26 D. Canade'nse (D. C. prod. 2. p. 328.) stem erect, rather pilose and striated; leaflets oblong-lanceolate, smoothish; stipulas filiform; racemes terminal; joints of legume 4-5, oval, bluntly triangular, hispid from short hairs. ♃. H. Native of North America, in sandy fields and woods; plentiful throughout Canada. Hedys. Canadénse, Lin. spec. 1054. Hedys. scàbrum, Mœnch.—Corn. can. 45. with a figure.—Moris. oxon. sect. 2. t. 11. f. 9. Flowers reddish purple, in simple or panicled, lateral or terminal racemes. Bracteas lanceolate.

Canadian Desmodium. Fl. Jul. Aug. Clt. 1640. Pl. 4 to 6 ft.

27 D. cane'scens (D. C. prod. 2. p. 328.) stem erect, angular, ciliated, hispid; leaflets ovate-roundish, canescent from adpressed hairs beneath; stipulas ovate; racemes panicled; bracteas cordate; joints of legume ovate-triangular, hispid. ♃. H. Native of Virginia and Carolina. Hedys. canéscens, Lin. spec. 1054. but not of Mill. Hedys. scabérrimum, Ell. sketch. 2. p. 217. ?—Pluk. alm. t. 308. f. 5. Flowers pale purple, middle-sized.

Var. β, *paleàceum* (D. C. l. c.) racemes almost simple. ♃. H. Native of Virginia. Hedys. paleàceum, Poir. dict. 6. p. 418.

Canescent Desmodium. Fl. July, Aug. Clt. 1733. Pl. 3 to 4 ft.

28 D. Maryla'ndicum (D. C. prod. 2. p. 328.) stem erect, pilose, branched; leaflets oblong, villous beneath; stipulas subulate; racemes panicled; joints of legume 3, rhomboid, reticulated, and rather pilose. ♃. H. Native of North America, from New York to Carolina. We have seen this plant growing in great plenty in dry sandy woods near New York and in Long Island. Hedys. Marylándicum, Lin. spec. 1055.—Dill. hort. elth. t. 174. f. 171. Flowers pale purple, fading to blue, the vexillum having a green spot at the base.

Maryland Desmodium. Fl. July, Oct. Clt. 1725. Pl. 2 feet.

29 D. obtu'sum (D. C. prod. 2. p. 329.) stem erect, pubescent; leaflets ovate, obtuse, somewhat cordate at the base: stipulas lanceolate-subulate; panicle terminal; joints of legume semi-orbicular, reticulated, and hispid. ♃. H. Native from Pennsylvania to Virginia, in woods and fields, and in dried up marshes. Hedys. obtùsum, Muhl. in Willd. Hedys. coriàceum, Poir. dict. 6. p. 418. ? Flowers violaceous.

Obtuse-leafletted Desmodium. Fl. July, Aug. Clt. 1805. Pl. 2 feet.

30 D. cilia're (D. C. prod. 2. p. 329.) stem erect, rather pilose, slender; leaves approximate, on very short petioles; leaflets small, oval, obtuse; stipulas subulate; racemes axillary, and terminal, panicled; joints of legume oval, hispid. ♃. H. Native about New York and Philadelphia. Hedys. ciliàre, Nutt. gen. amer. 2. p. 109. Flowers small, violaceous.

Ciliated Desmodium. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 ft.

31 D. viridiflòrum (D. C. prod. 2. p. 329.) stem erect, branched, pubescent; leaflets ovate-oblong, scabrous beneath; stipulas lanceolate, cuspidate; racemes panicled, bracteate; joints of legume oval, rough. ♃. H. Native from New Jersey to Carolina, and of Upper Louisiana, in woods and in waste fields. Hedys. viridiflòrum, Lin. spec. 1055. but not of Burm. —Pluk. alm. t. 308. f. 5. Flowers reddish purple, but at length becoming greenish.

Greenish-flowered Desmodium. Fl. July, Sept. Clt. 1787. Pl. 3 feet.

32 D. læviga'tum (D. C. prod. 2. p. 329.) stem simple, erect, glabrous, and rather glaucous; leaves quite glabrous, on long petioles; leaflets ovate, acute; stipulas subulate; panicle terminal; flowers twin, on long pedicels; bracteas ovate, acute, shorter than the flower-buds; lower segment of calyx elongated. ♃. H. Native of the State of New York, in woods. Hedys. lævigàtum, Nutt. gen. amer. 2. p. 109. Flowers purple. Legume unknown. Allied to the following species.

Smooth Desmodium. Pl. 2 to 3 feet.

33 D. bracteòsum (D. C. prod. 2. p. 329.) stem erect, glabrous; leaflets oblong-oval, acuminated, glabrous; stipulas subulate; racemes terminal, few-flowered; bracteas ovate, acuminated, striated, glabrous; joints of legume nearly oval. ♃. H. Native of Pennsylvania and the western parts of Virginia. Hedys. bracteòsum, Michx. fl. bor. amer. 2. p. 73. Pursh, fl. amer. sept. 2. p. 482. Flowers largish, purple.

Var. β, *cuspidàtum* (D. C. l. c.) leaves with scabrous margins; stipulas ovate-lanceolate; joints of legume ovate, reticulated, glabrous, but with pubescent margins. ♃. H. Native of shady woods. Hedys. cuspidàtum, Willd. spec. 3. p. 1198. Pursh, l. c. Said by Nuttall to be hardly a variety of *D. bracteòsum.*

Large-*bracted* Desmodium. Fl. July, Aug. Clt. 1806. Pl. 1 to 2 feet.

34 D. glabe'llum (D. C. prod. 2. p. 329.) stem erect, glabrous; leaflets ovate, obtuse, rather glaucous beneath; stipulas small, subulate; panicle terminal; joints of legume triangularly-rhomboid. ♃. H. Native from Virginia to Carolina, in woods and fields. Hedys. glabéllum, Michx. fl. bor. amer. 2. p. 73. Flowers small, purple. Perhaps the same as D. paniculàtum

according to Ell. sketch. 2. p. 211. but the leaflets are said to be not half the size, and blunter.

Glabrous Desmodium. Fl. July, Sept. Pl. 1 to 2 feet.

35 D. PANICULA'TUM (D. C. prod. 2. p. 329.) stem erect, glabrous; leaflets oblong-lanceolate or elliptic, glabrous; stipulas subulate; panicle terminal; joints of legume 4, rhomboid, pubescent. ♃. H. Native from New York to Carolina, in dry woods. Hedys. paniculàtum, Lin. spec. 1056.—Pluk. alm. t. 432. f. 6. Flowers small, pale purple.

Panicled-flowered Desmodium. Fl. July. Clt. 1781. Pl. 2 ft.

36 D. STRI'CTUM (D. C. prod. 2. p. 329.) stem straight, erect, glabrous, simple; leaflets linear-elliptic, glabrous, reticulately veined, glaucous beneath; stipulas subulate; panicle terminal, pedunculate, few-flowered; joints of incurved legume somewhat lunately triangular, hispid. ♃. H. Native of woods, in New Jersey. Hedys. hírtum, Pursh, fl. amer. sept. 2. p. 483. Nutt. gen. amer. 2. p. 109. Flowers purple.

Straight Desmodium. Pl. 1 to 2 feet.

37 D. ACUMINA'TUM (D. C. prod. 2. p. 329.) stem erect, simple, pubescent, leafy at the apex; leaves on long footstalks; leaflets ample, ovate, long-acuminated, rather pilose on both surfaces, the terminal one roundish-ovate; panicle terminal, on a long peduncle; pedicels rather pilose; joints of stipitate legume 3, bluntly triangular, pubescent. ♃. H. Native from New England to Carolina, and Upper Canada at Lake Huron. Hedys. acuminàtum, Michx. fl. bor. amer. 2. p. 72. Pursh, l. c. Hedys. glutinòsum, Willd. spec. 3. p. 198. Pursh, l. c. ex Nutt. l. c. Flowers purple.

Acuminated-leafletted Desmodium. Fl. July, Aug. Clt. 1805. Pl. 1 to 2 feet.

38 D. NUDIFLÒRUM (D. C. prod. 2. p. 330.) stem erect, simple, smoothish; leaflets broad-oval, acuminated; scape panicled, glabrous, radical, higher than the leaf-bearing stems; joints of legume roundish-triangular, smoothish. ♃. H. Native from New England to Carolina, and in Canada about Quebec, in woods and in waste fields. Hedys. nudiflòrum, Lin. spec. 1056. Ell. sketch. 2. p. 209. Flowers purple.

Naked-flowered Desmodium. Fl. Jul. Aug. Clt. 1823. Pl. 1 ft.

39 D. PAUCIFLÒRUM (D. C. prod. 2. p. 330.) stem decumbent, very humble and filiform; leaves on very long petioles; leaflets broad-ovate, acuminated, ciliated with pubescence; stipulas obsolete; racemes terminal, pedunculate, few-flowered, hardly exceeding the leaves. ♃. H. Native of the woods of Ohio, Kentucky, and Tennessee. Hedys. pauciflòrum, Nutt. gen. amer. 2. p. 109. Flowers small, white.

Few-flowered Desmodium. Fl. July, Aug. Clt. 1818. Pl. decumbent.

40 D. RI'GIDUM (D. C. prod. 2. p. 330.) stem erect, much branched, tomentose; leaflets oblong-ovate, obtuse, reticulated, pubescent; panicle branched; bracteas ovate-lanceolate, acuminated. ♃.? H. Native of Carolina. Hedys. rígidum, Ell. sketch. 2. p. 215. Flowers purple.

Stiff Desmodium. Pl. 1 to 2 feet.

41 D. RHOMBIFÒLIUM (D. C. prod. 2. p. 330.) plant pubescent; leaflets rhomboid, obtuse, thickish, reticulately wrinkled; panicle compound; bracteas small: joints of legume 1-3, almost orbicular, veiny and pubescent. ♃.? F. Native of Carolina, near Beaufort. Hedys. rhombifòlium, Ell. sketch. 2. p. 215. Flowers purple.

Rhomb-leafletted Desmodium. Pl.

42 D. LINEA'TUM (D. C. prod. 2. p. 330.) stem creeping, green, and lined; leaves almost sessile; leaflets nearly orbicular, smoothish; racemes elongated, few-flowered; joints of legume lenticular. ♃. H. Native of Carolina. Hedys. lineàtum, Michx. fl. bor. amer. 2. p. 72. but not of Lin. Flowers purple.

Lineated-stemmed Desmodium. Pl. creeping.

43 D. ROTUNDIFÒLIUM (D. C. prod. 2. p. 330.) stem prostrate, hairy; leaflets orbicular, pilose on both surfaces: stipulas roundish-cordate, reflexed; racemes axillary, and forming a terminal few-flowered panicle; bracteas cordate; joints of legume rather rhomboid, reticulated, and scabrous. ♃. H. Native from Pennsylvania to Carolina, in dry rocky places. Hedys. rotundifòlium, Michx. l. c. Pursh, l. c. but not of Vahl. Hedys. canéscens, Willd. ex Ell. Flowers purple.

Round-leafletted Desmodium. Fl. July, Aug. Clt. 1733. Pl. prostrate.

† *North American species not sufficiently known.*

44 D. PEDUNCULA'TUM (D. C. prod. 2. p. 338.) stem herbaceous, erect; leaflets ovate at the base, and acuminated at the apex, smooth, middle one longer than the petiole; racemes axillary, erect, very long. ♃. F. Native of South Carolina. Hedys. pedunculàtum, Mill. dict. no. 17. Flowers pale yellow.

Peduncled Desmodium. Pl. 1 foot.

45 D. GRANDIFLÒRUM (D. C. prod. 2. p. 338.) leaflets oval, veiny, smooth on both surfaces; racemes axillary, erect; flowers large; legumes pendulous, many-jointed.—Native of Carolina. Hedys. grandiflòrum, Walt. car. 185. but not of Pall.

Great-flowered Desmodium. Pl. 2 feet.

46 D. RE'PENS (D. C. prod. 2. p. 338.) stems procumbent; leaflets obcordate; racemes lateral. ♃. H. Native of Virginia. Hedys. rèpens, Lin. spec. 1056.—Dill. hort. elth. 172. t. 142. f. 9. ex Lin. but Dillenius's plant is a native of the East Indies.

Creeping Desmodium. Pl. creeping.

* * *Mexican species.*

47 D. ALAMA'NI (D. C. prod. 2. p. 330.) stem erect, angular, smoothish, branched; leaflets ovate, acute, hardly pubescent; stipulas lanceolate, acuminated, spreadingly reflexed; racemes terminal; pedicels twin; bracteas lanceolate, acuminated, deciduous; lower segment of the calyx elongated. ♃. G. Native of Mexico. Hedys. geminiflòrum, and perhaps Hedys. mucronàtum, Moc. et Sesse, fl. mex. icon. ined. Hedys. Alamàni, Spreng. syst. append. p. 291. Flowers purple. Young legume 4-5-jointed, rather hoary.

Alaman's Desmodium. Pl. 1 to 3 feet.

48 D. STIPULA'CEUM (D. C. prod. 2. p. 330.) stem erect, branched, pilose; leaflets ovate, rather obtuse; stipulas horizontal, obliquely ovate-lanceolate, acuminated, ciliated; stipels large; racemes terminal, somewhat panicled. ♃. G. Native of Mexico, on the mountains. Hedys. stipulàceum, Moc. et Sesse, fl. mex. icon. ined. Flowers purple.

Large-*stipuled* Desmodium. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

49 D. INFRA'CTUM (D. C. prod. 2. p. 330.) stem nearly erect, rather angular, bent at the leaves; leaflets ovate, acute, puberulous as well as the petioles and peduncles; stipulas ovate, acute; racemes axillary, simple; joints of legume 2, semi-orbicular, glabrous. ♃. G. Native of Mexico, on the mountains. Hedys. biarticulàtum, Moc. et Sesse, fl. mex. icon. ined. but not of Lin. Hedys. infráctum, Spreng. syst. append. 290. Flowers violaceous.

Bent-stemmed Desmodium. Pl. 1 to 2 feet.

50 D. APARI'NES (D. C. prod. 2. p. 330.) stem erect, rough from crowded hairs, which are hooked at the apex; leaflets oblong, rather pilose, painted with white above and pale beneath; racemes terminal. ♃. G. Native of Mexico. Hedys. Aparìnes, Link. enum. 2. p. 247. Hedys. ramòsum, H. W. no. 13789. ex Schlecht. et Cham. in Linnæa. 5. p. 586. Leaflets sometimes roundish. Flowers purple.

Cleaver Desmodium. Fl. June, Jul. Clt. 1823. Pl. 1 to 2 ft.

51 D. CINE'REUM (D. C. prod. 2. p. 330.) branches clothed

with white tomentum; leaflets elliptic, rather mucronate, having parallel veins, clothed with hoary silky tomentum on both surfaces; racemes elongated; joints of legume 1-5, deltoid, semi-orbicular, clothed with soft canescent pubescence. ♄. S. Native between Acapulco and the city of Mexico, near Mascala and Chilpacingo, Hedys. cinèreum, H. B. et Kunth, nov. gen. amer. 6. p. 526. Flowers purple.

Cinereous Desmodium. Fl. Jul. Aug. Clt. 1820. Sh. 1 to 2 ft.

52 D. SEROTÌNUM (D. C. prod. 2. p. 338.) stem herbaceous; leaflets elliptic, obtuse, pubescent beneath as well as the petioles; racemes terminal, simple. ♃. G. Native of Mexico, near Jalapa. Hedys. serotìnum, Willd. enum. p. 777.

Late-flowering Desmodium. Pl. 1 foot.

53 D. PLICA'TUM (Schlecht. et Cham. in Linnæa. 5. p. 585.) stem erect, terete, clothed with retrograde canescent tomentum upwards, but below with dense canescent pubescence; leaves on short petioles; leaflets oblong-elliptic, rather retuse and mucronate at the apex, pubescent above and tomentose beneath; stipulas and stipels ending in a long acumen each; spikes panicled; flowers in fascicles; bracteas very narrow and very acute, exceeding the calyx; legumes tomentose, with a few, usually 3-4, complicated joints. ♄. G. Native of Mexico, in fields, between Misantla and Colipa. The whole plant is of a yellowish-cinereous colour. Corolla violaceous. Habit of *Hedys. cajanifòlium*, H. B. et Kunth. Hedys. multiflòrum, H. W. no. 13797. et Schlecht. et Cham. l. c.

Plicate-podded Desmodium. Shrub 2 feet.

* * * *South American and West Indian species. Hedýsarum, Swartz, fl. ind. occid. 3. p. 1263. H. B. et Kunth, nov. gen. amer. 6. p. 517.*

54 D. UNCINA'TUM (D. C. prod. 2. p. 331.) stem shrubby, climbing, rough from hairs, which are hooked at the apex; leaflets ovate, villous, painted with white above; racemes terminal. ♄. ◡. S. Native of the Caraccas. Hedys. uncinàtum, Jacq. hort. schœnb. 3. t. 298. Flowers violaceous.

Hooked-haired Desmodium. Shrub cl.

55 D. CŒRU'LEO-VIOLA'CEUM (D. C. prod. 2. p. 331.) stems shrubby, terete, diffuse, and are as well as the leaves clothed with villous pubescence; leaflets elliptic; stipulas lanceolate-subulate, ciliated; racemes terminal, capitate; legumes scabrous, pilose. ♄. S. Native of Guiana. Hedys. cœrùleo-violàceum, Meyer. esseq. 246. Calyx 5-parted, with lanceolate-subulate lobes. Corolla bluish violet.

Bluish-violet-flowered Desmodium. Shrub 1 to 2 feet.

56 D. MOLLÍCULUM (D. C. prod. 2. p. 331.) stems diffuse, clothed with soft pili as well as the petioles and peduncles; leaflets pilose on both surfaces, terminal one rhomboid-orbicular, lateral ones roundish-elliptic, mucronate; racemes loose-flowered, young legumes with 2 hispid joints. ♄. S. Native of South America. Hedys. mollículum, H. B. et Kunth, nov. gen. amer. 6. p. 512. Heterolòma lanàtum, Desv. ined. Flowers purple. Allied to *D. lanàtum* and *D. rotundifòlium*.

Softish Desmodium. Shrub diffuse.

57 D. ARENA'RIUM (H. B. et Kunth, nov. gen. amer. 6. p. 527.) stems herbaceous, procumbent; stipulas ovate, acuminately-subulate; leaflets oblong-elliptic, clothed with adpressed pubescence on both surfaces, glaucescent beneath; racemes almost terminal or opposite the leaves, solitary; joints of legume few, hairy. ♃. S. Native on the banks of the Orinoco, near Atures, in sandy places. Flowers violaceous.

Sand Desmodium. Pl. procumbent.

58 D.? MULTICAU'LE (D. C. prod. 2. p. 331.) stems diffuse, slender, suffrutescent at the base, clothed with hoary-velvety down as well as the leaves; leaflets elliptic; stipulas broad, cordate, acuminated; racemes opposite the leaves and about the same length; pedicels twin; bracteas tern, acuminated. ♄. S. Native of Peru. Root thick, woody. Flowers small. Young legume slender and many-jointed, villous. Perhaps this plant does not belong to the present genus.

Many-stemmed Desmodium. Shrub diffuse.

59 D. ERYTHRINÆFÒLIUM (D. C. prod. 2. p. 331.) stems twiggy, glabrous, angular; leaflets broad-ovate, acuminated, glabrous, pale beneath; stipulas subulate; racemes terminal, somewhat panicled; joints of legume very smooth and dolabriform, acute at both ends. ♄. S. Native of South America. Hedys. erythrinæfòlium, Juss. in Poir. dict. 6. p. 408.

Erythrina-leaved Desmodium. Shrub.

60 D. CARIPE'NSE; plant erect; branches, petioles, and peduncles rather hairy; leaflets ovate-oblong, mucronate, ciliated, hairy above but glabrous beneath; racemes elongated; joints of legume 3-5, rhomboid, hairy. ♄. S. Native of Cumana, near Caripe. Hedys. Caripénse, H. B. et Kunth, nov. gen. amer. 6. p. 523. D. Cumanénse, D. C. prod. 2. p. 331. Flowers purple.

Caripe Desmodium. Shrub 2 to 3 feet.

61 D. CAJANIFÒLIUM (D. C. prod. 2. p. 331.) branches densely hairy; leaflets oblong, obtuse, full of parallel veins, glabrous and shining above, but covered with soft silky pubescence and glaucescent beneath; racemes panicled; joints of legume 2-6, semi-orbicular, and puberulous. ♄. S. Native on the banks of the river Magdalena, near Honda, and of the island of Trinidad. Hedys. cajanifòlium, H. B. et Kunth, nov. gen. amer. 6. p. 525. t. 598. Flowers bluish.

Pigeon-pea-leaved Desmodium. Fl. July, Aug. Clt. 1820. Shrub 2 to 3 feet.

62 D. WA'DE (D. C. prod. 2. p. 331.) stem shrubby; lower leaves simple, the rest trifoliate; leaflets ovate-lanceolate, ciliated; racemes very long, opposite the leaves; pedicels tern; legumes membranous, scabrous, 3-jointed. ♄. S. Native of Brazil, particularly in Para. Hedys. Wàde, Vand. in Rœm. script. 63. Flowers small, white. *Wade* is the vernacular name of the plant.

Wade Desmodium. Shrub 1 to 2 feet.

63 D. RACEMI'FERUM (D. C. prod. 2. p. 331.) stem terete, slender, hispid; leaflets oval, obtuse, glabrous above, villous beneath, and somewhat marcescent; stipulas and bracteas oblong, acuminated, villous; racemes terminal; pedicels twin at each bractea, which is caducous. ♄. S. Native of Cayenne. Hedys. racemòsum, Aubl. guian. 2. p. 774.? but not of Thunb. Flowers purple.

Raceme-bearing Desmodium. Shrub 1 to 2 feet.

64 D. ANCISTROCA'RPUM (D. C. prod. 2. p. 331.) stem frutescent, pilosely-pubescent; leaves glaucous beneath; leaflets of the lower leaves orbicular, of the upper ones elliptic; racemes opposite the leaves, elongated; joints of legume numerous, semi-orbicular, hispid from stiff hairs, which are hooked at their apices. ♄. S. Native of Brazil. Hedys. ancistrocárpum, Ledeb. ind. hort. dorp. suppl. 1823. Flowers small, purple.

Ancistrum-fruited Desmodium. Shrub 1 to 2 feet.

65 D. INCA'NUM (D. C. prod. 2. p. 332) stem suffrutescent. erect, terete, pubescent; leaflets ovate-oblong, hoary beneath; stipulas oblong, acuminated, glabrous; racemes terminal; pedicels solitary; legumes deflexed, puberulous, having semi-orbicular joints. ♄. S. Native of Jamaica and St. Domingo, among bushes and grass. Hedys. incànum, Swartz, fl. ind. occid. 1265. but not of Thunb. Hedys. canéscens, Mill. but not of Lin. Hedys. incànum, Lun. hort. jam. Æschynómene incàna, Meyer.—Plum. ed Burm. t. 149. f. 1. Flowers pale red.

Hoary Desmodium. Fl. Jul. Aug. Clt. 1818. Sh. 2 to 3 ft.

66 D. SUPÌNUM (D. C. prod. 2. p. 332.) stems frutescent, declinate, pubescent above; leaflets ovate, clothed with hoary villi beneath; stipulas lanceolate, acuminated, puberulous; racemes

terminal; pedicels solitary; legumes nearly erect, pubescent, with semi-ovate joints. ♄. S. Native of Jamaica, Guadaloupe, Santa Cruz, among grass, and of the Spanish Main, about Bordones and Cumana. Hedys. supìnum, Swartz, fl. ind. occid. 1264. H. B. et Kunth, nov. gen. amer. 6. p. 524. but not of Vill. nor Pall. Æschynómene spicàta, Poir. 4. p. 452. ex herb. mus. par. D. Cumanénse, Willd. herb.—Sloane, hist. jam. 1. t. 118. f. 2. Flowers small, bluish purple. Perhaps the plant of Kunth is distinct from that of Swartz.

Supine Desmodium. Fl. July, Aug. Clt. 1816. Sh. trail.

67 D. tortuòsum (D. C. prod. 2. p. 332.) stem erect, herbaceous, terete, pubescent, suffrutescent at the base; leaflets elliptic, smoothish; stipulas much acuminated; racemes axillary, elongated, loose; legumes erectish, pubescent, with roundish twisted joints. ♄. S. Native among bushes on the mountains of Jamaica, Porto Rico, and on the banks of the river Magdalena, near Honda. Hedys. tortuòsum, Swartz, fl. ind. occid. 1271. H. B. et Kunth, nov. gen. amer. 6. p. 521.—Sloan. jam. 1. t. 116. f. 9. Flowers pale blue.

Var. β, hirtéllum (D. C. prod. 2. p. 332.) stem beset with short hooked hairs; leaves rather villous on both surfaces. ♄. S. Native of Guadaloupe. Perhaps a proper species.

Twisted Desmodium. Fl. Jul. Aug. Clt. 1781. Sh. 2 to 3 ft.

68 D. mólle (D. C. prod. 2. p. 333.) stem erect, terete, glabrous; leaflets ovate, attenuated, clothed with soft villi beneath; racemes terminal; pedicels tern; young legumes twisted, puberulous, with rhomboid joints, the ultimate one largest and somewhat orbicular, at length all glabrous. ♄. S. Native of the islands of Santa Cruz, St. Thomas, and St. Domingo. Hedys. mólle, Vahl. symb. 2. p. 83. Flowers purple.

Soft Desmodium. Shrub 1 to 2 feet.

69 D. adscéndens (D. C. prod. 2. p. 332.) stem suffrutescent, ascending, terete, pilose; leaflets roundish, pubescent beneath; stipulas lanceolate, falcate; racemes erect, axillary, simple; pedicels solitary; legumes declinate, pubescent. ♄. S. Native of the West Indies. Hedys. adscéndens, Swartz, fl. ind. occid. 1263. but not of Sieb. Flowers small, red. Perhaps many species are confused under this name.

Var. β, Orinocénse (H. B. et Kunth, nov. gen. amer. 6. p. 520. t. 597.) legumes with 1-3 joints.

Ascending Desmodium. Fl. Ju. Aug. Clt. 1818. Sh. 1 to 2 ft.

70 D. cœrúleum; stem terete; branches declinate, ascending, pilose; leaflets roundish, pubescent beneath, mucronate, somewhat emarginate; stipulas rather falcate; racemes simple, erect, axillary, many-flowered. ♄. S. Native of Brazil. D. adscéndens var. β, cœrùleum, Lindl. bot. reg. 815. D. C. prod. 2. p. 332. Flowers large, blue. Stamens monadelphous according to the figure.

Blue-flowered Desmodium. Fl. June, Aug. Clt. 1818. Sh. 1 to 2 feet.

71 D. Liménse (Hook, bot. misc. 2. p. 215.) stem erect, furrowed, hairy; leaves on long stalks; leaflets smoothish above, and covered with adpressed hairs beneath; racemes long, terminal, and axillary; bracteas ovate, acuminated, silky; legumes flexuous, with 5-8 oval, hairy, scabrous joints. ♄. S. Native of Peru, near Lima.

Lima Desmodium. Shrub 1 to 2 feet.

72 D. trigònum (D. C. prod. 2. p. 332.) stem herbaceous, scandent, triquetrous, hairy; leaflets ovate, acute, hairy; racemes terminal, very long; legumes twisted, hispid, and inflexed. ♃. ◡. S. Native of Jamaica, in shady bushy places. Hedys. trigònum, Swartz, fl. ind. occ. 1267. Hedys. triphýllum, P. Browne, jam. 301. f. 7. Hedys. intórtum, Mill. dict. Hedys. adhæ'rens, Vahl. symb. 2. p. 82. Flowers large, pale red or bluish.

Trigonal-stemmed Desmodium. Fl. July, Aug. Clt. 1733. Pl. climbing.

73 D. oblongifòlium (D. C. prod. 2. p. 332.) stems herbaceous, diffuse, terete, and are as well as the petioles clothed with rough villi; stipulas scarious, ovate, acuminated; leaflets ovate-oblong, acuminated, villously pubescent; peduncles almost radical, elongated, loosely racemose at the apex; lower pedicels twin. ♃. ◡. S. Native of Jamaica, on the higher mountains. Hedys. oblongifòlium, Bert. ined. Flowers purplish-violet. Ovary puberulous, 2-3-jointed.

Oblong-leaved Desmodium. Pl. diffuse.

74 D. spirále (D. C. prod. 2. p. 332.) stem herbaceous, climbing, rooting at the base, angular, glabrous; leaflets ovate, glabrous; stipulas subulate; racemes terminal, elongated; pedicels twin or tern; legumes pubescent, spirally twisted. ♄. ◡. S. Native of the south of Jamaica, in shady, arid, bushy places. Hedys. spiràle, Swartz, fl. ind. occid. p. 1273. H. procúmbens, Mill. dict. Flowers small, greenish yellow. Leaflets marked with a shining spot above, sometimes obtuse and sometimes acuminated, according to Swartz.

Var. β. stoloníferum (D. C. prod. 2. p. 333.) leaflets acuminated; stipulas ovate, acute, striated. ♃.? ♄.? S. Native of Porto Rico. Hedys. stoloníferum, Poir. dict. 6. p. 421. Perhaps a proper species. Plant creeping and rooting.

Spiral-podded Desmodium. Fl. July, Aug. Clt. 1700. Pl. cl.

75 D. tenuículum (D. C. prod. 2. p. 333.) stems herbaceous, diffuse, slender, smoothish; leaflets ovate, acute, glabrous, the terminal one twice the size of the rest; stipulas spreading, subulate; racemes terminal; pedicels twin, spreading. ♃. S. Native of St. Domingo. Hedys. tenéllum, Spreng. in herb. Balb. Flowers small, purple.

Very small Desmodium. Pl. diffuse.

76 D. tenéllum (D. C. prod. 2. p. 333.) branches ascending, glabrous; floral leaves simple, the rest trifoliate; leaflets clothed with adpressed pubescence on both surfaces, glaucescent beneath, terminal one ovate-oblong, lateral ones elliptic, acute; racemes loose, rather flexuous; legumes with 2-5 joints, spirally twisted, glabrous, the joints rhomboid. ⊙. S. Native of shady humid places near Caraccas. Hedys. tenéllum, H. B. et Kunth, nov. gen. amer. 6. p. 522. Nearly allied to *D. tortuòsum* and *D. spiràle*. Flowers purple.

Slender Desmodium. Fl. July, Aug. Clt. 1818. Pl. 1 ft.

77 D. axilláre (D. C. prod. 2. p. 333.) stem herbaceous, creeping, and rooting at the joints, rather pubescent; leaflets rhomboid-roundish, pubescent beneath, and reticulately veined; racemes axillary, much longer than the leaves; pedicels 1-3-together; legumes declinate, pubescent, with 2-4 semi-ovate joints. ♃. S. Native of Jamaica, St. Domingo, and Guadaloupe. Hedys. axillàre, Swartz, fl. ind. occ. 1274. Flowers small, of a purplish blood-colour.

Axillary-flowered Desmodium. Pl. creeping.

78 D. réptans (D. C. prod. 2. p. 333.) stems creeping; leaflets obovate-roundish, lateral ones unequal-sided, rounded at both ends, glabrous above, but clothed with canescent pubescence beneath; racemes ascending, on very long peduncles; joints of legume 2, semi-orbicular, hispid. ♄. S. Native of St. Domingo and of New Granada, in very hot places, on the banks of the river Magdalena, near Nares. Hedys. réptans, Poir. dict. 6. p. 422. H. B. et Kunth, nov. gen. amer. 6. p. 518. Flowers flesh-coloured.

Creeping Desmodium. Shrub creeping.

79 D. scorpiúrus (Desv. l. c.) stems herbaceous, procumbent, rather pilose; stipulas ovate-falcate, apiculated; leaflets obovate-oblong, obtuse, pubescent beneath; racemes opposite the leaves, elongated; joints of legume 4-5, ovate. ♃. S. Native of Jamaica and St. Domingo. Hedys. scorpiùrus, Swartz, fl. ind. occid. p. 1268. Flowers purple.

Scorpion-tail-like-racemed Desmodium. Pl. procumbent.

80 D. ásperum (Desv. l. c.) stems tetragonal, hispid, fistular;

leaflets ovate, obtuse, rough above, but soft and hoary beneath; panicle terminal, diffuse; joints of legume small, ovate-globose, pubescent.—Native country unknown. Hedys. ásperum, Poir. dict. 6. p. 408.

Rough Desmodium. Fl. July, Aug. Clt. 1816. Sh. 1 to 2 ft.

† *Species natives of the same countries, but are not sufficiently known.*

81 D.? glàbrum (D. C. prod. 2. p. 338.) stems herbaceous, erect, panicled; leaflets obcordate; legumes lunulate, 1-seeded, glabrous. ⊙. H. Native of Campeachy. Hedys. glàbrum, Mill. dict. no. 12. Flowers pale purple.

Glabrous Desmodium. Pl. 1 foot.

82 D. Portoricénse (Spreng. syst. 3. p. 314. under *Hedys.*) plant herbaceous, erect; leaflets oblong, obtuse; stipulas subulate, short; panicle terminal, bractless; joints of legume reticulated and pubescent. ♃. S. Native of Porto Rico.

Porto Rico Desmodium. Pl. 1 to 2 feet.

83 D. tenéllum (Spreng. syst. 3. p. 314. under *Hedys.*) plant herbaceous, procumbent; branches filiform, smooth, as well as the leaves; leaflets ovate, glabrous; stipulas setaceous; racemes terminal. ♃. S. Native of St. Domingo.

Tender Desmodium. Pl. procumbent.

84 D. leiocárpum; shrubby; leaflets ovate-oblong, obtuse, pubescent beneath; panicle terminal; legumes glabrous, compressed, moniliform. ♄. S. Native of Brazil. Hedys. leiocárpum, Spreng. syst. 3. p. 316.

Smooth-fruited Desmodium. Shrub 1 to 2 feet.

85 D.? villòsum (D. C. prod. 2. p. 338.) stems herbaceous, diffuse, branched, villous; leaflets oval, rather hispid; racemes terminal, rather spicate; calyxes rather villous; joints of legume numerous, usually somewhat 4-horned. ⊙. S. Native of Vera Cruz. Hedys. villòsum, Mill. dict. no. 9. but not of Willd. Flowers small, pale purple.

Villous Desmodium. Pl. diffuse.

86 D. Guianénse (D. C. prod. 2. p. 338.) stem frutescent; leaflets hoary beneath; flowers crowded, racemose; legumes hairy.—Native of French Guiana. Hedys. Guianénse, Aubl. guian. 774. without a description.

Guiana Desmodium. Pl. 1 to 2 feet.

87? D. emarginàtum (D. C. prod. 2. p. 338.) stem herbaceous, angular, and rather villous; leaflets ovate, obtuse, glabrous; stipulas ovate-lanceolate; racemes axillary, simple; legumes glabrous, having only one joint, which is emarginate on one side. ♃. S. Native of Martinico. Hedys. emarginàtum, Poir. dict. 6. p. 412. Flowers small, yellow.

Emarginate-jointed Desmodium. Pl. 1 to 2 feet.

* * * * *Species, native of the Cape of Good Hope. Hedýsarum, Thunb. fl. cap. 594.*

88 D.? ciliàtum (D. C. prod. 2. p. 333.) stem suffrutescent, erect, villous; leaflets ovate, mucronate, pilose on the margins and midrib; stipulas spreading, lanceolate, glabrous; pedicels axillary, 1-flowered, shorter than the leaves; calyx 5-parted. ♄. G. Native of the Cape of Good Hope, in grassy fields. Hedys. ciliàtum, Thunb. nov. act. ups. 6. p. 43. t. 2. fl. cap. 594. Perhaps the plant belongs to a different genus: the legume is unknown.

Ciliated-leafletted Desmodium. Shrub 1 foot.

89 D. squarròsum (D. C. prod. 2. p. 333.) stem suffruticose, erect, hairy; leaflets ovate, obtuse, pubescent above, but tomentose and nerved beneath; stipulas lanceolate; flowers disposed in spikes? reflexed; legume 2-jointed, hairy. ♄. G. Native of the Cape of Good Hope, among grass. Hedys. squarròsum, Thunb. l. c.

Squarrose Desmodium. Shrub 1 foot.

* * * * * *Species natives of Guinea.*

90 D. Bullaménse; stems creeping and rooting; branches beset with rough villi; leaflets roundish-obovate, pale, and clothed with adpressed pubescence beneath; stipulas subulate; peduncles long, loose-flowered. ♄. S. Native of Sierra Leone; on the Bullam shore. Flowers purple (v. s. herb. Lamb.).

Bullam Desmodium. Shrub creeping.

91 D. lineariifòlium; stem erect, branched; branches very villous; leaflets elliptic-lanceolate, obtuse at both ends, clothed with adpressed villi beneath; peduncles few-flowered, panicled; legumes with 4-6 smooth joints. ♄. S. Native of Sierra Leone. Flowers purple (v. s. herb. Lamb.)

Linear-leafletted Desmodium. Shrub 1 foot.

92 D. símplex; stem erect, simple, clothed with adpressed villi, as well as the under side of the leaves; leaflets of the lower leaves roundish-obovate, emarginate, of the upper ones obovate, mucronate; raceme terminal, on a long naked peduncle. ♄. S. Native of Sierra Leone. Flowers purple (v. s. herb. Lamb.).

Simple-stemmed Desmodium. Shrub 2 to 3 feet.

93 D. oxalidifòlium; plant suffruticose, branched, prostrate; leaflets obovate-roundish, membranous, glabrous, mucronate, small; stipulas subulate; peduncles elongated, few-flowered; legume with rough joints. ♄. S. Native of the Island of St. Thomas. Flowers small, flesh-coloured.

Sorrel-leaved Desmodium. Shrub prostrate.

94 D. ramosíssimum; plant shrubby, erect, much branched; leaflets obovate, glabrous, rounded at the apex and mucronulate; racemes spiked, terminal, few-flowered; legumes articulated. ♄. S. Native of the Island of St. Thomas. Flowers small, flesh-coloured.

Much-branched Desmodium. Shrub 2 feet.

95 D. sparsiflòrum; shrubby, branched, erect, pilose; leaflets broad, oblong-lanceolate, acute, rather cordate at the base, pubescent beneath; racemes terminal and axillary, long and slender, few-flowered. ♄. S. Native of the Island of St. Thomas. Flowers flesh-coloured.

Scattered-flowered Desmodium. Shrub 1 to 3 feet.

96 D. ténue; stems shrubby, ascending, simple, weak; leaflets small, obovate, mucronate; racemes spiked, slender. ♄. S. Native of Sierra Leone. Joints of legume hairy. Flowers rose-coloured.

Slender Desmodium. Shrub ascending.

* * * * * * *Species, natives of the Mauritius, Madagascar, and Arabia.*

97 D. cæspitòsum (D. C. prod. 2. p. 333.) stems creeping, tufted, and smoothish; stipulas lanceolate, acuminated, scarious; leaflets obovate-roundish; racemes erect, terminating the branches; pedicels solitary; legumes pubescent, with 2-3 semi-ovate joints. ♃. S. Native of the Mauritius. Hedys. cæspitòsum, Poir. dict. 6. p. 421.

Tufted Desmodium. Pl. creeping.

98 D. Mauritiànum (D. C. prod. 2. p. 334.) stem erect, terete, pubescent; stipulas lanceolate, acuminated, scarious, clothed with adpressed down, as well as the stems, petioles, and pedicels; leaflets obovate-oblong, obtuse; raceme terminal, simple; legumes drooping, with semi-orbicular joints, when young pubescent. ♄. S. Native of the Mauritius. Hedys. Mauritiànum, Willd. spec. 3. p. 1185. Æschynómene arbòrea, Sieb. pl. maur. exsic. no. 155. and perhaps of Lin. Flowers drooping. Roots creeping.

Mauritian Desmodium. Shrub ½ to 1 foot.

99 D. Scálpe (D. C. prod. 2. p. 334.) stem erect, suffruticose; stipulas lanceolate-linear, acuminated, glabrous; leaflets ovate or rhomboid, acuminate[illegible] mucronate, with sinuately-crenated margins; racemes terminal, elongated; pedicels twin, capillary. ♄. S. Native of the island of Bourbon, and per-

haps of Madagascar. Hedys. Scálpe, Comm. herb. Hedys. repándum, Poir. dict. 6. p. 408. but not of Vahl. Æschynómene remòta, Poir. dict. 4. p. 452. Petioles nodose at the base. Stems pubescent at the apex, as well as the under side of the leaves. Legume unknown. Perhaps this and the following species would constitute a new genus. *Scalpe* is the vernacular name of the plant.

Scalpe Desmodium. Shrub 1 to 2 feet.

100 D. repa'ndum (D. C. prod. 2. p. 334.) stem shrubby, erect; stipulas lanceolate, ciliated; leaflets ovate-rhomboid, obtuse, with repandly-crenated margins; raceme terminal, elongated; pedicels 2-3 together, capillary. ♄. G. Native of Arabia Felix. Hedys. repándum, Vahl. symb. 2. p. 82.

Repand-leaved Desmodium. Shrub 1 to 3 feet.

101 D. oxybra'cteum (D. C. prod. 2. p. 334.) stem frutescent, terete, glabrous; leaflets oblong, acuminated, glabrous; stipulas and bracteas lanceolate, and very much acuminated; racemes axillary and terminal; legumes deflexed, depressed, smoothish, coriaceous. ♄. S. Native of the Mauritius, spontaneous or cultivated. Flowers purple.

Sharp-bracted Desmodium. Shrub 1 to 2 feet.

102 D. diversifòlium (D. C. prod. 2. p. 334.) stem shrubby, terete, glabrous; leaves simple and trifoliate; leaflets oval, glabrous, but puberulous on the middle nerve beneath, the terminal leaflets always twice or thrice the size of the lateral ones; racemes almost terminal; legumes villous, compressed, nearly linear. ♄. S. Native of Madagascar. Hedys. diversifòlium, Poir. dict. 6. p. 403.

Diverse-leaved Desmodium. Fl. July, Aug. Clt. 1816. Sh. 1 to 2 feet.

103 D. Abyssi'nicum (D.C. prod. 2. p. 338.) stems twining; leaflets ovate, shining, rather pubescent, lateral ones sessile; racemes terminal, loose; stamens monadelphous. ♃. S. Native of Abyssinia. Hedys. Abyssínicum, Hoffmanns. verz. 1824. p. 217. Legumes unknown.

Abyssinian Desmodium. Pl. cl.

* * * * * * * *Species natives of the East Indies, Nipaul, &c.*

104 D. polyca'rpum (D. C. prod. 2. p. 334.) stem terete, erect, clothed with adpressed pubescence; leaves trifoliate, with obovate obtuse leaflets, terminal one the largest; racemes terminal and axillary, crowded; legumes with 6-8 semi-orbicular joints. ♄. S. Native of the East Indies. Lam. ill. t. 628. f. 4. Hedys. polycárpum, Poir. dict. 6. p. 413. Flowers purple. Said to be allied to *D. latifòlium* and *D. lasiocárpum*.

Many-fruited Desmodium. Shrub 2 to 3 feet.

105 D. Pryòni (D. C. prod. 2. p. 334.) stem almost terete, smoothish, erect; leaflets oval, acute, glabrous above, but clothed with silky pubescence beneath, the terminal leaflet thrice the size of the lateral ones; racemes axillary, longer than the leaves; legumes hardly puberulous, with 6 semi-orbicular joints. ♄. S. Native of the East Indies. Hedys. viridiflòrum, Burm. ind. 167. exclusive of the synonymes. Hedýsarum spicàtum foliis acuminatis, Pryon in herb. Burm. Hedys. Prỳoni, Spreng. syst. append. 292. The legumes are like those of *D. Gangéticum*.

Pryon's Desmodium. Shrub 1 to 2 feet.

106 D. triflòrum (D. C. prod. 2. p. 334.) stems herbaceous, procumbent, filiform, puberulous; leaflets obcordate, glabrous above, but puberulous on the nerves beneath; pedicels axillary, 1-flowered, 2-3 together; legumes puberulous, with 3-4 semi-orbicular joints. ♃. S. Native of China, Malabar, the Mauritius, also of the West Indies, and Guiana. Hedys. triflòrum, Lin. spec. 1057. Swartz, obs. 288. t. 6. f. 1. Hedys. stipulàceum, Burm. ind. t. 54. f. 2. zeyl. t. 54. f. 2. Hedys. biflòrum, Willem. maur. 49.? Flowers red.

Three-flowered Desmodium. Shrub procumbent.

107 D. heterophy'llum (D. C. prod. 2. p. 334.) stem herbaceous, ascending, rather pilose; leaflets obovate, obtuse, glabrous above, and clothed with adpressed pubescence beneath; pedicels axillary, 1-flowered, 2-3 together; legumes ciliated, with the joints semi-orbicular. ♃. S. Native of Ceylon. Burm. zeyl. t. 54. f. 2. Hedys. heterophýllum, Willd. spec. 3. p. 1201. Flowers red.

Variable-leaved Desmodium. Fl. July, Aug. Clt. 1820. Pl. 1 foot, ascending.

108 D. parvifòlium (D. C. in ann. sc. nat. 4. 1825. p. 100.) stems procumbent, herbaceous, much branched, weak, and glabrous; leaflets small, obovate or roundish, emarginate or mucronate, covered beneath with adpressed hairs, but glabrous above; racemes panicled, axillary, 5-6-flowered, much longer than the leaves; pedicels capillary, diverging; legumes glabrous. with 3-4 semi-orbicular joints. ♃. G. Native of Nipaul. Hedys. tenéllum, D. Don, prod. fl. nep. p. 243. but not of Kunth. Hedys. parviflòrum, Spreng. syst. 3. p. 318. Flowers small, purple. Calycine segments lanceolate, awned.

Small-leaved Desmodium. Fl. July, Aug. Pl. procumbent.

109 D. du'bium (Lindl. bot. reg. 967.) leaflets obovate, rather retuse, mucronate, pubescently-pilose, paler beneath; racemes elongated, many-flowered, terminal; bracteas subulate, equal in length to the pedicels; stems angular, and are as well as the pedicels hairy. ♄. G. Native of the Himalaya mountains. Flowers rose-coloured.

Doubtful Desmodium. Fl. July. Clt. 1823. Shrub 2 feet.

110 D. laxiflòrum (D. C. l. c.) stem frutescent, erect, terete, glabrous; branches pubescent; stipulas lanceolate; leaflets elliptic, acuminated, glabrous above, and clothed with adpressed pubescence beneath; racemes terminal, loose; pedicels hairy, filiform, much longer than the calyx; joints of legume oblong, compressed, hardly puberulous, usually 4-5. ♄. G. Native of Nipaul. Flowers purple. Perhaps not distinct from the following.

Loose-flowered Desmodium. Shrub 1 to 2 feet.

111 D. diffu'sum (D. C. l. c.) stem shrubby, nearly erect, terete, glabrous; branches pubescent; stipulas lanceolate; leaflets elliptic, acuminated, glabrous above, but clothed with adpressed pubescence beneath; racemes terminal, elongated; pedicels twice the length of the calyx, in fascicles; young legumes villous. ♄. S. Native of the East Indies. Hedys. diffùsum, Roxb. hort. beng. p. 57. but not of Willd. Hedys. Roxbúrghii, Spreng. syst. append. 292. Flowers purple.

Diffuse Desmodium. Fl. July, Aug. Clt. 1818. Sh. 1 to 2 ft.

112 D.? e'legans (D. C. l. c.) stem shrubby, branched, terete; branches angular, pubescent; stipulas linear, acuminated; leaflets roundish-ovate, acuminated, pubescent beneath; racemes terminal, panicled; pedicels hispid, filiform; calyx obsoletely 5-toothed. ♄. G. Native of Nipaul, on Shreenagur.

Elegant Desmodium. Shrub 3 to 6 feet.

113 D. nu'tans (Wall. mss. Graham in edinb. phil. journ. Hook. bot. mag. 2867.) shrubby, branched; racemes compound, terminal, and axillary, and are, as well as the branches, pendulous; flowers twin; bracteas acute; leaves pendulous; leaflets roundish-rhomboid, tomentose on both surfaces; stipulas subulate. ♄. S. Native of the East Indies. Corolla bluish lilac. Stamens monadelphous.

Nodding-leaved Desmodium. Fl. July, Aug. Clt. 1823. Shrub 1 to 3 feet.

114 D. pe'ndulum (Wall. pl. rar. asiat. 1. p. 81. t. 94.) erect, twiggy; branches villous; leaflets cuneate-oblong, obtuse, cuspidate, villous and many-nerved beneath; stipulas and bracteas large and dry, membranous, aristately mucronate; racemes solitary, terminal, pendulous; flowers twin; legumes compressed, moniliform on one side; joints 4, reniform, lower one sti-

pitate. ♄. S. Native of Nipaul, on the mountains on the confines of the valley. Flowers purple.

• *Pendulous-racemed* Desmodium. Shrub 3-4 feet.

115 D.? MULTIFLÒRUM (D. C. l. c.) stem shrubby, terete, glabrous; branches hairy, trigonal; stipulas lanceolate, subulate; leaflets ovate, mucronate, pubescent above, and villous beneath; racemes axillary and terminal, hairy, longer than the leaves. ♄. G. Native of Nipaul. Hedys. floribúndum, D. Don, prod. fl. nep. 244.? Flowers purple. Calyx nearly smooth. Young legume with 5-6 ovate pubescent joints.

Many-flowered Desmodium. Fl. July, Aug. Clt. 1823. Sh. 3 to 4 feet.

116 D. ANGULA'TUM (D. C. l. c.) stem suffruticose; branches angular, pubescent, but villous along the angles; leaflets ovate, acutish, clothed with adpressed villi on both surfaces; racemes axillary and terminal, almost spicate; bracteas villous, very much acuminated, deciduous, longer than the flowers. ♄. G. Native of Nipaul. Hedys. retùsum, D. Don, prod. fl. nep. 243? Hedys. Wallichiànum, Spreng. syst. append. 293. Flowers purple.

Angular-stemmed Desmodium. Shrub 2 feet.

117 D. PILOSIU'SCULUM (D. C. prod. 2. p. 335.) stem angular, rather pilose; leaflets ovate-lanceolate, acute, glabrous above, and puberulous beneath; racemes terminal, somewhat spicate; bracteas deciduous, villous, somewhat acuminated; legumes a little incurved, with oval scabrous joints. ♄. S. Native of the Philippine islands.

Pilose Desmodium. Shrub 1 to 2 feet.

118 D. CONFE'RTUM (D. C. in ann. sc. nat. 4. 1825. p. 100.) stem shrubby, nearly terete, villous; leaflets ovate, acutish, rather coriaceous, glabrous above, and villous beneath; racemes crowded, short, terminal; bracteas ovate, acutish, glabrous, ciliated. ♄. G. Native of Nipaul. Flowers purple.

Crowded Desmodium. Shrub 1 to 2 feet.

119 D. SUEMBUE'NSE (D. C. prod. 2. p. 335.) leaflets roundish-oval, mucronulate, villous, canescent beneath; stipulas lanceolate, mucronate; racemes secund; calycine teeth ovate, acute, upper one broader and emarginate. ♄. G. Native of Upper Nipaul at Suembu. Hedys. Suembuénse, D. Don, prod. fl. nep. 243. Flowers flesh-coloured. Legume with 5 joints.

Suembu Desmodium. Fl. July. Shrub 1 to 2 feet.

120 D. RUFE'SCENS (D. C. in ann. sc. nat. 4. 1825. p. 100.) branches and peduncles terete, covered with rufous villi; leaflets ovate-elliptic, obtuse, mucronate, glabrous above, and pubescent beneath; racemes terminal, panicled; bracteas deciduous, villous, very much acuminated. ♄. S. Native of the East Indies. Hedys. rufèscens, Spreng. syst. append. 292. Upper leaves with one leaflet. Stipulas broad at the base, but elongated and subulate at the apex.

Rufescent Desmodium. Shrub 1 to 2 feet.

121 D. CONCI'NNUM (D. C. l. c.) stem shrubby, branched; branches terete, pubescent; leaflets elliptic-obovate, mucronate, pubescent beneath, with rather prominent nerves; stipulas lanceolate-linear, acuminated; racemes terminal; pedicels twin, hairy; bracteas deciduous, ovate, acuminated, villous. ♄. G. Native of Nipaul. Hedys. concínnum, Spreng. syst. append. 292. Allied to the preceding species, but differs in the leaflets being 1½ inch long, not 2-3, and in having fewer nerves. Flowers violaceous.

Neat Desmodium. Shrub 1 to 2 feet.

122 D. TRICHOCAU'LON (D. C. l. c.) stems procumbent, suffruticose at the base, terete, hairy; leaflets obovate, roundish, obtuse, glabrous above, pubescent beneath; stipulas scarious, lanceolate-linear, acuminated, glabrous; bracteas conforming to the stipulas, ciliated; racemes terminal; pedicels twin. ♃. G. Native of Nipaul. Flowers violaceous.

Hairy-stemmed Desmodium. Pl. procumbent.

123 D. VI'SCIDUM (D. C. prod. 2. p. 336.) stems suffruticose; branches terete, covered with adpressed villi; leaflets smoothish; terminal one obovate and larger than the lateral ones, which are ovate and acutish; racemes almost terminal, villous; stipulas and bracteas scabrous, ovate-lanceolate, acuminated, striated, glabrous. ♄. S. Native of Java. Burm. zeyl. t. 84. f. 1. Hedys. viscòsum, Burm. ind. 167. Flowers blue.

Viscid Desmodium. Shrub 1 to 2 feet.

124 D. PAUCINE'RVIUM (D. C. l. c.) stem shrubby, erect, branched, terete, smoothish; leaflets elliptic, obtuse, pubescent and veiny beneath; stipulas membranous, acuminately-awned; bracteas conforming to the stipulas, somewhat ciliated; racemes terminal; pedicels solitary or twin. ♄. S. Native of the East Indies. Very like *D. concinnum*. Flowers violaceous.

Few-nerved-leaved Desmodium. Shrub 1 to 2 feet.

125 D. LESCHENAU'LTII (D. C. l. c.) stem terete, puberulous, suffruticose; leaflets rhomboid, mucronate, puberulous on both surfaces; racemes axillary, slender; stipulas and bracteas deciduous, acuminated, and rather pilose; pedicels 2-3-together, spreading. ♄. S. Native of the East Indies. Flowers purple.

Leschenault's Desmodium. Fl. July, Aug. Clt. 1825. Sh. 1 to 2 feet.

126 D. CAPITA'TUM (D. C. prod. 2. p. 336.) stem shrubby, erect; leaflets roundish-obovate, obtuse, tomentose beneath; stipulas lanceolate, dry; racemes axillary, bracteate before the flowers expand, and of a capitate, conical figure; legumes pendulous. ♄. S. Native of Ceylon. Hedys. capitàtum, Burm. ind. 167. t. 54. f. 1. Hedys. cónicum, Poir. dict. 6. p. 419. According to the legume this species belongs to section *Pleurolòbium*. Flowers purple.

Capitate-flowered Desmodium. Fl. July. Clt. ? Sh. 1 to 2 ft.

127 D. SILIQUÒSUM (D. C. prod. 2. p. 336) stem shrubby, erect, clothed with adpressed silky pubescence above; stipulas dry, lanceolate-linear, setaceously acuminated; leaflets elliptic-obovate, obtuse, mucronate, glabrous above, but clothed with silky villi beneath; racemes terminal, dense-flowered, bracteate. ♄. S. Native of Java. Hedys. siliquòsum, Burm. fl. ind. 169. t. 55. f. 2. Perhaps a species of *Lespedèza*.

Siliquose-podded Desmodium. Shrub 1 to 2 feet.

128 D. RETROFLE'XUM (D. C. prod. 2. p. 336.) stem shrubby, erect; leaflets roundish-ovate, clothed with silky tomentum beneath; racemes axillary, erect, elongated; legumes reflexed. ♄. S. Native of the East Indies. Hedys. retrofléxum, Lin. mant. 103. Allied to *Flemíngia lineàta*, but the legume is many-jointed. It differs from *D. concínnum* in the leaflets being roundish, not elliptic, and in the racemes being axillary, &c.

Retroflexed Desmodium. Shrub 1 to 2 feet.

129 D. BIFLÒRUM (D. C. prod. 2. p. 336.) stem twining, terete, pubescent; leaflets ovate, tomentose; peduncles axillary, 2-flowered, length of petioles; legumes hairy, 5-6-jointed. ♄. ◠. S. Native of the East Indies. Hedys. biflòrum, Willd. spec. 3. p. 1200. but not of Willem.

Two-flowered-peduncled Desmodium. Sh. tw.

130 D. LA'XUM (D. C. in ann. sc. nat. 4. p. 102.) stems twining, trigonal, and are either pilose or glabrous, as well as the petioles; stipulas lanceolate, acuminated; leaflets elliptic, acuminated, glabrous, but pubescent on the nerves beneath, middle one acuminated at the base, lateral ones unequally semicordate at the base; panicle terminal, very loose; pedicels twin. ♄. ◠. G. Native of Nipaul. Hedys. láxum, Spreng. syst. append. 292. Young legume smooth and repand.

Loose-flowered Desmodium. Shrub. tw.

131 D. WILLDENÒWII; stems ascending, triquetrous; stipulas obliquely cordate; leaflets oblong-ovate, obtuse, hoary beneath; racemes erect, panicled; bracteas cordate, deciduous; legumes with 4 roundish, hairy joints. ♄. S. Native of Tranquebar.

Hedys. diffùsum, Willd. spec. 3. p. 1180. D. diffùsum, D. C. prod. 2. p. 336.

Willdenow's Desmodium. Shrub 2 to 3 feet, diffuse.

132 D. DICHÓTOMUM (D. C. prod. 2. p. 336.) stem erect, triquetrous; pubescent; stipulas and bracteas ovate; leaflets elliptic, obtuse, pubescent, hoary beneath; racemes elongated; legumes hairy, with 6 joints. ♄. S. Native of Tranquebar. Hedys. dichótomum, Willd. spec. 1180. This species is like the preceding.

Dichotomous-stemmed Desmodium. Shrub 2 to 3 feet.

133 D. OXYPHY'LLUM (D. C. in ann. sc. nat. 4. p. 102.) stem erect, terete, branched, and is rather angular and smooth, as well as the branchlets; stipulas subulate; leaflets elliptic, acuminated, glabrous, pale white beneath; panicle terminal, loose; pedicels 2-3-together, in fascicles. ♄. G. Native of Nipaul. Hedys. oxyphýllum, Spreng. syst. append. 292.

Sharp-leaved Desmodium. Shrub 1 to 2 feet.

134 D. PODOCA'RPUM (D. C. l. c.) stem ascending, terete; branches rather angular, and are as well as the petioles and peduncles pilose; stipulas subulate; leaflets broad-ovate, rather rhomboid, pale beneath, but rather puberulous above; racemes terminal, elongated, slender; pedicels twin; legume with 1-3 triangular, puberulous, distant joints, lower joint stipitate. ♄. G. Native of Nipaul. Flowers purple.

Foot-fruited Desmodium. Shrub 1 to 2 feet.

135 D. HETEROCA'RPUM (D. C. prod. 2. p. 337.) stem shrubby, erect, and is as well as the petioles scabrous; stipulas setaceous; leaflets elliptic, obtuse, glabrous; racemes axillary and terminal; legumes puberulous, erect, lower ones with only 1 joint, the rest having 5-7 orbicular joints. ♄. S. Native of Ceylon. Burm. zeyl. 117. t. 53. f. 1. Hedys. heterocárpum, Lin. spec. 1054. but not of Thunb. Flowers pale purple.

Various-fruited Desmodium. Shrub 1 to 2 feet.

136 D. SE'QUAX (Wall. pl. asiat. rar. 2. p. 46. t. 157.) plant shrubby, erect, twiggy, and branched; branches terete, and are villous, as well as the petioles; leaflets lanceolate, acuminated, clothed with adpressed pili above, and villous beneath, intermediate one double the size of the lateral ones; stipulas linear; racemes axillary, about equal in length to the leaves; flowers usually twin, on villous pedicels; legumes slender, linear, many-jointed, many-toothed on both edges, and covered with hooked pili. ♄. S. Native of the East Indies, on the mountains of Kamaon. Flowers pale red.

Sticking Desmodium. Shrub 3 feet.

137 D. LABURNIFÒLIUM (D. C. prod. 2. p. 337.) stem shrubby, branched, terete, smoothish; stipulas setaceous; leaflets ovate, acute, glabrous, shining above, clothed with adpressed pubescence beneath; racemes terminal, loose; legumes pendulous, hispid, with oblong compressed joints. ♄. S. Native of Java. Hedys. laburnifòlium, Poir. dict. 6. p. 422. but not of Sieb. This plant probably belongs to section *Eudesmòdium.*

Laburnum-leaved Desmodium. Shrub 2 to 3 feet.

138 D. SALICIFÒLIUM (D. C. prod. 2. p. 337.) stem frutescent, branched, terete, glabrous; stipulas and stipels lanceolate-setaceous, elongated; leaflets lanceolate-oblong, acuminated, glabrous; panicle terminal, diffuse; bracteas lanceolate-subulate; legumes arched, hispid. ♄. S. Native of the East Indies. Hedys. salicifòlium, Poir. dict. 6. p. 422.

Willow-leaved Desmodium. Shrub 1 to 2 feet.

139 D. ROTTLE'RI; plant herbaceous, erect; leaflets large, oblong-elliptic, acutish, rather strigose beneath; panicle terminal, elongated, diffuse; legumes linear, arched, glabrous. ♃. S. Native of the East Indies. Hedys. lineàre, Rottl. Hedys. Rottlèri, Spreng. syst. 3. p. 320.

Rottler's Desmodium. Pl. 1 foot.

† *Species, natives of Nipaul, which differ from the other species in having a 4-toothed calyx instead of being 5-toothed.*

140 D. RETU'SUM; leaflets oblong, retuse, mucronulate, villous, canescent beneath; stipulas lanceolate, acuminated; racemes many-flowered; bracteas ovate, mucronate, villous, imbricated; calycine teeth ovate, cuspidate; keel of corolla truncate at the apex. ♄. G. Native of Nipaul, at Narainhetty. Hedys. retùsum, Hamilt. mss. ex D. Don, prod. fl. nep. 243. Leaflets nearly 2 inches long and half an inch broad.

Retuse-leafletted Desmodium. Fl. July, Aug. Clt. 1820. Sh. 1 to 2 feet.

141 D. FLORIBU'NDUM; leaflets ovate, mucronate, and are as well as the branches pilosely tomentose; stipulas lanceolate, falcate; racemes many-flowered: pedicels capillary, aggregate; calycine segments ovate, acute, upper one broader and emarginate. ♄. G. Native of Nipaul, at Gosaingsthan. Hedys. floribúndum, D. Don, prod. fl. nep. p. 244. Flowers reddish. Perhaps the same as *D. multiflòrum* of D. C.

Bundle-flowered Desmodium. Shrub 2 to 3 feet.

142 D. TILIÆFÒLIUM; leaflets roundish-ovate, acuminated, pubescent; racemes terminal, panicled; calyx bluntly 4-lobed. ♄. G. Native of Nipaul, on Shreenagur. Hedys. tiliæfòlium, D. Don, l. c. Leaflets almost 3 inches long.

Lime-tree-leaved Desmodium. Shrub 2 to 3 feet.

143 D. DIOÍCUM (D. C. prod. 2. p. 338.) leaflets oval, obtuse, coriaceous, glaucous, and pilose beneath; stipulas ovate, acute; racemes many-flowered; bracteas ovate, acute, ciliated, imbricated; calycine teeth ovate, acute. ♄. G. Native of Nipaul, at Narainhetty. Hedys. dioícum, Hamilt. mss. ex D. Don, prod. fl. nep. 244. Leaflets 3-4 inches long and 2 broad. Flowers axillary, dioecious. Vexillum obovate, shorter than the falcate wings. Keel concave, mucronate at the apex. Stamens 10, monadelphous. Style bearded below. Legume 3-jointed. Perhaps a proper genus.

Diœcious Desmodium. Shrub 3 feet.

† *Doubtful species, natives of the East Indies.*

144 D. GRANDIFÒLIUM (D. C. prod. 2. p. 338.) stem frutescent, simple, trigonal; stipulas ciliated; petioles triquetrous; leaflets oblong-lanceolate, acute, racemes somewhat spicate. ♄. S. Native of the East Indies. Hedys. grandifòlium, Horn. hort. hafn. cat. 2. p. 700.

Great-leaved Desmodium. Shrub 2 to 3 feet.

145 D.? PUNCTA'TUM (D. C. prod. 2. p. 338.) stem twining, furrowed, pilose; leaflets ovate, acute, and are as well as the calyxes beset with red dots; racemes axillary, short. ♄. ⌒. S. Native of the East Indies. Hedys. punctàtum, Rottl. berl. mag. p. 231.

Dotted Desmodium. Shrub tw.

146 D.? HIPPOCRE'PIS (D. C. prod. 2. p. 338.) stem shrubby, erect; leaflets ovate, glabrous, middle one largest; spikes oblong, dense; legumes straight, bearded, jointed on the upper suture. ♄. G. Native of Cochin-china. Hippocrèpis barbàta, Lour. fl. coch. p. 453. Flowers purple.

Hippocrepis-like Desmodium. Shrub 4 feet.

147 D. MALACOPHY'LLUM (D. C. prod. 338.) stem herbaceous, erect, hairy; leaflets oblong, somewhat cordate, pale, and clothed with soft hairs beneath; racemes terminal. ♃. S. Native of Manilla. Hedys. malacophýllum, Link. enum. 2. p. 247.

Soft-leaved Desmodium. Fl. July, Aug. Clt.? Pl. 1 to 2 ft.

* * * * * * * *Species, natives of New Holland and New Caledonia.*

148 D. SPARTIOÌDES (D. C. prod. 2. p. 337.) stem slender, terete, dichotomous, glabrous; stipulas acute; leaflets oblong-linear, mucronate, glabrous above, but pale, and pubescent beneath; racemes terminal and opposite the leaves; pedicels from

1-3, in a fascicle, distant, joints of legume 4, semi-orbicular, hardly puberulous. ♄. G. Native of New Holland. The figure in Burm. ind. t. 51. f. 2. agrees with this plant, but the description does not.

Broom-like Desmodium. Shrub 1 to 2 feet.

149 D. VA′RIANS; lower leaflets ellip[illegible], upper ones oblong; racemes axillary and terminal, flexuous. ♃. ◡. G. Native of New Caledonia. Hedys. vàrians, Labill, cal. p. 71. t. 71.

Varying Desmodium. Pl. cl.

150 D. TUBERCULA′TUM; leaves simple and ternate; leaflets obovate, grey beneath; racemes terminal. ♄. G. Native of New Caledonia. Hedys. tuberculòsum, Labill. cal. p. 71. t. 72.

Tubercled Desmodium. Shrub 1 to 2 feet.

* * * * * * * * *Species, natives of Japan and China. Hedýsarum, with ternate leaves, Thunb. fl. jap.* 284.

151 D. MICROPHY′LLUM (D. C. prod. 2. p. 337.) stem shrubby, erect, glabrous; stipulas ovate, subulate, almost covering the branches; leaflets ovate, villous; panicle terminal; legumes scabrous, 3-jointed. ♄. G. Native of Japan, near Nagasaki. Hedys. microphýllum, Thunb. l. c. Flowers purple.

Small-leaved Desmodium. Shrub 1 to 2 feet.

152 D. RACEMÒSUM (D. C. prod. 2. p. 337.) stem shrubby, erect; branches angular, glabrous; stipulas setaceous; leaflets ovate-oblong, acute, glabrous, canescent beneath; racemes axillary, erect, very long; legumes glabrous. ♄. G. Native of Japan. Hedys. racemòsum, Thunb. fl. jap. p. 285. Said to be allied to *D. viridiflòrum.*

Racemose-flowered Desmodium. Shrub 1 to 2 feet.

153 D. CAUDA′TUM (D. C. l. c.) stem herbaceous, erect, glabrous; stipulas setaceous; leaflets oblong, acute, glabrous; panicle terminal, contracted, villous; legumes clothed with rusty tomentum. ♃. G. Native of Japan. Hedys. caudàtum, Thunb. fl. jap. 286. Flowers purple.

Tailed Desmodium. Pl. 1 foot.

154 D. TOMENTÒSUM (D. C. prod. 2. p. 337.) stem herbaceous, erect, angular, flexuous, tomentose, as well as the petioles, peduncles, and under sides of the leaves; stipulas broadest at the base, setaceous; leaflets ovate-oblong, obtuse, mucronate; racemes axillary. ♃. G. Native of Japan. Hedys. tomentòsum, Thunb. fl. jap. 286.

Tomentose Desmodium. Pl. 1 foot.

155 D. THUNBE′RGII (D. C. l. c.) stem herbaceous, angular, glabrous; leaflets oblong, acuminated, glabrous; stipulas setaceous; racemes axillary, drooping; legumes puberulous, some with 1 joint and others with 2 joints. ♃. G. Native of Japan. Hedys. heterocárpum, Thunb. fl. jap. 289. but not of Lin. Stems drooping. Flowers flesh-coloured.

Thunberg's Desmodium. Pl. 2 feet.

156 D. PILÒSUM (D. C. l. c.) stem herbaceous, decumbent, filiform, hairy; leaflets ovate, obtuse, villous on both surfaces, acuminated; peduncles axillary, usually 4-flowered, length of petioles. ♃. G. Native of Japan. Hedys. pilòsum, Thunb. fl. jap. 288. Perhaps a species of *Lespedèza.* Flowers purple.

Pilose Desmodium. Pl. decumbent.

157 D. STRIA′TUM (D. C. l. c.) stem herbaceous, angular; racemes erectish, pilose; stipulas ovate, membranous; leaflets obtuse and somewhat retuse, mucronate, glabrous, having a hairy line on the back of each; pedicels axillary, solitary, 1-flowered. ♃.? G. Native of Japan. Hedys. striàtum, Thunb. fl. jap. 289. Perhaps a species of *Lespedèza.* Flowers purple.

Striated Desmodium. Pl. 1 to 2 feet.

† *A doubtful species, of which the native country is unknown.*

158 D. VIOLA′CEUM; plant shrubby, erect, branched, pubescent; leaves petiolate, ovate-lanceolate, mucronate at the apex, clothed with hoary tomentum beneath; stipulas very villous; bracteas pubescent, lanceolate, acute. ♄. S. Native of Maranham. Flowers small, violaceous.

Violaceous-flowered Desmodium. Fl. Aug. Sept. Sh. 2 ft.

159 D. NEÆ′I (D. C. prod. 2. p. 338.) branches terete, rather angular at the apex, clothed with silky villi; leaflets ovate-lanceolate, acuminated, puberulous above, but clothed with silky villi beneath; racemes axillary and terminal, somewhat spicate; bracteas longer than the flowers; acuminated, rather villous at the apex. ♄. S. Native country unknown.

Nees's Desmodium. Shrub 1 to 2 feet.

† *Species only known by name, from Roxburgh's Hortus Bengalensis, p.* 57. *and p.* 98. *under Hedýsarum, many of which may be identical with some of those described above.*

1 *D. réptans.* 2 *D. orbiculàtum.* 3 *D. recurvàtum.* 4 *D. divérgens.* 5 *D. purpùreum.* 6 *D. cephalòtes.* 7 *D. pàtens.* 8 *D. tuberòsum.* 9 *D. quinquangulàtum.* 10 *D. arbòreum.*

Cult. The stove and greenhouse species of this genus grow well in a mixture of loam and peat, and young cuttings will root readily in sand, under a hand-glass in heat. The hardy kinds or those natives of North America succeed well in a light rich soil, and are increased by dividing at the root in spring, or by seeds.

CLVI. DI′CERMA (from δις, *dis*, twice, and ἑρμα, *erma*, a prop; in reference to the calyx being propped by 2 bracteas). D. C. legum. mem. vii. prod. 2. p. 339.

LIN. SYST. *Diadélphia, Decándria.* Calyx bilabiate, propped by 2 adpressed bracteas at the base; upper lip entire or hardly bidentate at the apex, lower one trifid, with the middle lobe rather longer than the lateral ones. Vexillum obovate. Carina and wings about equal in length. Keel obtuse, not obliquely truncate at the apex. Stamens diadelphous. Legume constantly of 2, rarely of 3 orbicular, regular, flat, 1-seeded joints, which are not echinated, the ultimate one bearing the permanent style.—Shrubs with trifoliate leaves. Pedicels 1-flowered, numerous, aggregate in the axils of the leaves or bracteas. Flowers yellow or purple.

SECT. I. PHYLLÒDIUM (from φυλλον, *phyllon*, a leaf; in reference to the leaflets being stipellate). Desv. journ. bot. 3. p. 123. t. 5. f. 24. D. C. prod. 2. p. 339. Leaves on long petioles, pinnately trifoliate; leaflets stipellate. Floral leaves bifoliate, the odd one being abortive, lateral ones orbicular, lined, formed like bracteas, the petiole ending in a bristle. Flowers numerous in the axils of the floral leaves, on very short pedicels. Stipulas distinct and free from the petioles.

1 D. PULCHE′LLUM (D. C. prod. 2. p. 339.) stem erect, shrubby; leaves pinnately trifoliate; leaflets elliptic-oblong, pubescent beneath, glabrous above, terminal one very large; floral leaves bifoliate, with the petiole ending in a bristle; legume straight, 2-jointed. ♄. S. Native of the East Indies, Java, Mindanao, and China. Hedys. pulchéllum, Lin. spec. 1053. Phyllòdium pulchéllum, Desv. l. c.—Burm. zeyl. t. 52.—Pluk. alm. t. 433. f. 7. Flowers purple, 2 to each pair of floral leaves.

Neat Dicerma. Fl. July, Aug. Clt. 1798. Sh. 2 to 3 feet.

2 D. E′LEGANS (D. C. prod. 2. p. 339.) stem shrubby, erect; leaves trifoliate; leaflets ovate, obtuse, tomentose on both surfaces; leaflets of floral leaves ovate and pilose; legume arched, pilose, 3-jointed. ♄. G. Native of China, near Canton. Hedys. élegans, Lour. coch. p. 450. Zórnia élegans, Pers. ench. 2. p. 318. Flowers yellow.

Elegant Dicerma. Fl. July, Aug. Clt. 1819. Sh. 2 to 3 ft.

SECT. II. APHYLLÒDIUM (from *a*, priv. and φυλλον, *phyllon*, a leaf; in reference to the leaflets being without stipels) D. C. legum. mem. vii. prod. 2. p. [illegible]39. Leaves trifoliate; leaflets about equal in size, exstipellate, rising from the top of the petiole; floral leaves reduced to stipulas, and therefore the flowers are disposed in an almost naked terminal raceme. Stipulas joined, opposite the leaves. The plant in this section is very different in habit from those species contained in the first section, but the character of the fructification is very similar.

3 D. biarticula'tum (D. C. prod. 2. p. 339.) leaflets 3, disposed in a palmate manner, obovate-oblong, obtuse, smoothish; branches and legumes clothed with adpressed pubescence. ♄. S. Native of the East Indies. Hedys. biarticulàtum, Lin. spec. 1054.—Burm. zeyl. 114. t. 50. f. 2.

Two-jointed-podded Dicerma. Fl. July, Aug. Clt. 1808. Shrub 2 feet.

Cult. This is a genus of elegant shrubs; they will grow in a mixture of loam and peat, and they may be increased by young cuttings, planted in sand, with a hand-glass placed over them, or by seeds.

CLVII. TAVERNIE'RA (in honour of J. B. Tavernier, a traveller in the Levant). D. C. legum. mem. vii. prod. 2. p. 339.

Lin. syst. *Diadélphia, Decándria.* Calyx bibracteolate at the base, half 5-cleft, and somewhat bilabiate; the segments lanceolate-linear, and acuminated. Corolla papilionaceous; vexillum nearly obovate. Wings shorter than the calyx. Keel obtuse. Stamens diadelphous, straight, or a little inflexed at the apex. Style filiform, long, flexuous, deciduous. Legume constantly of 2 orbicular, compressed, 1-seeded joints.—Shrubs, natives of the Levant, with simple and trifoliate leaves. Stipulas joined together at the base. Flowers rose-coloured or white.

1 T. nummula'ria (D. C. leg. mem. vii. t. 52.) leaves all simple, on short petioles, orbicular, mucronate, glaucous, pubescent; racemes axillary, few-flowered, much longer than the leaves. ♄. G. Native of the Levant, between Bagdad and Kermancha. Hedys. nummularifòlium, D. C. in ann. sc. nat. 4. p. 102. Hedys. Olivèrii, Spreng. syst. append. p. 290. Stem clothed with velvety-hoary down. Flowers rose-coloured, according to the dried specimen.

Money-wort Taverniera. Fl. June, July. Clt. 1826. Sh. 1 to 2 feet.

2 T. spa'rtea (D. C. prod. 2. p. 339.) leaves simple or trifoliate; leaflets oblong; racemes axillary and terminal; pedicels twin, 1-flowered, very short. ♄. G. Native of Persia. Hedys. spárteum, Burm. fl. ind. 166. t. 51. f. 2. Flowers yellow.

Broom-like Taverniera. Shrub 1 to 2 feet.

3 T. lappa'cea (D. C. prod. 2. p. 339.) stems suffruticose, procumbent, branched, divaricate, terete; leaves trifoliate; leaflets fleshy, obcordate, villous; flowers 1-2-together, axillary on short pedicels; legume beset with stiff bristles, which are hooked at the apex. ♄. G. Native of Arabia Felix, at Lohajam. Hedys. lappàceum, Forsk. descr. 136. Vahl. symb. 1. p. 54. Flowers yellow.

Burdock-podded Taverniera. Fl. Jul. Aug. Clt. 1820. Sh. pr.

Cult. See *Dicérma* for culture and propagation, p. 298.

CLVIII. HEDY'SARUM (*ἡδυσαρον, hedysaron*, is the name of a plant of Theophrastus and Dioscorides; said to be from *ἡδυς, hedys*, sweet, and *αρωμα, aroma*, perfume. The present genus, however, has nothing to do with the plant of Theophrastus, further than belonging to the papilionaceous tribe. His plant being *Trigonélla fœ'num Græ'cum*, from which an oil was extracted and mixed with ointments by the Hindoos). Jaum. journ. bot. 3. p. 61. exclusive of some species. D. C. legum. mem. vii. prod. 2. p. 340.—Echinolòbium, Desv. journ. bot. 3. p. 123. t. 5. f. 20-21.—Hedýsarum species of Lin. and others.

Lin. syst. *Diadélphia, Decándria.* Calyx 5-cleft; the segments linear-subulate and nearly equal. Corolla with a large vexillum and obliquely truncate keel, which is much longer than the wings. Stamens diadelphous, having the staminiferous tube abruptly infracted. Legume constantly of numerous, flat, orbicular or lenticular, regular, 1-seeded joints, which are connected together in the middle, and therefore the sutures are convex on both sides.—Herbs [illegible] subshrubs, with impari-pinnate leaves, axillary, simple peduncles, bearing racemose spikes of large, purple, white, or cream-coloured flowers. This genus is nearly allied to *Onobrychis*, but differs in the legumes being of many joints, not of one joint only as in that genus. All the species are very elegant when in blossom.

Sect. I. Echinolòbium (from *εχινος, echinos*, a hedge-hog, and *λοβος, lobos*, a pod; in reference to the prickly legumes). D. C. prod. 2. p. 340. Joints of legumes villous, ribbed, muricated, or glochidate in the disks.

* *Plants almost stemless. Calycine segments subulate and elongated.*

1 H. grandiflòrum (Pall. itin. 2. p. 743. t. Y. ed. gall. append. no. 367. t. 82.) plant nearly stemless: leaflets elliptic, clothed with silky hoary down beneath; wings of flower equal in length to the calyx; keel shorter than the vexillum; legumes jointed, clothed with white villi, wrinkled, having the disks of joints muricated with spinules, which are glochidate at the apex. ♃. H. Native of Iberia, the Ukraine, and south of Podolia, on calcareous hills at the Nieper, and at the Irtish. Bieb. cent. pl. ross. 3. t. 63. ex suppl. no. 1445. H. sericeum, Bieb. fl. taur. 2. p. 176. H. argénteum, Lam. in Pall. l. c. Astrágalus grandiflórus, Lin. spec. 1071.—Gmel. sib. 4. t. 31. Corolla large, cream-coloured or pale purplish.

Great-flowered Hedysarum. Fl. June, Jul. Clt. 1821. Pl. ½ to 1 foot.

2 H. arge'nteum (Lin. fil. suppl. 333.) plant almost stemless; leaflets oval or ovate, villous above and clothed with shining silky pubescence beneath; petioles and peduncles clothed with adpressed pubescence; calyx shorter than the corolla; keel twice the length of the wings and about equal in length to the vexillum; legumes articulated, tomentose, rough. ♃. H. Native of Caucasus and of Siberia, at the river Iacus. Bieb. fl. taur. 2. p. 175.—Gmel. sib. 4. p. 30. t. 13. Flowers purple.

Silvery Hedysarum. Fl. July, Aug. Clt. 1796. Pl. ½ foot.

3 H. ca'ndidum (Bieb. fl. taur. 2. p. 176. and suppl. no. 1444.) plant almost stemless; leaflets roundish, ovate, pubescent above and clothed with silky white down beneath; petioles and peduncles covered with spreading pubescence; calyx length of corolla; carina twice the length of the wings, but about equal in length to the vexillum; legumes tomentose, wrinkled, roughish. ♃. H. Native of Tauria, on calcareous hills. H. argénteum, Willd. spec. 3. p. 1205. exclusive of the synonymes. H. cretàceum, Pall. ined. taur. Flowers pale purplish, but at length changing to a cream colour.

Var. β, hùmile (D. C. prod. 2. p. 40.) scapes declinate; plant more humble than the species. ♃. H. Native of Tauria, about Sudak. H. supinum, Pall. ined. taur. H. hùmile, Hablitz, taur. 152.

White-leaved Hedysarum. Fl. May, Ju. Clt. 1824. Pl. ½ ft.

4 H. sple'ndens (Fisch. in litt. D. C. prod. 2. p. 340.) stems short; leaves with 1-3 pairs of ovate leaflets, which are clothed with adpressed silvery-silky pubescence on both surfaces; peduncles or scapes longer than the leaves; spikes racemose, oblong; wings of flowers shorter than the calyx; vexillum striated, almost the length of the carina; legumes clothed with silky pubescence, having 2 reticulately-veined joints. ♃. H. Native of Siberia, at the river Irtish. Flowers large, pale red. Leaves sometimes unifoliate. Bracteas longer than the pedicels. Stipulas joined in one, opposite the leaves.

Splendid Hedysarum. Fl. July, Aug. Clt. 1819. Pl. ½ ft.

* * *Plants with stems. Calycine segments subulate or linear. Legumes prickly.*

5 H. PA'LLIDUM (Desf. fl. atl. 2. p. 177.) stems procumbent; leaves with 6-7 pairs of elliptic-orbicular, pubescent leaflets; spikes or racemes of flowers oblong, crowded; wings of flower thrice the length of the calyx; joints of legume orbicular, prickly. ♄. H. Native of Barbary, near Mascar. Sims, bot. mag. 1251.? Flowers pale rose-coloured, about the size of those of *H. coronàrium.*

Pale-flowered Hedysarum. Fl. Ju. Jul. Clt. 1820. Pl. pr.

6 H. CORONA'RIUM (Lin. spec. 1058.) stems diffuse; leaves with 3-5 pairs of elliptic or roundish leaflets, which are clothed with pubescence beneath, and on the margins; spikes or racemes of flowers ovate, crowded; wings of flower twice the length of the calyx; legumes glabrous, with 2-5 orbicular prickly joints. ♂. H. Native of Spain and Italy, in fields and meadows. Gærtn. fruct. 2. t. 155. Mart. fl. rust. 115.—Riv. tetr. irr. t. 98. Besl. hort. eyst. 13. t. 2. f. 1. H. clypeàtum, Ger. amac. 1235. Park. parad. 339. t. 337. f. 10. Flowers deep red or white. In Calabria this plant grows wild in great luxuriance near 4 feet high, affording excellent nourishment to horses and mules, both green and made into hay; but it does not well bear the spring in the north of Italy, and therefore we may presume that it will not bear our climate well enough to answer the purposes of husbandry. Orbeck mentions that he saw great bundles of it brought to Cadiz as food for cattle. The plant is called in Italian and Spanish *Sulla.* In German it is called *Kronencklee*, *Schildklee*, and *Spanischeklee.* In French *Sainfoin d'Espagne*, and *Sainfoin à bouquets.* In Dutch *Sierlyk haanekop.* Parkinson calls it *Red satin-flower* or *Red-flowered Fitching*, but it is commonly known in British gardens under the name of *French honeysuckle.*

Garland Hedysarum or French honeysuckle. Fl. June, July. Clt. 1596. Pl. 3 to 4 feet.

7 H. HU'MILE (Lin. spec. 1058.) stem erect; leaves with 7-9 pairs of linear-cuneiform, obtuse leaflets; flowers racemose; wings one-half shorter than the carina, and with the vexillum also shorter than the carina; joints of legume 2-3, orbicular, villous, and muricated with tubercles, when in a young state they are tomentose. ♂. H. Native of the south of France, Sicily, and Spain, on dry sandy hills.—J. Bauh. hist. 2. p. 336. f. 1.—Pluk. alm. t. 50. f. 2. H. coronàrium *β*, Lam. fl. fr. 2. p. 665. Flowers purple, smaller than those of *H. coronàrium.*

Dwarf Hedysarum. Fl. July, Aug. Clt. 1640. Pl. ½ to 1 ft.

8 H. SPINOSI'SSIMUM (Lin. spec. 1058. exclusive of the synonymes,) stems diffuse; leaves with 5-7 pairs of obovate or oblong, emarginate, smoothish leaflets; spikes capitate, few-flowered; wings one-half shorter than the carina; vexillum about equal in length to the carina; joints of legume 2-3, orbicular, pubescent, and prickly; the prickles hooked at the apex. ⊙. H. Native of Spain, and the south of Italy.—Pluk. phyt. t. 50. f. 2. Flowers purple, 8 lines long.

Very-spiny-podded Hedysarum. Fl. July, Aug. Clt. 1731. Pl. diffuse.

9 H. CAPITA'TUM (Desf. atl. 2. p. 177. but not of Burm.) stems decumbent; leaves with 6-7 pairs of obovate-obtuse leaflets; spikes or racemes of flowers ovate, loose; wings of corolla twice the length of the calyx; legumes villous and prickly, with orbicular joints. ⊙. H. Native of Barbary, near Cafsa and Lacalle, also of Corsica. Sims, bot. mag. 1251, but the flowers are less erect. H. glomeràtum, Dietr. H. Córsicum, Balb. cat. hort. taur. 1813. p. 39. append. 1. p. 12. H. decúmbens, Dennsf. nom. bot. 217. ex Balb. Flowers rose-coloured, about the size of those of *H. coronàrium.*

Capitate-flowered Hedysarum. Fl. July, Aug. Pl. decum

10 H. CARNÒSUM (Desf. fl. atl. 2. p. 177. t. 200.) stems decumbent; leaves with 5 pairs of obovate, truncate, mucronate, fleshy, glabrous leaflets; spikes of flowers racemose; flowers spreading. ♃. H. Native of Barbary, in sandy places by the sides of rivulets. Flowers rose-coloured, about the size of those of *H. coronàrium.*

Fleshy-leaved Hedysarum. Fl. July, Aug. Clt. 1820. Pl. decumbent.

11 H. FLEXUÒSUM (Lin. spec. 1058.) stems diffuse; leaves with 3-4 pairs of elliptic or oblong leaflets; spikes of flowers ovate; legume jointed, rather undulated, prickly. ⊙. H. Native of Asia. H. síliqua undulàta, Riv. tetr. irr. t. 213. Flowers red, tinged with blue, about the size of those of *H. coronàrium*, of which it is perhaps only a variety.

Flexuous-stemmed Hedysarum. Fl. July, Aug. Clt. 1671. Pl. 1 foot.

12 H. VA'RIUM (Willd. spec. 3. p. 1206.) stem ascending; leaves with 7 pairs of elliptic acute leaflets, which are pubescent above, and tomentose beneath; legumes articulated, rough. ♃. H. Native of Armenia. Flowers yellowish? ex Vaill. H. orientàle incanum floribus variis magnis, siliquâ âsperâ, Tourn. cor. 27.

Various-flowered Hedysarum. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

13 H. ANÒMALUM (D. C. prod. 2. p. 341.) stem suffruticose, diffuse; upper leaves trifoliate, and are, as well as the branchlets, rather villous; leaflets elliptic, mucronate, terminal one much the largest; spikes few-flowered; legumes with 2 prickly joints. ♄. H. Native country unknown. According to the legume this species belongs to section *Echinolòbium*, but its habit is very distinct from the other species.

Anomalous Hedysarum. Shrub 1 foot.

* * * *Plants caulescent. Segments of the calyx subulate. Legumes pilose or pubescent, or crestedly wrinkled, but not prickly.*

14 H. TRICHOCA'RPUM (Desv. in herb. mus. par. D. C. prod. 2. p. 341.) stem erect, clothed with adpressed silky down; leaves with 7-8 pairs of oblong-cuneated obtuse leaflets, which are clothed with silky pubescence on both surfaces; legumes with only one oval, compressed, reticulated joint, bearing on the nerves very long hair-like bristles.—Native of Persia. Perhaps the same as Onobrýchis cristàta of Desv.

Hairy-fruited Hedysarum. Pl. 1 foot.

15 H. LASIOCA'RPUM (Ledeb. in hort. dorp. suppl. 1824. p. 4.) stem erect; leaflets ovate-lanceolate, rather pubescent; racemes elongated, axillary; bracteas exceeding the pedicels; teeth of calyx lanceolate, about equal in length to the tube; vexillum length of the wings, but shorter than the carina; legumes pendulous, pilose, with somewhat quadrangular joints. ♃. H. Native of the Altaian mountains. Flowers purple.

Woolly-fruited Hedysarum. Fl. Jul. Aug. Clt. 1816. Pl. 1 ft.

16 H. RUTIDOCA'RPUM (D. C. prod. 2. p. 341.) stems ascending; leaves with 8-9 pairs of elliptic obtuse leaflets, which are pubescent beneath; spikes of flowers ovate, pedunculate, crowded; vexillum emarginate, a little longer than the keel; wings twice the length of the calyx; legumes reticulately wrinkled, and clothed with hoary pubescence, with 2-3 orbicular joints. ♃. H. Native of Siberia, in the desert between the rivers Oby and Irtisch. H. prostràtum, Pall. ex herb. Patrin. Flowers purple.

Wrinkled-fruited Hedysarum. Fl. July, Aug. Clt. 1826. Pl. prostrate.

17 H. TAU'RICUM (Pall. nov. act. petrop. 10. p. 315.) stem erect; leaves with 4-6 pairs of lanceolate-linear leaflets, which are clothed with adpressed pubescence beneath; spikes of flowers

ovate; vexillum emarginate, longer than the wings, but shorter than the keel; joints of legume reticulately veined, hoary. ♃. H. Native of Tauria, on calcareous mountains. Bieb. cent. 2. p. 85. ex fl. taur. and suppl. no. 1447. H. fruticòsum, Habl. taur. 121. H. ròseum, Sims, bot. mag. 996. Flowers rose-coloured. Leaves sometimes with 8-10 pairs of leaflets.

Taurian Hedysarum. Fl. July. Clt. 1804. Pl. ½ to 1 foot.

18 H. ròseum (Steph. ex Fisch. in litt. D. C. prod. 2. p. 342.) stem erect; leaves with 6-8 pairs of oblong-lanceolate leaflets, which are clothed with adpressed villi on both surfaces, when young they are canescent beneath; spikes of flowers oblong or ovate, pedunculate; vexillum emarginate, shorter than the carina; wings length of the calyx; legumes articulated, pubescent, reticulately veined. ♃. F. Native of Siberia, and the Altaian mountains. Flowers rose-coloured. This species is very like *H. Taúricum*, but differs in the wings of the corolla being about equal in length to the calycine segments, not longer. Bracteas longer than the pedicels.

Rose-coloured-flowered Hedysarum. Fl. July, Aug. Clt. 1803. Pl. 1 foot.

19 H. Alta'icum (Fisch. in litt. D. C. prod. 2. p. 342.) stems erect; leaves with 6-8 pairs of elliptic or oblong leaflets, which are clothed with adpressed pubescence beneath; peduncles longer than the leaves; spikes of flowers oblong or ovate; wings longer than the calyx, but about equal in length to the carina; vexillum a little longer than the keel; ovaries pubescent, 2-jointed. ♃. H. Native of Siberia, on the Altaian mountains. Flowers purple. Bracteas and segments of the calyx subulate. Stipulas concrete, opposite the leaves. Leaflets of the lower leaves oval, of the upper ones oblong, and nearly linear.

Altaian Hedysarum. Fl. July, Aug. Clt. 1818. Pl. 1 ft.

20 H. venu'stum (Fisch. in litt. D. C. prod. 2. p. 342.) stem erect; leaves with 5-7 pairs of elliptic leaflets, canescent on both surfaces from adpressed down; peduncles a little longer than the leaves; spikes of flowers oblong; vexillum rather longer than the keel, but the wings are shorter than it, and hardly exceeding the segments of the calyx; legumes villous, with 3 joints. ♃. H. Native of the Altaian mountains, in the desert of Scythia. Flowers large, purple. Bracteas a little longer than the pedicels. Stipulas concrete, opposite the leaves.

Shewy Hedysarum. Pl. ½ to 1 foot.

21 H. ni'tidum (Willd. spec. 3. p. 1205.) stems flexuous, clothed with white tomentum; leaflets elliptic, clothed with silky tomentum on both surfaces; wings length of the carina; legumes articulated, smooth. ♃. H. Native of Armenia. H. orientàle argenteum, flore luteo, siliquâ glabrâ, Tourn. cor. 27. The ovary examined in Tournefort's specimen is tomentose, and contains 3 ovula, therefore the legumes must be 3-jointed. Flowers yellow.

Shining Hedysarum. Pl. ½ to 1 foot.

**** *Plants caulescent. Calycine teeth short. Legumes wrinkled or a little crested, pubescent.*

22 H. fruticòsum (Lin. fil. suppl. 333.) stem erect, shrubby; leaves with 5-7 pairs of alternate, elliptic, obtuse leaflets, which are clothed with adpressed pubescence on both surfaces; flowers disposed in spikes, few, distant; wings hardly longer than the calyx; vexillum length of keel; joints of legume reticulately wrinkled, with the nerves a little echinated. ♄. H. Native of Siberia, beyond the Baikal, and of Dahuria, in sandy places. Pall. itin. 3. p. 763. t. 5. f. 1. ed. gall. append. no. 368. t. 92. f. 2.—Gmel. sib. 4. t. 22. Calyx with 5 short teeth. Corolla pale purple. This is a very handsome plant, very grateful to horses, and extremely useful in fixing sand.

Shrubby Hedysarum. Fl. June, July. Clt. 1782. Shrub.

23 H. Ibe'ricum (Bieb. fl. taur. 2. p. 177.) stems erect; leaves with 4-5 pairs of elliptic, mucronate, opposite leaflets, which are pubescent beneath; flowers disposed in spikes, few, rather distant; wings, vexillum, and keel about equal in length; joints of legume hoary, with crenulated margins. ♃. H. Native of Iberia. Stamens distinctly and abruptly infracted. Flowers purple.

Iberian Hedysarum. Fl. July, Aug. Clt. 1818. Pl. 1 ft.

24 H. Razoumowia'num (Helm, et Fisch. ined. D. C. prod. 2. p. 342.) stems erect; leaves with 6-7 pairs of oblong-linear, rather pubescent leaflets; spikes of flowers pedunculate, longer than the leaves; wings of flower twice the length of the calyx, and about one-half shorter than the carina; vexillum a little longer than the keel; legumes rather hoary, reticulately wrinkled, not crested. ♃. H. Native of Siberia, in the desert of Scythia in the region of Orenburg. Flowers purple. Habit of *H. fruticòsum* and *H. Ibéricum*.

Razoumow's Hedysarum. Pl. ½ to ¾ foot.

25 H. Creta'ceum (Fisch. in litt. 1825. D. C. prod. 2. p. 342,) stems erect; leaves with 4-7 pairs of oblong-linear, acute, glabrous leaflets; spikes of flowers elongated, slender; wings of flower shorter than the obcordate vexillum, but twice the length of the calyx; keel exceeding the vexillum; joints of legume 2-3, flat, pubescent. ♃. S. Native of Siberia, at the Don and the Volga, near Serotinsk. H. Volgénse, Fisch. in litt. 1810. Flowers purple.

Cretaceous Hedysarum. Fl. July, Aug. Clt. 1819. Pl. ½ to 1 foot.

Sect. II. Leiolòbium (from λειος, *leios*, smooth, and λοβος, *lobos*, a pod; in reference to the smooth pods). D. C. prod. 2. p. 343. Joints of legume smooth, not echinated, nor pilose. Calycine segments shorter than the corolla.

26 H. consangui'neum (D. C. prod. 2. p. 343.) stems erect; leaves with 6-8 pairs of elliptic leaflets, which are pubescent beneath; peduncles longer than the leaves; spikes of flowers crowded, ovate; wings longer than the calyx, but a little shorter than the carina; vexillum nearly equal to the corolla; ovary linear, glabrous, 5-6-ovulate. ♃. H. Native of Siberia, on the Altaian mountains. H. Altàica var. or species affinis, Fisch. in litt. Habit of *H. Altàicum*, but the ovary is like that of *H. subspinòsum*. Stipulas membranous, white, concrete in one, which is bidentate at the apex. Flowers purple.

Kindred Hedysarum. Fl. July, Aug. Clt. 1820. Pl. 1 ft.

27 H. obscu'rum (Lin. spec. 1057.) stems erect; leaves with 5-9 pairs of ovate glabrous leaflets; stipulas concrete, opposite the leaves, sheathing; bracteas longer than the pedicels; vexillum a little shorter than the keel; legumes pendulous, quite smooth. ♃. H. Native of the Alps of Austria and Provence. Jacq. austr. t. 168. Curt. bot. mag. 282. H. alpìnum β, Lin. spec. 1057. H. contravérsum, Crantz. aust. 425. t. 2. f. 3. Hall. enum. 1. t. 14. hist. 2. t. 12. Flowers beautiful, purple, seldom white. Root creeping.

Obscure Hedysarum. Fl. June, Aug. Clt. 1640. Pl. ½ ft.

28 H. brachyse'mum; stem erect; leaves with 5-9 pairs of ovate smooth leaflets; stipulas concrete; bracteas longer than the pedicels; vexillum one-half shorter than the keel, but about equal in length to the wings; legumes smooth, pendulous. ♃. H. Native of the Altaian mountains, at the metal mines of Riddessk. H. obscùrum Altàicum, Fisch. in litt. H. obscùrum β, brachysèmum, D. C. prod. 2. p. 343.—Gmel. sib. 4. t. 10. Flowers larger than those of *H. obscùrum*, purple, seldom white.

Short-bannered Hedysarum. Fl. Jul. Aug. Clt. 1817. Pl. 2 ft.

29 H. alpi'num (Lin. spec. 1057.) stem erect; leaflets oblong or lanceolate, pubescent beneath; upper stipulas distinct; bracteas usually shorter than the pedicels; legumes pendulous, quite glabrous. ♃. H. Native of Siberia and Dahuria. Jacq. vind.

266. H. Sibéricum, Poir. suppl. 5. p. 17. Lam. ill. t. 628. f. 3. Flowers purple, seldom white. An elegant plant.

Var. β, pedicellàre (D. C. prod. 2. p. 343.) bracteas shorter than the pedicels. H. alpìnum, Willd. spec. 3. p. 1207. Ker. bot. reg. 808. Sims, bot. mag. 2213.

Alpine Hedysarum. Fl. July, Aug. Clt. 1798. Pl. 2 to 3 ft.

30 H. Cauca'sicum (Bieb. fl. taur. 2. p. 178.) stem erect; leaflets ovate, smoothish; upper stipulas concrete, opposite the leaves; racemes on long peduncles; bracteas longer than the pedicels; legumes glabrous, pendulous. ♃. H. Native of Caucasus and Iberia, on the Alps. Flowers purple. Peduncles almost a foot long.

Caucasian Hedysarum. Fl. Ju. Aug. Clt. 1820. Pl. 2 to 3 ft.

31 H. borea'le (Nutt. gen. amer. 2. p. 110.) stem rather decumbent; leaflets oblong-obovate, villous beneath; stipulas joined, sheathing; with subulate segments; racemes on long peduncles; joints of legume smooth or pubescent, and roundish. ♃. H. Native of North America, on the naked arid plains of the Missouri at Fort Mandan, and in the north of Canada, and from the Saskatchawan to the Arctic circle, Rocky mountains, &c. H. alpinum, Michx. fl. bor. amer. 2. p. 74. Flowers purple, secund.

Northern Hedysarum. Pl. 2 to 3 feet.

32 H. Macke'nzii (Rich. in Frankl. journ. append. p. 745.) stems decumbent; leaflets oblong, clothed on both surfaces with canescent pili; stipulas sheathing; joints of legume wrinkled transversely and pilose. ♃. H. Native of Arctic America and about the Saskatchawan, on the Eagle and Red-deer hills. Flowers large, red. This is the liquorice plant mentioned by Sir Alexander Mackenzie as being indigenous to North-west America.

Mackenzie's Hedysarum. Pl. decumbent.

33 H. subspinòsum (Fisch. in litt. D. C. prod. 2. p. 343.) stems suffruticose, much branched, erect, and are as well as the leaves clothed with adpressed canescent down; branches and peduncles permanent, and becoming hardened into spines; petioles flattish; leaves with 5-7 pairs of elliptic leaflets; spikes of flowers pedunculate, longer than the leaves; wings shorter than the calyx; ovary linear, glabrous. ♄. F. Native of Siberia, at Lake Inderskoi. This is a very singular species, with the habit of *Astrágalus gibbòsus.*

Spinose Hedysarum. Shrub ½ to 1 foot.

34 H. incarna'tum (Willd. spec. 3. p. 1209.) stem erect, glabrous; leaflets oblong, acute, hoary beneath; stipulas wanting; flowers racemose, drooping.—Native of Japan. H. incànum, Thunb. fl. jap. 289. but not of Swartz. Flowers flesh-coloured. Said to be allied to *H. obscùrum*, but the plant is without stipulas.

Flesh-coloured-flowered Hedysarum. Pl. 1 foot.

† *Doubtful species.*

35 H. linea're (Lour. fl. cochin. 452.) stem suffruticose, diffuse; leaflets lanceolate-linear, glabrous; spikes terminal; legumes straight, linear, smooth, 6-seeded. ♄. G. Native of Cochin-china. Flowers pale violet. The root is esteemed to be deobstruent, emmenegogue, and to create an appetite.

Linear-podded Hedysarum. Shrub 2 feet.

36 H. uniflòrum (Lapeyr. abr. p. 436.) stems ascending; leaflets elliptic, rather silky beneath; flowers pedunculate, solitary; wings twice the length of the calyx; legumes 4-parted, villous beneath; lobes 2-horned. ♃. H. Native of the Pyrenees, among rocks. Flowers yellow.

One-flowered Hedysarum. Pl. ascending.

Cult. All the species of this genus are very handsome when in flower, being clothed with racemes of elegant pea blossoms; they are therefore well adapted for ornamenting flower borders or rock-work. They succeed well in light rich soil, and the perennial kinds are increased by dividing the plants at the roots in spring or by seeds. The seeds of the annual species only require to be sown in the open border in spring.

CLIX. ONOBRY'CHIS (from *ονος*, *onos*, an ass, and *βρυχω*, *brycho*, to gnaw; the plants are grateful to the ass). Tourn. inst. t. 211. Gærtn. fruct. 2. t. 148. D. C. fl. fr. 4. p. 511. legum. mem. vii. prod. 2. p. 344. Desv. journ. bot. 3. p. 125. t. 6. f. 33, 34. 1814. 1. p. 80. Hedýsarum species of Lin. and others.

Lin. syst. *Diadélphia, Decándria.* Calyx 5-cleft, with nearly equal subulate segments. Corolla papilionaceous, with the carina as if it was truncate, and the wings short. Stamens diadelphous. Legume sessile, of only one compressed, indehiscent, rather coriaceous, echinated, crested or winged, 1-seeded joint, which is thicker and straight on the upper suture, but convex and thinner on the lower suture.—European or Asiatic herbs, with impari-pinnate leaves, axillary elongated peduncles, bearing spikes of red or white flowers at their tops. The ovary when young is perhaps truly bi-ovulate. The legume also is sometimes 2-seeded, but only 1-celled.

Sect. I. Eubry'chis (from *ευ*, *eu*, well or good, *βρυχω*, *brycho*, to gnaw; this section contains the most useful species in agriculture). D. C. legum. mem. vii. prod. 2. p. 344. Legume oblique, wrinkled or prickly in the disk, and toothed or interruptedly crested on the back.

1 O. sati'va (Lam. fl. fr. 2. p. 652.) stem erect; stipulas usually distinct; leaflets elliptic-oblong, mucronate, glabrous; spikes of flowers elongated; keel of flower shorter than the vexillum; wings shorter than the calyx; legumes pubescent, denticulated on the back, but having the sides wrinkled, and rather prickly. ♃. H. Native of Europe, on dry calcareous hills. In Britain on all calcareous hills. Hedys. onobrýchis, Lin. spec. 1059. Jacq. austr. t. 352. Smith, engl. bot. 96. O. viciæfòlia, Scop. O. vulgàris, Jaum. O. spicàta, Mœnch. Flowers variegated, crimson.

Saintfoin is called *L'esparcet* in French; *Esparzette* in German, and *Cedrangola* in Italian. It is a deep-rooting perennial plant, with branching spreading stems. It is a native of England and many parts of Europe, but never found but on dry, warn, chalky soils, where it is of great duration. It has been long cultivated in France and other parts of the continent, and as an agricultural plant was introduced from the latter country into England about the middle of the 17th century. It has since been a good deal cultivated in the chalky districts, and its peculiar value is that it may be grown on soils unfit for being constantly under tillage, and which would yield little under grass. This is owing to the long and descending roots of the *saintfoin*, which will penetrate and thrive in fissures of rocky and chalky substrata. Its herbage is said to be equally suited for pasturage or for hay, and that eaten green it is not apt to swell or hove cattle like the clovers or lucern. Arthur Young says, that upon soils proper for this plant no farmer can sow too much of it; and in the code of agriculture it is said to be "one of the most valuable herbage plants we owe to the bounty of Providence." There are no varieties of this plant, but there are numerous other species of the same genus that might be cultivated.

The best soil for saintfoin is that which is dry, deep, and calcareous, but it will grow on any soil that has a dry subsoil. Kent thinks that the soils most suited to the culture of this plant are those of the chalky loam, and light sandy or gravelly kinds, or almost any of those of a mixed quality, provided they be not too wet, and have a rocky and hard calcareous bottom to check the roots at the depth of a foot or foot and a half below the surface, which he, notwithstanding the above, conceives necessary, as the plants are apt to exhaust themselves in running down. And for this reason he considers it as improper for being sown where there is a great depth of soil or mould. Marshal says, that the poorest soils afford a large produce, and such as are more rich and arable abundant crops. Still he conceives that it is only on calcareous soils, as the dry chalk and limestone, or such as have been well impregnated with that sort of matter, that it succeeds in a perfect manner, or becomes durable. In sandy soils, as in Norfolk, which are unfit for any other purpose, under *saintfoin* will produce after the first year about two tons per acre of excellent hay, with an after grass extremely valuable for weaning and keeping lambs.

The best preparation which any soil fit for this plant can undergo is deep trenching, but the usual preparatory culture is the same as for clover, ploughing however deeper than ordinary, either by means of the trench plough, or by the common plough going twice in the same tract. Boys (Communications to the Board of Agriculture, vol. iii.) recommends as a preparation for *saintfoin*, 1st year, pare and burn for turnips to be eaten on the land by sheep; 2nd, barley to be sown very early, with clover seed; 3rd, clover eaten off by sheep; 4th, wheat; 5th, turnips, with manure; 6th, barley, with *saintfoin*. The corn crops must be carefully weeded, and in particular cleared of charlock. Under this system, the produce has been great, and the ground has been laid down in the highest order with *saintfoin*, or any other grass calculated for this species of soil.

The season of sowing saintfoin; it may be observed, that the earlier it can be put into the soil in spring the better, as from the greater moisture of such soils at that season, there will be a greater probability of their vegetating in a perfect manner; therefore the sowing of *saintfoin* seed should never be deferred later than the beginning of March, and it is still better if this work is completed in February. Some, however, think it may be deferred to the middle of March without injury.

The manner of sowing saintfoin seed is almost always broad-cast, but it may be sown in drills, or even transplanted, though neither of these modes can be recommended. Some advise its being sown with about half the quantity of barley, which is annually sown for a full crop, that it may shade and keep it moist during the first summer, and at the same time not injure it from the crop being lighter, which is sometimes the case. Where the barley is drilled, the saintfoin may be put in afterwards in the same manner, but in a contrary direction. If sown over wheat, it should be harrowed in, and afterwards rolled. In whatever manner it is sown, as the seeds are larger than those of many other herbage plants, the ploughing the seed in with a very thin or shallow furrow is recommended. In most cases, especially in all the more light soils, in which this sort of crop is grown, the use of the roller may be necessary immediately after the seed is put into the ground. It is the practice in some districts to sow a small portion of clover-seed with *saintfoin*, with the idea of increasing the first year's produce, but it is perhaps better to increase the quantity of *saintfoin-seed* without mixing it with that of any other, as different kinds of herbage seed do not answer well when sown together, from there being a continual contest in their growth. It is, however, supposed by Marshal that such a practice is beneficial in alternately procuring a fine clean crop of *saintfoin* upon the land. It is a sort of crop that grows in so perfect a manner in the broad-cast method, that there can seldom be any necessity for having recourse to drills. It may, however, be cultivated in the latter mode with much success. And in Norfolk it is the practice with some cultivators to have it drilled at nine inches apart across the barley field, which has been sown in the same way, but in a contrary direction.

The quantity of seed required in the broad-cast method, which is that mostly employed, is about four bushels the acre, though less is frequently given, but on soils proper for this plant that quantity is always necessary. But when the drill system is adopted a smaller quantity is used, from two to three bushels per acre. In Lincolnshire, where this plant is much grown, the common allowance of seed is five bushels per acre. In that county 4 pounds of trefoil-seed is recommended to be sown with each acre of *saintfoin*. The reason for which is, that in that exposed country, the young plants suffer more by the sun in summer than by the frost in winter. Of course, the trefoil coming to perfection in the first year, and living only three, will be a shelter for the young plants during the first year or two, and die off when the *saintfoin* wants its room.

In the choice of saintfoin-seed it is the best practice for the cultivator to select it from the best and most abiding plants in his particular soil, as such as is purchased from the seed-shops can rarely be depended upon. The external signs of good seed are, that the husk is of a bright colour, and the kernel plump, of a light grey or blue colour, and sometimes of a shining black. The seed may be good though the husk is black, which is owing sometimes to the letting it receive wet on the field. If, when the kernel is cut across, it appears greenish and fresh, it is a certain sign that it is good. Seed of the former year's sowing is always the best, as older seeds seldom vegetate in a perfect manner.

The after culture and management of saintfoin consists in occasional dressings with manure, and in the judicious intervention of mowing and pasturing. The first year some farmers do not mow it, while others do; but the second year and the succeeding summer a crop of hay may be taken, and the after grass be fed down with any sort of stock but sheep till towards December, care being taken that they do not eat it in too close a manner, as where that is the case, from the largeness of the roots, there may be danger of injuring the crowns of the plants. In the following autumn there will, however, be less risk in this respect, and sheep as well as cattle stock may be turned in and kept upon the pastures till they are well eaten down, being always careful to shut them up as early as possible in the beginning of the year. This is the opinion of Kent. And it is supposed, that as this sort of herbage is considered to be improved by being nipped by the frost, it may be a proper practice not to turn stock upon these leys too early in the autumnal season. With this intention it may be adviseable to defer it till the latter end of September, when this sort of rouen or after grass will be found to have much effect in promoting the flow of milk in cows, as well as in forwarding the condition of fattening beasts, great store of feed being still left for sheep. But with this sort of stock they should not be too closely fed down, or the sheep remain too long upon them, as much injury may be sustained by it. It has been suggested that all sort of cattle stock should be removed by the beginning of the year from these rouens, as much harm may be done by their continuing longer.

In top dressing saintfoin, peat ashes are the best material that can be made use of, where they can be procured in sufficient quantity. And other sorts of ashes are likewise found beneficial where these cannot be had. This should be applied so as to form a thin, even, regular dressing over the whole surface of the crop. In this view soot has also been found of great utility, when spread evenly over such leys in the beginning of January, in the proportion of 25 to 30 bushels to the acre. Malt dust has also been employed in the same way with considerable success; and it is supposed where these sorts of dressings can be applied every third or fourth year, the *saintfoin* crops, when well established in the soil, may be preserved in a state of vigorous growth for 10 or 15 years or more, and the land be considerably improved by the roots striking so deeply into it.

In taking and using the saintfoin crop, the same practice may be followed as for taking clover; it may be mown for soiling or hay or seed, and eaten on the spot by tethering, hurdling, or common pasturing. In making it into hay, it is cut immediately on its coming into full blossom, and as it remains but a short time in that state, as much expedition as possible should be employed both in mowing it and making the produce into hay. It is the most easy crop to make into hay, when the season is favourable. The haymakers follow the scythe, and having turned over the swaths, throw it into wind-rows, when it may be immediately formed into cocks, and the whole crop be fit for carting in a week after it is mown; and though it may appear green, and the stack acquire a considerable degree of heat, there is no danger to be apprehended, provided the weather has been fair during the hay-ricking, as it is so far from taking harm by heating in the stack, that the contrary state is most to be feared, and for this reason great care is necessary not to suffer the fodder to continue too long either in the swath or in the cocks, lest the air and wind should dry it too fast, and by exhaling its juices prevent its heating in the stack, and thereby render it of little value.

In regard to the frequency of cutting *saintfoin*, it is probable that on the thinner sorts of soils it can seldom be done more than once, but on those of the deeper sorts two crops may sometimes be taken, in the same manner as clover, care being taken in these cases that the future growth of the plants be not injured by this means.

The usual duration of saintfoin, in a profitable state, is from 8 to 10 years. It usually attains its perfect growth in about 3 years, and begins to decline towards the 8th or 10th year on calcareous soils, and about the 7th or 8th on gravels. There are instances, however, of fields of *saintfoin* which have been neglected and left to run into pasture, in which plants have been found upwards of 50 years from the time of sowing. In general the great enemy to the endurance of *saintfoin* is the grass, which accumulates and forms a close tuft on the surface, and thus chokes up the plant.

The quantity of produce on a medium of soils and cultivation may probably be estimated at from about one and a half to two tons per acre. And on the poorer and thinner staple sorts of land it will perhaps seldom afford less than from a ton to a ton and a half on an acre.

The nutritive products of saintfoin are the same as clover, viz. $3\frac{3}{10}$ being $1\frac{6}{10}$ per cent. more than those of lucern.

In saving seed from saintfoin, it should remain on the land till the husks become of a somewhat brownish colour, and the seeds are perfectly plump and firm. It requires some experience to know of what degree of ripeness to cut the seeded *saintfoin*, because all the seeds do not ripen at the same time on the same spike or head, as all the heads begin blossoming at the lower part, and continue to blow gradually upwards for many days, so that before the flowers have gone off the top, the seeds are almost mature at the bottom, therefore if the cutting is deferred till the top seeds are quite ripe, the lower, which are the best, would then all be lost. The best time to cut it is when the greater portion of the lower seeds are ripe, and the last blown beginning to be full. The unripe seeds will ripen after cutting, and be in all respects as good as those that were ripe before. It should be mown in the morning and evening, when the plant is most supple, for if mown in the heat of the day the ripe seeds will shed. In fine clear weather *saintfoin* seed will soon dry. After being dried it may be either thrashed out in the house or on the field on a large sheet, it then should be riddled through a large sieve, to separate the seed from the chaff and broken stems. The haulm may be then used as hay.

Cultivated or Common Saintfoin. Fl. June, July. Britain. Pl. 2 to 3 feet.

2 O. TANAI'TICA (Spreng. neue. entd. 2. p. 162.) stem erectish; stipulas usually distinct; leaflets elliptic-lanceolate, mucronulate, clothed with silky pubescence beneath, the rest of the plant as in *O. sativa.* ♃. H. Native of Siberia, on the banks of the Don. Hedys. onobrỳchis, Bieb. fl. taur. no. 1431. O. satìva, var. β, subvillòsa, D. C. prod. 2. p. [illegible]44. O. satìva Tatárica, Fisch. in litt. Flowers flesh-coloured.

River *Don* Saintfoin. Fl. June, July. Clt. 1817. Pl. 2 ft.

3 O. MONTA'NA (D. C. fl. fr. 4. p. 611.) stem rather decumbent; stipulas joined together, opposite the leaves; leaflets cuneate-lanceolate, mucronulate, glabrous; spikes of flowers short; keel longer than the vexillum; wings shorter than the [illegible]; legumes toothed on the back, but wrinkled and pubescent on the sides. ♃. H. Native of the alps of Europe and of the Pyrenees, in the higher meadows. Hedys. montànum, Pers. ench. 2. p. 324. According to Wahlenberg this is only a variety of *O. sativa.* Flowers deep purple or red.

Mountain Saintfoin. Fl. June, July. Clt. 1817. Pl. dec.

4 O. CONFE'RTA (Desv. journ. bot. 1814. 1. p. 83.) stems declinate; stipulas usually distinct; leaflets oblong-elliptic, mucronulate, pubescent beneath; racemes of flowers ovate; wings shorter than the calyx; keel equal in length to the vexillum; legumes rather hoary, furnished with rather long prickles on the back, but wrinkled and furnished with a few short prickles on the sides. ♃. H. Native of Caucasus, Iberia, south of Podolia, in grassy places. Hedys. confértum, Bieb. fl. taur. et suppl. 1452. Flowers deep red.

Crowded-flowered Saintfoin. Fl. June, Aug. Clt. 1817. Pl. decumbent.

5 O. FONTANE'SII; procumbent, pubescent; stipulas ovate, acute, dry; leaflets crowded, elliptic, obtuse, pubescent, and nerved beneath; racemes of flowers ovate, crowded. ♃. H. Native of Tunis, in sandy places near Sbiba. Hedys. confértum, Desf. fl. atl. 2. p. 178. O. conférta β, Fontanèsii, D. C. prod. 2. p. 344. Flowers fine red.

Desfontain's Saintfoin. Fl. June, Aug. Clt. 1820. Pl. ½ ft.

6 O. PROCU'MBENS (Stev. in litt. D. C. prod. 2. p. 344.) stems procumbent; leaflets oblong-linear, mucronate, pubescent beneath; spikes of flowers cylindrical, on long peduncles; wings shorter than the calyx; keel rather exceeding the vexillum; legumes pubescent, denticulated on the back, with the sides wrinkled, and rather prickly. ♃. H. Native of Iberia, about Tiflis. Hedys. onobrỳchis var. Ibérica, Bieb. suppl. 484. Flowers red.

Procumbent Saintfoin. Fl. June, Aug. Clt. 1819. Pl. proc.

7 O. SUPI'NA (D. C. fl. fr. 5. p. 612.) stems diffuse, rather hairy; leaflets oblong, hardly mucronulate; spikes ovate-oblong, pedunculate; wings of flower shorter than the calyx, and the carina shorter than the calyx; legumes villous, crested and toothed on the back, but with the disks wrinkled, and rather prickly. ♃. H. Native of Lower Vallais, Provence, Dauphiny, Cevennes, and the Pyrenees. Hedys. supìnum, Vill. dauph. 3. p. 394. H. herbàceum, Lapeyr. H. pállidum, Schleich. Flowers pale red.

Supine Saintfoin. Fl. June, July. Clt. 1819. Pl. proc.

8 O. GLA'BRA (Desv. journ. bot. 1814. vol. 1. p. 82.) stems ascending; leaflets lanceolate, acuminated, quite glabrous; legumes oblong, chinky, glabrous, crested, with the crest toothed at the apex. ♃. H. Native of Tauria. Hedys. onobrỳchis var. ε, Gouan. ill. 48.? Flowers red.

Glabrous Saintfoin. Fl. June, July. Clt. 1816. Pl. ascending.

9 O. ARENA'RIA (D. C. prod. 2. p. 345.) stem erect, suffrutescent at the base; leaflets oblong-linear, mucronate, glabrous; spikes of flowers cylindrical; wings shorter than the calyx; keel about equal in length to the vexillum; legumes pubescent, almost toothless on the back, but wrinkled on the sides. ♃. H. Native of Hungary and of Siberia, at the Irtish about Kroupeanka. Hedys. arenàrium, Kit. in litt. Willd. enum. suppl. 31. H. eréctum, Patrin. herb. Flowers red.

Sand Saintfoin. Fl. June, Aug. Clt. 1818. Pl. 1 foot.

10 O. MAREÓTICA (Steven, in litt. D. C. prod. 2. p. 345.) stems erect; leaflets linear, mucronate, glabrous; racemes cylindrical, very long; wings shorter than the calyx; keel about equal in length to the vexillum; legumes villous, prickly on the back, and with the sides wrinkled and prickly. ♃. H. Native of the Mareotic marsh in Egypt. Lobes of calyx long and villous. Prickles on the legumes arranged in two rows on each side. Flowers pale red. Very nearly allied to *O. álba*, but differs from it in being glabrous.

Mareotic Saintfoin. Fl. June, Aug. Clt. 1820. Pl. 1 foot.

11 O. A'LBA (Desv. l. c.) stem erect, velvety; leaflets linear, mucronate, clothed with silky-pubescence on the under surface; spikes of flowers cylindrical; wings shorter than the calyx; keel a little longer than the vexillum; legumes pubescent, crested on the back, and furnished with longish prickles, but with the disks wrinkled, and furnished with short prickles. ♃. H. Native of Hungary, on calcareous mountains, and of Abruzzo by way sides. Hedys. álbum, Waldst. et Kit. pl. hung. 2. t. 111. Stem angular. Upper leaves sessile. Flowers white.

White-flowered Saintfoin. Fl. Ju. Aug. Clt. 1804. Pl. 1 ft.

12 O. ECHINA'TUM; stem nearly erect, velvety; leaves all pinnate, petiolate; leaflets linear, mucronate, pilose above, and clothed with silky pubescence beneath, elegantly nerved; spikes of flowers cylindrical, short; wings falcate, acuminated, not half so long as the calycine teeth; legume 1-seeded, crested, and prickly on the back, with the sides pitted and prickly in front. ♃. H. Native of Calabria, on calcareous hills. Hedýsarum echinàtum, Guss. pl. rar. p. 301. Flowers flesh-coloured.

Echinated-podded Saintfoin. Fl. June, July. Clt. 1831. Pl. 1 foot.

13 O. PETRÆ'A (Desv. l. c.) stem erect; leaflets linear, mucronate; spikes cylindrical, on long peduncles; wings twice the length of the calyx; keel a little shorter than the vexillum; legumes crested, and denticulated on the back, but wrinkled and toothless on the sides. ♃. H. Native of Caucasus, among calcareous rocks. Hedys. petræ'um, Bieb. fl. taur. et suppl. 1453. Corolla white, but with the keel tipped with purple. There are two varieties of the species, the one having the legumes and leaves quite smooth, and the other having the under side of the leaves and the legumes pubescent.

Rock Saintfoin. Fl. June, Aug. Clt. 1818. Pl. 1½ foot.

14 O. GRA'CILIS (Bess. enum. pl. volh. p. 74.) stems ascending; leaflets linear-lanceolate, mucronate, with the mid-rib usually beset with adpressed pili above; wings of flower hardly longer than the tube of the calyx; legumes roundish, canescent, toothed with prickles on the back, and with the sides reticulately wrinkled. ♃. H. Native of the south of Podolia. O. petræ'a, Bess. enum. p. 27. Flowers small, pale, the vexillum streaked with pale red and yellow at the base, but having the keel tipped with purple.

Slender Saintfoin. Fl. June, Aug. Clt. 1820. Pl. ascending.

15 O. SAXA'TILIS (All. pedem. no. 1191. t. 19. f. 1.) stem ascending; leaflets linear, mucronate; spikes cylindrical, pedunculate; wings longer than the calyx; keel a little shorter than the vexillum; legumes glabrous, crested, and entire on the back, and wrinkled on the sides. ♃. H. Native of Provence, Dauphiny, Nice, and Spain, on hills and among rocks. Hedys. saxátile, Lin. spec. 1059. O. tenuifòlia, Mœnch. Hedys. microcárpum, Dufour, in litt. Flowers white. There are varieties of this species with glabrous and silky-villous leaves, and glabrous and pubescent legumes.

Stone Saintfoin. Fl. June, Aug. Clt. 1790. Pl. ascending.

16 O. ERIÓPHORA (Desv. l. c.) stems trailing; leaflets linear, acute, pubescent; legumes clothed with hoary tomentum, crested and prickly on the back, and wrinkled and prickly on the disks, the prickles are hairy, and disposed in 3 rows. ♃. H. Native of Spain. Hedys. erióphorum, Pourr. Flowers red?

Wool-bearing Saintfoin. Pl. trailing.

17 O. CRINI'TA (Desv. l. c.) stems trailing; leaflets ovate, obtuse, pubescent, hoary; legumes prickly on both sides; prickles pubescent. ♃. H. Native of the Levant.

Hairy Saintfoin. Pl. trailing.

18 O. HO'RRIDA (Desv. l. c. t. 22.) stems declinate; leaflets linear, acuminated, pubescent; legumes crowded, large, lunate, bearing spines; spines acute, pubescent, longer than the crest on the back of the legumes. ♃. H. Native of Barbary.

Horrid Saintfoin. Pl. declinate.

19 O. STENORHI'ZA (D. C. prod. 2. p. 346.) stem erectish; leaflets oblong-linear, mucronate, 3-4 pairs, clothed with silky-hoary down beneath; legumes crowded, clothed with hoary vilii, and beset with prickles on all sides; the prickles pubescent. ♃. H. Native of Spain in the kingdom of Valentia, in arid places. Hedys. stenorhìzum, Dufour. in litt. Root long, slender, simple. This plant differs from all the other species of the genus in the leaves having only 3 or 4 pairs of leaflets. Flowers unknown.

Slender-rooted Saintfoin. Pl. 1 foot.

20 O. CA'PUT-GA'LLI (Lam. fl. fr. 2. p. 651.) stems erect; leaflets oblong or cuneate-obovate, mucronate, pubescent; spikes few-flowered; wings rather longer than the calyx; keel a little shorter than the vexillum; legumes rather pubescent, very prickly on all sides. ⊙. H. Native of the south of Europe, in rugged exposed places. Hedys. càput-gálli, Lin. spec. 1059.—Lob. icon. 2. p. 81. f. 1. Flowers flesh-coloured.

Cock's-head Saintfoin. Fl. July, Aug. Clt. 1731. Pl. 1 foot.

21 O. CRI'STA-GA'LLI (Lam. fl. fr. 2. p. 652.) stems trailing; leaflets cuneate, oblong or obovate, obtuse or retuse, pubescent; spikes few-flowered; calyxes about equal to the corolla; wings and keel about the same length as the vexillum; legumes glabrous, crested on the back; the crest parted into broad, flat, oblong, toothed segments, having the disks wrinkled, and rather prickly. ⊙. H. Native of the south of Europe, in rugged exposed places. Gærtn. fruct. 2. t. 148. Hedys. crísta-gálli, Lin. syst. 563. Flowers pale red.

Cock's-comb Saintfoin. Fl. June, Aug. Clt. 1710. Pl. proc.

22 O. FOVEOLA'TA (D. C. prod. 2. p. 346.) stems trailing; leaflets cuneate-oblong, mucronate, villous; racemes few-flowered, hardly twice the length of the leaves; legumes pubescent, crested on the back; the crest divided into 3 or 4 entire unequal segments; disks reticulated, with prominent, prickly, villous nerves, the hollows between the nerves deep and glabrous. ⊙. H. Native of Sicily, on arid hills. Flowers pale red?

Foveolate-podded Saintfoin. Fl. June, July. Pl. tr.

23 O. ÆQUIDENTA'TA (D'Urv. enum. pl. archip. p. 90.) stem erect; leaflets oblong, obtuse, mucronate, rather pubescent; peduncles 3 or 4 times longer than the leaves; legumes glabrous, somewhat orbicular, with the disks wrinkled and somewhat arched; the back crested, with the crest divided into equal entire teeth. ⊙. H. Native of the islands of Candia and Melos on hills. O. Crética foliis viciæ, fructu magno cristato et aculeato, Tourn. 26. Hedys. æquidentàtum, Smith, fl. græc. prod. 3. p. 1752. O. cristàta, Desv. journ. bot. 1814. vol. 1. p. 83. t. 23. Flowers red, having the vexillum streaked with blood-colour.

Equal-toothed-crested Saintfoin. Pl. 1 foot.

† *Species belonging to section Eubrỳchis, but are not sufficiently known.*

24 O. ECHI'NUS (D. C. prod. 2. p. 346.) stems glabrous; leaflets linear, rather pilose, mucronate; raceme terminal? simple; calyx villous; legumes thick, lanuginous, very prickly on all

sides. ♃.? H. Native country unknown. Hedys. echìnus, Poir. suppl. 5. p. 19. Perhaps only *O. càput-gálli.*

Hedgehog Saintfoin. Pl. ¾ foot.

25 O. PEDUNCULA'RIS (D. C. prod. 2. p. 346.) leaflets linear-lanceolate, villous; peduncles very long, bearing racemes of flowers at their tops; legumes 1-seeded, prickly. ⊙.? H. Native about Tangiers. Hedys. pedunculàre, Cav. anal. sci. nat. 1801. vol. 4. p. 75.

Long-*peduncled* Saintfoin. Pl. 1 foot.

26 O. INCURVA'TA (D. C. prod. 2. p. 346.) leaflets oblong, silky beneath; spikes of flowers incurved; wings 3 times shorter than the carina; legumes 1-seeded, hairy, with a prickly crest. ♃. H. Native country unknown. Hedys. incúrvum, Horn. hort. hafn. 2. p. 702. Flowers pale red.

Incurved-spiked Saintfoin. Pl. ascending.

27 O. CARPA'THICA (D. C. prod. 2. p. 346.) stems ascending; leaflets lanceolate; wings length of vexillum; legumes glabrous, 1-seeded, prickly. ♃. H. Native of the Carpathian mountains. Hedys. Carpáthicum, Walds. et Kit. in Willd. enum. p. 776. Flowers red.

Carpathian Saintfoin. Fl. June, Aug. Clt. 1817. Pl. asc.

28 O. BERGERIA'NA (D. C. prod. 2. p. 346.) stems diffuse, smoothish; leaflets obovate, rather retuse, and rather pilose; stipulas scarious; corolla shorter than the calyx; legumes 1-seeded, prickly; prickles subulate, a little hooked. ♃. H. Native of Campagna, near Girace. Hedys. Bergeriànum, Spreng. pug. p. 2. t. 74. Habit of a species of *Medicàgo.*

Berger's Saintfoin. Pl. diffuse.

SECT. II. HYMENOBRY'CHIS (from *ὑμην, hymen*, a membrane, and *βρυχω, brycho*, to gnaw; in reference to the species contained in this section being furnished with a membranous crest on the back of the legume). D. C. legum. mem. vii. prod. 2. p. 346. Legumes falcate or somewhat orbicular, wrinkled, and prickly in the disks, expanded into a membranous, denticulated, or entire crest the whole length of the back. This section agrees with the genus *Hymenocárpus*, but differs in the pods being 1-seeded, not many-seeded, and in the disks of the pods being wrinkled, not smooth, as in that genus.

29 O. TOURNEFÓRTII (Desv. journ. bot. 1814. vol. 1. p. 81.) stem erect, velvety; leaflets elliptic-oblong, acute, velvety beneath; spikes of flowers cylindrical, erect; wings longer than the calyx; calyx and legumes velvety. ♃. H. Native of Armenia and Galatia. Hedýsarum Tournefórtii, Willd. spec. 3. p. 1214. O. orientàlis incana flore luteo, &c. Tourn. cor. 26. Flowers yellow, about the size of those of *Hedýsarum coronàrium.* Legumes falcate.

Tournefort's Saintfoin. Pl. 1 foot.

30 O. PALLA'SII (Bieb. pl. ross. 1. t. 35.) stem erect, hairy; leaflets elliptic-oblong, acuminated, tomentose beneath; spikes of flowers cylindrical; wings shorter than the calyx, oblong, and with one tooth at the base of each; calyx villous; legumes pubescent. ♃. H. Native of Iberia and Tauria, on calcareous hills. Hedys. Pallàsii, Willd. spec. 3. p. 1214. Bieb. fl. taur. et suppl. no. 2. p. 178. O. Buxbaumiàna, Desv. journ. bot. l. c.—Buxb. cent. 2. t. 42. Flowers cream-coloured, but the vexillum is painted with purple veins.

Pallas's Saintfoin. Fl. June, Aug. Clt. 1820. Pl. 1 ft.

31 O. RADIA'TA (Bieb. cat. hort. gor. 1812. p. 73.) stem erect, pilose; leaflets ovate, obtuse, mucronate, hairy beneath; spikes of flowers cylindrical; wings sagittate, twice the length of the calyx; calyx and legumes villous. ♃. H. Native of Caucasus, Iberia, and Cappadocia, on hills among stones. Hedys. radiàtum, Desf. ann. mus. 12. t. 13. Bieb. suppl. no. 1450. Hedys. Buxbaùmii, Bieb. fl. taur. no. 1150. exclusive of the synonyme of Buxbaum, Hedys. circinnàtum, Willd. spec. 3. p. 1213. O. circinnàta, Desv. l. c. Flowers cream-coloured, but the vexillum is lined with red, and with a yellow mark at the base.

Rayed-podded Saintfoin. Fl. June, Aug. Clt. 1818. Pl. 1 ft.

32 O. MICHAU'XII (D. C. prod. 2. p. 347.) stem erect, smoothish; leaflets elliptic-oblong, mucronate, glabrous; spikes elongated, loose-flowered; wings sagittate, shorter than the calyx, with the auricles diverging; calyxes villous; legumes clothed with velvety tomentum. ♃. H. Native of the Levant. Hedys. cryptápterum, Lher. herb. O. pícta, Desv. in herb. Desf. Flowers pale, with the vexillum striated. The figure in Buxb. cent. 2. t. 42. agrees pretty well with this species.

Michaux's Saintfoin. Fl. June, Aug. Clt. 1820. Pl. 1 ft.

33 O. ORNA'TA (Desv. l. c.) stem erect, flexuous, glabrous beneath, but pubescent above; leaflets ovate, cuspidate, clothed with hoary pubescence beneath; spikes elongated; wings longer than the calyx; legumes villous. ♃. H. Native of Galatia. Hedys. ornàtum, Willd. spec. 3. p. 1215. Hedys. coronàrium. Poir. dict. 6. p. 439. Flowers red? Legumes semi-orbicular.

Decked Saintfoin. Pl. 1 foot.

34 O. VENÒSA (Desv. l. c.) stem almost naked; leaflets elliptic, villously-tomentose beneath, outer one a little larger than the rest; peduncles radical, longer than the leaves; flowers spicate, distant; wings shorter than the calyx; legumes very villous. ♃. H. Native of Tunis, on the mountains of Sbiba, and of Persia, as well as the island of Cyprus. Hedys. venòsum, Desf. fl. atl. 2. p. 179. t. 201. Corollas pale yellow.

Veiny Saintfoin. Pl. ½ foot.

35 O. PTOLEMA'ICA (D. C. prod. 2. p. 347.) stem erect, villous; leaves with 3-6 pairs of elliptic villous leaflets; spikes about the length of the leaves; wings shorter than the calyx; legumes silky, orbicular, 2-seeded. ♃. F. Native of Egypt, in the desert of Suez. Hedys. Ptolemàicum, Delil. fl. ægyp. 111. t. 39. f. 1. Poir. suppl. 5. p. 18. Flowers yellow, painted with brown lines. Said to be allied to *O. venòsa*, but differs in the legumes being lunulate, with entire margins, and 2-seeded.

Ptolemais Saintfoin. Fl. June, Aug. Clt. 1816. Pl. 1 foot.

SECT. III. DENDROBRY'CHIS (from *δενδρον, dendron*, a tree, and *βρυχω, brycho*, to gnaw; in allusion to the species contained in this section being shrubby). D. C. legum. mem. vii. prod. 2. p. 347. Legumes smooth, unarmed, and crestless. Stems shrubby.

36 O. CORNU'TA (Desv. journ. bot. 1814. vol. 1. p. 81.) stem erect, shrubby; leaflets linear-lanceolate, pubescent; peduncles divaricate, few-flowered, and at length become spines; wings of flower longer than the calyx; vexillum villous, crenated at the apex. ♄. F. Native of the Levant, about Barbout (ex Tourn. voy. 2. p. 249. with a figure), and of Eastern Caucasus, in subalpine situations (ex Bieb. fl. taur. 2. p. 181.) Hedys. cornùtum, Lin. spec. 1060. O. orientàlis, Jaume, fam. nat. 2. p. 239. Flowers purple. Legumes reticulated in the disk. Perhaps the Caucasian plant is the same as the Armenian one.

Horned Saintfoin. Fl. June, Aug. Clt. 1816. Sh. ½ to 1 ft.

37 O. TRAGACANTHOÌDES (D. C. prod. 2. p. 347.) stem erect, shrubby; leaflets oblong-lanceolate; peduncles at length hardening into spines, and divaricate; wings longer than the calyx; vexillum obtuse, glabrous. ♄. F. Native of the Levant. Stipulas membranous, white, concrete in one, which is bifid at the apex.

Tragacanth-like Saintfoin. Shrub ½ to 1 foot.

38 O.? PU'MILA (Desv. l. c. p. 84.) stem suffruticose; leaflets oval-oblong; calyxes glabrous; wings shorter than the vexillum, and the vexillum shorter than the keel. ♄. F. Native of Spain. Hedys. pùmilum, Lin. mant. 448. Fruit unknown.

Dwarf Saintfoin. Shrub ½ foot.

SECT. IV. ECHINOBRY'CHIS (from *εχινος, echinos*, a hedge-hog, and *βρυχω*, *brycho*, to gnaw; in reference to the legumes being prickly). D. C. legum. mem. vii. prod. 2. p. 348. Legumes trigonal, rather incurved, prickly on the back. Leaves simple. Perhaps a proper genus.

39 O. rotundifòlia (Desv. l. c.) stems prostrate, angular, glabrous; leaves obovate, on short petioles, quite smooth, and bistipulate; racemes few-flowered; legumes somewhat incurved, triquetrous, acuminated, prickly on the back.—Native of the East Indies. Pluk. alm. t. 433. f. 1. Hedys. rotundifòlium, Vahl. symb. 2. p. 81. Hedys. erinàceum, Poir. dict. 6. p. 393. Hedys. nummularifòlium, Vahl. in herb. mus. par. et Juss.

Round-leaved Saintfoin. Pl. prostrate.

40 O. cuneifòlia (D. C. prod. 2. p. 348.) stem erect, shrubby, glabrous; leaves ovate-cuneated, ending in a very short recurved mucrone; flowers solitary, terminal; legumes half-lunate, prickly. ♄. S. Native of the East Indies. Hedys. cuneifòlium, Roth. nov. spec. 357. Stipulas scarious, ovate-subulate, ciliated, half-stem-clasping.

Wedge-leaved Saintfoin. Shrub.

Cult. All the species of this genus are very shewy when in bloom, and are therefore well adapted for ornamenting flower-borders or rock-work. The best method of increasing them is by seeds, which should be sown where the plants are to remain. The shrubby kinds do best in pots, filled with a mixture of chalk, loam, and sand.

CLX. ELEIO'TIS (from ἐλειος, *eleios*, a dormouse, and *ους ωτος*, *ous otos*, an ear; in allusion to the shape of the leaves, which have some resemblance to the ear of a dormouse.) D. C. legum. mem. vii. prod. 2. p. 348.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, truncate, hardly, but bluntly 5-toothed. Corolla papilionaceous. Vexillum obovate. Keel obtuse. Stamens diadelphous, permanent. Legume compressed, 1-celled, 1-seeded, rather membranous, semi-oval, with the upper suture straight, and the lower one curved.—Slender Indian herbs, with triquetrous stems, small acute adpressed stipulas, simple or pinnately trifoliate petiolate leaves, axillary racemes of small flowers much longer than the leaves, and twin distant pedicels. The plants are commonly called *Dormouse-ears* in India; hence the generic name.

1 E. monophy'lla (D. C. legum. mem. vii.) leaves simple, orbicular, somewhat emarginate at both ends. ♃. S. Native of the East Indies. Flowers red.

Var. α, hebecárpa (D. C. prod. 2. p. 348.) legumes puberulous in the disk on both sides. Glýcine monophýllos, Burm. fl. ind. 161. t. 50. f. 2.

Var. β, leiocárpa (D. C. l. c.) legumes glabrous. Petiv. gaz. t. 32. f. 1.

One-leaved Eleiotis. Pl. trailing.

2 E. soròria (D. C. legum. mem. vii. prod. 2. p. 348.) leaves pinnately-trifoliate, 2 lateral leaflets very small, rising beneath the middle of the petiole, terminal one very large, and almost orbicular, and emarginate at both ends. ♃. S. Native of the East Indies. Hedys. sorórium, Lin. mant. 270. exclusive of the synonyme of Burm. Poir. dict. 6. p. 403.? Hállia soròria, Willd. spec. 3. p. 1170. Onobrýchis soròria, Desv. journ. bot. 3. t. 6. f. 31. 1814. vol. 1. p. 60. Flowers red.

Sister Eleiotis. Clt. 1817. Pl. straggling.

Cult. The species of this genus grow well in any light rich soil, and cuttings will root under a bell-glass, in heat.

CLXI. LESPEDE'ZA (in honour of — Lespedez, once governor of Florida, and a great patron of botany). Michx. fl. bor. amer. 2. p. 70. Nutt. gen. amer. 107. Pers. ench. 2. p. 318. Desv. journ. bot. 3. p. 124. t. 6. f. 28. D. C. prod. 2. p. 348. —Hedýsarum species of Lin. and others.

Lin. syst. *Diadélphia, Decándria.* Calyx 5-parted, bibracteolate at the base; segments nearly equal. Corolla papilionaceous. Keel transversely obtuse. Stamens diadelphous. Legume lenticular, compressed, indehiscent, 1-seeded, unarmed.—Stems herbaceous or suffruticose. Leaves trifoliate; leaflets entire, the middle one stalked. Spikes racemose, pedunculate. Bracteas trifid, 2-flowered. Flowers of a violaceous purple-colour, yellow or cream-coloured, with a purple mark on the vexillum, rarely white.

1 L. ju'ncea (Pers. ench. 2. p. 318.) stem erect, simple; petioles short; leaflets linear-lanceolate, mucronate, clothed with adpressed villi on both surfaces; racemes short, almost sessile. ♄. H. Native of Siberia, Tartary, &c. Hedys. júnceum, Lin. fil. dec. 1. t. 4. Flowers purple or yellow.

Rushy Lespedeza. Fl. July, Aug. Clt. 1776. Sh. 2 to 3 feet.

2 L. Chine'nsis; stem erect, branched; leaflets obovate, retuse, mucronate; bracteas small; racemes short, on short peduncles. ♄. G. Native of China and Japan. Hedys. seríceum, Thunb. fl. jap. 287.? Flowers yellow or purple.

Chinese Lespedeza. Shrub 2 to 3 feet.

3 L. cunea'ta; stems simple; petioles very short; leaflets cuneate, retuse, mucronate, clothed with strigose pubescence beneath; racemes subumbellate, almost sessile; legumes smooth, about equal in length to the calyx. ♄. F. Native of? Anthýllus cuneàta, Dum. cours. bot. cult. 6. p. 100. Flowers yellow or purple.

Wedge-leafletted Lespedeza. Shrub 2 to 3 feet.

4 L. Palla'sii; shrub erect, branched; branches short, and are, as well as the under side of the leaves, clothed with adpressed pubescence; stipulas subulate; leaflets ovate-elliptic, ending each in a spine-like mucrone; racemes many-flowered, pedunculate, longer than the leaves. ♄. F. Native of Siberia. Flowers white or yellow.

Pallas's Lespedeza. Shrub 2 feet.

5 L. viola'cea (Pers. ench. 2. p. 316. Pursh. fl. amer. sept. 2. p. 481.) plant diffuse, much branched, glabrous; petioles elongated; leaflets elliptic, obtuse, clothed with short adpressed strigæ beneath; racemes somewhat umbellate, shorter than the leaves; calyxes shorter than the corolla; legumes rhomboid, reticulated, glabrous. ♃. H. Native of sandy and gravelly places from Virginia to Carolina. Hedýsarum violàceum, Lin. spec. 1055. Flowers violaceous. Plant procumbent.

Var. β, reticulàta (Pers. ench. 2. p. 318.) plant erect, simple; leaflets linear-obtuse. ♃. H. Native of New Jersey and Ilinois. L. sessiliflòra var. Michx. Hedys. reticulàtum, Muhl. L. angustifòlia, Rafin. but not of Nutt. Plant erect.

Var. γ, divérgens (Pursh. fl. amer. sept. 2. p. 481.) plant diffuse, branched; leaflets oblong; legumes ovate; racemes shorter than the petioles. Hedys. divérgens, Muhl. in Willd. spec. 3. p. 1196. L. violàcea var. Nutt. gen. amer. 2. p. 108.

Var. δ, sessiliflòra (Nutt. gen. amer. 2. p. 107.) plant erect, branched; petioles short; leaflets elliptic, obtuse; racemes axillary, almost sessile; legumes minute, naked, acute. Medicàgo Virgínica, Lin. syst. 3. p. 573. ex Pursh. Hedys. sessiliflòrum, Lam. dict. 6. p. 414. Plant erect.

Violaceous-flowered Lespedeza. Fl. July, Aug. Clt. 1739. Pl. 2 feet or procumbent.

6 L. trichoca'rpa (Pers. ench. 2. p. 318.) plant erect; petioles very short; leaflets elliptic-oblong, mucronate; racemes few-flowered, somewhat umbellate, axillary, almost sessile; calyx about equal in length to the corolla; legumes ovate, pubescent, one half shorter than the calyx. ♄. H. Native of Siberia. Hedys. trichocárpum, Willd. spec. 3. p. 1194. Stems and under surface of leaves clothed with very fine pubescence beneath. Stipulas filiform. Flowers purple.

Hairy-fruited Lespedeza. Pl. 2 to 3 feet.

7 L. erioca'rpa (D. C. in ann. mus. sci. nat. 4. p. 102.) erect; petioles short; leaflets cuneate-obovate, retuse, mucronate, reticulated on both surfaces; glabrous above, but clothed with strigose pubescence beneath; racemes in fascicles, almost sessile; calyxes one-half shorter than the corolla and legume, which is orbicular, acuminated, and hairy. ♄. G. Native of Nipaul. Aspàlathus violàceus, D. Don, prod. fl. nep. 246. Anthýllus cuneàta, Hamilt. mss. Flowers violaceous. Calycine segments lanceolate, acuminated, about equal in length to the corolla. (D. Don, l. c.)

Woolly-fruited Lespedeza. Fl. July, Aug. Clt. 1819. Sh. 2 to 3 feet.

8 L. Stu'vei (Nutt. gen. amer. 2., p. 107.) plant erect, simple, clothed with soft silky villi; petioles very short; leaflets elliptic-oval, mucronate; racemes corymbose, many-flowered, axillary, on short peduncles, about the length of the leaves; legumes pubescent, longer than the calyx. ⊙. H. Native of the state of New York, in sandy fields. Flowers purple.

Stuve's Lespedeza. Fl. July, Aug. Clt. 1824. Pl. 2 to 3 ft.

9 L. longifòlia (D. C. prod. 2. p. 349.) stem erect, angular, pubescent; petioles very short; leaflets oblong, glabrous above, but clothed with adpressed, silky-silvery pubescence beneath; racemes fasciculately corymbose, many-flowered, axillary and terminal; legume shorter than the lobes of the calyx. ⊙.? H. Native of Louisiana. Flowers purple.

Long-leaved Lespedeza. Pl. 2 to 3 feet.

10 L. frute'scens (D. C. prod. 2. p. 349.) plant erect; stems simple, villous; petioles short; leaflets elliptic, obtuse, rather mucronate, clothed with silky pubescence beneath; racemes axillary, almost sessile, shorter than the leaves; calyx shorter than the corolla; legumes pilose, shorter than the calyx. ♄. F. Native of Carolina. L. fruticòsa, Pers. ench. 2. p. 318. Hèdys. frutéscens, Lin. spec. 1055. Willd. spec. 3. p. 1193. Flowers purplish.

Shrubby Lespedeza. Fl. Ju. Aug. Clt. 1739. Sh. 2 to 3 ft.

11 L. capita'ta (Michx. fl. bor. amer. 3. p. 71.) plant erect, simple; petioles very short; leaflets elliptic, clothed with adpressed pubescence beneath; spikes capitate, on short peduncles, axillary, but they are also disposed into globose heads at the tops of the branches; calyxes villous, length of corolla, but much longer than the legume. ♃. H. Native from Carolina to New York, in sandy fields and on the edges of woods. Pursh. fl. sept. amer. 2. p. 480. Hedys. conglomeratum, Poir. dict. 6. p. 416. Flowers pale purple.

Capitate-flowered Lespedeza. Fl. Ju. Jul. Clt. 1789. Pl. 1-3 ft.

12 L. angustifòlia (Ell. sketch. 2. p. 206.) plant erect, pubescent; petioles very short; leaflets oblong-elliptic, or lanceolate, clothed with canescent pubescence beneath; racemes capitate, longer than the leaves; corolla longer than the calyx. ♃. H. Native of Carolina, in arid, sandy places. L. capitàta, var. angustifòlia, Pursh. fl. amer. sept. 2. p. 480. Flowers pale purple.

Narrow-leafletted Lespedeza. Fl. Ju. Jul. Clt. 1800. Pl. 2 ft.

13 L. polysta'chya (Michx. fl. bor. amer. 3. p. 71. t. 40.) plant erect, branched, very villous; petioles very short: leaflets roundish-oval, obtuse; spikes oblong, axillary, twice the length of the leaves, pedunculate; calyxes about equal in length to the corolla, but hardly longer than the legume. ♃. H. Native from Pennsylvania to Carolina, and of Upper Canada, in waste fields. Hedys. hírtum, Willd. spec. 3. p. 1193. Flowers white with a red spot on the vexillum.

Many-spiked Lespedeza. Fl. June, Aug. Clt. 1789. Pl. 2 to 3 feet.

14 L. villòsa (Pers. ench. 2. p. 318.) plant erect, branched, clothed with villous tomentum; petioles rather elongated; leaflets elliptic, obtuse; spikes axillary, slender, 3 or 4-times longer than the leaves; calyxes shorter than the corolla, but longer than the legumes. ♃. H. Native of North America. Hedys. hírtum, Lin. spec. 1055.? L. hírta, Horn. cat. 699.? Hedys. villòsum, Willd. spec. 3. p. 1195. Flowers white and pale yellow, twin, the lower pairs distant, with the flowers sometimes abortive and sometimes in fascicles, mixed with scales in the axils of the leaves.

Villous Lespedeza. Fl. July, Aug. Clt. 1819. Pl. 2 feet.

15 L. procu'mbens (Michx. fl. bor. amer. 2. p. 70. t. 39.) plant procumbent, slender, pubescent; petioles elongated; leaflets oval, obtuse, mucronulate; racemes axillary, loose-flowered, very long and slender; calyxes shorter than the corolla; legumes ovate, naked, smoothish. ♃. H. Native from New York to Carolina, in sandy or gravelly places. Nutt. gen. amer. 2. p. 108. Hedys. Lespedèza, Poir. dict. 6. p. 415. Flowers of a violaceous-purple colour.

Procumbent Lespedeza. Fl. July, Aug. Clt. 1816. Pl. pr.

16 L. prostra'ta (Pursh, fl. amer. sept. 2. p. 481. Nutt. gen. amer. 2. p. 108.) plant prostrate, slender, glabrous; petioles short; leaflets elliptic, obtuse, mucronate, hardly pubescent beneath; racemes axillary, slender, few-flowered, longer than the leaves; calyxes shorter than the corolla; legumes ovate, rather pubescent. ♃. H. Native of Pennsylvania (Muhl.), of New Jersey (Nutt.), Upper Canada (Dougl.). Hedys. prostràtum, Muhl. in Willd. spec. 3. p. 1200. Flowers purplish.

Prostrate Lespedeza. Fl. June, Aug. Clt. 1810. Pl. pr.

17 L. glomera'ta (Horn. hort. hafn. suppl. 81.) stems twining; leaflets oval, obtuse, rather pubescent; spikes of flowers axillary and terminal, sessile, glomerate. ⊙. ⌒. S. Native of the East Indies. Flowers probably red.

Glomerate-spiked Lespedeza. Fl. Jul. Aug. Clt. 1819. Pl. tw.

18 L. virga'ta (D. C. prod. 2. p. 350.) stem herbaceous, erect, branched, angular, pilose; leaflets ovate, mucronate, lined, glabrous, bearing hairs on the nerves beneath and on the margins; stipulas membranous, oblong. ♃. G. Native of Japan. Hedys. virgàtum, Thunb. fl. jap. 290. Peduncles 3-flowered and pilose, according to Thunberg, l. c. The plant is in habit like *L. eriocárpum*, which is seen by a specimen in the herbarium of Agardh, at Copenhagen.

Twiggy Lespedeza. Pl. 1 to 2 feet.

19 L. I'ndica (Spreng. syst. 3. p. 202.) leaflets roundish-ovate, clothed with rusty tomentum beneath; racemes axillary, crowded, few-flowered; flowers bracteate; calyxes villous; stem shrubby. ♄. S. Native of the East Indies. Hállia trifoliàta, Roth.

Indian Lespedeza. Shrub 2 to 3 feet.

Cult. The species are rather shewy when in flower, and are therefore worth cultivating for the purpose of decorating flower-borders. The herbaceous perennial kinds grow well in a light rich soil, or in peat borders, and are increased by dividing at the root in spring, or by seeds. The shrubby kinds are also very elegant plants, but they will not live unless protected by a greenhouse or frame during winter; for this purpose they should be grown in pots, in a mixture of sand and peat, and young cuttings of them will strike root readily if planted in a pot of sand, with a bell-glass placed over them. The seeds of the annual kinds should be sown in a peat-border, in as sheltered a situation as possible.

CLXII. E'BENUS (from *abnous*, the Arabic name for ebony, or ἔβενος or ἔβελος, of the Greeks, *ebenus* or *ebenum* of the Romans, from the Hebrew *Heben*). Lin. gen. no. 895. D. C. legum. mem. vii. prod. 2. p. 350.—Anthýllis species of Lam.

Lin. syst. *Monadélphia, Decándria.* Calyx permanent, cleft into 5 beyond the middle; the tube becoming at length rather ventricose; the segments linear-subulate, about equal in length to the corolla. Corolla with minute wings, almost shorter than the tube of the calyx. Stamens monadelphous. Legume roundish, 1-2-seeded.—Plants with usually pinnate leaves, having the terminal or odd leaflet sessile. Stipulas distinct from the petiole. Peduncles axillary, elongated, bearing dense spikes of reddish flowers. This genus differs from *Anthýllis* in the wings of the flower being small, and in the calycine segments being longer. The plants have the habit of *Onobrýchis.*

1 E. Cre'tica (Lin. spec. 1076.) shrubby; leaves rarely trifoliate, usually impari-pinnate, with 2 pairs of leaflets and an odd sessile one; leaflets oblong-linear; stipulas connected, and therefore bifid at the apex and opposite the leaves; spikes of flowers ovate-cylindrical. ♄. F. Native of Candia. Anthýllis Crética, Lam. dict. 1. p. 203. Sims, bot. mag. 1092.—Alp. exot. t. 278.—Barrel. icon. t. 377. and 913. Flowers large, reddish, or purple. Staminiferous tube elegantly striated.

Cretan Ebony. Fl. June, July. Clt. 1737. Sh. 1 to 2 ft.

2 E. pinna'ta (Desf. act. soc. hist. nat. par. 1. p. 21. t. 3. fl. atl. 2. p. 152.) plant herbaceous; leaves pinnate, with 4-5 pairs of linear or oblong leaflets, with an odd one; stipulas distinct, acuminated; stem beset with soft hairs; spikes of flowers ovate. ♂. F. Native of Barbary, on uncultivated hills. Lher. stirp. nov. t. 38. Hedys. seríceum, Vahl. symb. 2. p. 83. t. 41. Anthýllis serícea, Willd. spec. 3. p. 1014. Onobrýchis, &c. Shaw, spec. no. 431. Onobr. serícea, Spreng. syst. 3. p. 205. Bracteas ovate, acute, concave, one under each flower. Corolla reddish, shorter than the calyx.

Pinnate-leaved Ebony. Fl. July, Aug. Clt. 1786. Pl. 1 ft.

3 E. Sibthórpii (D. C. legum. mem. vii. t. 53.) plant herbaceous; leaves impari-pinnate, with 4-5 pairs of oblong-linear, mucronate leaflets; stipulas distinct, acuminate, bifid; stem clothed with adpressed pubescence; spikes spherical. ♂. H. Native of Mounts Atlas and Parnassus. E. pinnàta, Smith, fl. græc. prod. 3. p. 92. exclusive of the synonyme of Desf. and Willd. Onobrýchis orientàlis, &c. Tourn. cor. 26. Leaves rather silky. Bracteas 3-4, broad, ovate, appearing like an involucrum at the base of each head of flowers. Corolla purplish, about equal in length to the calyx.

Sibthorp's Ebony. Pl. 1 foot.

Cult. The species of this genus are propagated by seeds, which should be sown in pots in autumn, and placed in a frame or greenhouse, and in the month of May, when the plants will have attained a proper size, they should be planted singly in small pots, filled with a mixture of loam, sand, and peat, and the plants shifted into larger pots as they grow, some of them may be planted out into the open border, in a sheltered situation, where they will probably survive the winter with a little protection, if not too severe.

CLXIII. FLEMI'NGIA (in honour of John Fleming, M.D. F.R.S. and F.L.S., &c., an acute botanist, formerly President of the honourable East India Company's medical establishment in Bengal). Roxb. cor. 3. p. 44. Ait. hort. kew. ed. 2. vol. 4. p. 349. D. C. prod. 2. p. 351. Millingtònia, Roxb. mss.

Lin. syst. *Diadélphia, Decándria.* Calyx acutely 5-cleft, 4 of the segments almost equal, but the lowest one is much longer than the rest. Corolla papilionaceous. Vexillum striated. Stamens diadelphous. Legume sessile, oval, turgid, 2-valved, 1-celled, 2-seeded. Seeds spherical.—Herbs or shrubs, natives of the East Indies. Stipulas lanceolate, acuminated, deciduous. Leaves petiolate. Flowers red or purple, disposed in axillary crowded racemes. This genus is perhaps more nearly allied to *Rhynchòsia*, and therefore perhaps referrible to tribe *Phaseòleæ*, especially in the seeds being spherical.

• •

Sect. I. Flemingia'strum (an alteration from the generic name). Flowers naked, or propped with small deciduous bracteas. Leaves trifoliate; leaflets sessile.

1 F. stri'cta (Roxb. l. c. t. 248.) stem herbaceous, almost simple, straight; leaflets feather-nerved, broad-lanceolate, glabrous; racemes axillary, solitary, length of petioles; bracteas very long, acuminated, deciduous. ♃. S. Native of Coromandel. Crotalària macrophýlla, Puer. herb. Flowers purple.

Straight-stemmed Flemingia. Fl. July, Sept. Clt. 1798. Pl. 2 to 4 feet.

2 F. semiala'ta (Roxb. l. c. t. 249.) stem shrubby, branched; branches silky, erectish; leaflets 3-nerved, elliptic, acuminated, glabrous above, but clothed with silky pubescence beneath; petioles winged at the apex; spikes branched, panicled, terminal, and axillary; bracteas ovate, mucronate, villous. ♄. G. Native of Nipaul. D. Don, prod. fl. nep. 242. F. paniculàta, Dietr. ex Steud. Flowers pale red.

Half-winged-petioled Flemingia. Fl. July, Aug. Clt. 1805. Shrub 3 to 4 feet.

3 F. conge'sta (Roxb. in hort. kew. 4. p. 349.) stem shrubby, erect; leaflets broad-lanceolate, lateral ones 2-nerved, terminal one 3-nerved; racemes axillary, crowded, shorter than the petioles. ♄. S. Native of the East Indies. Branchlets, petioles, and racemes villous when young. Flowers purple. Perhaps the same as *F. trinérvia*, Desf.

Crowded-flowered Flemingia. Fl. July, Sept. Clt. 1802. Shrub 2 to 3 feet.

4 F. na'na (Roxb. in hort. kew. 4. p. 350.) stem shrubby, much branched; leaflets obovate; petioles winged; racemes crowded; legumes covered with viscid glands. ♄. S. Native of the East Indies.

Dwarf Flemingia. Clt. 1808. Shrub 1 foot.

5* F. linea'ta (Roxb. l. c.) stem suffruticose, erect, branched; leaflets oblong-cuneated, 3-nerved, linear, clothed with canescent velvety down; racemes axillary, elongated, pedunculate, dichotomous; legumes clothed with glandular pili. ♂. S. Native of the islands of Ceylon and Timor, and on the mountains called Nelligery, in India. Hedys. lineàtum, Lin. spec. 1054. Burm. ind. t. 53. f. 1. Lespedèza lineàta, Pers. ench. 2. p. 318. Onobrýchis lineàta, Desv. in journ. bot. 1814. vol. 1. p. 80. Flowers purple.

Lined-leaved Flemingia. Fl. Jul. Aug. Clt. 1793. Pl. 2 to 3 ft.

6 F. Rothia'na (D. C. prod. 2. p. 351.) stem shrubby, erect, rather tomentose; leaflets roundish-ovate, with the nerves rusty on the under side; racemes axillary, crowded, loose, 5-6-flowered; legumes compressed, pubescent, 1-seeded. ♄. S. Native of the East Indies. Hállia trifoliàta, Roth. spec. 352.

Roth's Flemingia. Shrub 2 to 3 feet.

Sect. II. Ostryo'dium (from *οστρυος*, *ostryos*, a scale, and *οδους*, *odous*, a tooth; in reference to the large leafy scale-like bracteas). Desv. journ. bot. 3. p. 119. t. 4. f. 2. D. C. prod. 2. p. 351.—Loùrea, Jaume, journ. bot. 3. p. 61. Flowers furnished with a large, leafy, concave, permanent bractea each. Leaves simple, feather-nerved.

7 F. strobilífera (Ait. hort. kew. ed. 2. vol. 4. p. 350.) stem shrubby, erect; leaves simple, entire, ovate, acuminated; spikes strobile-formed; bracteas cucullate, leafy, reticulated. ♄. S. Native of the East Indies. Lin. fl. zeyl. 287. t. 3. Hedys. strobiliferum, Lin. spec. 1053. Burm. ind. 164. Zórnia strobilífera, Pers. ench. 2. p. 319. Flowers purple.

Strobile-bearing Flemingia. Fl. July, Aug. Clt. 1788. Sh. 5 to 10 feet.

8 F. Guinee'nse; shrub glabrous; leaves with 5, obovate, obtuse leaflets; stipulas about the size of the lateral leaflets, nerved; peduncles axillary, racemose; bracteas large, round, nerved, crowded, one to each flower. ♄. S. Native of Sierra

Leone. This species is remarkable in having pinnate leaves and large stipulas. It is perhaps a species of *Dicérma*.

Guinca Flemingia. Shrub 2 to 3 feet.

Cult. The species of this genus are not worth cultivating, unless in botanical gardens. They will grow well in any light soil, and cuttings will root, if planted in a pot of sand, with a hand-glass placed over them, in heat.

Subtribe III. ALHA'GEÆ (plants agreeing with *Alhàgi* in some important characters). D. C. prod. 2. p. 352. Flowers disposed in racemes (f. 45. *h.*) or spikes. Legumes almost terete (f. 45. *d.*).

CLXIV. ALHA'GI (*Aghul* or *Algul* is the Arabic name of the first species). Tourn. cor. 54. t. 489. Desv. journ. bot. 3. p. 120. t. 4. f. 4. D. C. prod. 2. p. 352.—Hedýsarum species of Lin.—Mánna, D. Don, prod. fl. nep. 246.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, 5-toothed; teeth small, nearly equal. Corolla papilionaceous, with the petals almost equal in length, but the carina is a little shorter than the vexillum, which is obovate and complicated. Keel straight, obtuse; wings rounded at the apex. Stamens diadelphous. Ovary linear, many ovulate. Style filiform, glabrous, acute. Legume stipitate, rather woody, terete, torulose, few-seeded, not articulated. Seeds reniform.—Oriental subshrubs or herbs, with simple leaves and minute stipulas, and axillary spinose peduncles. Flowers few, red, disposed in racemes along the peduncles.

1 A. Mauròrum (Tourn. l. c.) stem shrubby; leaves obovate-oblong; teeth of calyx acute. ♄. G. Native of the deserts of Egypt, Syria, Mesopotamia, and other eastern countries. Rauw. itin. 94. with a figure. Hedys. Alhàgi, Lin. spec. 1051. exclusive of some of the synonymes. Alhàgi mannífera, Desf. l. c. Onònis spinòsa, Hasselq. ed gall. 1. p. 138. 2. p. 187. but not of Lin. Mánna Hebràica, D. Don, prod. fl. nep. 247. Spines strong, and longer than those of the following. Flowers purple in the middle and reddish about the edges. It is on this shrub that manna (*Trungibin* or *Terengabin*) is found in Mesopotamia. It is chiefly gathered about Tauris, where the shrub grows plentifully. Sir George Wheeler found it growing in Tenos. Tournefort also found it in many places in Armenia and Georgia. The manna is a natural exudation from the leaves and branches of this shrub, which takes place only in very hot weather. The Arabian writers believed that it fell from the clouds upon the plant. At first the manna resembles drops of honey, but soon thickens into solid grains, as big as a coriander seed at most. It is collected with more or less care, and is valued according to its purity, which is evinced by the distinctness of the granulations. The manna of this country is collected from the flowering ash, and has nothing to do with Persian manna.

Moors' Alhagi or Hebrew Manna. Fl. July, Aug. Clt. 1714. Shrub 2 to 3 feet.

2 A. camelòrum (Fisch. cat. hort. gor. 1812. p. 72.) stem herbaceous; leaves lanceolate, obtuse; teeth of calyx manifestly obtuse. ♃. F. Native of Caucasus, about the Caspian Sea, Tartary, and in Middle Iberia, in arid fields. Hedys. pseùdo-Alhàgi, Bieb. fl. taur. et suppl. no. 1442. Hedys. Alhàgi, Lerche, nov. act. cur. 5. p. 167. Alhàgi pseùdo-Alhàgi, Desv. l. c. Mánna Cáspica, D. Don, prod. fl. nep. p. 247.—Gmel. itin. 2. p. 29. Flowers red. Manna exudes from this plant as from the last.

Camel's Alhagi or Caspian Manna. Fl. July, Aug. Clt. 1816. Pl. 1 to 2 feet.

3 A. Nipaulé'nsis (D. C. prod. 2. p. 352.) plant shrubby; leaves obovate, mucronulate, veinless, clothed with silky-silvery down on both surfaces; calyxes longer than the pedicels; teeth acute, ♄. G. Native of Nipaul, near Sitaucund. Flowers red. Mánna Nepaulénsis, D. Don, prod. fl. nep. 247. Hedys. Hamiltònii, Spreng. syst. 3. p. 316.

Nipaul Alhagi or Manna. Fl. April. Shrub 1½ to 2 feet.

Cult. These plants require to be grown in pots filled with a mixture of sand, loam, and peat, in order that they may be sheltered in winter in a greenhouse. Young cuttings will root if planted in sand, with a bell-glass placed over them; but seeds, if they can be procured, is a preferable mode of increasing the plants, which should be raised on a hot-bed.

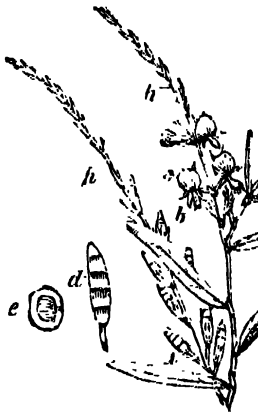
CLXV. ALYSICA'RPUS (from αλυσις, *alysis*, a chain, and καρπος, *karpos*, a fruit; in reference to the shape of the legume, which is composed of many 1-seeded joints, giving the whole the appearance of a chain). Neck. elem. no. 1315. Desv. journ. bot. 3. p. 120. t. 4. f. 8. D. C. prod. 2. p. 352.—Hállia, Jaume, journ. bot. 3. p. 60. but not of Thunb.—Fabrìcia, Scop. but not of Gærtn.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, permanent, 5-cleft (f. 45. *a.*); segments equal, lanceolate, acute (f. 45. *a.*). Corolla small, papilionaceous (f. 45. *c.*). Stamens diadelphous. Legume (f. 45. *d.*) constantly composed of many closed, 1-seeded joints (f. 45. *e.*), which are equal on both sides, terete, or compressed, at length separating from each other.—Indian and African herbs, with scarious stipulas and bracteas, and simple, linear, oval or roundish, entire leaves. Racemes of flowers opposite the leaves and terminal, bearing pedicellate, twin, or solitary, distant flowers, which are either yellow or purple, and hardly longer than the calyx.

* *Joints of legume smooth or irregularly nerved.*

1 A. bupleurifòlius (D.C. prod. 2. p. 352.) plant smooth; leaves lanceolate-linear, acute; stipulas rather longer than the petioles; lobes of calyx puberulous; legumes terete, moniliferous, glabrous with 2-4 joints, a little longer than the calyx. ♄. S. Native of the East Indies. Hedys. rugòsum, Sieb. fl. maur. exsic. no. 153. Hedys. bupleurifòlium, Lin. spec. 1081. Burm. ind. 163. Roxb. cor. 2. t. 194. Sims, bot. mag. 1722. Hedys. gramineum, Retz. obs. 5. p. 26. Wendl. hort. herr. 1. t. 5. Hedys. Cochin-chinénse, Schranck, hort. monac. 3. t. 23. Flowers red. (f. 45.)

FIG. 45.



Var. β, hýbridus (Burm. herb, D. C. prod. 2. p. 352.) lower leaves roundish, as in *A. nummularifòlius*, but the upper ones are oblong and acute, as in *A. bupleurifòlius*, and the upper stipulas are longer than the petioles.

Hare's-ear-leaved Alysicarpus. Fl. June, Aug. Clt. 1798. Pl. 1 to 2 feet.

2 A. vagina'lis (D. C. prod. 2. p. 353.) stem rather rough from short hairs; leaves rather cordate at the base, oval or oblong mucronulate, glabrous, but with the margins and middle nerve rather pubescent; stipulas length of petiole; legume terete, reticulated, 4-5-jointed, rather pubescent, much longer than the calyx. ⊙. S. Native of the East Indies and of Senegal. Burm. zeyl. t. 49. f. 1. Hedys. vaginàle, Lin. spec. 1051. fl. zeyl. 287. Hedys. ovalifòlium, Vahl. in herb. Desf. Hedys. bupleurifòlium, Sieb. pl. seneg. exsic. no. 39. Flowers red.

Sheathed Alysicarpus. Fl. July, Aug. Clt. 1790. Pl. pr.

3 A. nummularifòlius (D. C. prod. 2. p. 353.) plant gla-

brous; leaves ovate or roundish; stipulas shorter than the petioles; legumes between terete and compressed, rather reticulated, smoothish, 5-6-jointed, much longer than the calyx. ♃. S. Native of the East Indies and the Mauritius. Hedys. nummulàrium, Lin. spec. 1051. fl. zeyl. 288. Burm. fl. ind. 164. Hedys. cylíndricum, Poir. dict. 5. p. 400.—Petiv. gaz. t. 26. f. 1. Flowers purple.

Money-wort-leaved Alysicarpus. Fl. July, Sept. Clt. 1777. Pl. 1 to 2 feet.

4 A. monílifer (D. C. prod. 2. p. 353.) stem hispid; leaves elliptic-roundish, pubescent beneath; stipulas length of petioles; legumes terete, velvety, 4-5-jointed, much longer than the calyx. ♃. S. Native of the East Indies and the Mauritius. Hedys. monilíferum, Lin. mant. 102.—Burm. ind. t. 52. f. 3. Flowers purple.

Necklace-bearing Alysicarpus. Fl. July, Aug. Clt. 1816. Pl. prostrate.

5 A. gluma'ceus (D. C. prod. 2. p. 353.) plant glabrous; leaves lanceolate, acuminated; stipulas length of petioles; joints of legume 4-6, roundish, compressed, wrinkled. ♃. G. Native of Arabia Felix. Hedys. glumàceum, Vahl. symb. 2. p. 106. Willd. spec. 3. p. 1172. Hedys. violàceum, Forsk. descr. 136. Vahl. symb. 1. p. 54. Flowers yellow, but reddish inside.

Glumaceous Alysicarpus. Pl. procumbent.

* * *Legumes articulated, furrowed, and wrinkled transversely.*

6 A. styracifòlius (D. C. prod. 2. p. 352.) stem villous; leaves ovate, obtuse, clothed with villous pubescence beneath; stipulas length of petioles, which are villous; joints of legume 3-4, glabrous, wrinkled transversely, a little longer than the calyx. ♄. S. Native of the East Indies and the Mauritius. Hedys. styracifòlium, Lin. spec. 1052. A. cylíndricus, Desv. Flowers red.

Styrax-leaved Alysicarpus. Fl. Jul. Aug. Clt. 1816. Sh. as. ?

7 A. rugòsus (D. C. prod. 2. p. 353.) stem glabrous, but with a pilose, decurrent line the whole length; leaves linear-lanceolate, obtuse, pubescent beneath and on the margins; stipulas longer than the petioles; joints of legume 4-5, roundish, compressed, wrinkled transversely. ♃. S. Native of Guinea. Hedys. rugòsum, Willd. spec. 3. p. 1173. Flowers red?

Wrinkled-podded Alysicarpus. Pl. 1½ foot.

Cult. The species of this genus are not worth cultivating, unless in botanical gardens. They grow well in light rich soil, and are increased by cuttings or seeds.

CLXVI. BREMONTIE'RA (in honour of M. Bremontier, a French agricultural writer). D. C. in ann. sc. nat. 4. jan. 1825. p. 93. Legum. mem. vii. prod. 2. p. 353.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, rather truncate, hardly 5-toothed; teeth small, acute, rather distant. Corolla papilionaceous, 3-times longer than the calyx. Stamens diadelphous. Legumes constantly of numerous, compressed, 1-seeded joints, which are prominent at the sutures and truncate at both ends, at length separating from each other. Seeds ovate, with a lateral hylum. Radicle incurved. Cotyledons foliaceous, obovate-oblong.—Shrubs with simple, oblong leaves, which are canescent from short down, and standing on short petioles, tapering at both ends. Stipulas small, acute, not scarious. Flowers small, purple, disposed in axillary, spicate racemes.

1 B. ammóxylon (D. C. l. c.). ♄. S. Native of the Mauritius, where it is called *Bois-de-sable*, or sand-wood. Mullèra verrucòsa, herb. mus. par. but not of Pers. Hedys. ammóxylon, Spreng. syst. append. 293. Legume with 12-14 joints. Branches terete but angularly compressed at the apex, and are as well as the leaves clothed with cinereous pubescence. Leaves usually dotted with black, from some species of *Puccínia.*

Var. β, Burmánni (D. C. prod. 2. p. 353.) legume with only 5 or 8 joints, ♄. S. Native of Ceylon. Ornithopòdium, &c. Burm. zeyl. 177. t. 82. Perhaps a proper species.

Sand-wood Bremontiera. Clt. 1826. Shrub 4 to 6 feet.

Cult. See *Alysicárpus* for culture and propagation.

§ 2. *Sarcólobæ* (from σαρξ σαρκος, *sarx sarcos*, flesh, and λοβος, *lobos*, a lobe; in reference to the thick fleshy cotyledons). *Embryo with thick fleshy cotyledons* (f. 21. *b.*), *which do not undergo any change at the time of germination. The seeds of all the plants contained in this division of Leguminosæ are used as food in different countries, while none of those of the first division, Phyllólobæ, are so employed.*

Tribe IV.

VICIE'Æ (plants agreeing with *Vicia* in some characters). Bronn. diss. p. 133. D. C. legum. mem. vii. prod. 2. p. 353. —Vìciæ, Adans. fam. 2. p. 329. Corolla papilionaceous (f. 46. *d.*). Stamens diadelphous, 9 joined, and 1 free (f. 46. *g.*). Legumes continuous (f. 46. *h.*). Cotyledons thick, farinaceous, not changing, even in germination, when above the earth, but remaining inclosed in the spermaderm. Radicle curved inwards (f. 21. *f. e.*). The leaves of all the plants contained in this tribe are abruptly-pinnate (except in some species of the genus *Cicer*, which are impari-pinnate), with the common petiole ending in a bristle or tendril instead of a leaflet, the petiole not jointed above the stem. This is a very natural tribe, which agrees with *Phaseòleæ* in the twining habit and thick cotyledons.

CLXVII. CI'CER (from κικυς, *kikys*, force or strength. The Ciceronians had their name from the pulse, as the Pisons had from pisum or pea, and the Lentuli from the lens or lentil). Tourn. inst. 389. t. 210. f. 2. Lin. gen. no. 1189. Gærtn. fruct. 2. p. 326. t. 151. D. C. prod. 2. p. 354.

Lin. syst. *Diadélphia, Decándria.* Calyx 5-lobed, with the tube more or less gibbous on the upper side; lobes acuminated, with 2 or 4 of the upper ones lying upon the vexillum. Legume turgid, 2-seeded. Seeds gibbous, mucronate.—Annual herbs, clothed with numerous glandular hairs, with impari or abruptly-pinnate leaves; having the leaflets and stipulas much nerved, and the petioles ending in a tendril, and axillary and almost always solitary flowers from abortion. Fruit pilose.

1 C. arietìnum (Lin. spec. 1040.) leaves impari-pinnate; leaflets ovate, serrated, equal; stipulas lanceolate, somewhat toothed; calyxes hardly gibbous, with the segments equal in length to the wings of the corolla. ⊙. H. Native of Spain, Italy, and the Levant, among corn. Lam. ill. t. 632. Sims, bot. mag. 2274. The glandular hairs on the plant are full of acid juice. Flowers purple or white. The form of the seed is like that of a ram's head. The seeds are eatable, and the plant is cultivated for their sake in the south of Europe and the Levant, where they are frequently eaten both raw and boiled. The seeds should be sown broadcast like tares, or in drills like peas, about 2 feet asunder, that there may be room for the branches to spread, when the plants are fully grown, as also to hoe the ground, to keep it clean from weeds, which is all the culture these plants require. The plant flowers in June, and the seeds ripen in August, but unless the season proves dry and warm the plants decay in this country before the seeds are ripe.

Ram's-head-podded or Common Chick-pea. Fl. July, Aug. Clt. 1548. Pl. 1 foot.

2 C. Songa'ricum (Steph. ex Fisch. in litt. D. C. legum. mem. viii. with a figure) lower leaves impari-pinnate, upper ones abruptly pinnate, bearing simple tendrils at the apex; leaflets obovate-cuneated, serrated, upper ones smallest; stipulas ovate,

toothed; calyx very gibbous at the base, with the segments shorter than the wings of the corolla. ⊙. H. Native of Songaria and Persia. The flowers and the fruit are almost twice the size of those of *C. arietinum*.

Songarian Chick-pea. Pl. 1 foot.

3 C. Solonie'nse (Schranck. not. pl. dec. Frioul, p. 49.) peduncles elongated, 1-flowered; leaves with 2 pairs of leaflets, lower ones obovate, middle ones oblong, upper ones linear. ⊙. H. Native of Europe.

Solon Chick-pea. Pl. 1 foot.

4 C.? nummularifòlium (Lam. dict. 2. p. 2.) stem filiform, slender; leaves simple, obovate, entire, hairy; peduncles 2-3-flowered; calycine segments obtuse; legumes cordate. ⊙. H. Native of the East Indies.—Pluk. alm. t. 389. This plant ought to be perhaps excluded from the present tribe.

Money-wort-leaved Chick-pea. Pl. prostrate.

Cult. The seeds of these plants require only to be sown in the open ground in the spring.

CLXVIII. FA'BA (from φαγω, *phago*, to eat; the esculent seeds of the common bean are well known). Tourn. inst. t. 222. D. C. fl. fr. 4. p. 598. prod. 2. p. 354.—Vicia species of Lin. and others.

Lin. syst. *Diadélphia, Decándria.* The character of *Fàba* is nearly the same as that of *Vícia*, but differs principally in the great size of the legume, which is coriaceous, and rather tumid, and in the seeds being oblong, not round, and in the hylum being terminal, not lateral.—Erect plants, with abruptly-pinnate leaves with or without a simple tendril.

1 F. vulga'ris (Mœnch. meth. p. 130.) leaves thick, with 2-5 broad, oval, mucronate leaflets; stipulas semi-sagittate, oval; tendrils of leaves almost wanting; teeth of calyx almost linear. ⊙. H. Said to be found wild on the confines of Persia, not far from the Caspian Sea, and is now cultivated to a great extent in gardens and fields, for the sake of its seeds. Vicia Fàba, Lin. spec. 1039. Flowers white, with a blackish-blue silky spot in the middle of the wings. The legumes almost terete, or flat, green or black. Seeds more or less roundish, or very broad and flat, varying much in size.

Var. α, *horténsis;* seeds flat, white, usually large. There are the following varieties of the garden bean.

1 *Mazagan-bean.* An excellent early bean. It was brought from a Portuguese settlement just without the straits of Gibraltar. The seeds of this are even smaller than the *horse-bean.* If the seeds of this sort are sown in October under a warm hedge, pale, or wall, and carefully earthed up when the plants are advanced, they will be fit for the table by the middle of May.

2 *Early Portugal or Lisbon-bean.* This appears to be the *Mazagan* sort saved in Portugal. It is the kind used by gardeners for their first crop, but it is not so well tasted as the *Mazagan;* therefore when the *Mazagan-bean* can be procured no one would think of sowing this sort.

3 *Small Spanish-bean.* This will come in well for the second crop, soon after the *Portugal*, and as it is rather a sweeter bean, it should be preferred to it.

4 *Broad Spanish-bean.* This is a little later than the last sort, and being a good bearer is therefore frequently sown.

5 *Sandwich-bean.* This comes in soon after the *broad-Spanish*, and is almost as large as the *Windsor-bean*, but being hardier is commonly sown a month sooner. It is a plentiful bearer, but not a very delicate sort for the table.

6 *Toker-bean.* Is ready for use about the same time as the *Sandwich*, and is a great bearer, but rather a coarse bean.

7 *White and black-blossomed beans* are by some persons much esteemed; the seeds of the former when boiled are almost as green as peas; and being a tolerably sweet sort renders it more valuable. These two sorts are very apt to degenerate if the seeds are not saved with great care.

8 *Windsor-bean.* This is allowed to be the best of all the sorts for the table. When sown on a good soil, having plenty of roots, the beans will be very large, and when gathered young they are the sweetest and best tasted of all the sorts. This sort is seldom sown before Christmas, because it is found not to bear the frost so well as many other sorts; so it is generally sown for the principal crop to come in in June and July.

9 *Fan* or *cluster-bean.* This sort is chiefly sown for curiosity. It is dwarf 6 or 10 inches high, with branches spreading like a fan, and flowers succeeded by small pods, both in clusters.

10 *Long-podded-bean.* A very tall kind, and a good bearer; the pods long and narrow, closely filled with oblong middle-sized seeds. Of this there are several subordinate varieties, as the *early Turkey*, &c.

11 *White blossomed-bean.* The flowers are pure white, having none of the black marks on the wings. The seeds are semi-transparent, and have less of the peculiar bean flavour when young than any of the others, and are by some persons esteemed on that account. It bears abundance of smallish, long, narrow pods, and the seeds are almost black when ripe.

12 *Red-blossomed-bean.* This is a very shewy plant; the blossoms very red, without any mixture of white. It bears smallish pods and seeds, which are not very palatable, and the plant is therefore only grown for curiosity.

There are a number of other varieties of the *garden-bean*, such as the *green-nonpareil*, *Munford*, &c., but they are hardly worth notice.

The following varieties of the *field* or *horse-bean* are worth cultivating.

Var. β, *equina;* the *common horse-bean*, from which perhaps all the varieties have originated.

1 *Common field* or *horse-bean.* This is the kind most commonly sown for agricultural purposes.

2 *Tick-bean.* This is lower in stature than the former, but is a more plentiful bearer, and succeeds better on light land. There are several subordinate varieties of this kind, such as the *Flat-Ticks* or *May-beans*, *Small* or *Essex Ticks*, and *French Ticks.* Some of the *garden-beans* are taken into field culture in Kent, as the *Toker*, *Windsor*, *Long-podded*, *Spanish* or *Lisbon*, and the *Mazagan-bean;* besides others cultivated only in small quantities for supplying the London seedsmen.

* *Garden beans, their culture and uses.*

Estimate of sorts. The *Mazagan* is one of the hardiest and best flavoured of the small and early sorts. The *Lisbon* is next in point of earliness and fruitfulness. The *dwarf-fan* or *cluster-bean* is likewise an early variety, but it is planted chiefly for curiosity. The *Sandwich-bean* has been long noted for its fruitfulness. The *Toker* and the *broad-Spanish* are also great bearers. Of all the large kinds, however, the *Windsor-bean* is preferred for the table. When gathered young, the seeds are sweet and very agreeable. There are several sub-varieties of the *Windsor-bean*, such as the *Kentish-Windsor* and *Taylor's-Windsor.* The *long-podded-bean* rises about 3 feet, and is a great bearer. This sort is now very much cultivated, and there are several sub-varieties of it, as the *early*, the *large*, and the *sword-long-pod.* The *white-blossomed-bean*, so called because it is destitute of the black mark on the wings of the blossom so conspicuous in other kinds. The seed is transparent, and when young has little of the peculiar bean flavour, and is on that account much esteemed; it is at the same time a great bearer, and proper for a late crop. Delauney, in Le Bon Jardinier, describes as excellent a new variety cultivated about Paris, which he calls the *green-bean* from China. It is a late sort, but very productive, and the pods remain green even when ripe and dried.

Times of sowing for early and successive crops. For the earliest crop plant some *Mazagans* in October, November, or December, in a warm border, under an exposure to the full sun. Set them in rows, 2 or 2½ feet asunder, about 1½ inch deep, and 2 or 3 inches apart in the rows. The most successful plan for nurturing a crop over the winter, is to sow the beans thickly together in a bed of light earth under a warm aspect, for the intermediate object of protecting the infant plants the better from rigorous weather, and with the view of transplanting them at the approach of spring or when the size of the plants (2 or 3 inches in height) require it, into warm borders, at the distances at which the plants are in fruit. For this object, the size of a garden frame is a convenient width for the bed, which should slope a little to the south; plant at the depth of 2 inches, and an inch apart each way. At the approach of frost, protect the young plants with a frame, or matting or other shelter. In February or March, as soon as the mild weather offers, transplant them into a warm south border, placing one row close under a protecting fence, as far as that advantage can be given. Take them from the seed bed with balls of earth, and pull off the old beans. Then plant them at final distances, closing the earth rather high about the stems. Beans are accelerated in their growth by transplanting. If severe frosts kill the early advanced plants, or if it were omitted to sow an early crop at the general season, a quantity may be sown thick in a moderate hot-bed in January or February, or in large pots placed therein, or in a stove, to raise some plants quickly for transplanting as above. In all cases, as the young plants come up give occasional protection in the severity of winter, and hoe up a little earth to the stems. Plants which can have no other shelter should be covered lightly with the haulm of plants or straw, but such a covering must be carefully removed as often as the weather turns mild. To succeed the above, plant more of the same sort, or some of the *early-long-pod* or *small-Lisbon* in December or January, when mild weather, for larger supplies, in more open exposures. And in order to obtain either, a more full succession, or a first general crop, plant some *early* and *large long-pods* and *broad-Spanish* at the end of January, if open weather, in some warm quarter of mellow ground. Some of the larger *Sword long-pod*, *Sandwich*, and *Toker-beans* may also be planted in fuller crops in February, if the weather permit, both for succession and principal supplies. You may likewise plant any of the preceding kinds, as well as *Windsors* and other sorts, in full and succession crops in February, March, and April. For the main summer crops adopt principally the *Windsors*, *Sandwich*, *Toker*, *large-long-pod*, and *broad-Spanish*. The *Windsors* rank first in regard to flavour, but prove on common soils not so plentiful a bearer as other late kinds. Plant also full succession crops in March and April, and smaller portions in May and June for late production, especially the *long-pod*, *broad-Spanish*, and *Toker*; also any of the early sorts, which are more successful in late planting than the larger broad varieties. The *white-blossomed bean*, though the smallest of the middle-sized sorts is very desirable to plant as secondary crops, both in the general and late planting seasons, from March till June and July, being a great bearer and a tender and sweet eating bean, if gathered young. Any of the other sorts named may also be planted to increase the variety. For sowing in June and July, the smaller and early kinds again become the most proper, as their constitution fits them for standing late as well as early. Thus the regular supplies may be provided for, in succession from June till September. (Abercrombie).

Quantity of seed. For early crops one pint of seed will be requisite for every 80 feet of row; for late crops nearly the same quantity as for the early. For the main crops the quantity cultivated, in proportion to that for early or late crops, is generally treble or quadruple, as to the extent of ground; but a less quantity of seed is requisite for the same space.

Method of sowing. Plant all the sorts in rows, 2½ feet apart for the smaller, or very early, or very late kinds; and 3 feet for the larger; the smaller beans 2 inches deep, and 3 inches distant in the row; the larger beans 3 inches deep, and 4 inches apart in the row.

Transplanting. Speechly constantly transplants his early *bean* crops, and considers this plant may be as easily transplanted as cabbage or any other vegetable. He plants them alternately with potatoes in the same row, the rows 3 feet apart, and the potatoes 18 inches apart in the row. The beans are transplanted, by which means they have the start and advantage of the potatoes and weeds, and as they come in early may be gathered before they can possibly incommode or injure the potatoes. (Speechly's Practical Hints, &c. p. 17.)

Manual process. The work of sowing is most generally effected by a dibble, having a thick blunt end to make a wide aperture for each bean, to admit it clean to the bottom without any narrow hollow parts below, strike the earth fully and regularly into the holes over the inserted beans. Or the planting may be performed occasionally in drills, drawn with a hoe the proper depth and distance, placing the beans at proper intervals along the bottom of each drill, and earth them over evenly, which method, though suitable to any kinds, may be more particularly adopted in sowing the early and other small sorts.

Soaking seed in summer. In planting late crops in June and July, if the weather be dry, it is eligible to give the beans a previous soaking for several hours in soft water, or if they are to be sown in drills, water the drills beforehand, then directly put in the beans, and earth them in while the ground remains moist.

Subsequent culture. As the plants come up, and advance from 2 to 4 and 6 inches high, hoe up some earth to the stems on both sides of each row, cutting down all weeds. Repeat the hoeing as future weeds arise, both to keep the ground about the plants clean, and to loosen the earth to encourage their growth. In earthing up, great care must be taken that the earth does not fall on the centre of the plants so as to bury them, for this occasions them to rot or fail. After earthing up, stir between the rows with a three-pronged fork. As the different crops come up into full blossom, pinch or cut off the tops, in order to promote their fruiting sooner in a more plentiful production, or well-filled pods. (Abercrombie). Nicol says, "Topping is unnecessary for any but the early crops." Most gardeners are, however, of opinion, that topping improves the crop both in quantity and quality. To forward an early crop, see Pisum.

To produce a very late crop. Neill mentions an expedient sometimes resorted to to produce a late crop. A quarter of beans is fixed on, and when the flowers appear, the plants are entirely cut down, a few inches from the surface of the ground. New stems spring from the stools, and these produce a very late crop of beans.

Gathering. For table use, gather only such as are tender, the seed decreasing in delicacy after they obtain about half their proper size. When they become black eyed, they are tough and strong tasted, and much inferior for eating.

To save seed. Either plant some of the approved sorts in February or March wholly for that purpose, or leave some rows of the different crops ungathered, in preference to the gleanings of gathered crops. The pods will ripen in August, and the beans become dry and hard; then pulling up the stalks, place them in the sun to harden the seed thoroughly, after which thresh out each sort separately. (Abercrombie).

Use. The seeds are the only part used in cookery, and are either put in soups, or sent up in dishes apart.

* * *Field beans, and their culture.*

It is only of late years that the *bean* has been cultivated in Britain upon general soils, being formerly considered as adapted to rich and moist clays. At that time they were all sown in the broad-cast method, in which way instead of benefitting the ground, they were of detriment to it, for weeds got away on the outset, and in dry seasons often ruined the crop.

The drilling of beans with a small mixture of peas is now become a general practice in every well cultivated district, more particularly in those where the soil and climate permit the practice to be successfully executed. In this way not only heavy crops are raised, but what is of greater importance, the ground is kept constantly in good order, provided suitable attention is bestowed upon the clearing process. This is generally carried on by horse-hoeing the crop at different times.

The varieties of the bean may be included under two general heads, the white or garden *beans*, and the grey or field *beans*. Of the white *bean*, sown in the fields, the Mazagan and Long-pod are almost the only sorts. Of the grey *beans*, that known as the horse-bean, the small or ticks, and the prolific or Heligoland, are the chief sorts. New varieties are procured in the same manner as other plants.

In the choice of sorts, tick-beans are supposed by some farmers to be more productive than horse-beans, but the latter grow higher in the stem and shade the land more, and are consequently the most suitable for the stronger sorts of soil; and Young remarks that the common little horse-bean has the advantage of all others, in being more generally marketable, for in certain situations, it is not always easy to dispose of ticks, Windsors, long-pods, and various other large sorts. They also grow higher, shade the ground more from the sun in summer, and yield a larger quantity of straw, which makes excellent manure, but some of the other sorts are generally supposed to yield larger products.

The best soils for beans are clays and strong loams; on such soils they generally succeed wheat or oats, but sometimes also clover leys. Turnip soils or sands are by no means proper for them.

In the preparation of the soil, much depends upon the nature of the land and the state of the weather; for as *beans* must be sown early in spring, it is sometimes impossible to give all the labour which a careful farmer would wish to bestow. It must also be regulated in some measure by the manner of sowing. In all cases it ought to be ploughed with a deep furrow after harvest or early in winter, and as two ploughings in spring are highly advantageous, the winter furrow may be given in the direction of the former ridges, in which way the land is sooner dry in spring than if it had been ploughed across. The second ploughing is to be given across the ridges as early in spring as the ground is sufficiently dry, and the third furrow either forms the drills or receives the seed (Suppl. E. Brit. Art. Agr.).

Manure is applied if the crop succeeds wheat. By some, dung is spread on the stubble previous to the winter ploughing, but this cannot always be done in a satisfactory manner, unless during frost, when it may lie long exposed to the weather before it can be turned in. The most desirable mode therefore is, to lay the manure into drills immediately before the beans are sown. According to Brown (Treatise on Rural Affairs) the best way is to apply the dung on the stubble before the winter furrow is given, which greatly facilitates the after process. Land dunged to *beans*, if duly hoed, is always in high order for carrying a crop of wheat in succession.

The climate most favorable to *beans* is one neither very dry nor very moist; the first brings on the fly and the last prevents the setting of the blossoms.

The time of sowing beans, is as early as possible after the severity of winter, in the south sometimes in January, but never later than the end of March, as the ripening of the crop and its safe harvesting otherwise would be very precarious in this climate.

The mode of sowing is almost always in rows; they are sometimes dibbled, but for the most part drilled by judicious cultivators, or deposited after the plough in every furrow, or only in every second or third furrow. In the latter method the crop rises in rows at regular intervals of 9, 18, or 27 inches, and the hand hoe ought to be invariably employed, but it is only where the widest intervals are adopted that the horse-hoe can be used with much effect in their subsequent culture. The seed may either be deposited by the drill machine or by the hand.

The dibbling of beans is considered by some as an excellent method, if well performed; the rows are marked out one foot asunder, and the seed deposited in holes made by the dibbler 2 inches apart; this method is greatly to be preferred to sowing the beans at random.

The quantity of seed is very different in the southern and northern parts of Britain, in the former, even when in rows, only 2 or 2½ bushels are allowed per acre, but in Scotland seldom less than 4 bushels to an English statute acre, even when sown in rows, 27 inches distant, and a bushel more when sown broadcast. Thin sown crops of *beans* seldom turn out well, unless upon very rich lands, for unless the rows are close weeds get the better after the clearing process is finished. Both in the broad-cast and drill husbandry it is common to mix a small quantity of peas along with *beans*. This mixture improves both the quality and quantity of the straw for fodder, and the peas-straw is useful for binding up the bean-straw in harvest.

The after-culture of the *bean* crop commences with harrowing just before the young plants reach the surface. When sown in rows, in either of the modes already described, the harrows are employed about 10 or 12 days after, and being driven across the ridges, the land is laid completely level for the subsequent operations, and the annual weeds destroyed.

After the beans have made some growth, sooner or later, according as the soil may happen to be incumbered with or free from weeds, the horse-hoe is employed in the intervals between the rows, and followed by the hand-hoe, for the purpose of cutting down such weeds as the horse-hoe cannot reach, and the weeds among the *beans* beyond the reach of either hoe should be pulled up by the hand. The operation may be repeated as often as the land requires it. Before the introduction of the horse-hoe, a common small plough, drawn by one horse, was used in working between the rows, and is still necessary where root-weeds abound. The plough goes down the intervals, turning the earth from the *beans*, and forming a ridgelet in the centre, then hand-hoes are immediately employed. The same plough with an additional mould-board, finally splits open the intermediate ridgelet, and lays up the earth to the *beans* on each side.

Before reaping beans the grain ought to be tolerably well ripened, otherwise the quality is impaired, whilst a long time is required to put the straw in such a condition as to be preserved in the stack. In an early harvest, or where the crop is not weighty, it is an easy matter to get *beans* sufficiently ripened; but in a late harvest, and in every one where the crop takes on a second growth, it is hardly practicable to get them thoroughly ripened for the sickle. Under these circumstances, it is unnecessary to let *beans* stand uncut after the end of September or the first of October, because any benefit that can be derived afterwards is not to be compared with the disadvantages that accompany a late wheat-seed time. *Beans* are usually cut with the sickle and tied in sheaves, either with straw ropes or with ropes made from peas sown along with them. It is proper to let the sheaves lie untied several days, so that the winning process may be hastened, and when tied to set them up on end, in order that the full benefit from the air may be obtained, and the grain kept off the ground. *Beans* are sometimes mown, and in a few instances pulled up by the roots. In all cases they should be cut as near to the ground as possible, for the sake of the straw, which is of considerable value as fodder, and because the best pods are often placed on the stems near the roots (Brown).

Beans are stacked either in the round or oblong manner, and it is always proper, if the stack be large, to construct one or more funnels, to allow a free circulation of air.

The threshing of beans is nearly as easy as that of peas.

The produce of beans, when proper management is exercised, and where diseases have not occurred, is generally from 25 to 35 bushels per acre. Donaldson says that a crop of *beans*, taking the island at large, is from 16 to 40 bushels, but that a good average crop cannot be reckoned to exceed 20. In Middlesex, Middleton says that *bean* crops vary from 10 to 80 bushels per acre. The produce in haulm is very bulky in moist seasons.

In the application of beans. The grain in Scotland is sometimes made into meal, the finer for bread and the coarser for swine; but *beans* are for the most part applied for feeding horses, swine, and other domestic animals. In Middlesex, all are given to horses, except such as are preserved for seed, and such as are gathered while green and sent to the London markets. When pigs are fed on *beans*, it is observed that the meat becomes so hard, as to make very ordinary pork, but excellent bacon.

The flour of beans is more nutritive than that of oats, as appears in the fattening of hogs; whence, according to the respective prices of these two articles, Dr. Darwin suspects that peas and *beans* generally supply a cheaper provender for horses than oats, as well as for other domestic animals. But *beans* are more difficult of digestion than oats, although of more nutriment. Some advise cut straw or bran to be mixed with *beans* to accelerate their digestion.

Bean-straw, when mixed with peas, Brown considers as affording almost as much nourishment, when properly harvested, as is gained from hay of ordinary quality, when it is well got horses are fonder of it than of pea-straw. It should either be given when newly threshed, or else stacked up and compressed by treading or covering, as the air is found to affect materially both its flavour and nutritive quality.

The produce of beans in meal is like that of peas, more in proportion to the grain than in any of the cereal grasses. A bushel of *beans* is supposed to yield 14 pounds more of flour than a bushel of oats, and a bushel of peas 18 pounds more, or according to some, 20 pounds. In 1000 parts of bean-flour, were found by Sir Humphrey Davy, 570 parts of nutritive matter, of which 428 were mucilage, 103 gluten, and 41 extract, or matter rendered insoluble during the process.

The diseases of beans are the rust, the honey-dew, mildew, and black-fly or aphides, which the lady-birds are supposed to feed upon, as they are observed to be plentiful wherever the black-fly is found. The fly almost always succeeds the honey-dew, both are most prevalent on the summits of the plants, and some have attempted to mitigate the evil by cutting them off. In general, however, these diseases are without remedy, either preventive or positive; therefore the best thing that can be done when the plants are attacked is to plough them down.

Common Garden-bean and Horse-bean. Fl. year. Clt. ? Pl. 2 to 3 feet.

CLXIX. VI'CIA (said to be from *vincio*, to bind together, because the species have tendrils by which they bind other plants). Tourn. inst. t. 221. Juss. gen. 360. D. C. fl. fr. 4. p. 589. prod. 2. p. 354.—Vìcia species of Lin.

Lin. syst. *Diadélphia, Decándria.* Calyx tubular, 5-cleft or 5-toothed (f. 46. *a.*), the 2 superior teeth shortest (f. 46. *a.*). Corolla papilionaceous (f. 46. *d.*). Stamens diadelphous (f. 46. *g.*). Style filiform, almost forming a straight angle with the ovary, villous on the upper side (f. 46. *g.*). and on the under side beneath the apex. Legume oblong (f. 46. *h.*), 1-celled, many-seeded (f. 46. *h.*); seeds with a lateral, oval, or linear hylum.—Usually climbing herbs, with abruptly pinnate leaves, having many pairs of leaflets; the common petiole drawn out into a tendril at the apex (f. 46. *i.*), which is usually branched. Stipulas usually semi-sagittate. Peduncles axillary, elongated, many-flowered, or short and 1-flowered. The species of the genus are not well defined.

§ 1. *Peduncles elongated, many-flowered; flowers secund.*

1 V. pisifórmis (Lin. spec. 1034.) plant quite smooth; leaves mucronate, with 3-4 pairs of ovate, cordate, obtuse, reticulately-veined, distant leaflets; stipulas ovate, semi-sagittate, toothed; peduncles many-flowered, length of leaves; calycine teeth nearly equal, shorter than the tube; legumes oblong, compressed, reticulately veined; seeds globose, with the hylum linear. ♃. ◡. H. Native of the south of Europe, in woods. Sturm, deutsch. fl. 1. fasc. 31. Jacq. austr. 4. p. 33. t. 364.—Riv. tetr. irr. t. 52. The lowest leaflets approximating the stem and sessile. Flowers cream-coloured, about the size of those of *V. sylvática*.

Pea-formed Vetch. Fl. July, Aug. Clt. 1739. Pl. cl.

2 V. amœ'na (Fisch. in litt. Ser. in D. C. prod. 2. p. 355.) stems erect, tetragonal, firm, and smoothish; leaves distant on the stem, tendrilled at the apex; leaflets numerous, dense, opposite and alternate, elliptic-lanceolate, rather mucronate, reticulated with numerous diverging fine nerves; stipulas semi-sagittate, toothed; peduncles many-flowered, rather longer than the leaves; the superior teeth of the calyx broadish, short, and acute, lower ones elongated and subulate; style hardly pilose at the apex; legumes unknown. ♃. H. Native of Siberia, about Truetsk.—Gmel. sib. 4. p. 11. no. 11. t. 3.? Flowers purple, about the size of those of *V. onobrychioìdes*. Leaflets large, like those of the first species.

Pleasing Vetch. Fl. June, July. Clt. 1818. Pl. cl.

3 V. Carolinia'na (Walt. fl. carol. p. 182.) plant smoothish; leaves with 8-10 or more elliptic-lanceolate, obtuse, mucronate, alternate leaflets; stipulas ovate-lanceolate, entire, small; peduncles many-flowered; flowers rather distant; calycine teeth short; style villous at the apex; legumes lanceolate, glabrous, obliquely reticulated. ♃. ◡. H. Native of Carolina. V. parviflòra, Michx. fl. car. 2. p. 69. V. craccoìdes, Rafin. in litt. V. Crácca, Pursh, ex Rafin. Corolla white, smaller and narrower than in *V. Crácca*, having the vexillum tipped with black.

Carolina Vetch. Fl. June, July. Clt. 1820. Pl. cl.

4 V. Po'ntica (Willd. spec. 3. p. 1094.) plant pubescent; leaflets numerous, elliptic-lanceolate, obtuse, mucronate; stipulas lanceolate, quite entire, nerved; peduncles very long, many-flowered; flowers crowded; legumes unknown. ♃. H. Native of the country near the Euxine sea. Flowers secund, nodding, about the size of those of *V. Crácca*, white. Leaves with a few, scattered, adpressed pili on the under side. Vìcia multiflòra, floribus albis, calyce purpureo, Tourn. cor. 27.

Pontic Vetch. Pl. cl.

5 V. dumetòrum (Lin. spec. 1035.) plant smoothish; leaflets reflexed, ovate-lanceolate, mucronulate, alternate, very finely and reticulately veined; stipulas lunate and setaceously toothed; peduncles many-flowered, about the length of the leaves; calycine teeth very short, equal among themselves; style bearded at the apex; legumes oblong, compressed, reticulately and finely

veined; seeds roundish, with the hylum linear. ♃. H. Native of America and Europe, in bushy and shady places, particularly in Austria, Switzerland, Piedmont, France, and Germany. Sturm, deutschl. fl. 1. fasc. 31. with a figure. Oxypògon élegans, Rafin. in litt. V. tetragòna, hort. par. in litt. This species differs from *V. pisifórmis* in the flowers being purplish-blue, and in the deep-green and longer leaflets, with the lower pairs not approximating the stem.

Hedge Vetch. Fl. May, June. Clt. 1752. Pl. cl.

6 V. MENZIE'SII (Spreng. syst. 3. p. 267.) leaflets ovate, smooth, near an inch and a half long; stipulas lunate, with sharp teeth; peduncles few-flowered, shorter than the leaves; petals all strongly recurved; calycine teeth taper-pointed. ♃.? G. Native of Owyhee, at the upper edge of a forest, on a mountain called Mowna-rooa, which is 6000 feet high, where it was collected by Mr. Menzies. V. grandiflòra, Smith, in Rees' cycl. Flowers pale-purple, full twice the size of those of *V. dumetòrum.* Clusters of flowers rather loose and downy. Legumes not seen.

Menzies's Vetch. Pl. cl.

7 V. DENTA'TA (Fisch. in litt.) this plant differs from *V. dumetòrum* in the smaller approximate leaflets, which are ovate-obtuse, the lower ones roundish and acutely toothed towards the apex in the more loose flowers, and in the semi-sagittate serrated stipulas. ♃. H. Native of the south of Russia. V. dumetòrum, var. β, dentàta, Ser. in D. C. prod. 2. p. 355.—Gmel. sib. 4. p. 9. tub. p. 221. Flowers violaceous.

Toothed-leafletted Vetch. Fl. June, Jul. Clt. 1819. Pl cl.

8 V. SYLVA'TICA (Lin. spec. 1035.) plant smooth; leaflets numerous, alternate or opposite, elliptic-oblong, mucronulate, finely and reticulately veined; stipulas between semi-sagittate and reniform, setaceously-toothed; peduncles longer than the leaves, many-flowered; calycine segments hardly the length of the tube; style villous at the apex; legumes oblong-linear, compressed, finely reticulated, incurved at the apex; seeds globose, with a linear hylum. ♃. H. Native of Europe, in mountain woods. Plentiful in mountainous parts of the north of England and Scotland, in woods. Sturm, deutschl. fl. 1. fasc. 31. with a figure. Smith, engl. bot. 79. Oed. fl. dan. 277. Hall. helv. no. 426. t. 12. f. 2. Stipulas fringed. Style with the beard at the apex hardly discernible. Flowers rising from the peduncle by twos or threes, with interruptions, rather large, having the vexillum and wings whitish, and beautifully variegated with blue, and keel pale blue. This is an elegant plant when in flower.

Wood Vetch. Fl. June, Aug. Britain. Pl. cl.

9 V. AMERICA'NA (Muhlenb. ex Willd. spec. 3. p. 1096.) leaflets numerous, elliptic-lanceolate, obtuse, glabrous, mucronate; stipulas semi-sagittate, deeply toothed; peduncles many-flowered, shorter than the leaves; legumes unknown. ♃. H. Native of Pennsylvania. This plant differs from *V. sylvática*, in the longer leaflets, in the teeth of the stipulas not being awned, and lastly in the racemes being fewer-flowered and never longer than the leaves. Leaflets 8-12 in number.

American Vetch. Fl. June, July. Clt. 1800. Pl. cl.

10 V. VARIEGA'TA (Willd. spec. 3. p. 1096.) plant villous; leaflets numerous, elliptic, obtuse, villous, alternate, lower ones emarginate, mucronate; tendrils trifid; stipulas semi-sagittate, quite entire; peduncles many-flowered, rather longer than the leaves; racemes crowded with secund flowers; calycine teeth about equal, shorter than the tube; style bearded; legumes rather pubescent. ♃. H. Native of Eastern Caucasus, on the alps. Desf. cor. p. 86. t. 65. ann. mus. 12. p. 111. t. 12. Leaflets 14-26. Stipulas ovate-lanceolate, bipartite at the base. Flowers with a rose-coloured standard, white wings, and purplish keel, and variegated.

Variegated-flowered Vetch. Fl. Ju. Jul. Clt. 1816. Pl. cl.

11 V. PURPU'REA (Stev. in mem. soc. mosq. 4. p. 53. et Bieb. fl. taur. suppl. 468.) plant hardly canescent; leaflets numerous, oval, mucronate, villous; stipulas semi-sagittate, quite entire; peduncles many-flowered, rather longer than the leaves; racemes crowded with secund flowers; calycine teeth much shorter than the tube, the superior ones almost obsolete. ♃. H. Native of Tauria. Flowers purple.

Var. β, *minor* (Stev. l. c.) leaves small; flowers paler. ♃. H. Native of Tauria, near the region of perpetual snow.

Purple-flowered Vetch. Pl. cl.

12 V. ALPE'STRIS (Stev. in mem. mosq. 4. p. 53. and Bieb. fl. taur. suppl. 469.) plant hardly canescent; leaflets elliptic-obovate, mucronulate, villous; stipulas semi-sagittate, almost quite entire; tendrils usually trifid; peduncles usually 6-flowered, longer than the leaves; racemes crowded; calyx villous, having the teeth much shorter than the tube, but with the superior ones almost obsolete; legumes unknown. ♃. H. Native of Tauria. Flowers purple.

Alp Vetch. Pl. cl.

13 V. CASSU'BICA (Lin. spec. 1035.) leaflets numerous, opposite or alternate, ovate-elliptic, mucronate, nearly glabrous, firm, reticulated with numerous diverging nerves; lower stipulas lanceolate and semi-sagittate at the base, upper ones linear and almost entire; peduncles many-flowered, about equal in length to the leaves; racemes crowded with secund flowers; calycine teeth unequal, shorter than the tube; style villous at the apex; legumes coriaceous, hardly reticulated, oblong, short, compressed, smoothish; seeds globose. ♃. H. Native of the south of Europe. Oed. fl. dan. 98.—Pluk. phyt. t. 72. f. 2. Root creeping. Flowers pale blue. Leaves impari-pinnate.

Var. α, *glabriúscula* (Ser. mss. in D. C. prod. 2. p. 356.) stem pilose; petioles cirrhous, villous; leaflets almost glabrous. ♃. H. V. multiflòra, Poll. pal. 2. p. 307. Wallr. sched. 385. D. C. fl. fr. 5. p. 577. V. Cassùbica, Sturm. deutschl. fl. 1. fasc. 31.

Var. β, *O'robus* (Ser. mss. in D. C. prod. 2. p. 356.) the whole plant clothed with pili; leaflets pilose or ciliated; tendrils wanting, or somewhat foliaceous. ♃. H. V. órobus, D. C. fl. fr. 5. p. 557. O'robus sylváticus, D. C. fl. fr. 4. p. 586.

Cassubian Vetch. Fl. June, July. Clt. 1711. Pl. 1 foot.

14 V. ABBREVIA'TA (Fisch. in litt. ex Spreng. pl. min. cogn. pug. 1. p. 50.) leaflets oblong, rounded at both ends and mucronulate, rather pubescent; stipulas almost obsolete; peduncles many-flowered, shorter than the leaves, which are impari-pinnate. ♃. H. Native of Caucasus, on the margins of woods. Very like *V. Cassùbica*, but differs in the stem being quite smooth and not flexuous, in the stipulas being very minute, and lastly in the calyxes being villous. Leaves impari-pinnate, as in *V. Cassùbica.* Perhaps only a variety of *V. Cassùbica*, according to Ser. Flowers pale blue.

Short Vetch. Fl. June, July. Clt. 1818. Pl. 1 foot.

15 V. GALLOPROVINCIA'LIS (Poir. suppl. 5. p. 471.) leaflets opposite or alternate, very numerous, elliptic-lanceolate, mucronulate, villous; stipulas semi-sagittate; tendrils almost simple; peduncles shorter than the leaves; flowers small, very numerous; vexillum broad, length of wings; legumes unknown. ♃. H. Native of the south of Provence, on the mountains. Ger. Galloprov. p. 497. no. 5. t. 19. Flowers blue or purple.

Provence Vetch. Pl. cl.

16 V. CINE'RIA (Bieb. fl. taur. suppl. 470.) leaves with very short tendrils; leaflets linear-elliptic, obtuse, clothed with hoary villi; stipulas bipartite, with elongated teeth; peduncles usually 2-flowered, shorter than the leaves; calycine teeth triangular, acute, superior ones very small. ♃. H. Native of Tauria, about Tiflis. Flowers pale blue, about the size of those of *V. Crácca.* Calyx clothed with silky villi.

Cinèreous Vetch. Pl. cl.

17 V. setifòlia (H. B. et Kunth, nov. gen. amer. 6. p. 500.) stems weak, smoothish; leaflets 8-9, very narrow-linear, mucronate, puberulous on both surfaces, as well as the rachis or petiole; stipulas lanceolate, semi-sagittate; calyx turbinate at the base, with the superior teeth ascending; peduncles 3-4-flowered, a little longer than the leaves, and are, as well as the calyxes, pubescent; legumes lanceolate, glabrous. ♃. H. Native near the city of Mexico, Quito, and Santa-Fe de Bogota, at the height of 3500 or 4500 feet above the level of the sea. Flowers flesh-coloured.

Bristle-leaved Vetch. Pl. cl.

18 V. Broteria'na (Ser. mss. in D. C. prod. 2. p. 357.) leaflets nearly oval, villous; lower stipulas semi-sagittate, and somewhat dentate; flowers imbricate; peduncles very villous; calycine teeth setaceous, and villous; legumes rather villous, pendulous. ⊙. H. Native of Portugal, in cultivated fields about Coimbra. V. villòsa, Brot. fl. lus. 2. p. 150. but not of Roth. Corolla deep purple at the apex.

Brotero's Vetch. Fl. June, July. Clt. 1817. Pl. cl.

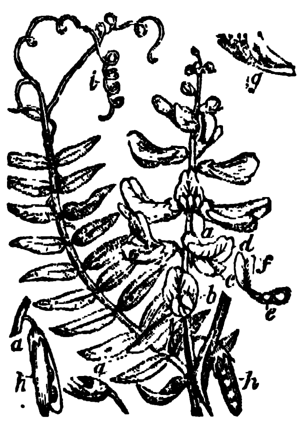
19 V. acutifòlia (Ell. sketch. car. et geogr. 2. p. 225.) stem glabrous; leaflets few, linear, acute at both ends; stipulas lanceolate, entire; peduncles few-flowered, longer than the leaves. —Native of Georgia.

Acute-leafletted Vetch. Pl. cl.

20 V. pulche'lla (H. B. et Kunth, nov. gen. amer. 6. p. 499. t. 583.) stems weak, puberulous; leaflets 8-12, linear, acute, pubescent beneath, as well as the calyxes; stipulas linear, semi-sagittate; calycine teeth very unequal, superior ones much the smallest; peduncles 16-20-flowered, longer than the leaves, pubescent; legumes unknown. ♃. H. Native of Mexico, on the western declivities of mountains, especially near Mescala at the height of 795 feet above the level of the sea. Flowers white.

Neat Vetch. Pl. cl.

FIG. 46.



21 V. Cra'cca (Lin. spec. 1095.) stems branched; leaves cirrhous at the apex; leaflets numerous, oblong, lanceolate, alternate or opposite, pubescent, mucronate, with rather parallel simple nerves; stipulas linear, semi-sagittate; peduncles angular, hairy, bearing numerous secund flowers, equal in length to or exceeding the leaves; calycine teeth unequal, upper ones very short, lower ones shorter than the tube; style pilose at the apex; legumes oblong-lanceolate, coriaceous, reticulated, compressed, glabrous; seeds globose, black. ♃. H. Native of Europe, in fields and hedges; plentiful in all parts of Britain. Sturm, deutschl. fl. fasc. 31. with a figure. Smith, engl. bot. t. 1168. Curt. lond. 5. t. 54. Mart. fl. rust. 117. Crácca, Riv. tetr. irr. t. 50. Root creeping. Flowers blue and purple or violet mixed, marked with veins of a deeper colour. Leaves clothed with canescent down, giving them a manifest whiteness; this is most apparent in plants growing in exposed dry situations, for in moist soils the leaves are almost green. Dr. Plot, in his history of Staffordshire, says, that this and the *Wood-Vetch* advance starved or weak cattle above any thing yet known. These perennial vetches yield such abundance of food, that they seem to deserve the notice of agriculturists. But it is well observed in English botany, that to gather them from their native situations would be impracticable, so firmly do they cling by their tendrils to their neighbours; and if cultivated, they would probably choke themselves for want of support.

Var. a, violàcea; flowers bluish violet.

Var. β, purpùrea; flowers purple.

Var. γ, albiflòra; flowers pure white.

Cracca or Tufted-Vetch. Fl. June. Sept. Britain. Pl. cl.

22 V. Bivònæ (Rafin. prec. 37. Desv. journ. bot. 1814. p. 269.) plant pubescent; stems tetragonal; tendrils simple; leaflets 10-14, oblong-linear, mucronate; stipulas lunate, semi-sagittate, rather toothed at the base; peduncles few-flowered, about equal in length to the leaves; flowers secund, rather distant; calycine teeth setaceous, length of tube; style bearded at the apex; legumes oblong-lanceolate, compressed, finely reticulated. ♃. H. Native of Sicily about Palermo, and of Corsica. V. leucántha, Bertol. stirp. sic. fasc. V. littoràlis, Salzm. exsic. Flowers pale, purplish blue, with the carina tipped with black. Perhaps the same as *V. pseudocrácca.*

Bivona's Vetch. Pl. cl.

23 V. Gera'rdi (Jacq. fl. astr. t. 229. D. C. fl. fr. 4. p. 591. exclusive of the synonymes,) stems simple; leaves cirrhous at the apex; leaflets numerous, oblong-lanceolate, alternate or opposite, mucronate, rather woolly, having parallel simple nerves; stipulas linear, semi-sagittate; peduncles many-flowered, rather shorter than the leaves; style pilose at the apex; legume oblong, coriaceous, finely reticulated, compressed, glabrous. ♃. H. Native of the south of Europe, particularly in Austria and France. V. mùtilans, Crantz. Flowers violaceous. Root creeping? Calycine teeth unequal, pilose.

Gerard's Vetch. Fl. June, July. Clt. 1810. Pl. cl.

24 V. pseudocra'cca (Bertol. pl. rar. p. 58.) plant pubescent; stems branched at the base, diffuse; leaflets 8-12, oblong-obtuse; stipulas linear, semi-sagittate; peduncles usually 6-flowered, longer than the leaves; flowers secund, loose, deflexed; calycine teeth unequal, linear, acute, shorter than the tube; style villous at the apex; legumes elliptic, short, smooth, finely reticulated. ⊙. H. Native of Italy near Pisa. V. tenuifòlia, Tenore, prod. p. 42. Very like *V. Crácca,* but differs in the annual roots, in the broader legumes, and in the longer calycine teeth. Flowers blue.

False-Cracca Vetch. Fl. June, July. Clt. 1820. Pl. cl.

25 V. Andícola (H. B. et Kunth, nov. gen. amer. 6. p. 498. t. 582.) plant pubescent; stems weak; leaflets 7-12, linear-lanceolate, obtuse, mucronate; stipulas linear, semi-sagittate, acute; tendrils bifurcate; peduncles 2-4-flowered, hardly exceeding the leaves; calyx bilabiate, the superior teeth the smallest; legumes somewhat cultriform, smoothish. ♃. F. Native of the Andes of Quito on mount Antisana, at the height of 6300 feet above the level of the sea. Flowers violaceous.

Andes Vetch. Pl. cl.

26 V. microphy'lla (D'Urv. enum. pl. arch. p. 87.) stems weak, branched at the base, and diffuse; leaflets 8-10, ovate on short petioles, small, mucronate; stipulas very small, and semi-sagittate; peduncles straight, twice or thrice longer than the leaves, 4-6-flowered; flowers pale; legumes compressed, glabrous, 5-7-seeded. ♃. H. Native of the island of Melos, on hills. Corolla very pale violet or white, double the length of the calyx, and sometimes longer. Perhaps the same as V. pseudocrácca of Bertol.

Small-leafletted Vetch. Pl. cl.

27 V. polyphy'lla (Desf. fl. atl. 2. p. 162.) leaflets numerous, linear-lanceolate, mucronate, villous; stipulas linear, semi-sagittate; peduncles many-flowered, longer than the leaves; flowers secund, crowded. ♃. H. Native about Algiers. The flowers are like those of *V. Crácca,* but they are larger and paler. The vexillum is blue, and wings and keel white.

Many-leafletted Vetch. Fl. June, July. Clt. 1816. Pl. cl.

28 V. tenuifòlia (Roth. fl. germ. 2. p. 183.) stem branched; leaves cirrhous at the apex; leaflets numerous, linear-lanceolate, smoothish, mucronate, alternate or opposite, full of parallel sim-

ple veins; lower stipulas semi-sagittate, linear, upper ones linear-setaceous; peduncles longer than the leaves; flowers crowded, secund; calycine teeth unequal, lower ones length of the tube; style pilose at the apex; legumes lanceolate. ♃. H. Native of France, Germany, and Tauria. Sturm, deutschl. fl. 1. fasc. 31. V. Gerárdi, Willd. enum. no. 736. Flowers beautiful violaceous or purple. Very like *V. Crácca*, but does not creep at the roots.

Fine-leaved Vetch. Fl. June, Aug. Clt. 1799. Pl. cl.

29 V. SE'SSEI; plant smoothish; stems angular; stipulas subulate, semi-sagittate or bifid; leaflets 15-16, linear-lanceolate, mucronate; tendrils trifid, and divided again; peduncles about the length of the leaves; flowers numerous, racemose; style villous at the apex. ♃. H. Native of Mexico. V. polyphýlla, Moc. et Sesse in herb. Lamb. Flowers apparently pale blue.

Sesse's Vetch. Pl. cl.

30 V. SUBULA'TA (Sesse et Moc. mss. in herb. Lamb.) plant canescent and pubescent; leaflets 10-12, subulate; tendrils bifid; peduncles shorter than the leaves; flowers crowded, secund; stipulas subulate, semi-sagittate. ♃. H. Native of Mexico. Flowers white or pale blue.

Subulate-leafletted Vetch. Pl. cl.

31 V. CONSENTI'NA (Spreng. pl. min. cogn. pug. 2. p. 74.) stem and petioles pubescent; leaflets lanceolate, mucronate, lower ones elliptic; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; flowers remote, glabrous, cream-coloured. ⊙. H. Native of Naples and about Cosenza. Perhaps only a variety of *V. pseudocrácca.*

Cosenza Vetch. Fl. June, Aug. Clt. 1818. Pl. cl.

32 V. CAPE'NSIS (Berg. pl. cap. p. 215.) stem branched at the base; leaves impari-pinnate; leaflets linear, truncate, and mucronate; stipulas lanceolate, acute; peduncles elongated, many-flowered; style hairy at the apex; legumes lanceolate, compressed. ♃. G. Native of the Cape of Good Hope. Flowers purple.

Cape Vetch. Fl. June, Aug. Clt. 1802. Pl. 1 foot.

33 V. CANE'SCENS (Labill. syr. dec. 1. p. 17. t. 7.) plant clothed with canescent down; leaflets numerous, oblong-linear, obtuse, alternate; tendrils almost wanting; stipulas lanceolate, semi-sagittate, quite entire; peduncles 3-7-flowered, about equal in length to the leaves; calycine teeth narrow, shorter than the tube; style bearded at the apex; legumes ovate-lanceolate, compressed, hairy, 3-4-seeded; seeds roundish. ⊙. H. Native of mount Lebanon. Flowers blue. Lower leaves impari-pinnate.

Canescent Vetch. Fl. June, July. Clt. 1800. Pl. cl.

34 V. OCHROLEU'CA (Tenore, prod. p. 42. and cat. 1819. p. 56.) leaflets ovate-lanceolate or oblong-linear, obtuse, mucronate, smoothish, nearly opposite, with the nerves parallel; stipulas subulate, semi-sagittate at the base, quite entire; peduncles many-flowered, longer than the leaves; flowers crowded; teeth of calyx very short; style pilose at the apex; legumes glabrous, reticulated. ♃. H. Native of Italy. This plant is very like *V. Crácca,* but the flowers are cream-coloured, and smaller.

Cream-cóloured-flowered Vetch. Clt. 1825. Pl. cl.

35 V. PUNCTA'TA (Schleich. ex Pers. ench. 2. p. 307.) leaflets ovate-lanceolate, mucronate, glabrous; stipulas cut; peduncles many-flowered, longer than the leaves; calyxes obtuse. ⊙. H. Native of Switzerland. Flowers purple? The under side of the leaflets are observed to be dotted with white, when examined by a microscope.

Dotted Vetch. Fl. July. Clt. 1819. Pl. cl.

36 V. ONOBRYCHIOI'DES (Lin. spec. 1036.) stems striated; tendrils almost simple; leaflets numerous, linear, alternate or opposite, obtuse, and mucronate, with parallel nerves; stipulas linear, semi-sagittate, dentate; peduncles very long, many-flowered; flowers distant; calycine teeth lanceolate, length of the tube; style clavate, bearded at the apex; legumes lanceolate. ♃. H. Native of Europe, in the mountainous parts. Sturm, deutschl. fl. 1. fasc. 31. with a figure. All. pedem. t. 42. no. 1198. Sims, bot. mag. 2206. Flowers purplish blue.

Var. β, angustissima (Ser. mss. in D. C. prod. 2. p. 358.) leaflets setaceous, and shorter. ⊙. H. Native about Montpelier.

Saintfoin-like Vetch. Fl. Ju. July. Clt. 1759. Pl. cl.

37 V. ATROPURPU'REA (Desf. fl. atl. 2. p. 164.) plant villous; stems tetragonal; tendrils very trifid; leaflets oblong, mucronate, numerous, opposite, and alternate; stipulas lanceolate, semi-sagittate, usually toothed at the base; peduncles many-flowered, hardly the length of the leaves; flowers secund, approximate: calycine teeth setaceous, pilose, longer than the tube; style elongated, somewhat clavate, bearded at the apex; legumes oblong, compressed, very hairy; seeds globose, black, rather velvety. ⊙. H. Native of Algiers. Vent. hort. cels. t. 84. Lindl. bot. reg. 871. Flowers dark purple.

Dark-purple-flowered Vetch. Fl. Ju. July. Clt. 1815. Pl. cl.

38 V. GIGA'NTEA (Hook. fl. bor. amer. p. 157.) plant pubescent, black when dried; stems furrowed; leaflets 20-26, oblong, petiolulate, obtuse, mucronate; stipulas large, semi-sagittate, profoundly toothed at the base; peduncles 5-10-flowered, much shorter than the leaves; flowers crowded; style hardly bearded; legume broad, oblong, glabrous, obscurely reticulated. ♃. H. Native of North America, in open woods on the Columbia. Flowers purple, about the size of those of *V. Americána.* Stems hardly one-third of an inch broad, hollowed, and herbaceous. Stipulas an inch and a half in length. The plant turns black on drying.

Giant Vetch. Pl. trailing.

39 V. NI'GRICANS (Hook. in Beech. bot. p. 20.) plant pubescent; stems tetragonal; leaflets oblong-elliptic, obtuse, alternate; tendrils divided; stipulas semi-sagittate; peduncles twice the length of the leaves, many-flowered; flowers crowded, the 2 superior teeth of the calyx almost wanting, lower ones subulate, middle one elongated, and exceeding the tube; stigma bearded. ♃. H. Native of Chili about Conception. Leaflets more than an inch long. Plant becoming very black on drying.

Blackish Vetch. Pl. cl.

40 V. BENGALE'NSIS (Lin. spec. 1036.) leaflets elliptic, obtuse, stipulas entire; peduncles usually bearing only 5 flowers, length of leaves; legumes turgid, hairy. ⊙. H. Native of the Stœchades Islands.—Herm. ludg. 624. t. 625. Flowers deep purple, having the keel tipped with black. Plant downy.

Bengal Vetch. Fl. June, July. Clt. 1792. Pl. cl.

41 V. PERE'NNIS (D. C. cat. hort. monsp. 155. and fl. fr. 5. p. 578.) plant villous; stems tetragonal; tendrils simplish; leaflets oblong-linear, mucronate, villous, opposite or alternate; stipulas lanceolate, semi-sagittate, and usually toothed at the base; peduncles few-flowered, length of leaves; flowers secund, rather lax; calycine teeth setaceous, pilose, length of tube; style elongated, rather clavate, bearded at the apex; legumes oblong, compressed, pubescent, reticulated; seeds orbicular, compressed, bay-coloured. ♃. H. Native of France, about Perpignan. Flowers purple.

Var. β, suffruticòsa (Ser. mss. in D. C. prod. 2. p. 359.) stems smaller, diffuse, suffruticose at the base; leaves and leaflets smaller.

Perennial Vetch. Fl. June, July. Clt. 1820. Pl. cl.

42 V. LONGIFÒLIA (Poir. dict. 8. p. 567.) stems tetragonal; tendrils branched; leaflets numerous, narrow, very long, glabrous; stipulas semi-sagittate, entire; peduncles many-flowered, longer than the leaves; flowers drooping; calycine teeth unequal, acute, superior ones very small. ⊙.? H. Native of Syria. Flowers cream-coloured.

Long-leaved Vetch. Fl. June, July. Clt. 1818. Pl. cl.

43 V. ARGE'NTEA (Lapeyr. abr. 417.) plant canescent; stems

tetragonal, never climbing; tendrils wanting; leaves clothed with silvery-grey down; leaflets oblong-linear, mucronate; stipulas lanceolate, semi-sagittate; peduncles many-flowered, about the length of the leaves; flowers secund, loose; calycine segments almost equal, length of the tube; style elongated, rather clavate, bearded at the apex; legumes oblong, compressed, tomentose. ♃. H. Native of the Pyrenees, on the Spanish side. D. C. fl. fr. suppl. no. 4011. Hook. bot. mag. 2946. Calyx reddish with green teeth. Flowers with the vexillum and wings yellowish-white, streaked with purple, but the keel is white. Root fusiform.

Silvery Vetch. Fl. June, July. Clt. 1827. Pl. 1 foot.

44 V. TRICHOCA'LYX (Moris, elench. sard. ex Schlecht. Linnæa. 5. p. 96.) plant pubescent; leaflets elliptic-oblong, mucronulate; tendrils branched; stipulas lanceolate, semi-sagittate, toothed; peduncles many-flowered, about equal in length to the leaves; flowers secund, crowded; calyx very villous, with setaceous teeth, which are much longer than the tube; legumes hairy. ⊙. H. Native of Sardinia, in corn-fields. This plant is very like *V. atropurpùrea* of Desf. but differs in flowering later, and in every part being much larger, in the calyx being more villous, and, lastly, in the corolla being white, and only rose-coloured at the apex.

Hair-calyxed Vetch. Pl. cl.

45 V. VILLÒSA (Roth. fl. germ. 2. p. 182. but not of Brot.) plant clothed with villi; stems tetragonal; tendrils almost simple; leaflets oblong, mucronulate, opposite or alternate; stipulas lanceolate, entire, semi-sagittate; peduncles many-flowered, length of the leaves; flowers secund, rather loose; calycine teeth setaceous, pilose, longer than the tube; style villous at the apex; legumes oblong, compressed, glabrous; seeds globose, variegated. ⊙. H. Native of Germany. Sturm, deutschl. fl. 1. fasc. 31. with a figure. Flowers purple. Like *V. atropurpùrea*, but differs in the stipulas being entire, and in the legumes being smooth.

Villous Vetch. Fl. June, July. Clt. 1815. Pl. cl.

46 V. DISPE'RMA (D. C. cat. hort. monsp. 154. and fl. fr. 5. p. 578.) plant rather pilose; stems tetragonal; tendrils simple; leaves with 8-10 pairs of linear-oblong mucronate leaflets; stipulas semi-sagittate, entire; peduncles 2-3-flowered, shorter than the leaves; flowers small; calycine teeth nearly equal, lanceolate-subulate, length of the tube, and about equal in length to the corolla; style villous at the apex; legumes oblong, compressed, glabrous, reticulated, transversely 2-seeded; seeds globose, black. ⊙. H. Native of the south of France. V. parviflòra, Lois. fl. gall. 466. but not of Michx. Flowers and fruit like those of *E'rvum léns*.

Two-seeded Vetch. Fl. June, July. Clt. 1820. Pl. cl.

47 V. ALTI'SSIMA (Desf. fl. atl. 2. p. 163.) leaflets elliptic, quite smooth, truncate at the apex; petioles usually bearing 10 leaflets; stipulas dentate; peduncles many-flowered, longer than the leaves; flowers nodding; calycine teeth unequal, superior ones minute, lower ones acute and longer; style bearded; legumes lanceolate, compressed, many-seeded. ♃. H. Native of Barbary. Flowers pale blue, about the size of those of *V. sèpium*.

Tallest Vetch. Fl. June, July. Clt. 1820. Pl. cl.

48 V. POLYSPE'RMA (Tenore, prod. append. 5, 1826. ex Schlecht. Linnæa. 3. p. 102.) stem branched; leaves cirrhiferous; leaflets ovate-oblong, obtuse, entire, mucronate, glabrous; tendrils branched; stipulas toothed; peduncles 8-10-flowered, longer than the leaves; flowers erect, loosely racemose; calycine teeth unequal, upper ones shorter, lower ones setaceous, longer; legumes linear-lanceolate, 3 inches long, flat, glabrous, 14-20-seeded. ♃. H. Native of Naples, in hedges. Flowers the size of those of *V. sativa*, pale blue. Very nearly allied to *V. altissima*, but in it the legume does not exceed an inch in length, the leaflets are also elliptic and truncate at the apex, lines long and 3 broad, but in the present plant they are 8 lines long and 5 broad. Flowers densely racemose.

Many-seeded Vetch. Pl. cl. 8 feet.

49 V. BIE'NNIS (Lin. spec. 1036.) leaflets about 12, lanceolate, glabrous; petioles furrowed, cirrhous; stipulas semi-sagittate, acute; peduncles many-flowered, hardly longer than the leaves; calycine teeth unequal; legumes ascending, compressed, glabrous, short. ♂. H. Native of Siberia. Poir. dict. 5. p. 558.—Gmel. sib. 4. p. 10. t. 2. Leaves involute. Flowers pale blue. Seeds globular, dirty yellow, spotted with black. This promises to become an useful plant for fodder, the stalks growing to a great length, and being well furnished with leaves, which do not decay in autumn, but continue green through the winter, in defiance of the most severe frost; so that in February and March, when there is often a scarcity of green food for ewes and lambs, this may be of great service.

Biennial Vetch. Fl. July, Aug. Clt. 1758. Pl. cl.

50 V. NISSOLIA'NA (Lin. spec. 1036.) plant downy; petioles cirrhous; leaflets oblong, hardly retuse, rather downy; stipulas lanceolate, entire, very narrow; peduncles many-flowered; flowers small, dark purple; legumes ovate-oblong, villous, nodding, 5-seeded. ⊙. H. Native of the Levant. Stem angular. The plant in the gardens under this name is a very shewy species, with dark-purple, elegant, crowded, secund flowers, and is th plant figured in bot. reg. t. 871. under the name of *V. atr* *purpùrea*.

Nissol's Vetch. Fl. June, July. Clt. 1773. Pl. cl.

51 V. PELLU'CIDA (Jacq. hort. schœnbr. 2. p. 220. t. 222 stems branched; leaflets obovate, emarginate; stipulas oblong peduncles usually 4-flowered, shorter than the leaves, which ar without tendrils; calycine teeth equal, spreading; style beard at the apex; legumes oblong, compressed, falcate, membranous rather villous; seeds kidney-shaped, compressed. ♃. G. Native of the Cape of Good Hope. Flowers purple, but with the vexillum variegated. Leaves impari-pinnate.

Pellucid Vetch. Fl. July, Aug. Clt. 1812. Pl. 1 foot.

52 V. HOOKE'RI; plant sparingly pilose; leaves with 3-4 pairs of narrow, linear, acuminated leaflets; tendrils almost simple; stipulas semi-sagittate, linear, entire; peduncles shorter than the leaves, few-flowered; calyx short, campanulate; the teeth lanceolate and equalling the tube; corolla glabrous; legumes lanceolate, 6-seeded, compressed, with pilose sutures. ♃. F. Native of Chili, about Conception. V. parviflòra, Hook, in Beech. bot. p. 20. but not of Cav. Habit of *E'rvum tetraspérmum*.

Hooker's Vetch. Pl. cl.

53 V. MITCHE'LLI (Rafin. prec. 37. and in Desv. journ. bot. 1814. p. 269.) plant glabrous; stems weak, striated; leaves for the most part with 7 pairs of leaflets; leaflets oblong, cuneiform, retuse, mucronate; stipulas entire or multifid, small; peduncles many-flowered; vexillum pubescent; legumes 2-seeded, pilose. ⊙. H. Native of North America, in Long Island. Ell. sketch. car. et geogr. 2. p. 224. Seeds edible.

Mitchel's Vetch. Pl. cl.

54 V. PARVIFLÒRA (Cav. annal. sci. nat. 4. p. 73. bu [illegible] Michx. nor Lois.) stems filiform; leaves cirrhous; leaflet [illegible], mucronate; stipulas normal; peduncles elongated, 2-4-flowered. ⊙. H. Native about Mogodor.

Small-flowered Vetch. Pl. cl.

55 V. BIDENTA'TA (Hook, bot. misc. 2. p. 215.) plant quite smooth; leaves with 2-3 pairs of opposite and alternate, cuneated leaflets, which are bidentate at the apex, and with a mucrone in the centre; tendrils simple; stipulas broad, semi-sagittate, a little toothed; peduncles 3-4-flowered, equal in length to the leaves; legumes oblong, glabrous. ⊙. H. Native of Peru, near Lima.

Bidentate-leaved Vetch. Pl. 1 foot.

56 V. biflòra (Desf. atl. 2. p. 166. t. 197.) leaves tendrilled; leaflets numerous, linear-lanceolate; stipulas semi-sagittate, entire; peduncles 2-flowered, shorter than the leaves; calycine teeth nearly equal, small. ⊙. H. Native of Algiers. Flowers blue.

Two-flowered Vetch. Fl. June, Aug. Clt. 1801. Pl. cl.

57 V. grami'nea (Smith, in Rees' cycl. vol. 37.) plant almost smooth; leaflets 3 pairs, linear, pointed; stipulas ovate, entire, slightly sagittate; peduncles 4-flowered, shorter than the leaves; tendrils simple or divided; legumes smooth, compressed, not an inch in length, elliptic-oblong, with an oblique, incurved point; seeds 6-7, small, round. ♃.? H. Native of Buenos Ayres. Flowers very small, pale, apparently tinged with purple. Calyx rather downy, with the teeth shorter than the tube.

Grassy-leaved Vetch. Pl. cl.

§ 2. *Flowers pedunculate, solitary.*

58 V. calcara'ta (Desf. fl. atl. 2. p. 166.) stems rather tetragonal, decumbent; leaflets linear-lanceolate, obtuse; stipulas furcate; peduncles 1-flowered, bracteolate at the apex, much shorter than the leaves; calycine teeth small, ac[illegible]; legumes compressed, glabrous [illegible] H. Native of Algiers. V. monántha, Retz. [illegible] 39. Willd. spec. 3. p. 1109. and enum. p. 7[illegible] blue and veined.

[illegible]red Vetch. Fl. July, Aug. Clt. 1790. Pl. cl.

[illegible] V. Bithy'nica (Lin. spec. 1038.) stems weak, leafy, an[illegible]ar, slightly branched; leaves with 2 pairs of lanceolate, mu[illegible]onate leaflets, hairy beneath; stipulas semi-sagittate, with [illegible]ep fringed teeth; peduncles axillary, 1-flowered; calyx hairy, [illegible]ith very long rather unequal fringed teeth; legumes erect, [illegible]road, slightly tumid, clothed with rigid tawny hairs. ♃. H. [illegible]ative of the south of Europe. In Britain in bushy places, on gravelly soil, often near the sea, near Doncaster, Yorkshire; [illegible]n woods, near Clifton-upon-Teme, Worcestershire; between Rockenhall and Sandbury, in the same county; in a field half way between Weymouth and Portland Ferry, near the sea, and on the coasts of Dorsetshire and Hampshire. Smith, engl. bot. 1842. Jacq. hort. vind. 2. p. 69. t. 147. Flowers with a purplish vexillum, and the keel and wings white, the former tipped with violet.

Bithynian Vetch. Fl. July, Aug. Britain. Pl. prostrate.

60 V. Syrìaca (Weinm. hort. dorp. 162.) plant glabrous; stems decumbent; leaves with 4-5 pairs of ovate-oblong, mucronate leaflets; stipulas linear, entire, small; legumes pedunculate, solitary, reflexed, 4-5-seeded. ⊙. H. Native of Syria. Flowers violaceous. Very like *V. calcaràta.*

Syrian Vetch. Fl. June, July. Clt. 1816. Pl. cl.

61 V. hu'milis (H. B. et Kunth, nov. gen. amer. 6. p. 498. t. 581.) stems weak; leaves with 2-3 pairs of linear-lanceolate, obtuse, mucronate, glabrous leaflets; tendrils simple; stipulas linear, acute, semi-sagittate; peduncles 1-flowered, shorter than the leaves; calycine segments long; legumes lanceolate; calyx and rachis clothed with adpressed down. ⊙. H. Native of Mexico, near Moran, at the height of 3990 feet above the level of the sea. Flowers rose-coloured.

Humble Vetch. Pl. cl.

§ 3. *Flowers nearly sessile, solitary.*

62 V. interme'dia (Viv. fl. lyb. p. 42. t. 19. f. 1.) leaves with 3-4 pairs of leaflets, lower ones obcordate, cuneated, superior ones linear, emarginate and mucronulate; tendrils obsolete; stipulas semi-sagittate; flowers solitary; calyx 10-nerved, gibbous at the base; legumes hairy, rather compressed. ⊙. H. Native of Cyrenaica, in meadows. Allied to *V. lathyroides* and *V. sativa*, according to Viviani. Flowers purple.

Intermediate Vetch. Fl. June, July. Pl. ½ foot.

63 V. pimpinelloìdes (Mauri, pl. rom. cent. 13. p. 35.) leaflets deeply crenated, superior ones quite entire; stipulas spotted, a little toothed, semi-sagittate; flowers usually solitary and almost sessile; calycine teeth elongated, ciliated; legumes erect, oblong, glabrous; seeds roundish, compressed. ⊙. H. Native of Italy, about Rome. Flowers purple?

Pimpernel-like Vetch. Fl. June, July. Pl. cl.

64 V. re'pens (D'Urv. enum. pl. arch. p. 88.) stems diffuse, branched at the base, trailing; leaflets usually 6, alternate, very narrow and acute; stipulas small; flowers axillary, solitary, almost sessile; legumes compressed, glabrous, 4-seeded. ♃. H. Native of the island of Melos, in dry places. Flowers pale purple, twice or thrice the length of the calyx. Root creeping.

Creeping Vetch. Pl. trailing.

65 V. globòsa (Rets. obs. 3. p. 39.) leaves tendrilled; leaflets 4-8, pubescent, each ending in a reflexed bristle; stipulas spotted, 4-toothed; flowers solitary, erect, almost sessile; calycine teeth linear-lanceolate, ciliated; legumes terete, spreading, glabrous; seeds globose. ⊙. H. Native [illegible] country unknown. Very like *V. sativ*[illegible] but differs [illegible] from it in the stipulas, in the longer calyx, [illegible] the form of the legume, and lastly in the fewer lea[illegible] [illegible]ers blue.

Globose-seeded Vetch. Fl. June, Aug. Clt. 1804. Pl. cl.

66 V. pilòsa (Bieb. fl. taur. 2. p. 161.) plant hairy; leaves hardly cirrhiferous, upper leaflets linear-lanceolate, acute, or truncate and mucronulate, hairy; stipulas semi-sagittate, a little toothed; flowers solitary, sessile; calyxes cylindrical, with linear, parallel, nearly equal segments, length of the tube; style bearded at the apex. ⊙. H. Native of Tauria. Flowers purple. Seeds globose, black.

Pilose Vetch. Fl. June, July. Clt. 1818. Pl. 1½ foot.

67 V. peregrìna (Lin. spec. 1038.) leaves tendrilled; leaflets 10-12, linear, truncate, and mucronate; stipulas semi-sagittate, linear, entire; flowers solitary, pedunculate; calyxes campanulate, with lanceolate-linear, nearly equal, diverging segments, which are about the length of the tube; style bearded at the apex; legumes compressed, lanceolate, reticulated, inclined, broad, puberulous; seeds nearly globose. ⊙. H. Native of the south of Europe. Hoppe in Sturm, deutschl. fl. 1. fasc. 32. with a figure. Flowers of a dusky violet colour.

Foreign Vetch. Fl. July, Aug. Clt. 1779. Pl. cl.

68 V. megalospe'rma (Bieb. fl. taur. 2. p. 161. and suppl. 471.) leaves cirrhiferous, leaflets linear, retuse, mucronate; stipulas semi-sagittate, entire, small; flowers solitary, almost sessile; style bearded at the apex; legumes pubescent, reflexed; seeds large, globose, brown, with more obscure confluent spots. ⊙. H. Native of Tauria. Flowers purple.

Large-seeded Vetch. Fl. June, July. Clt. 1798. Pl. cl.

69 V. Michau'xii (Spreng. cat. hort. hal. ex Willd. enum. 764.) leaflets linear, truncate, mucronate; stipulas lanceolate, undivided; peduncles very short, tufted; calycine teeth unequal, upper ones very short, lower ones length of the tube; legumes finely pubescent, 3-4-seeded. ⊙. H. Native country unknown. Corolla white. Nearly allied to *V. peregrìna*, but the calyxes are very distinct.

Michaux's Vetch. Fl. June, July. Clt. 1803. Pl. 1½ foot.

70 V. linearifòlia (Hook. in Beech. bot. p. 20.) plant pilose; stems angular; leaves with 5 pairs of linear retuse leaflets; tendrils usually simple, or almost so; stipulas broad, semi-sagittate, toothed at the base, dotless; flowers almost sessile, solitary; calyx campanulate, villous; teeth subulate, about equal; corolla glabrous; legumes hairy. ⊙. H. Native of Chili, about Conception. Flowers not half the size of those of *V. sativa.* Like *V. Michaùxii.*

Linear-leafletted Vetch. Pl. cl.

71 V. amphica'rpa (Dorth. journ. phys. 35. p. 131.) leaves tendrilled; lower leaflets obcordate, mucronate, upper ones linear, retuse, and mucronate; stipulas semi-sagittate, entire or

toothed; flowers solitary, almost sessile; calyxes cylindrical with equal, linear, parallel segments, which are shorter than the tube; style bearded at the apex; legumes reticulated, puberulous, stem ones linear-oblong, inclined, under-ground or root ones ovate, compressed, and short. ⊙. H. Native of the south of France, in gravelly places. Ger. mag. cno. ann. 6. vol. 3. p. 344. with a figure. D. C. fl. fr. no. 4021. Flowers crimson, hardly the size of those of *V. sativa.*

Both-sided-fruited or Underground-podded Vetch. Fl. May, June. Clt. 1815. Pl. cl.

72 V. Pyrena'ica (Pour. act. toul. 3. p. 333.) leaves tendrilled; leaflets obcordate, mucronate; stipulas semi-sagittate, entire or denticulated; flowers solitary, almost sessile; calyxes somewhat campanulate, with unequal, lanceolate, somewhat spreading segments, which are shorter than the tube; style bearded at the apex; legumes oblong-linear, reticulated, smoothish, and inclined. ♃. H. Native of the Pyrenees, in meadows. D. C. fl. fr. no. 4022. icon. rar. 1. p. 10. t. 33. Flowers purplish. Root creeping.

Pyrenean Vetch. Fl. May. Clt. 1818. Pl. ½ foot.

73 V. lathyroìdes (Lin. spec. 1037.) plant downy; stems branched; leaves cirrhiferous; leaflets 4-6, elliptic-oblong; lower ones obcordate, tendrils simple; stipules semi-sagittate, entire; flowers solitary, sessile; calyx cylindrical, with nearly equal, linear, parallel segments, which are shorter than the tube; style bearded at the apex; legumes compressed, reticulated, glabrous or wrinkled, inclined; seeds globose, dotted with warts. ⊙. H. Native of the south of Corsica, and Britain, in fallow fields on a gravelly soil, in chalky pastures, or on banks; about Norwich, and in Hyde-park, also in the King's-park, and various other places round Edinburgh. Sturm, deutschl. fl. 1. fasc. 31. Smith, engl. bot. 30. Oed. fl. 98. Jacq. misc. 2. p. 299. t. 18. E'rvum Soloniénse, Lin. spec. 1040. Flowers small, bluish purple, occasionally white.

Lathyrus-like Vetch. Fl. May, June. Britain. Pl. tr.

74 V. læviga'ta (Smith, engl. bot. 483. fl. brit. 2. p. 773.) plant quite smooth; stems nearly erect, quadrangular, branched; leaves cirrhiferous; leaflets 8, elliptic-lanceolate, rounded, and mucronulate; stipulas green or brownish, cloven; calycine segments linear, equal, about the length of the tube; legumes compressed, short, lanceolate-oblong, quite smooth. ♃. H. Native of the south of England, among pebbles by the sea-side, at Weymouth, Dorsetshire. V. hýbrida, Huds. fl. angl. 319. Flowers of a whitish or pale blue, seldom yellowish.

Smooth Vetch. Fl. July, Aug. Britain. Pl. ½ foot.

75 V. lu'tea (Lin. spec. 1037.) plant pilose; stems branched; leaves cirrhiferous; leaflets elliptic-lanceolate, sometimes retuse, hairy beneath; flowers solitary, almost sessile; calycine segments unequal, diverging, superior ones short, lower ones shorter than the tube; vexillum emarginate, glabrous; style bearded at the apex; legumes compressed, ovate-oblong, finely reticulated, pilose, bent down as it ripens; seeds oval, smooth. ⊙. H. Native of the south of Europe; in Britain on stony ground, chiefly near the sea; upon the pebbly beach at Orford, Suffolk; at Aldburgh; near Weymouth; Shoreham, Sussex; in a chalk pit on the side of Glastonbury Torhill; in Scotland, in Mearnshire. Sturm, fl. germ. 1. fasc. 31. with a figure. Smith, engl. bot. 481. Corolla pale yellow, rarely white.

Var. β, *muricàta* (Ser. mss. in D. C. prod. 2. p. 363.) fruit muricated. ⊙. H. Native about Tangiers.

Yellow-flowered Vetch. Fl. June, Aug. Britain. Pl. cl.

76 V. hi'rta (Balb. misc. alt. Pers. ench. 2. p. 308.) stems hairy; leaves cirrhiferous; leaflets linear, mucronate; vexillum glabrous; legumes sessile, solitary, pilose, reflexed. ⊙. H. Native about Nice, in fields. This plant comes very near *V. lùtea*, but differs in being more hairy, in the leaflets being narrower, and in the flowers being white or very pale cream-coloured.

Hairy Vetch. Fl. June, July. Clt. 1816. Pl. cl.

77 V. hy'brida (Lin. spec. 1037.) plant pilose; stems branched; leaves cirrhiferous; leaflets obcordate, mucronulate; stipulas semi-sagittate, a little toothed; flowers solitary, almost sessile, somewhat deflexed; calycine segments narrow, nearly equal, length of the tube; vexillum emarginate, pilose; style bearded at the apex; legumes lanceolate-oblong, compressed, finely reticulated, pilose, reflexed. ⊙. H. Native of Europe; in the south of England but very rare; on Glastonbury Torhill. Sturm, fl. germ. 1. fasc. 32. with a figure. Smith, engl. bot. 482. Jacq. hort. vind. 2. t. 146. Flowers pale yellow, streaked a little with red.

Hybrid Vetch. Fl. June, July. Britain. Pl. cl.

§ 4. *Flowers solitary, pedunculate.*

78 V. spu'ria (Rafin. car. p. 72.) stems procumbent, rather angular; leaves with 5-6 pairs of obovate, retuse, mucronate, pilose leaflets; stipulas ovate-lanceolate, spotless; flowers axillary, solitary, pedunculate, drooping; vexillum villous; legumes linear, compressed, 2-4-seeded. ⊙. H. Native of Sicily, near Palermo, and on mount Etna. Flowers yellowish.

Spurious Vetch. Pl. procumbent.

79 V. pusi'lla (Muhl. in Willd. spec. 3. p. 1106.) upper leaves furnished with long tendrils; leaflets usually 6, lanceolate, mucronate; stipulas quite entire, semi-sagittate; peduncles long, solitary, 1-flowered; legumes oblong, small, glabrous. ⊙. H. Native of Pennsylvania. Perhaps the same as *E'rvum tetraspérmum.* Flowers small, white with a tinge of red.

Small Vetch. Pl. cl.

80 V. cilia'ris (Smith, fl. græc. t. 700. ex prod. 2. p. 71.) leaflets about 7 pairs, emarginate; stipulas setaceously-multifid; peduncles 1-flowered, awned, length of the leaves. ♃. H. Native of Asia Minor. Tendrils many-parted. End of pedicels drawn out beyond the flower. Flowers pale blue, streaked with purple. Legumes 1 inch long, compressed, 2-seeded.

Ciliated-stipuled Vetch. Pl. cl.

81 V. melanòps (Smith, fl. græc. t. 701. ex prod. 2. p. 72.) stems diffuse; stipulas marked with black; wings depressed, incumbent; legumes solitary, reflexed, linear, glabrous. ♃. H. Native of Laconia. Flowers of a dull greenish-yellow; their wings, which converge horizontally, tipped with very dark brown. Very like *V. hýbrida.*

Black-marked Vetch. Pl. cl.

82 V. ba'ctra (Zucc. obs. bot. cent. 1. no. 83. A.) stem 2-edged, striated; leaflets wedge-shaped, retuse; stipulas toothed, upper segments dotted; legumes solitary, almost sessile. ⊙. H. Native country unknown.

Bactra Vetch. Pl. cl.

§ 5. *Flowers almost sessile, twin.*

83 V. inci'sa (Bieb. fl. taur. suppl. p. 471.) leaflets obovate, retuse, mucronate, deeply serrated; stipulas toothed, semi-sagittate; legumes sessile, usually twin, pubescent. ⊙. H. Native of Tauria. Very like *V. sativa*, but differs in the leaflets being very deeply cut into 2-4 opposite serratures on each side. Flowers purple.

Cut-leafletted Vetch. Fl. June, July. Clt. 1820. Pl. cl.

84 V. corni'gera (Chaub. in Saint Amans fl. agen. p. 294.) leaflets linear, very narrow, villous; stipulas entire, lower ones semi-sagittate, superior ones lanceolate; flowers almost sessile, twin; vexillum subulate, convolute, spiral. ⊙. H. Native of sandy places, near Agen. Flowers purple. It is perhaps only a narrow leafletted variety of *V. sativa.*

Horn-bearing Vetch. Pl. 1 foot.

85 V. CANADÉNSIS (Zucc. obs. bot. cent. 1. no. 83.) leaves with 7 pairs of retuse mucronate leaflets; upper stipulas simple, marked above, lower ones ciliately 4-toothed; superior legumes solitary, lower ones twin, and horizontal; seeds globose, lentiform, yellowish. ⊙. H. Native of Canada. Flowers purple?

Canada Vetch. Pl. cl.

86 V. CORDÀTA (Wulf. ex Hoppe in Sturm, deutschl. fl. 1. fasc. 32.) leaves cirrhiferous; leaflets 10-12, oblong-obcordate, mucronate; stipulas semi-sagittately-toothed; flowers usually twin, sessile; calyx cylindrical, with lanceolate-linear, nearly equal, somewhat parallel segments, which are about the length of the tube; legumes oblong, rather torulose, puberulous; seeds globose, variegated. ⊙. H. Native of Germany. Flowers purple. This plant comes very near *V. sativa*, but still it is very distinct.

Cordate-leafletted Vetch. Fl. June, July. Clt. 1816. Pl. cl.

87 V. DÙBIA (Schultes, obs. 149.) leaves with 6 pairs of linear-truncate or linear-lanceolate, mucronate, ciliated leaflets; stipulas marked, profoundly toothed; flowers usually twin; calyx striated, nerved, pubescent, with subulate teeth; legumes glabrous, terete, erect; seeds round, cream-coloured. ⊙. H. Native country unknown.

Doubtful Vetch. Pl. cl.

88 V. SATÌVA (Lin. spec. 1037.) leaves cirrhiferous: leaflets 6-10, obovate, or elliptic-oblong, retuse, mucronulate, pilose or smoothish; stipulas semi-sagittately-toothed; flowers usually twin, sessile; calyx cylindrical, with lanceolate-linear, nearly equal parallel segments, which are about the length of the tube; style bearded at the apex; legumes compressed, somewhat torulose, oblong, reticulated, erectish; seeds nearly globose, smooth, variable in colour. ♃. H. Native of Europe, in corn or cultivated fields; plentiful in Britain; also of North America about Fort Vancouver. Flowers purple. This is a very variable plant in the form of the leaflets, in the size of the stems, and in the colour and size of the seeds.

Var. α, obovàta (Ser. mss. in D. C. prod. 2. p. 361.) leaflets obcordate, pilose; legumes pubescent. V. sativa, Hoppe in Sturm, deutschl. fl. 1. fasc. 31. with a figure. V. sativa nemoràlis, Pers. ench. 2. p. 307. V. Helvética, Hort. prag. ex Gerhard. Flowers reddish purple.

Var. β, segetàlis (Ser. l. c.) leaflets oblong, truncate, pointed, pilose; legumes pubescent. ⊙. H. V. segetàlis, Thuil. fl. par. ed. 2. p. 367. et Hoppe in Sturm. l. c. with a figure. V. satìva, Smith, engl. bot. 331. Oed. fl. dan. t. 522. Mart. fl. rust. 116. V. Luganénsis, Schleich. in herb. Balb. Flowers reddish purple.

The *tare*, *vetch* or *fitch*, is called in French *vesce*; in German *wicke*; and in Italian *loglio*. It has been cultivated for its stems and leaves from time immemorial. Ray, in 1686, informs us that the common *tare* or *vetch* was then sown almost all over Europe; that it was chiefly used in England mixed with peas and oats to feed horses, but that it was sometimes sown separately for soiling cattle, and was reputed to cause milch cows to yield much milk. The *tare*, Brown observes, is of hardy growth, and when sown upon rich land will return a large supply of green fodder, for the consumption of horses or for fattening cattle.

The varieties of the *tare* are chiefly two, the *winter* and *spring-tare*: both have local names, as *gore-vetch*, *rath-ripe-vetch*, &c. Professor Martin observes, that there appears a material difference in the constitution of the two plants in question. Not to say any thing of a trifling difference in the colour and size of their seeds, the only visible mark of distinction seems to be a disparity in the first leaves of the upright stalks, which in the *spring-tare* are elliptic and rounded, or notched at the end, but in the *winter-tare* linear, and drawn to a point. The leaves of the branches, which afterwards issue below, and in time form the bulk of the plants, are the same in both the varieties. But whatever the difference may be, it is evident that the seeds of the two sorts ought to be kept separate, since each sown out of its proper season is found not to prosper. Numerous other species of *Vicia* might be cultivated with advantage, as the *V. Narbonénsis* and *V. serratifòlia*, which are cultivated in Germany. Dr. Anderson has recommended the *V. sèpium*, and a writer in the Bath Agricultural Transactions the *V. crácca*.

In choosing between the spring and winter tare every thing must depend on the intention of the crop. If the object is to have early food, the winter variety is undoubtedly to be preferred; but where the land is foul, and requires to be two or three times ploughed in spring, or where a late crop is desired, or a crop for seed, then the spring variety will generally deserve the preference. The soil preferred by the *tare* is clay; but it will grow in any rich soil, not over dry. In a moist climate, the haulm grows so luxuriant as to rot at the bottom, and in one over dry it is deficient of strength. A dry season is upon the whole more favourable than a moist one, as the crop soon covers the surface.

The preparation of the soil seldom consists of more than one ploughing if for autumn sowing, and of a winter and spring ploughing when to be sown in spring. If in the latter case the land is very foul, several ploughings are given. In general *tares* succeed some of the corn crops. In England, manure is sometimes given, either with a view to eating them off early, and following with a crop of turnips, or to the enriching the soil for a crop of wheat.

The time of sowing depends on the kind of *tare*, and the purpose in view. The winter variety is sown in September and October, and the first sowing in spring ought to be as early as the season will permit. If they are to be cut green for soiling throughout the summer and autumn, which is the most advantageous method of consuming them; successive sowings should follow till the end of May. Summer *tares*, when meant for seed, ought to be sown early, otherwise the return will be imperfect, but when for green food any time betwixt the first of April and the end of May will answer, provided crops in succession from the first to the last mentioned period be regularly cultivated. In Middlesex, the winter sowing is commenced about the beginning of August; in the northern counties no winter sowings are made, as the *tare* there will not endure the severity of that season.

The mode of sowing tares is mostly broad-cast, which should be performed as early as possible over well prepared land, the seeds being afterwards covered in by proper harrowing. It has been suggested, that in rich soil it is probable the row method would succeed well with this sort of crop, as Marshal states is the practice in some of the southern districts of the island. After the seed is sown, and the land carefully harrowed, a light roller ought to be drawn across, so that the surface may be smooth, and the scythe permitted to work without interruption. It is proper also to guard the field for several days against the depredations of pigeons, who are remarkably fond of *tares*, and will pick up a great part of the seed unless constantly watched.

The quantity of seed to an acre is from 2½ to 3½ bushels, according to the time of sowing, and as they are to be consumed green or left to stand for a crop. When *tares* are intended for seed less seed is required. A writer in the Farmer's magazine, vol. 1. has suggested that the most productive manner of sowing this crop when intended for seed, is to mix them amongst beans when drilled, at the rate of one firlot of *tares* to one boll of beans, and by this means the quality of *tares* is vastly improved, as by clinging to the beans they are kept from the ground, and enjoy the full benefit of the sun in ripening them in the most perfect manner. The beans at the same time answer for bands to tie the principal crop, and the produce in this way on an average of seasons is considered at least double. A little rye sown with the *winter-tares*, and a few oats with the *spring-tares*, not only serves to support the weak climbing stems, but adds to the bulk of the crop, by growing up through the interstices.

In the choice of the seed. It is hardly possible to distinguish the grain of the winter from that of the spring variety; the former is said to be rather smaller and lighter coloured, but the only reliance must be on the honesty of the vender.

The after culture given to tares, consists merely in pulling out the larger weeds, unless they are in rows, in which case the horse or hand-hoe is applied; or intended for seed, in which case the weeding must be more particularly executed.

In reaping tares for soiling, they ought always to be cut with the scythe, as the sickle by breaking asunder the stalks, and tearing up a number of the roots, renders the second crop of little value. When sown early, they will sometimes produce three mowings, but generally two. In reaping *tares* for seed, they may be either mown or cut down with the sickle, and treated like peas in drying, stalking, and threshing.

Tares are eaten off the ground in some places by different kinds of live stock, particularly by sheep; and as the winter-sown variety comes very early in spring, the value of this rich food is then very considerable. The waste, however, in this way must be very great, even though the sheep be confined by hurdles, and must be still greater when consumed by horses or cattle.

Tare crops are sometimes made into hay, in which case great attention is necessary in drying it properly. The best time for cutting *tares* for hay is when the blossoms have begun to decline and the *tares* begin to fall and lie flat. When well made the hay is of the best and most nutritious properties.

The produce of tares cut green is, according to Middleton, 10 to 12 tons the acre, which is a large crop, and when made into hay about 3 tons the acre, which shows the disadvantage of making these crops into hay. And it is found that the *spring-tare* crops are lighter and more likely to be injured by a dry season.

The produce in seed is likewise found to be considerable, being by some stated to be at from 3 to 6 sacks, but in other instances 40 bushels or more have been obtained from the acre.

In the application of tares they are found to be a most nourishing food for all sorts of cattle. Cows give more butter when fed with this plant than with any other food whatsoever. Horses thrive better upon *tares* than they do upon clover or rye-grass; and the same remark is applicable to the fattening of cattle, who feed faster upon this article of green fodder than upon any kind of grass or esculent plant whatever. Danger often arises from their eating too much, especially when the *tare* is podded, as colics and other stomach disorders are apt to be produced by the excessive loads which they devour, in consequence perhaps of the great quantity of fixed air contained in the plant. When the *tares* are over succulent, fewer dangers would follow if the *tares* were mixed with oat-straw in the stalls. If the plants are cut green and given to live stock, either on the field or in the fold-yards, there is perhaps no green crop of greater value, nor any better calculated to give a succession of herbage from May to November. The winter-sown *tare*, in a favorable situation, is ready for cutting before clover. The first spring crop comes in after the clover must be all consumed or made into hay, and the successive spring sowings give a produce more nourishing for the larger animals than the after math of clover, and may afford green food at least a month longer. In the county of Sussex, Young observes, " *tare* crops are of such use and importance, that not one-tenth of the stock could be maintained without them: horses, cows sheep, hogs, all feed upon them: hogs are soiled upon them without any other food. This plant maintains more stock than any other plant whatsoever. Upon an acre, Davies maintained 4 horses in much better condition than upon 5 acres of grass. Upon 8 acres he has kept 12 horses and 5 cows for three months, without any other food whatever. No artificial food is equal to this excellent plant." This statement must be coupled with the usual produce of turnips in Sussex, 10 or 15 tons per acre, hence the superiority of *tares* to every other green crop. *Tares* cut green, Professor Thaer observes, draw no nourishment from the soil whatever, while made into hay they afford a fodder preferred by cattle to peas-straw, and more nutritive than hay or any other herbage.

The use of the grain of tares, is usually for sowing; but they are also given to pigeons, by whom they are highly relished, and it is thought they would form a very good food for poultry. In Germany they are given to horses, cows, sheep, and swine.

The diseases of tares are so few as to be of no consequence. A crop is sometimes, but rarely, lost by the mildew.

Common or *Cultivated* Vetch or Tare. Fl. May, July. Britain. Pl. cl.

89 V. ANGUSTIFÒLIA (Roth. tent. fl. germ. p. 310.) leaves cirrhiferous; leaflets 10-12, linear-lanceolate, lower ones obcordate, mucronulate, pilose, or smoothish; stipulas semi-sagittately toothed; flowers twin, sessile: calycine segments linear, nearly equal: legumes compressed, somewhat torulose, erectish, reticulated; seeds globose, black. ⊙. H. Native of Europe, in corn-fields. Engl. bot. suppl. 2614. V. sativa β, Lin. l. c. Smith, engl. fl. 3. p. 381.—Sturm, deutschl. fl. 1. fasc. 31. with a figure. V. Luganénsis, Schleich. exsic. ex herb. D. C. V. lathyroìdes, Huds. angl. ed. 2. p. 318. but not of Lin. Flowers purplish-crimson.

Narrow-leaved Vetch. Fl. May, June. Britain. Pl. cl.

90 V. GLA`BRA (Schleich. ex pl. exsic.) leaflets oblong-ovate, rather truncate and mucronate, glabrous, as well as the legumes and calyxes; the rest as in *V. satìva*. ⊙. H. Native of Switzerland, in fields. V. satìva, var. ε, glàbra, Ser. in D. C. prod. 2. p. 361. Flowers purple.

Glabrous Vetch. Fl. May, July. Clt. 1819. Pl. cl.

91 V. BOBA`RTII (Forst. in Lin. trans. vol. 16. p. 442.) leaves cirrhiferous, rather hairy; leaflets 6-7 linear, lower ones obcordate; stipulas small, narrow, toothed, with a pale depression beneath; flowers solitary, nearly sessile; legume nearly upright, narrow, downy; finally blackish; seed globose, smooth. ⊙. H. Native of England, in grassy pastures, on a chalky or gravelly soil; in Essex; on Shotover-hill, Oxfordshire; in Stow wood; in Hyde-park; among the grass in Richmond Gardens; also in Scotland. V. angustifòlia, Smith, eng. fl. 3. p. 382. V. angustifòlia, β, Pers. V. lathyroìdes, Dicks. V. lathyroìdes, β, Huds. V. satìva, γ, Smith, fl. brit. 770. Flowers crimson, white at the keel and lower edge of the wings.

Bobart's Vetch. Fl. May, July. Britain. Pl. cl.

92 V. LEUCOSPE`RMA (Mœnch. meth. 148.) leaves cirrhiferous; leaflets 10-12, obcordate, pilose or glabrous; stipulas semi-sagittately toothed; flowers usually twin, sessile; calyx cylindrical, with linear-lanceolate, nearly equal segments; legumes somewhat torulose; seeds globose, white, or yellow. ⊙. H. Native of Europe. V. álba, Mœnch. meth. 148. Flowers white or purple.

White-seeded Vetch. Fl. May, July. Clt. 1810. Pl. cl.

93 V. GRANDIFLÒRA (Scop. fl. carn. 2. p. 65. t. 42.) leaves cirrhiferous; leaflets obcordate, mucronate, 10-12, approximate; stipulas ovate; flowers usually twin, inclined; calycine segments nearly equal, length of tube; vexillum obovate, mucronulate; style bearded at the apex; legumes oblong, com-

pressed, glabrous, brown; seeds globose, blackish red. ⊙. H. Native of Carniola, and other parts of Europe. Flowers large, yellow. The vexillum edged with red.

Great-flowered Vetch. Fl. June, July. Clt. 1818. Pl. cl.

94 V. SO'RDIDA (Waldst. et Kit. pl. rar. hung. 2. p. 133. t. 133.) stems branched; leaves cirrhiferous; leaflets 10-12, obovate, retuse, mucronate; stipulas semi-sagittate, entire, spotted; flowers usually twin, inclined; calyx cylindrical; the segments hardly unequal, linear, a little shorter than the tube, parallel; vexillum large, somewhat obcordate and mucronulate; style bearded at the apex; legumes lanceolate, compressed, declinate, smoothish, reticulated; seeds somewhat globose. ⊙. H. Native of Hungary. Sturm, fl. germ. 1. fasc. 31. with a figure. Flowers large, yellow tinged with green, pedicellate.

Var. β, *rotundàta* (Ser. mss. in D. C. prod. 2. p. 363.) leaflets roundish-obcordate.

Sordid-flowered Vetch. Fl. June, July. Clt. 1802. Pl. cl.

95 V. BIEBERSTEI'NII (Besser. in Bieb. fl. taur. suppl. 492.) leaves cirrhiferous; leaflets 8-10, linear, rather truncate and mucronulate; stipulas semi-sagittate, lanceolate, spotted; flowers usually twin; calyx cylindrical, with hardly unequal, linear segments, which are a little shorter than the tube; legumes nearly sessile, usually solitary and spreading, glabrous. ⊙. H. Native of Podolia. V. sórdida, Bieb. fl. taur. 2. p. 161. exclusive of the synonymes. Flowers yellow.

Bieberstein's Vetch. Fl. June, July. Clt. 1820. Pl. cl.

96 V. LINEA'TA (Bieb. fl. taur. suppl. 473.) leaflets linear-elliptic, pilose; stipulas spotted, lower ones deeply toothed; flowers usually twin, almost sessile; calycine teeth broadish, shorter than the tube, glabrous; style bearded at the apex; vexillum glabrous, lined; legumes very pilose. ⊙. H. Native of Tauria. Flowers pale yellow?

Lined-flowered Vetch. Pl. 1½ foot.

97 V. BIPARTI'TA (Mœnch. meth. p. 149.) leaves cirrhiferous; leaflets 5-7, linear, obtuse, acuminated; stipulas lanceolate, bipartite; peduncles twin, longish; calycine teeth lanceolate; legumes terete, glabrous, 6-8-seeded. ⊙. H. Native country unknown.

Bipartite-stipuled Vetch. Pl. cl.

98 V. BA'CLA (Mœnch. meth. p. 148.) leaflets oblong, obtuse, and mucronulate; stipulas semi-lunate, toothed; flowers twin; legumes erect, smooth; calyx glabrous; seeds somewhat compressed, olive-coloured. ⊙. H. Native country unknown.

Bacla Vetch. Pl. cl.

99 V. BI'COLOR (Willd. enum. suppl. p. 51. ex Horn. hort. hafn. suppl. p. 81.) leaflets oblong, obtuse; stipulas subulate, with one tooth at the base; peduncles naked, usually twin? shorter than the leaves. ⊙. H. Native country unknown. Flowers mixed with purple and white.

Two-coloured-flowered Vetch. Fl. Ju. Aug. Clt. 1820. Pl. cl.

§ 6. *Flowers almost sessile, 2-4-together, on very short pedicels, or few flowers on very short peduncles.*

100 V. TRI'COLOR (Sebast. et Mauri, prod. fl. rom. p. 245. t. 4.) stems simple; leaves cirrhiferous; leaflets numerous, oblong, retuse, and mucronulate, villous; stipulas semi-sagittate, lanceolate, spacelate; flowers 3-together, inclinate; calyx obliquely-campanulate, with unequal, diverging teeth, which are shorter than the tube; vexillum dotted with rust colour; style bearded at the apex; legumes lanceolate, glabrous, ciliated, reflexed. ⊙. H. Native about Naples. Vexillum yellowish. Wings purplish.

Var. α, *obcordàta* (Ser. in D. C. prod. 2. p. 364.) leaflets obcordate, truncate, clothed with silky villi beneath.

Var. β, *oblónga* (Ser. l. c.) leaflets oblong, somewhat truncate, and mucronulate.

Three-coloured-flowered Vetch. Fl. Ju. Aug. Clt. 1818. Pl. cl.

101 V. SE'PIUM (Lin. spec. 1038.) stems branched; leaves cirrhiferous; leaflets 10-12, ovate, retuse, and somewhat mucronulate, hairy, ciliated; stipulas semi-sagittate, lower ones toothed, each marked with a brown spot; flowers 3-4-together, leaning one way; calyx hairy, tubular, with unequal teeth, which are deflexed at the apex and shorter than the tube; style bearded at the apex; legumes smooth, lanceolate-oblong, inclinate, a little ciliated, reticulated; seeds globose, smooth. ♃. H. Native of Europe, in shady places. In Britain in thickets and under hedges, common. Sturm, fl. germ. 1. fasc. 31. with a figure. Smith, engl. bot. 1515. Oed. fl. dan. 699. Riv. tetr. irr. t. 56. Flowers dull bluish purple. This plant shoots earlier in spring than any other plant eaten by cattle, vegetates in the autumn, and continues green all the winter. A patch sown in drills in a garden was cut five times in the course of the second year, and produced at the rate of 24 tons an acre of green food, which when dry would weigh near four tons and a half. Though palatable to all kinds of cattle, it would be difficult to cultivate on a large scale, the seeds being generally devoured by the larvæ of a species of *Attelabus*, which larvæ are the prey of a species of *ichneumon*.

Var. α, *ochroleùca* (Bast. suppl. no. 8. D. C. fl. fr. 5. p. 581.) flowers cream-coloured.

Var. γ, *subrotúnda* (Ser. mss. in D. C. prod. 2. p. 364.) leaflets ovate-roundish; flowers violaceous.

Var. δ, *capsélla* (Ser. l. c.) leaflets obcordate, similar in shape of the pods to *Capsélla;* flowers 1-3-together, white? Native of the Levant.

Hedge Vetch. Fl. May, July. Britain. Pl. cl.

102 V. PANNÓNICA (Jacq. fl. aust. t. 34.) plant pilose; stems simple; leaves cirrhiferous; leaflets oblong, mucronate; stipulas lanceolate, marked; flowers from 2-4-together, inclinate, almost sessile; calycine segments setaceous, nearly equal, length of the tube or longer; vexillum pilose and emarginate; style bearded at the apex; legumes oblong-lanceolate, compressed, pilose, deflexed. ⊙. H. Native of Hungary and Austria. Sturm, fl. germ. 1. fasc. 31. with a figure. Flowers dirty white.

Pannonian Vetch. Fl. June, July. Clt. 1658. Pl. cl.

103 V. STRIA'TA (Bieb. fl. taur. 2. p. 162.) plant beset with hairs; leaves cirrhiferous; leaflets elliptic, oblong, acute, clothed with silky pili beneath; stipulas lanceolate, marked; vexillum clothed with silky pili; legumes pedunculate, 2 or 3-together, reflexed, clothed with silky pili. ♃. H. Native of Tauria. Vicioides hirsùta, Mœnch. meth. 137. V. Pannónica β, Willd. spec. 3. p. 1107. V. purpuráscens, D. C. hort. monsp. 155. V. Pannónica β, purpuráscens, Ser. in D. C. prod. 2. p. 364. Flowers violaceous and streaked, wings and keel paler.

Var. β, *linearifòlia*; flowers purple; leaflets linear-oblong, mucronulate. V. Pannónica γ, linearifòlia, Ser. l. c.

Striated-flowered Vetch. Fl. June, July. Clt.? Pl. cl.

104 V. TRUNCA'TULA (Fisch. cat. hort. gorenk. 1812. p. 72. ex Bieb. fl. taur. suppl. p. 473.) stems almost simple, striated, glabrous; leaflets elliptic, truncate, and mucronulate at the apex, puberulous, with numerous diverging nerves; tendrils almost obsolete; stipulas semi-sagittate, ovate, small, acuminated; peduncles almost sessile, few-flowered; calyx pilose, black, with nearly equal teeth, which are shorter than the tube; style bearded; legumes lanceolate. ♃. H. Native of Caucasus. Flowers cream-coloured. This plant is nearly allied to *V. sèpium*, but with the leaves impari-pinnate, as in *V. Cassùbica.*

Var. β, *glabriùscula* (Ser. in D. C. prod. 2. p. 364.) plant less pubescent, teeth of calyx short and rather spacelate. Native of Iberia.

Truncate-leafletted Vetch. Fl. June, Aug. Clt. 1818. Pl. 1 foot.

§ 7. Annual plants, with broad leaflets, resembling the common bean.

105 V. NARBONE'NSIS (Lin. spec. 1038.) stem tetragonal, striated, quadrifariously pilose; leaves cirrhiferous; leaflets ovate, entire; stipulas semisagittately toothed, ciliated, lower ones entire; flowers 2-3-4-together, on short pedicels; calyx campanulate, with ovate, 3-nerved segments, having the sides reflexed above; style bearded at the apex; legumes oblong, compressed, obliquely reticulated, glabrous, with ciliately-serrated sutures; seeds nearly globose. ⊙. H. Native of the south of Europe. Flowers dark purple. Knor. del. 2. t. L. 1. Riv. tet. t. 40. This plant might be cultivated with advantage as tares. Leaflets 4.

Narbonne Vetch. Fl. June, July. Clt. 1596. Pl. cl.

106 V. SERRATIFÒLIA (Jacq. fl. aust. append. t. 8.) stem tetragonal, striated, pilose; leaves cirrhiferous; leaflets ovate, serrated; peduncles short, 2-3-flowered; stipulas toothed; calyx campanulate, with ovate, 3-nerved segments, which are inflexed at the sides above; style bearded at the apex; legumes lanceolate, compressed, with ciliately-serrated sutures; seeds nearly globose. ⊙. H. Native of Austria and Hungary. Sturm, fl. germ. 1. fasc. 32. with a figure. Flowers deep purple. V. Narbonénsis, var. *a*, serratifòlia, Ser. in D. C. prod. 2. p. 365. Very like *V. Narbonénsis*, but differs in the serrated leaflets.

Serrate-leafletted Vetch. Fl. June, Aug. Clt. 1723. Pl. cl.

107 V. PLATYCA'RPOS (Roth. abandl. 10. t. 1.) leaflets ovate, toothed at the apex; stipulas ciliately toothed; style bearded at the apex; legumes almost sessile, solitary, compressed, a little inflated; seeds with scabrous margins. ⊙. H. Native country unknown. Flowers deep purple. J. Bauh. hist. 2. p. 286. with a figure. Perhaps only a variety of *V. Narbonénsis*. Leaflets 2 or 4.

Broad-fruited Vetch. Fl. June, Aug. Clt. 1723. Pl. cl.

108 V. MONADE'LPHA (Roth, cat. bot. part 2. p. 97. ex Poir. dict. 8. p. 568.) leaves cirrhiferous; leaflets oval, repand-toothed; stipulas semi-lunate, laciniately-toothed, upper ones entire at the apex; peduncles 6-flowered; calycine segments unequal, 2 superior ones lanceolate, and rather falcate, lower one very long and linear, and ciliated at the apex; legumes terete. ♂. H. Native of America. Flowers deep purple.

Monadelphous Vetch. Fl. June, Aug. Clt. 1820. Pl. cl.

† *The names of species mentioned in various garden catalogues, but not described. Most of them are probably synonymous with those described above.*

1 *V. Bæ'tica*, Fisch. 2 *V. Còris*, Thouin. 3 *V. ferruginea*, Bess. 4 *V. grácilis*, Russell. 5 *V. hirsùta*, Fisch. 6 *V. hirsutíssima*, Cyrill. 7 *V. Músquincz*, Bosc. 8 *V. nodòsa*, Fisch. 9 *V. Thouíni*, Martius. 10 *V. torulòsa*, Desf. 11 *V. Virgínica*, Martius.

Cult. The species grow in any common soil. The perennial ones are increased by dividing the roots or by seeds. The seed of the annual kinds only require to be sown in the open border in spring. All those belonging to the first division of the genus are worth cultivating for the beauty of their blossoms.

CLXX. E'RVUM (from *erw*, tilled land, in Celtic; some of the species are a pest in cultivated fields). Lin. gen. 874. D. C. fl. fr. 4. p. 598. prod. 2. p. 366.

LIN. SYST. *Diadélphia, Decándria.* Calyx 5-cleft, with linear acute segments, about equal in length to the corolla. Stigma glabrous. Legume oblong, 2-4-seeded.

SECT. I. LE'NS (the Latin name of the lentil, which is the Celtic name for the plant). Ser. mss. in D. C. prod. 2. p. 366. —Léns, Tourn. inst. t. 210. Legumes somewhat inflated, broad, oblong, 2-seeded.

1 E. LE'NS (Lin. spec. 1039.) stems branched; leaflets oblong, usually 8, nearly glabrous; stipulas lanceolate, ciliated; tendrils nearly simple; peduncles 2-3-flowered, about equal in length to the leaves; legumes broad, short, somewhat truncate, finely reticulated, glabrous, 2-seeded; seeds compressed. ⊙. H. Native of Europe, in corn-fields. Sturm, fl. germ. 1. fasc. 32. with a figure. Riv. tetr. irr. t. 35. Léns esculénta, Mœnch. meth. p. 131. Cìcer punctulàtum, Hortul. Flowers small, pale blue, with the vexillum veined. There are varieties of this plant with fulvous, bay-coloured, and black seeds, varying in size. The *lentil* is called *Les lentils* in French, *Lentzen* in German, and *Lenticcia* in Italian. It is a legume of great antiquity, being in esteem in Esau's time, and much prized in eastern countries ever since. In Egypt and Syria the seeds are parched in a frying-pan and sold in the shops, and considered by the natives as the best food for those who undertake long journeys. The *lentil* is considered a native of France, but has been known in England from the earliest agricultural records. In Gerarde's time they were sown like tares, their haulm given to cattle, and the grain to pigeons, and used in meagre soups.

There are three varieties of *lentil* cultivated in France and Germany; the small brown, which is highest flavoured, and the best for haricots and soups; the yellowish, which is the largest and the next best; and the *Lentil of Provence*, which is almost as large as a pea, with luxuriant straw, and more fit to be cultivated as a tare, than for the grains as human food. A dry warm sandy soil is requisite for the *lentil*; it is sown rather later than the pea, at the rate of a bushel or a bushel and a half per acre, in other respects its culture and harvesting are the same, and it ripens sooner. The *lentil*, Young observes, is a crop not uncommon about Chesterford, in Essex, where they sow a bushel an acre on one ploughing in the beginning or middle of March. It is there the custom to make hay of them, or seed them for cutting into chaff for trough-meat for sheep and horses, and they sow them on both heavy and dry soils. It is, however, added, that the whole county is of a calcareous nature. It is likewise stated, that attention should be paid not to water horses soon after eating this sort of food, as it is apt to hove them. They are likewise asserted to be cultivated for the same purposes in Oxfordshire, and probably in other districts. The produce of the *lentil* in grain is about one-fourth less than that of the tare, and in straw it is not a third as much, the plants seldom growing above 1 or 1½ foot in length. The straw is, however, very delicate and nourishing, and preferred for lambs and calves, and the grain on the Continent sells at nearly double the price of peas. Einhoff obtained from 3840 parts of *lentils*, 1260 parts of starch, and 1433 of matter analogous to animal matter.

The use of the *lentil* on the Continent is very general, and particularly by Roman Catholics in time of Lent, both in soups and dressed in butter sauce as haricot. They are imported from Hamburgh and sold in London for the same purposes.

Lentil. Fl. May, Aug. Clt. 1548. Pl. cl.

2 E. NI'GRICANS (Bieb. fl. taur. 2. p. 164.) plant pubescent; leaflets oblong; stipulas semi-sagittate, denticulated at the base; tendrils nearly obsolete; peduncles usually 2-flowered, longer than the leaves; calycine segments rather diverging, subulate, longer than the corolla; tube of calyx very short; legumes black, glabrous, 2-seeded; seeds black. ⊙. H. Native of the south of Tauria and of Lucania. E. lentoìdes, Tenor. prod. suppl. 2. p. 68. and cat. 1819. p. 56. Flowers pale blue.

Black-podded Lentil. Fl. June, July. Clt. 1817. Pl. cl. 1 ft.

3 E. LENTI'CULA (Schreb. herb. ex Sturm, fl. germ. 1. fasc. 32. with a figure) leaflets oblong-linear; stipulas small, lanceolate, acute; tendrils almost wanting; peduncles 1-flowered, longer than the leaves; calycine segments lanceolate-linear, equal, ciliated; legumes somewhat ovate, compressed, rather

truncate, puberulous, 2-seeded; seeds globose, dotted with black. ⊙. H. Native of Carinthia, in fields. E. Soloniénse, Wulf. in Schranck, pl. rar. t. 48. E. uniflòrum, Tenore, prod. suppl. 2. p. 68. Sebast. pl. rom. fasc. 2. p. 13. t. 4. Cìcer ervoìdes, Brig. pl. foro-juliens, 27. Flowers blue.

Small Lentil. Fl. June, July. Clt. 1820. Pl. 1 foot.

4 E. vicioìdes (Desf. fl. atl. 2. p. 168. t. 198.) plant hairy; leaves cirrhiferous, with many leaflets; leaflets oval-oblong, obtuse, and mucronate; stipulas subulate; peduncles few-flowered; calyx very pilose, with the segments longer than the tube; legumes hairy, rhomboid, reticulated, 2-seeded; seeds roundish, black. ⊙. H. Native of Algiers, in hedges. E. viciæfórme, Spreng. syst. 3. p. 270. Corolla pale blue, twice the length of the calyx.

Vetch-like Lentil. Pl. cl.

5 E. hirsu'tum (Lin. spec. 1039.) leaves cirrhiferous; leaflets linear, retuse, mucronulate; stipulas semi-sagittate, narrow; peduncles 3-7-flowered, shorter than the leaves; calycine segments lanceolate-linear, equal, longer than the tube; legumes oblong, compressed, rather truncate, hairy, finely reticulated, nodding, 2-seeded; seeds globose, variegated. ⊙. H. Native of Europe, in cultivated fields; plentiful in Britain: also of North America, at Fort Vancouver. Sturm, fl. germ. 1. fasc. 32. with a figure. Smith, engl. bot. 971. Curt. fl. lond. 54. Oed. fl. dan. 639. V. Michélli, Rafin. ex Ell. car. 2. p. 224. D. C. prod. 2. p. 360? Flowers small, pale blue, or almost white. This is a very troublesome weed in corn-fields; in wet seasons whole crops are overpowered by it. All sorts of cattle will eat it. In some parts of England it is known by the name of *Tine-tare.*

Hairy Lentil or Tine-tare. Fl. June, July. Brit. Pl. cl.

6 E. Cochinchine'nsis (Pers. ench. 2. p. 309.) leaflets 3, nearly lanceolate, wrinkled, and pilose; peduncles many-flowered; legumes terete, acuminated, 2-seeded; seeds globose. ⊙. H. Native of Cochin-china. E. hirsùtum, Lour. cochin. p. 461. Flowers purplish.

Cochin-china Lentil. Pl. 2 feet.

7 E. Terro'nii (Tenore, fl. neap. prod. append. 5. 1826.) leaves cirrhiferous, with 8 pairs of linear-elliptic, truncate, rather mucronate, glabrous leaflets; peduncles awned, 4-8-flowered, much shorter than the leaves; calycine segments lanceolate-linear, equal, pubescent, and about the length of the corolla; legumes glabrous, ovate, truncate, inflated, reticulated; seeds bay-coloured. ⊙. H. Native of Naples, in hedges. This plant differs from *E. dispérmum* in being smooth, and in the peduncles being many-flowered.

Terrone's Lentil. Pl. cl.

8 E. dispe'rmum (Roxb. in Willd. enum. p. 766.) leaflets linear-lanceolate, pubescent; peduncles 2-flowered, awned; legumes glabrous, 2-seeded. ⊙. H. Native of the East Indies. Peduncles and calyxes pubescent.

Two-seeded Lentil. Fl. June, July. Clt. 1802. Pl. cl.

9 E. camelòrum (Spreng. syst. 3. p. 270.) peduncles 1-flowered, nodding, awned; legumes 2-seeded, glabrous; leaves pubescent, upper ones cirrhiferous, with 6-8 pairs of leaflets, lower ones oblong, upper ones linear, mucronate. ⊙. H. Native country unknown.

Camel's Lentil. Pl. cl.

Sect. II. Erví'lia (an alteration from the generic name). Ser. mss. in D. C. prod. 2. p. 366.—Ervília, Link. enum. vol. 2. Legumes somewhat inflated, oblong-linear, 4-6-seeded.

10 E. Ervília (Lin. spec. 1040.) plant glabrous; leaves cirrhiferous; leaflets numerous, oblong, mucronulate; flowers usually twin, pedunculate; stipulas sub-lanceolate, toothed; calycine segments equal, very narrow, much longer than the tube; legumes torulose, 4-seeded, glabrous, transversely and finely reticulated; seeds roundish, angular. ⊙. H. Native of the south of Europe, in cultivated fields. Sturm, fl. germ. 1. fasc. 32. with a figure. Riv. tetr. irr. t. 6. Blackw. icon. t. 208. t. 3. Vicia Ervília, Willd. spec. 3. p. 1103. Ervília satìva, Link. enum. 2. p. 240. Flowers pale purple. The seeds of this plant ground into flour are sometimes used in medicines abroad, and the green herb is employed for feeding cattle in some countries, but the plant is not worth cultivating for that purpose in England.

Ervil or Bastard Lentil. Fl. June, July. Clt. 1596. Pl. cl.

11 E. mona'nthos (Lin. spec. 1040.) stems tufted, simple; leaflets numerous, linear, truncate, and mucronulate; tendrils almost simple; stipulas unequal, one of which is linear-lanceolate, and entire; the other very narrow, and fringed; peduncles 1-flowered, about equal in length to the leaves; calycine segments linear, equal, longer than the tube; legumes oval, compressed, glabrous, with transverse reticulated veins, torulose, 3-4-seeded. ⊙. H. Native of the south of Europe. Sturm, fl. germ. 1. fasc. 32. with a good figure. Vicia articulàta, Willd. spec. 3. p. 1109. Láthyrus monánthos, Willd. enum. 760. but not of his spec. pl. Vìcia multífida, Wallr. fl. hal. suppl. 3. p. 85. Flowers purple, with blue veins.

One-flowered Lentil. Fl. June, July. Clt. 1798. Pl. cl.

12 E. tetraspe'rmum (Lin. spec. 1039.) stems tufted, branched; leaves cirrhiferous; leaflets 4-6 pairs, oblong, bluntish, mucronulate; stipulas lanceolate, semi-sagittate; peduncles 1-4-flowered, but usually 2-flowered, filiform; calycine segments unequal, broadish, shorter than the tube; legumes oblong, compressed, glabrous, nerveless, rather torulose; seeds nearly globose, black. ⊙. H. Native of Europe, in cultivated fields; also of North America, in Upper Canada, in grassy meadows. Sturm, fl. germ, 1. fasc. 32. with a good figure. Curt. lond. 1. t. 55. abr. 15. Smith, engl. bot. 1223. Oed. fl. dan. t. 95. Flowers very pale grey. The keel tipped with deep blue.

Var. β, phyllocárpon (Ser. mss. in D. C. prod. 2. p. 367.) leaflets numerous, transformed into legumes.

Four-seeded Lentil. Fl. June, July. Britain. Pl. cl.

13 E. gra'cile (D. C. cat. hort. monsp. 109. et fl. fr. 5. p. 581.) stems ascending, angular, with the angles pubescent above; tendrils simple; leaflets 6-8, linear-lanceolate, acuminated, rather pubescent; stipulas semi-sagittate, entire, narrow; peduncles 3-flowered; flowers secund, pendulous; calycine teeth unequal, 2-superior ones short, broad, and a little recurved, the lower 3 equal, awl-shaped, and acute; corolla one-half longer than the calyx; legumes pendulous, compressed, torulose, glabrous; seeds of a testaceous colour, nearly globose. ⊙. H. Native of France and Spain, in corn-fields. Vìcia grácilis, Lois. fl. gall. p. 460. f. 12. E. tenuifòlium, Lagasc. nov. gen. p. 22. E. tenuissimum, Pers. ench. 2. p. 309. E. longifòlium, Tenor. prod. p. 59. Vìcia laxiflòra, Brot. phyt. 123. E. tetraspérmum β, grácile, Ser. Flowers white, having the vexillum streaked with purple or red.

Slender Lentil. Fl. June, July. Clt. 1822. Pl. cl. 1 foot.

14 E. pube'scens (D. C. cat. hort. monsp. p. 109. fl. fr. 5. p. 582.) stems tufted, branched; leaves cirrhiferous; tendrils forked; leaflets 4-6, elliptic, mucronulate; stipulas linear; peduncles 1-4-flowered, filiform; calycine segments unequal, broadish, shorter than the tube; legumes oblong, compressed, rather villous, nerveless, and a little torulose. ⊙. H. Native of Provence, and about Naples. Flowers purplish?

Var. β, leiocárpum (Moricand, herb.) legumes glabrous; stems smaller. Native about Naples.

Pubescent Lentil. Fl. June, July. Clt. 1820. Pl. cl.

15 E. Loiseleu'rii (Bieb. fl. taur. suppl. p. 475. exclusive of the synonyme of Lois.) leaflets oblong-linear; lower stipulas semi-hastate, upper ones subulate; peduncles usually 2-flow-

ered, shorter than the leaves; teeth of calyx setaceous, longer than the tube; legumes glabrous, 4-seeded; seeds globose. ⊙. H. Native of Tauria. This is perhaps nothing else but *E. tetraspérmum*.

Loiseleur's Lentil. Pl. cl.

16 E. ARISTA'TUM (Rafin. prec. p. 38. and in Desv. journ. bot. 1814. p. 270.) stems weak, angular; leaves with 3 pairs of linear acute leaflets; tendrils simple; peduncles axillary, very long, awned, and for the most part bearing 2 flowers each; legumes 2-6-seeded. ⊙. H. Native of Sicily, on mount Etna, and near Messina.

Awned-peduncled Lentil. Pl. cl.

17 E. DIPHY'LLUM (Besser in Balb. cat. hort. taur. 1813. append. 1. p. 11.) leaflets unknown: stipulas lanceolate; tendrils obsolete, having 2, rarely 4 leaflets; peduncles 1-flowered, longer than the leaves; legumes finely pubescent. ⊙. H. Native country unknown. Besser. cat. hort. lyc. volh. suppl. mss. no. 24.

Two-leaved Lentil. Pl. cl.

18 E. VA'RIUM (Brot. fl. lus. 2. p. 152.) leaflets linear, acutish, pubescent beneath; peduncles 3-4-flowered; legumes glabrous; seeds 4-5, globose. ⊙. H. Native of Portugal, about Coimbra. Flowers purplish?

Variable Lentil. Pl. cl.

Cult. None of the species of this genus are worth cultivating unless in botanical gardens. The seeds of them only require to be sown in the open border in spring.

CLXXI. PI'SUM (*pis* in Celtic means a pea, hence *pisum* in Latin). Tourn. inst. 394. t. 215. D. C. prod. 2. p. 368.—Pisum spec. of Lin.

LIN. SYST. *Diadélphia, Decándria.* Calyx with foliaceous segments, the 2 superior ones shortest. Vexillum ample, reflexed. Style compressed, carinated, villous above. Legume oblong, rather compressed, but not winged. Seeds globose, numerous, with a roundish hylum.—Annual herbs, with abruptly-pinnate cirrhiferous leaves, having 3 pairs of leaflets, and large foliaceous stipulas.

1 P. SATI'VUM (Lin. spec. 1026.) petioles terete, bearing 3 pairs of ovate, entire, glaucous leaflets, with undulated margins, usually opposite and mucronulate; stipulas ovate, somewhat cordate, crenated at the base; peduncles 2 or many-flowered; legumes rather fleshy. ⊙. H. Native of the south of Europe, and now cultivated in fields and gardens throughout the world. Lam. ill. 633. Flowers white or red.

Var. α, saccharàtum (Ser. mss. in D. C. prod. 2. p. 368.) stem tall; legumes rather coriaceous, between terete and compressed; seeds globose, distant. Lam. ill. 633. Tourn. inst. t. 215. Called in France *Petits-pois* and *Pois-sucres*, and in England *sugar-pea*.

Var. β, macrocárpum (Ser. l. c.) stems large; legumes large, falcate, very much compressed, not coriaceous, every part edible; seeds large, distant. Pisum sine cortice duriore, C. Bauh. pin. 343. Called in France *Pois-goulus*, *Pois-sans-parchemin*, and *Pois-mange-tout*.

Var. γ, umbellàtum (Lin. spec. 1027.) stipulas quadrifid, acute; peduncles many-flowered, terminal, somewhat umbellate. —Tabern. icon. t. 459. P. umbellàtum, Mill. dict. no. 3. Seeds large, round, bay-coloured. Called in French *Pois-à-bouquet*, and *crown-pea* in English. Perhaps a proper species.

Var. δ, quadràtum (Lin. spec. 1027.) seeds very dense, square. Pisum majus quadratum fructu cenerei coloris. C. Bauh. pin. 342. Called in French *Pois-carré*.

Var. ε, hùmile (Poir. dict. 5. p. 436.) stem weak, dwarf; legumes smaller, rather coriaceous; seeds approximate, roundish. P. hùmile, Mill. dict. no. 2. Called in French *Pois-nains*, and *dwarf-pea* in English.

The varieties of the *pea* are very numerous, but the following are the names of the principal sorts cultivated in gardens.

1 *Early Charlton*; an excellent early sort, nearly equal to the genuine frame.

2 *Nimble tailor*; an excellent early kind.

3 *Early golden-Charlton*.

4 *Early Nichol's golden-Charlton*.

5 *Common-Charlton*.

6 *Early single-blossomed*.

7 *Reading Hotspur*; long pods.

8 *Dwarf marrowfat*; large long pods.

9 *Tall marrowfat*; large long pods.

10 *Green marrowfat* or *Patagonian*.

11 *Knight's wrinkled* or *marrow*; a white-blossomed, tall luxuriant grower; the seeds of excellent flavour, cream-coloured and shrivelled when ripe and dried.

12 *Spanish moratto*; rather large.

13 *Prussian blue*; a great bearer.

14 *Egg*; rather large.

15 *White rouncival*; large fine pods.

16 *Green rouncival*; large fine pods.

17 *Grey rouncival*; large fine pods.

18 *Tall sugar*; large crooked pods.

19 *Dwarf sugar*.

20 *Bishop's dwarf*; a very excellent early prolific kind.

21 *Crown* or *rose*; a tall strong grower, producing its blossoms and fruit in an umbel at the top of each peduncle.

22 *Leadman's dwarf*; a great bearer, but small in the pods; good for a late crop, or as required for succession.

23 *Spanish dwarf*; of low growth and small pods.

24 *Early dwarf-frame*; the best kind for forcing.

The *pea* has been cultivated in this country time immemorial. It was not, however, very common in Elizabeth's time, when, as Fuller informs us, peas were brought from Holland, and were "fit dainties for ladies, they came so far, and cost so dear." The use of the *pea* in cookery is familiar to every one. In one variety, called the *sugar-pea*, the inner tough film of the pods is wanting, and such pods when young are frequently boiled with the seeds or peas within them, and eaten in the manner of kidney-beans. This variety is comparatively new, having been introduced about the middle of the 17th century.

Estimate of sorts. The varieties, besides differing in the colour of the blossoms, height of stalks, and mode of growth, are found to have some material differences in hardiness to stand the winter, time of coming in, and flavour of the seeds. The *Charltons* are not only very early, but great bearers, and excellent peas for the table, and are therefore equally well fitted for the early crop, and forward succession crops, and inferior to few even for the main summer crops. The *frame-pea* may, indeed, be raised without the assistance of heat for a forward crop, and if a genuine sort will fruit a few days sooner than the *Charltons*, but it grows low and bears scantily. The *Hotspur* is hardy and prolific, and makes returns nearly as quick as the *Charltons*, and about a fortnight before the *marrowfat*. *Bishop's dwarf-pea* is an early kind and a great bearer. The sorts already specified, therefore, embrace the best for sowings made from the end of October till the middle of January, and for late crops raised between the middle of June and the beginning of August.

The fine flavour of the *marrowfat* is well known. A few dwarf *marrowfats* may be sown in December and January, as mild weather may occur; but the time for sowing full crops of the larger kinds of *peas*, is from the beginning of February till the end of April. *Knight's-pea* and *Bishop's dwarf*, two of the hardiest varieties, are very prolific, and retain their fine sweet flavour when full grown. The *egg*, the *maratto*, the *Prussian-blue*, and the *rouncivals*, the *large sugar*, and the *crown*, are all very fine eating peas in a young growth, and like the *marrowfat* may be sown freely according to the demand, from the third week of February to the close of April, and in smaller crops, until the middle of June. For late crops, in addition to the early sorts already mentioned, the *dwarf sugar*, *Leadman's dwarf*, *Bishop's dwarf*, and *Spanish dwarf* are very suitable. The *Leadman's* as well as *Bishop's dwarf*, are small, delicious peas, great bearers, and in high request at genteel tables, but as the fruit of *Leadman's dwarf* is long of coming in, it is not adviseable to sow it after the third week in June; rather sow it in March, April, and May, and then it will be later than the *Charltons* raised five weeks afterwards. The *Charltons* and *Hotspurs* may be sown in May, for late full crops, in June for a smaller supply, and in July, along with the *frame*, for the last returns.

Times of sowing. Much that relates to this has been incidentally mentioned in the estimate of sorts. To try for a crop as early as possible, sow of the sort preferred as hardy and forward, a small portion on a sheltered south border, or other favourable situation, at the close of October, or rather in the course of November. Follow with another sowing in December, that if the former should be casually cut off in winter, this, coming up later, may have a better chance to stand; and if both survive the frost, they will succeed each other in fruit in May and June. For more considerable and less uncertain returns, either in succession to the above, or as first early and intermediate crops, sow larger portions in December or January, if open temperate weather. To provide for main crops, make successive sowings of the suitable sorts from February till the end of May. It frequently proves that the fruit from a sowing at the beginning of February is not a week later than that from a crop sown in November; nay, the February-sown crop sometimes surpasses all that have stood the winter, in forward returns as well as quantity. From the middle of February, make successive sowings every three weeks in the course of March, April, and May, or twice a month in summer, when a continued succession is to be provided till the latest period. At the close of the sowing season, July and the first week of August, sow a reduced quantity each time, because the returns will depend on a fine mild autumn following, and whatever fruit is obtained will be small and scanty.

Quantity of seed. Of the small early kinds, one pint will sow a row of 20 yards; for the larger sorts for main crops, the same measure will sow a row of 33 yards.

Process of sowing. For early sorts make the drills 1½ inch deep; and let parallel drills be 2½ or 3 or 4 feet asunder. *Peas* that are to grow without sticks require the least room. For summer crops and large sorts, make the drills 2 inches deep and 4, 5, or 6 feet asunder. As to the distances along the drill, distribute the peas according to their size and the season; the *frame* 3 in the space of an inch; the *Charltons*, *Hotspur*, *and dwarf marrowfat*, 2 in an inch; the *Prussian-blue* and the middle-sized sorts 3 to 2 inches; the large *marrowfats* and *Knight's* a full inch apart; the *morotto*, *rouncivals*, and most larger sorts 1½ inch apart; and the *Patagonian* 2 inches.

Soil and situation. The soil should be moderately rich, and deeper and stronger for the lofty growers. *Peas* are not assisted but hurt by unreduced dung, recently turned in. A fresh sandy loam or road-stuff, and a little decomposed vegetable matter, is the best manure. The soil for early crops should be very dry, and rendered so where the ground is moist, by mixing sand with the earth of the drills. For early crops, put in from October till the end of January, let the situation be sheltered, and the aspect sunny. Before the end of December, every one or two rows should stand close under a south or south-eastern fence. In January, several parallel rows may be extended, under a good aspect, further from the fence. After January till the end of May, sow in an open situation. For the late crops, return again to a sheltered sunny border.

Subsequent culture. As the plants rise from half an inch high to 2 or 3 inches, begin to draw earth to the stems, doing this when the ground is in a dry state, and earthing gradually higher as the stems ascend. At the same time with the hoe loosen the ground between the young plants, and cut down rising weeds. Early crops should be protected during hard frosts by dry straw or other light litter, laid upon sticks or brushwood, but remove this covering as soon as the weather turns mild. If in April, May, and the course of summer, continued dry weather occurs, watering will be necessary, especially to plants in blossom and swelling the fruit, and this trouble will be repaid in the produce. Rows partly cut off may be made up by transplanting. This is best done in March. In dry weather water, and in hot days shade until the plants strike. All *peas* fruit better for sticking, and continue longer productive, especially the larger sorts. Stick the plants when from 6 to 12 inches high, as soon as they begin to vine. Provide branching sticks, of such a height as the sort will require; for the *Frame* and *Leadman's dwarf* 3 feet high; for the *Charltons* and middle-sized sorts 4 or 5 feet; for the *marrowfat* and larger kinds 6 or 8 feet; for the *rouncivals* and *Knight's marrow-pea* 9 or 10 feet. Place a row of sticks to each line of the plants on the sunny side, that the attraction of the sun may incline the plants towards the sticks. Place about half the number on the opposite side, and let both rows stand rather wider at top than at the ground. Some gardeners stop the leading shoots of the most early crop when in blossom, a device which accelerates the setting and maturing of the fruit.—*Abercrombie.*

Rotation of crops of garden peas.—In January sow on an early border or other warm situation, if the weather be open and the ground sufficiently dry. The *true-early-frame*, *nimble-tailor*, and *Charlton* are the best for this sowing. In February a full crop of *Charltons* may be sown about the beginning of the month, and of *marrowfats* and other larger sorts towards the end in the open quarters of a garden. It frequently happens that the fruit of a sowing made the beginning of this month is not a week later than that of a crop sown in November, and often surpasses all that have stood the winter, both in forward returns, as well as quantity. From the middle of this month make successive sowings every three weeks during the months of March and April, and twice in each of the months of June, July, and August, reducing the quantity each time from the end of June till the middle of August. In February sow peas of the early sorts in pots and flat boxes, and place them in a hothouse, and if for extensive crops sow on a light hot-bed. This has been practised by Mr. Bishop, an experienced gardener, and is the most rational plan of transplanting *peas* ever practised. In March sow *peas* as before directed, and transplant those that were sown in boxes or pots, or on hot-beds last month. In October, *peas* for the early crop next season may be sown, about the end of the month, in a warm south border, fully exposed to the sun. For this sowing the *early-frame*, *Charlton*, *nimble-tailor*, and *Hotspur* are the best sorts. If the ground is cold and wet, it is best to draw the mould up in ridges 2 feet high, both this and the three following months. In November and December sow the same kind of *peas* as are recommended for last month.

To forward an early crop, "sow or plant in lines from east to west, and stick a row of spruce-fir branches along the north side of every row, and sloping so as to bend over the plants, at 1 foot or 18 inches from the ground. As the plants advance in height, vary the position of the branches, so as they may always protect them from perpendicular colds or rain, and yet leave them open to the full influence of the winter and spring sun. Some cover during nights and in severe weather, with two boards nailed together lengthwise at right angles, which form a very secure and easy-managed covering, but excludes light. A better plan would be to glaze one of the sides, to be kept to the south, and to manage such row-glasses, as they might be called, when over *peas, beans, spinach,* &c. as hand-glasses are managed when over *cauliflowers,* that is, to take them off in fine weather, or raise them constantly or occasionally, by brick-bats or other props, as the weather and the nature of the crop might require." —*Loudon. ency. gard. p.* 691.

Management of a late crop. The best variety for this purpose is Knight's *marrow-pea,* which may be sown at intervals of 10 days from the beginning to the end of June. " The ground is dug over in the usual way, and the spaces to be occupied by the future rows of *peas* are well soaked with water. The mould upon each side is then collected so as to form ridges 7 or 8 inches above the previous level of the ground, and these ridges are well watered. The seeds are now sown in single rows along the tops of the ridges. The plants grow vigorously, owing to the depth of soil and abundant moisture. If dry weather at any time set in, water is supplied profusely once a week. In this way the plants continue green and vigorous, resisting mildew, and yielding fruit till subdued by the frost."—*Hort. trans. vol.* 2.

Taking the crop. " The early crops are generally gathered in very young growth, often too young, when the pods are thin and the peas small, for the sake of presenting some at table as soon as possible. In the main crops there is no cause for precipitation; take them as they become pretty plump, while the peas are yet green and tender. Leave none on to grow old, the young pods will then fill in greater perfection, and the plants will continue longer in bearing."

To save seed. " Either sow approved sorts in the spring, for plants to stand wholly for seed, to have the pods ripen in full perfection; or occasionally leave some rows of any main crop; let all the early pods ripen, and gather the later formed ones for the table, as the last gleanings of a crop seldom afford good full seed. For public supply extensive crops are commonly raised in fields. Let the seed attain full maturity, indicated by the pods turning brown and the peas hardening; then to be hooked up and prepared for threshing out, in due time cleansed and housed."—*Abercrombie.*

Forcing peas. " *Peas,*" Nicol observes. " are often raised in forcing-houses, and are brought to perfection very early."

For forcing peas in a pit, sow as directed for French beans, *Phaseolis vulgàris,* in pots or boxes, and transplant when $1\frac{1}{2}$ or 2 inches high into the pit in rows 15 inches asunder, and 3 inches from each other in the row.

Temperature may be progressive, beginning at 40° or 50° and rising to 52° or 66° from the origin of the plant to the state of flowering, and after flowering increase from 55° to 70°, or in a regular heat between the latter limits. For hot-beds the temperature may be 50°, or 55° for the nursery-bed, and 55° to 65° for fruiting.

The best sort of pea to force, is the genuine *early-frame.*

Forcing peas in a peach or cherry-house. For the earliest crop some of the true *early-frame* sort may be sown in October, in the borders of a cherry-house, peach-house, or vinery, intended to be forced from the beginning of the year. By the time the forcing commences they will be fit for transplanting, which is to be done in the same borders, either in a single row, or in more rows, according to the room. The distance between the rows may be 15 or 18 inches, and 2 inches in the line.

" *In forcing peas,*" Nicol observes " they should always be transplanted. They become more prolific, and run less to straw by that management than when they are sown where they are to remain. Indeed, it would be worth while to transplant the earliest crops in the open ground."—*Nicol, kal. p.* 29.

Beans may be forced in a similar manner, though this is seldom attempted.

Field peas, their culture and uses.

The *pea* is the most esteemed legume in field cultivation, both for its seed and haulm, and was cultivated by the Greeks and Romans, and in this country from time immemorial, though its culture appears to have diminished since the more general introduction of herbage plants and roots; and, excepting near large towns for gathering green, and in a few places for boiling, the *pea* has given way to the bean, or to a mixture of *peas* and beans. There are various inducements, however, to the cultivation of *peas* in dry warm soils near large towns. When the crop is good and gathered green, few pay better. The ground, after the *peas* have been removed, is readily prepared for turnips, which also pay well as a retail crop near towns, and the haulm is good fodder.

The varieties of peas cultivated in fields are numerous, but they may be divided into two classes, those grown for the ripened seed, and those grown for gathering in a green state. The culture of the latter is chiefly near large towns, and may be considered as in part belonging to horticulture rather than agriculture. The grey varieties are, the *early-grey,* the *late-grey,* the *purple-grey, Marlborough-grey,* and the *horn-grey.* The white varieties grown in fields are, the *pearl, early Charlton, golden Hotspur,* the *common white* or *Suffolk,* and other Suffolk varieties. New varieties are readily procured by selection or impregnation.

In the choice of sorts, where it is desired to grow grey *peas* for the sake of the seeds, the early variety is to be preferred in late situations, and the late variety in early ones; but when it is intended to grow them chiefly for covering the ground, and for haulm, then the late varieties claim the preference, and especially the *purple-grey.* Of white *peas* to be grown for gathering green, the *Charlton* is the earliest, and the *pearl* or *common Suffolk* the most prolific. When white *peas* are grown for boilers, that is, for splitting, the *pearl* and *Suffolk* are also the best sorts. It is supposed by some to be of considerable importance to the economy of a farm, when the nature of the soil is suitable, to have recourse to the early sorts, as by such means the crops may be in many cases cut, and secured while there is leisure, before the commencement of the wheat harvest. And where the nature of the soil is dry and warm, and the *pea* crop of a sufficiently forward kind, it may be easy to obtain a crop of turnips from the same land in the same year, as has already been suggested. But with this view it is the best practice to sow the crops in the row method, and keep them perfectly clean by means of attentive hand or horse-hoeing, as in that way the land will be in such a state of preparation for a crop of turnips, as only to require a slight ploughing, which may be done as soon as the *pea* crop is removed, and the turnip-seed drilled in as quickly as possible upon the newly turned up earth. In some particular districts a third crop is even put into the same land, the turnips being cleared off in the autumn, [illegible] replaced by cole-worts, for the purpose of greens in the following spring. This, according to Middleton, is the practice in some places in Middlesex. But it is obviously a method of cultivation that can only be attempted on the warm and fertile kinds of turnip soil, and where the *pea* crops are early; on the cold, heavy, and wet descriptions of land it is obviously impracticable, and wholly improper. *Loudon, encycl. agri. p.* 766.

The soil best suited for *peas* is a dry calcareous sand; it should be in good tilth, not too rich, nor dunged along with the crop. In Norfolk and Suffolk, *peas* are often sown after clover-leys, after one furrow, or after corn crops on two furrows, one given in autumn, and the other early in spring.

The climate required by the *pea* is dry and not very warm, for which reason as the seasons in this country are very often moist, and sometimes exceedingly dry and hot in June and July, the *pea* is one of the most uncertain of field crops.

The season of sowing must differ considerably, according to the intention of the cultivator. When they are grown for podding early for sale green, they should be sown at different times from January to the end of March, beginning with the dryest and most reduced soils, and with this intention they are sown in the autumn in some southern counties. For the general crops, from February to April, as soon as the lands can be brought into proper order; the grey sorts being employed in the early sowings, and the white in the later. It is always best to sow early, in order to get the crop off in time for a crop of turnips to follow, being a profitable kind of husbandry which should never be neglected.

The quantity of seed must be different in different cases and circumstances, and according to the time and manner in which the crop is sown; but in general it may be from 2½ to 3 bushels, the early sowings having the largest proportion of seed.

The most common mode of sowing field peas is broad-cast, but the advantages of the row culture in the case of a crop so early committed to the soil must be obvious. The best farmers, therefore, always sow *peas* in drills, either after the plough, the seed being deposited in every second or third furrow, or if the land is in a pulverized state, by drawing drills with a machine, or by ribbing. In Norfolk and Suffolk *peas* are generally dibbled on the back of the furrow, sometimes one, and sometimes 2 rows on each, but this method has no particular advantage. In Kent, where immense quantities of *peas* are grown, both for gathering green, and for selling ripe to the seedsman, they are generally sown in rows, from 18 inches to 3 feet asunder according to the kind, and well cultivated between; 4 to 6 inches is a proper depth for *peas* to be sown, but they will vegetate if sown at 1 foot in depth.

The after culture given to field peas is that of hoeing, either by the hand-hoe or the horse-hoe. Where the hand culture prevails, it is the general custom to give two hoeings; the first when the plants are about 2 or 3 inches in height, and again just before the period of their flowering. At the last of these operations, the rows should be laid down, and the earth well placed up to them. In Kent it is the custom, where this sort of crop is much grown, when the distance of the rows is sufficiently great to prevent the vegetation of weeds, to forward the growth of the *pea* crops by occasional horse-hoeing and the use of the brake-harrow, the mould being laid up to the roots of the plants at the last operation, by fixing a piece of wood to the harrow. This should, however, only be laid up on one side, the *peas* being always placed up to that which is the most fully exposed to the sun.

In harvesting the pea considerable care is requisite, both on account of the seed and haulm. When *pea* crops become ripe they wither and turn brown in the haulm, and the pods begin to open. In this state they should be cut as soon as possible, in order to prevent loss from shedding. In early crops the haulm is generally laid up into loose open heaps, which when dry are removed and stacked. In the general crops they are generally put into small heaps, called wads, which are formed by setting small parcels against each other, in order that they may be more perfectly dried both in seed and stem; these wads or bundles should be turned as often as possible. When wet weather happens whilst the *peas* lie in wads, it occasions a considerable loss, many of them being shed in the field, and of those that remain a great part will be so considerably impaired, as to render the sample of little value. This inability of *peas* to resist a wet harvest, together with the great uncertainty throughout their growth, and the frequent inadequate return in proportion to the length of the haulm, has discouraged many farmers from sowing so large a portion of this pulse as of other grain, though in light lands which are in tolerable heart the profit in a good year is far from inconsiderable.

In gathering green peas for the market, it is frequently a practice with the large cultivators of early *green pea* crops in the neighbourhood of London, to dispose of them by the acre to inferior persons, who procure the podders; but the smaller farmers, for the most part, provide this description of persons themselves. It is sometimes the custom to pick the crops over twice, after which the rest are suffered to stand till they become ripe, for the purpose of seed; but being the worst part of the crop are very improper for seed. This sort of crop affords the most profit in those pea seasons which are inclined to be cool, as under such circumstances the *peas* are most retarded in their ripening, and of course the markets kept from being over abundantly supplied, but in some warm dry seasons when their ripening is hastened they scarcely repay the expences.

The threshing of peas requires less labour than that of any other crop. Where the haulm is wished to be preserved entire it is best done by hand, as the threshing machine is apt to reduce it to chaff. But where the fodder of peas is to be given immediately to horses on the spot, the breaking it is of no disadvantage.

The produce of the pea in ripened seed is supposed by some to be from 3½ to 4 quarters an acre; others, however, as Donaldson, imagine the average of any two following crops not to be more than about 12 bushels, and therefore may be considered as a less profitable crop than most others. But as a means of ameliorating, and improving the soil at the same time, it is esteemed as of great value. With respect to the produce of *green peas* in the husk, the average of the early crops in Middlesex is supposed to be from about 25 to 30 sacks the acre, which selling at from 8 to 10 shillings per sack, affords 18*l*. the acre. The author of the "Synopsis of Husbandry," however, states the produce about Dartford in Kent at about 40 sacks per acre, though he says 50 sacks have been gathered from that space of land.

The produce of peas in straw is very uncertain, depending so much on the sort and the season, in general it is more bulky than that of grasses, but may be compressed into less room.

The produce of peas in flour is as 3 to 2 of the bulk of grain, and husked and split for soups as 4 to 2. A thousand parts of pea-flour afforded Sir H. Davy 574 parts of nutritive matter, viz. 501 of mucilage, 22 of sugar, 25 of gluten, and 16 of extract or matter rendered insoluble during the operation.

The use of peas for soups, puddings, and other culinary purposes is well known. In some places porridge, brose, and bread are made of pea-flour, and reckoned very wholesome and substantial. In Stirlingshire it is customary to give pease or bean biscuits to horses while in the yoke as a refreshment. The portion of *peas* that is not consumed as human food is mostly appropriated to the purposes of fattening hogs and other sorts of domestic animals, and in particular instances they are given to laboring horses in place of beans, but care should be taken when used in this way that they be sufficiently dry, as they are otherwise apt to occasion bowel complaints in those animals. For feeding swine the *pea* is much better adapted than the bean, it having been demonstrated by experience that hogs fatten more kindly when fed with this grain than on beans; and what is not easy to be accounted for, the flesh of swine which have been fed on *peas*, it is said, will swell on boiling, and be well tasted, whilst the flesh of the bean-fed hog will shrink on boiling, the fat will boil out, and the meat be less delicate in taste.

Peas straw cut green and dried is reckoned as nourishing as hay, and is considered as excellent for sheep.

In the sowing of any particular sorts for seed, they should be carefully looked over while in flower, in order to draw out all such plants as are not of the right sort, which if left to mix will degenerate the kind. As many rows as may be thought sufficient to furnish the desired quantity of seed should be marked out, and left till their pods turn brown and begin to split, when they should immediately be gathered up with the haulm; they may then be either stacked or threshed out as soon as they are dry; but care should be taken not to let them remain too long abroad after they are ripe, as wet would rot them, and heat after a shower of rain making their pods burst in such a manner, that the greater part of their seeds would be lost.

The diseases of peas are few, and chiefly the worm in the pod, and the fly on the leaves and flowers. They are also liable to be mildewed or blighted. None of these evils, however, are very common, and there is no known method of preventing them but by judicious culture.

Cultivated or Common Pea. Fl. June, Sept. Pl. cl.

2 P. ELA'TIUS (Bieb. fl. taur. 2. p. 151.) stems erect; petioles terete, bearing 6 lanceolate-oblong leaflets; stipulas rounded and crenated below; peduncles 2-flowered, longer than the leaves. ♃. ? H. Native of Iberia. Internodes naked, striated. Stipulas nearly like those of *P. satìvum*, but the leaflets are more oblong. Peduncles very long, erect. Flowers pale red, with the lamina of the wings dark purple. Legume unknown.

Taller Pea. Fl. June, Sept. Clt. 1820. Pl. cl.

3 P. ARVE'NSE (Lin. spec. 1027.) petioles terete? bearing 2-3 pairs of ovate, roundish, crenulated, mucronulate leaflets; stipulas ovate, semi-cordate, denticulated; peduncles usually 1-flowered, very short. ⊙. H. Native country unknown. P. satìvum arvénse, Poir. dict. 5. p. 456.—Moris. hist. 2. p. 47. sect. 2. t. 1. f. 4. Bram. icon. chin. t. 15. Called in French *Bisaille* and *Pois de Pigeon*. In English *field-pea* or *grey-pea*. Flowers red, the vexillum darkest. Seeds grey. For the culture and uses of *Pìsum arvénse*, see *field-peas*, and their culture under *Pìsum satìvum*, of which all the grey varieties belong to this species.

Field Pea. Fl. June, Sept. Pl. cl.

4 P. MARI'TIMUM (Lin. spec. 1027.) stem angular; petioles flattish above; leaflets 5-8, elliptical, mucronate, smooth, alternate; stipulas triangular, semi-sagittate, toothed towards the base; peduncles many-flowered, length of leaves; legumes oblong, small, obliquely-reticulated; seeds small, 6-8, approximate, roundish, rather bitter. ♃. H. Native of France, Denmark, and other parts of Europe, and Kamtschatka. In Britain on the stony sea beach; on the pebbly beach between Aldburgh and Orford, Suffolk; also near Hastings, Sussex; on the west side of Dungeness near Lyd, in Kent; on the sharp ridge running from Portland island to Bridport. Oed. fl. dan. 338. Smith, spicel. t. 9. engl. bot. t. 1046.—Moris. hist. 2. p. 47. sect. 2. t. 1. f. 5. Flowers large, purple, variegated with crimson veins. The seeds are very bitter. We learn from the epistles of Caius that the *sea-pea* was first observed in the year 1555, when in a great scarcity the poor people on the coast of Suffolk, about Orford and Aldburgh, supported themselves with it for some time. This legend is retailed by Stow and Camden, with the addition, that they supposed it to spring up opportunely in that year of dearth, from a ship-wrecked vessel loaded with peas, whereas the *sea-pea* is a very different species from all other peas. The legend of the miraculous arrival of these peas in a time of scarcity is still believed among the country people. Cattle are very fond of the herb.

Var. β, glàbrum (Ser. in D. C. prod. 2. p. 368.) leaves glabrous. Native of Canada.

Sea Pea. Fl. July. Britain. Pl. trailing.

5 P. AMERICA'NUM (Mill. dict. no. 5.) stem angular, procumbent; leaves with one pair of leaflets; lower leaflets lanceolate, acutely-toothed, upper ones sagittate. ♃. H. Native of South America, at Cape Horn. Peduncles 4-5-flowered. Flowers blue. Legumes tapering, near 3 inches long. Seed about the size of those of tares. Miller calls this the Cape Horn pea, from its having been brought by Lord Anson's cook when he passed that Cape, where this pea was a great relief to the sailors, but it is not so good for eating as the worst sort cultivated in England.

American Pea. Fl. June, Sept. Clt. 1800. Pl. proc.

6 P. JOMA'RDI (Schranck, in flora, p. 309.) plant quite smooth and glaucous; stem angular; petioles terete; stipulas toothed at the base, as well as the leaflets, which are ovate. ⊙. H. Native of Egypt. Flowers white.

Jomard's Pea. Fl. July, Aug. Clt. 1820. Pl. cl.

7 P. FU'LVUM (Smith, fl. græc. t. 688.) petioles terete; stipulas rounded below, and acutely-toothed; peduncles 2-flowered; legumes short. ⊙. H. Native of Asia Minor. Flowers of a beautiful fulvous colour, marked with deep or almost scarlet veins. Legume semi-elliptic, an inch long. Leaflets 2 or 4.

Fulvous-flowered Pea. Pl. cl.

8 P. THEBA'ICUM (Willd. enum. suppl. p. 51. ex Link. enum. 2. p. 236.) peduncles shorter than the leaves. ⊙. ? H. Native of Upper Egypt.

Thebes Pea. Fl. July, Aug. Clt. 1825. Pl. cl.

Cult. The seeds of all kinds of *peas* only require to be sown in the open ground in spring for common purposes, and the plants sticked to support them.

CLXXII. LA'THYRUS (from λαϑυρος of Theophrastus, which is said to be from λα, *la*, augmentative, and ϑουρος, *thouros*, any thing exciting; in reference to the qualities of the seeds). Lin. gen. no. 1186. D. C. prod. 2. p. 369.—Láthyrus, Clýmenum, and A'phaca, Tourn. inst. p. 394. 396. t. 216, 217, 218, 219, and 220.—Cicerélla, Mœnch. meth. 163.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, 5-cleft, the 2 superior lobes shortest. Corolla papilionaceous. Stamens diadelphous. Style complanate, dilated at the apex, villous or pubescent in front. Legumes oblong, many-seeded, 2-valved, 1-celled. Seeds globose or angular.—Usually climbing herbs, with semi-sagittate stipulas, and having the petioles terminating in branched tendrils, and furnished with 1 to 3 pairs of leaflets. Peduncles axillary.

SECT. I. EULA'THYRUS (from *eu*, well, and *lathyrus*; genuine species). Ser. mss. in D. C. prod. 2. p. 369. Vexillum toothless at the base. Leaflets opposite or wanting from abortion. Petioles furnished with a narrow wing.

§ 1. *Perennial plants, with many-flowered peduncles.*

* *Leaves with only one pair of leaflets.*

1 L. TOMENTÒSUS (Lam. dict. 2. p. 709.) plant clothed with rufescent tomentum; stems tetragonal, striated; leaves with one pair of linear-lanceolate leaflets; stipulas semi-sagittate, much shorter than the leaves; peduncles many-flowered, approximate, longer than the leaves; calycine teeth nearly equal, lanceolate, acute, length of the tube; legumes linear, clothed with silky tomentum; style very long, twisted at the base, linear-spatulate. ♃. G. Native of Buenos Ayres. Flowers large, purple?

Tomentose Lathyrus. Pl. cl.

2 L. SERI'CEUS (Lam. dict. 2. p. 708.) plant clothed with silky rufescent down; stems tufted, simple; leaves with one pair of linear leaflets; stipulas narrow, semi-sagittate, length of leaflets; tendrils very short; peduncles many-flowered. ♃. G. Native of Monte Video.

Silky Lathyrus. Pl. cl.

3 L. SYLVE'STRIS (Lin. spec. 1033.) plant quite glabrous; stems winged; leaves with one pair of lanceolate, attenuated, coriaceous leaflets; stipulas very narrow, semi-sagittate, shorter

than the leaves; peduncles 3-8-flowered, length of leaves; legumes compressed, reticulated lengthwise; seeds roundish, covered with wart-like dots. ♃. H. Native of Europe, in woods and hedges. In England in moist hedges and groves in chalky counties, but rare in Scotland. Corolla red, variegated with pale crimson, violet, and tints of green; the wings violet. Smith, engl. bot. 805. Curt. lond. 6. t. 52. Root creeping.

Var. α, ensifòlius (Ser. mss. in D. C. prod. 2. p. 369.) leaflets very narrow, and very much elongated. L. ensifòlius, Bidaro in diar. phys. chem. papiens. an. 1824.

Var. β, oblóngus (Ser. l. c.) leaflets shorter, elliptic-oblong. Oed. fl. dan. 325.

Wood Lathyrus or Narrow-leaved Everlasting-pea. Fl. July, Sept. Britain. Pl. cl.

4 L. PUBE´SCENS (Hook. in Beech. voy. p. 21.) plant clothed with soft pubescence above; stems winged; leaves cirrhiferous, having one pair of oblong-lanceolate leaflets, which are twice the length of the petiole; stipulas ovate, semi-sagittate, nearly one-half shorter than the petioles; peduncles many-flowered, longer than the leaves; calyx tubular, pubescent, with lanceolate teeth. ♃. H. Native of Chili, about Conception and Valparaiso. This species has many points in common with *L. sylvéstris*.

Pubescent Everlasting-pea. Pl. cl.

5 L. INTERME´DIUS (Wallr. sched. crit. p. 386.) plant quite glabrous; stems winged; leaves with one pair of oblong-lanceolate, self-coloured, mucronulate leaflets, which are obtuse at both ends; stipulas linear; peduncles many-flowered. ♃. H. Native of Germany. Flowers rose-coloured, larger than those of *L. sylvéstris*, as well as the legumes. L. sylvéstris, Muhl. fl. dan. 785. Perhaps only a variety of *L. sylvéstris*.

Intermediate Everlasting-pea. Fl. Ju. Sept. Clt. 1820. Pl. cl.

6 L. MAGELLA´NICUS (Lam. dict. 2. p. 708.) plant glabrous and blackish; stems a little branched, tetragonal, but not winged; leaves with one pair of ovate or ovate-oblong leaflets; stipulas broad, cordately-sagittate, broader than the leaves; tendrils trifid; peduncles long, 3-4-flowered; legumes unknown. ♃. H. Native of the Straits of Magellan. Flowers bluish purple.

Magellan Everlasting-pea. Fl. Ju. Sept. Clt. 1744. Pl. cl.

7 L. HOOKE´RI; plant glabrous, blackish; stems angular, hardly winged; leaves with one pair of linear-lanceolate leaflets; petioles furnished with a short tendril each: stipulas semi-sagittate, ovate, much shorter than the leaflets; peduncles twice the length of the leaves, usually 5-flowered; calyx campanulate, nerved, with nearly equal teeth. ♃. H. Native of Chili, about Conception. L. sessilifòlius, Hook. in Beech. voy. 1. p. 20. but not of Tenore. Closely allied to *L. praténsis* and *L. sylvéstris*. From *L. Magellánicus* it seems to differ principally in the shape of the leaflets.

Hooker's Everlasting-pea. Pl. cl.

8 L. LATIFÒLIUS (Lin. spec. 1033.) plant quite glabrous; stems winged; leaves with one pair of elliptic, rather glaucous, 3-5-nerved, obtuse, and mucronate leaflets; stipulas broad, ovate, semi-sagittate; peduncles many-flowered, longer than the leaves; legumes long, compressed, reticulated lengthwise. ♃. H. Native of Europe, in woods. In England, in Madingly, and other woods near Cambridge; on the rock by Red Neese, near Whitehaven, Cumberland; in Severn Stoke Copse, Worcestershire; and at Hawnes and Bromham, Bedfordshire. Smith, engl. bot. 1108. Mart. fl. rust. t. 8. Garid. prov. t. 108. Mill. fig. 52. Oed. fl. dan. 708. exclusive of the synonymes. Flowers large, rose-coloured. This is a shewy plant for shrubberies, arbours, wilderness quarters, and trellis-work. Bees resort much to it, and the flowers afford them abundance of honey.

Var. β, monstròsus (D. C. mem. legum. 1. t. 2.) calyx of 5 sepals; sepals linear; petals and stamens abortive; legumes foliaceous; seeds abortive.

Broad-leaved Everlasting-pea. Fl. Ju. July. Britain. Pl. cl.

9 L. PEDUNCULA´RIS (Poir. suppl. 2. p. 775.) stems thick, cylindrical, striated, winged, branched; leaves with one pair of oval, nerved, mucronate leaflets; stipulas semi-sagittate, lanceolate, setaceous at the apex; peduncles stiff, many-flowered, striated, very long; bracteoles setaceous. ♃. H. Native country unknown. Flowers pale rose-coloured.

Peduncled Everlasting-pea. Pl. cl.

10 L. NERVÒSUS (Lam. dict. 2. p. 708.) plant quite smooth; stems almost simple, striated; leaves with 1 pair of ovate, acute, nerved leaflets, which are longer than the internodes; petioles very short; tendrils trifid; stipulas sagittate, nerved; peduncles many-flowered; legumes long, linear, glabrous. ♃. G. Native of Monte Video. Flowers purple.

Nerved-leaved Everlasting-pea. Pl. cl.

11 L. ROTUNDIFÒLIUS (Willd. spec. 3. p. 1088.) plant quite glabrous; stems winged, branched; leaves with 1 pair of ovate-roundish, 3-5-nerved leaflets; stipulas semi-sagittate, a little toothed; peduncles many-flowered, longer than the leaves; calycine teeth broad and short; legumes compressed, reticulated lengthwise, dotted; seeds globose, obscurely dotted. ♃. H. Native of Tauria. Bieb. fl. taur. 2. p. 156. cent. pl. rar. ross. 1. t. 22. Flowers rose-coloured, very shewy, like those of *L. latifòlius*.

Var. β, ellipticus (Ser. mss. in D. C. prod. 2. p. 370.) stem with broader wings; stipulas larger; leaflets elliptic; corolla vermilion-coloured. ♃. H. Native in woods, on Mount Beschstau. Bieb. fl. taur. suppl. 466.

Round-leafletted Everlasting-pea. Fl. May, July. Clt. 1822. Pl. cl.

12 L. PRATE´NSIS (Lin. spec. 1033.) plant smoothish; stems tetragonal; leaves with 1 pair of oblong-linear or lanceolate, 3-nerved leaflets; tendrils usually simple; stipulas sagittate, ovate, shorter than the leaflets; peduncles many-flowered, twice the length of the leaves; calyx nerved, with nearly equal teeth, which are about the length of the tube; legumes compressed, obliquely reticulated; seeds globose, smooth. ♃. H. Native of Europe, in humid meadows. In England, in meadows, pastures, and thickets, very common. Curt. lond. fasc. 3. t. 44. Smith, engl. bot. 670. Mart. fl. rust. 52. Oed. fl. dan. 527. Flowers yellow. The plant is called in England *Tare everlasting*, *Meadow vetchling*, or *Common yellow vetchling*. In old authors it is much reprobated as a vile weed, that spreads much by means of its creeping roots. Many later writers, however, recommend it as an excellent food for cattle, and not without reason, since its quality is good and it bears a large burden of succulent leafy stalks. Among its patrons we may reckon Linnæus, Haller, Schreber, Curtis, and Young.

Var. β, velutìnus (D. C. fl. fr. 5. p. 575.) stem and leaves velvety: legumes rather pilose. Native of arid places.

Meadow Lathyrus. Fl. June, Aug. Brit. Pl. cl. 1 to 2 ft.

13 L. TUBERÒSUS (Lin. spec. 1033.) stems tetragonal; leaves with 1 pair of oblong-elliptic, rather mucronulate leaflets; stipulas semi-sagittate, narrow, acute, about equal in length to the petioles; peduncles 3-6-flowered, 2 or 3-times the length of the leaves; calyxes veinless, with almost equal, broad teeth, which are about equal in length to the tube; style arched; legumes compressed, reticulated lengthwise; seeds roundish, smooth. ♃. H. Native of Europe, on the margins of fields. Curt. bot. mag. 111. L. arvénsis, Riv. tetr. 42. L. attenuàtus, Viv. fragm. t. 19. ex Poir. suppl. 2. p. 776.?—Lob. icon. 2. p. 70. f. 2.—Moris. hist. sect. 2. t. 2. f. 1. Root creeping, putting out irregular, brown tubers. Flowers large, rose-coloured. The plant is cultivated in Holland for its roots, which are eaten there. Gerarde calls it *Peas-earth-nut*.

Tuberous-rooted Everlasting-pea. Fl. Ju. Jul. Clt. 1596. Pl.cl.

14 L. SESSILIFÒLIUS (Tenore, fl. neap. prod. append. 5. 1826.) root tuberous and fibrous; stems ascending, simple; leaves with 1 pair of leaflets, without a petiole; leaflets lanceolate-linear, mucronate; peduncles usually 3-flowered, longer than the leaves; calyx about equal in length to the tube of the corolla; the segments lanceolate and equal; legumes flat, many-seeded. ♃. H. Native of Naples, in Lucania, in hedges. L. attenuàtus, Tenore, prod. but not of Viv. Plant glabrous. Corolla blue, with the wings longer than the keel. Style flat, dilated in front, and rather villous. It differs from *L. tuberòsus*, in the leaflets being sessile and linear-lanceolate.

Sessile-leafletted Lathyrus. Pl. ascending.

15 L. RÒSEUS (Stev. in mem. soc. mosc. 4. p. 51. and Bieb. fl. taur. suppl. p. 466.) plant quite smooth; stem slender, not winged; leaves with 1 pair? of ovate-roundish leaflets; tendrils very short; stipulas small, subulate; peduncles filiform, longer than the leaves; calycine teeth acute, superior ones shortest. ♃. H. Native of Iberia. Flowers beautiful rose-coloured, rather smaller than those of *L. tuberòsus.*

Rose-coloured-flowered Everlasting-pea. Fl. Ju. Aug. Clt. 1822. Pl. cl.

16 L. GRANDIFLÒRUS (Sims, bot. mag. 1938.) hairy; stems tetragonal, winged; leaves with 1 pair of large, ovate, obtuse, waved leaflets; stipulas small, semi-sagittate, lanceolate; peduncles 2-3-flowered, longer than the leaves; teeth of calyx acute, longer than the tube; legumes long, linear, puberulous. ♃. H. Native of the south of Europe, in hedges and among bushes. In Sicily, about Palermo and on Mount Etna. Pìsum biflòrum, Rafin. car. di piant. p. 71. Perhaps *L. grandiflòrus*, Smith, fl. græc. t. 698. Flowers very large, rose-coloured, with an emarginate vexillum.

Great-flowered Everlasting-pea. Fl. June, Aug. Clt. 1814. Pl. cl.

17 L. PUS'ILLUS (Ell sketch. car. geogr. 2. p. 223.) tendrils simple; leaflets 2, linear-lanceolate; stipulas falcate; peduncles 1-flowered, elongated. Native of Carolina, at Cooper's River.

Small Lathyrus. Pl. cl.

* * *Leaves with 2-3-4 or more pairs of leaflets.*

18 L. PISIFÓRMIS (Lin. spec. 1034. but not of Houtt.) plant smoothish; leaves with 3-4 pairs of oval leaflets; stipulas unequally cordate, hastate, with the angles acute, equal in length to the leaflets; peduncles many-flowered, rather shorter than the leaves; the 2 upper segments of the calyx short; legumes linear-oblong, compressed, rather falcate, acute at the apex on the upper suture. ♃. H. Native of Europe, Siberia, and throughout North America, in the plains. L. marítimus, Begel. fl. bost. ed. 2. p. 262. L. Califórnicus, Dougl. in bot. reg. 1144. L. venòsus, Sweet, fl. gard. 2. ser. t. 37. but not of Willd. Begel. fl. bost. ed. 1. p. 167. but not of ed. 2. Pisum marítimum, Rich. in Frankl. 1. journ. ed. 2. append. p. 28.— Gmel. fl. sib. 4. p. 7. t. 1. Astrágalus Chinénsis, Buch. cent. 10. dec. 2. t. 5. Flowers purple. We have followed Dr. Hooker, in his recent publication, in adding the numerous synonymes, but we have some reason to believe that he is perfectly wrong with regard to some of the species.

Pea-formed Lathyrus. Fl. June, July. Clt. 1795. Pl. cl.

19 L. CALIFO'RNICUS (Dougl. in bot. reg. 1144.) stems tetragonal, glabrous; leaves glaucous, with 4-5 pairs of ovate-oblong, glabrous, mucronulate leaflets; tendrils 3-parted; stipulas semi-sagittate, about the size of the leaflets; peduncles many-flowered, about equal in length to the leaves; root creeping. ♃. H. Native of North California and the north-west coast of America. Flowers purple, elegantly veined, twice the size of those of *V. pisifórmis* or *V. mutábilis.* Legumes oblong, rather falcate, inflated.

Californian Lathyrus. Fl. July, Sept. Clt. 1826. Pl. cl.

20 L. MUTA'BILIS (Sweet, fl. gard. 194.) stems flexuous, winged: wings ciliately pubescent; leaves with 3-4 pairs of ovate, obtuse, glaucescent leaflets; stipulas semi-sagittate, ovate, acute, angularly toothed at the base; peduncles many-flowered, shorter than the leaves; calycine segments ovate-lanceolate, ciliated, unequal, length of tube; legumes convex, narrow, dotted, pubescent. ♃. H. Native of Siberia. Flowers changeable in colour, at first purplish pink, striped with numerous dark purple branching lines, but at length changing to a brownish green. Very like *L. pisifórmis.*

Changeable-flowered Lathyrus. Fl. June, Aug. Clt. 1825. Pl. cl.

21 L. OCHROLEU'CUS (Hook, in fl. bor. amer. p. 159.) plant quite glabrous; leaves with 3-4 pairs of broad, oval, or ovate leaflets; stipulas toothed, broad, semi-cordate, rather hastate, hardly smaller than the leaves, with the angles sometimes acute, and sometimes obtuse; peduncles many-flowered, about equal in length to the leaves; the 2 upper calycine segments short; legumes in an immature state, linear-elongated, acuminated, compressed, quite smooth. ♃. H. Native of North America, Hudson's Bay, and from the Red River, in lat. 49° through the whole woody country to Bear Lake, in lat. 66°. L. pisifórmis, Richards. in Frankl. 1st journ. edit. 2d append. p. 28. Flowers cream-coloured.

Cream-coloured-flowered Lathyrus. Pl. cl.

22 L. DECAPHY'LLUS (Pursh, fl. amer. sept. 2. p. 471.) plant glabrous or pubescent; leaves with 4-6 pairs of elliptic, rarely ovate or oblong leaflets; stipulas small, semi-sagittate, lanceolate, with the lobe deflexed and about equal in length to the stipulas; peduncles many-flowered, about equal in length to the leaves; calyx pubescent, with the superior teeth very short. ♃. H. Native of North America, on the banks of the Saskatchawan, abundant in bushy places in north-west America. Hook. bot. mag. 3123. Flowers purple.

Ten-leafletted Lathyrus. Fl. June. Clt. 1827. Pl. cl.

23 L. SPECIÒSUS; plant glabrous; leaves with 4 pairs of broad, elliptic, mucronate leaflets; stipulas as large as the leaflets; tendrils simple; peduncles many-flowered, longer than the leaves; segments of the calyx ovate-lanceolate, upper ones broadest and shortest, all mucronate. ♃. H. Native of Mexico. Flowers purplish-blue. (v. s. herb. Lamb.)

Showy Lathyrus. Pl. cl.

24 L. JAPÓNICUS (Willd. spec. 3. p. 1092.) stems acute-angular; leaves with 4 pairs of elliptic, acute leaflets; stipulas sagittate, stem-clasping, breadth of the leaflets, but shorter; peduncles many-flowered. ♃. H. Native of Japan. L. pisifórmis, Houtt. fl. syst. 8. t. 63. f. 1. but not of Lin. Flowers purple, or rose-coloured.

Japan Lathyrus. Pl. cl.

25 L. VENÒSUS (Muhl. in Willd. spec. 3. p. 1092.) stems tetragonal, not winged; leaves with many pairs of ovate, obtuse, nearly opposite, mucronulate, glabrous leaflets; tendrils trifid; stipulas semi-sagittate, ovate; peduncles many-flowered, shorter than the leaves. ♃. H. Native of Pennsylvania, and common throughout the great chain of lakes in Upper Canada; plentiful on the Red River and the river Winepeg. Oxypògon élegans, Rafin. in journ. phys. aug. 1819. p. 98, but the legume is said to be falciform and the ovary stipitate. Said to be like *L. pisifórmis*, but the stipulas are much smaller, and the leaflets are broader, ovate, and the corolla is larger. Flowers purple, veined.

Veiny Lathyrus. Pl. cl.

26 L. STIPULA'CEUS (Leconte, in cat. pl. new york, p. 92.) plant quite smooth; stems acutely tetragonal, hardly winged; leaves with 3 pairs of elliptic, mucronate leaflets; stipulas ovate, semi-sagittate, acuminated, large; peduncles 4-6-flowered, rather

longer than the leaves; legumes, when immature, linear, acuminated, compressed, glabrous. ♃. H. Native of North America, in meadows about New York, also of Upper Canada and about Lake Huron. Flowers large, purple.

Large-stipuled Lathyrus. Fl. July, Aug. Clt. 1816. Pl. cl.

27 L. MYRTIFÒLIUS (Muhl. in Willd. spec. 3. p. 1091.) stem weak, flexuous, tetragonal, not winged; leaves with 2-3 pairs of oblong-lanceolate, bluntish, stiffish, glabrous, mucronate leaflets, which are striated with veins; tendrils trifid; stipulas semi-sagittate, lanceolate, acuminated, with scabrous margins; peduncles 3-4-flowered, longer than the leaves. ♃. H. Native of North America, in Pennsylvania and the state of New York, and on the banks of the Niagara to Queenstown. This species has the habit of *L. palústris*, but differs in the calycine teeth being broad at the base, with the upper ones short. Flowers red.

Myrtle-leaved Lathyrus. Fl. July, Aug. Clt. 1822. Pl. cl.

28 L. POLYMÓRPHUS (Nutt. gen. amer. 2. p. 97.) stem tetragonal, not winged; leaves with many pairs of oblong or somewhat linear, obtuse, mucronate leaflets; stipulas semi-sagittate, lanceolate; peduncles many-flowered, longer than the leaves. ♃. H. Native on the grassy plains of the Missouri. Vìcia stipulàcea, Pursh, fl. amer. sept. p. 471. Allied to *L. palústris.* Flowers purple, streaked with deeper veins.

Polymorphous Lathyrus. Fl. June, July. Clt. 1824. Pl. cl.

29 L. MACRÆ'I (Hook, in Beech. voy. p. 21.) plant rather pilose; stems angular; leaves with 6 pairs of elliptic, retuse, feather-nerved leaflets, which are reticulately veined, white beneath, also full of pellucid dots; stipulas small, semi-sagittate, entire; peduncles many-flowered, longer than the leaves; lower segments of calyx very long and subulate, upper ones very short; style linear, pilose at the apex on all sides, but more conspicuous on the upper side. ♃. H. Native of Chili, about Valparaiso and Conception.

Mac Rae's Lathyrus. Pl. cl.

30 L. PALU'STRIS (Lin. spec. 1034.) plant quite glabrous; stems winged, erectish; leaves with 2-3 pairs of oblong, mucronulate leaflets; petioles subulate; tendrils bifid or trifid; stipulas semi-sagittate, acute, small; peduncles 3-5-flowered, hardly longer than the leaves; calycine segments unequal, nearly linear, length of tube; legumes compressed. ♃. H. Native of the north of Europe, in meadows and marshes; plentiful in Britain. Smith, engl. bot. t. 169. Oed. fl. dan. t. 399. Mart. fl. rust. t. 8. Garid. prov. t. 108. L. Narbonénsis, Riv. tetr. t. 40. Flowers variegated with blue and purple.

Var. β, linearifòlius (Ser. mss. in D. C. prod. 2. p. 371.) leaflets and stipulas very narrow. Native of Denmark and Switzerland.

Var. γ, subexstipulàtus (Ser. mss. in D. C. prod. 2. p. 371.) leaves with 2 pairs of linear-oblong leaflets; stipulas small, setaceous. L. palústris, Nestl. ex herb. D. C.

Marsh Lathyrus. Fl. July, Aug. Britain. Pl. cl.

31 L. HETEROPHY'LLUS (Lin. spec. 1034.) stem erect, rigid, winged; leaves with 1 or 2 pairs of lanceolate, mucronulate leaflets; petioles winged at the base; tendrils branched; stipulas lanceolate, semi-sagittate; peduncles 6-8-flowered; legumes compressed, glabrous. ♃. H. Native of Europe, at the bottom of mountains.—J. Bauh. hist. 2. p. 304. f. 1. Flowers large, with the standard and wings flesh-coloured and the keel whitish. By the leaves, the wings of the stem, and the size of the flowers, it appears to be intermediate between *L. latifòlius* and *L. sylvéstris.*

Various-leaved Lathyrus. Fl. July, Sept. Clt. 1731. Pl. cl.

32 L. VICIÆFÓRMIS (Wallr. sched. crit. p. 388.) stems simple, and are as well as the petioles winged; leaves with 6 pairs of linear-lanceolate, acuminated, mucronate leaflets; stipulas semi-sagittate, lanceolate; peduncles many-flowered, longer than the leaves. ♃. H. Native of Germany, in bushy places. Flowers violaceous, about the size of those of *O'robus vérnus.*

Vetch-formed Lathyrus. Pl. cl.

§ 2. *Annual plants, having the peduncles bearing from* 1-3 *flowers.*

* *Petioles leafless.*

33 L. A'PHACA (Lin. spec. 1029.) stems erect; tendrils cylindrical, filiform, leafless (rarely with 2 leaflets); stipulas ovate, sagittate, large; peduncles 1-flowered (rarely 2-flowered), articulated at the apex, furnished with a pair of small, narrow bracteas; calycine segments twice the length of the tube; legumes much compressed, broad, few-seeded; seeds compressed. ⊙. H. Native of Europe, in cultivated fields. In Britain, on the borders of sandy or gravelly fields, but rare; in Cambridgeshire and Oxfordshire; about Tottenham and Enfield; in a gravel-pit between Norwich and Brooke; and near Forncet, Norfolk. Smith, engl. bot. 1167. Curt. fl. lond. 5. t. 51.—Mill. fig. t. 43. Flowers small, yellow, with a paler keel. A smooth, glaucous herb.

Yellow-vetchling Fl. June, July. Brit. Pl. cl. 1 foot.

34 L. NISSÒLIA (Lin. spec. 1029.) stem erect; petioles dilated, foliaceous, grass-like, 3-5-nerved; stipulas small, subulate, usually wanting; flowers solitary, on long peduncles; peduncles articulated at the apex, and downy on the upper part, where they bear 2 little awl-shaped bracteas; legumes compressed, narrow, nerved, reflexed. ⊙. H. Native of Europe, in corn-fields. In Britain, in bushy places and grassy borders of fields. Smith, engl. bot. 112.—Magn. hort. t. 112. Curt. lond. fasc. 6. t. 51. Buxb. cent. 3. p. 84. t. 45. f. 1.—Moris. hist. sect. 2. t. 3. f. 7. Flowers beautiful crimson, variegated with purple and white. The plant, when young, very much resembles a grass.

Nissol's Lathyrus or Crimson Grass-vetch. Fl. May, June. Britain. Pl. ½ to 1 foot.

* * *Leaves with* 1 *pair of leaflets.*

35 L. SUBULA'TUS (Lam. dict. 2. p. 707.) plant pilose; stems tufted, filiform, tetragonal; leaves on short petioles; tendrils very short; leaflets linear, acute; stipulas linear, semi-sagittate, nearly the length of the leaflets; peduncles 1-3-flowered; calycine segments narrow, acute, nearly equal, length of tube. ⊙. H. Native of Monte Video. Flowers purple, like those of *L. tomentòsus*, but much smaller.

Subulate-leafletted Lathyrus. Pl. 1 foot.

36 L. INCONSPI'CUUS (Lin. spec. 1030.) stems obsoletely triquetrous; leaflets lanceolate, striated beneath, acuminated; stipulas semi-sagittate, lanceolate; tendrils on the lower leaves almost wanting, on the upper ones filiform and elongated; peduncles very short, 1-flowered. ⊙. H. Native of the Levant. Jacq. hort. vind. 1. t. 86. Corolla small, red, very little longer than the calyx. Legumes glabrous, straight, about the length of the leaflets, but broader.

Var. β, oblóngus (Ser. mss. in D. C. prod. 2. p. 372.) leaflets broad, elliptic; legumes finely reticulated, puberulous. ⊙. H.

Inconspicuous-flowered Lathyrus. Fl. June, Aug. Clt. 1739. Pl. ½ to 1 foot.

37 L. SPHÆ'RICUS (Retz. obs. 3. p. 39.) plant smoothish; stems erect, tetragonal, subulate at the apex; leaflets ensiform, mucronate, nerved; stipulas semi-sagittate, linear, length of peduncles and petioles; peduncles 1-flowered, thickish; calycine teeth narrow, longer than the tube; legumes somewhat torulose, nerved lengthwise; the nerves numerous and thick; seeds spherical. ⊙. H. Native of the south of Europe, in cultivated fields. D. C. icon. rar. 1. p. 10. t. 32. L. coccíneus, All. pedem. no. 1222. L. axillàris, Lam. dict. 2. p. 706.

Flowers beautiful crimson, about the size of those of *L. Nissòlia.*

Var. β, pilòsus (D. C. prod. 2. p. 372.) stems hairy; leaflets ciliated. ⊙. H. Native of Tauria. L. angulàtus, Stev. in litt.

Round-seeded Lathyrus. Fl. June, July. Clt. 1801. Pl. 1 ft.

38 L. MICRA'NTHUS (Gerard. in Lois. not. 106.) stems tetragonal; tendrils simple, very short; leaflets linear-lanceolate; peduncles very short, 1-flowered? ; stipulas ? ; calycine segments about equal in length to the corolla; legumes almost sessile, straight, spreading, cylindrical, rather villous. ⊙. H. Native of Provence, in corn-fields. Flowers purplish. Perhaps only a variety of *L. inconspícuus.*

Small-flowered Lathyrus. Fl. Ju. Jul. Clt. 1816. Pl. ½ to 1 ft.

39 L. ANGULA'TUS (Lin. spec. 1031.) plant glabrous; stems erect, tetragonal; leaflets linear, acuminated; tendrils trifid; stipulas semi-sagittate, linear, acute, hardly longer than the petiole; peduncles filiform, 1-flowered, hardly equal in length to the leaves, somewhat cirrhiferous; bracteas ovate, very short; calycine teeth acute, length of tube; legumes narrow, compressed, veinless; seeds angular. ⊙. H. Native of the south of Europe, in cultivated fields.—Buxb. cent. 3. p. 23. t. 42. f. 2. Flowers small, red, or purple.

Angular-seeded Lathyrus. Fl. June, July. Clt. 1683. Pl. ½ to 1 foot.

40 L. LONGIPEDUNCULA'TUS (Ledeb. hort. dorp. suppl. 1824. p. 5.) leaflets linear; tendrils trifid; peduncles 1-flowered, awned, exceeding the leaves; legumes cylindrical, nerveless; seeds angular. ⊙. H. Native country unknown. Perhaps *A. angulàtus,* Roth. cat. 3. p. 68. Flowers red.

Long-peduncled Lathyrus. Fl. Ju. Jul. Clt. 1817. Pl. 1 ft.

41 L. LEPTOPHY'LLUS (Bieb. fl. taur. 2. p. 155. suppl. p. 465.) stems erect; leaflets linear-lanceolate; tendrils branched; stipulas narrow, subulate, semi-sagittate; peduncles short, 1-flowered; calycine teeth lanceolate; legumes lanceolate, glabrous; seeds globose, tubercled. ⊙. H. Native of eastern Caucasus. Flowers purple but with the keel white.

Slender-leaved Lathyrus. Fl. June, Jul. Clt. 1818. Pl. 1 ft.

42 L. SETIFÒLIUS (Lin. spec. 1031.) plant glabrous; stems erect, tetragonal; leaflets linear, very narrow; stipulas very narrow, semi-sagittate, length of petiole; tendrils trifid; peduncles 1-flowered, filiform, shorter than the leaves, jointed at the apex, furnished each with a small bractea; calycine teeth acute, length of tube; tendrils trifid; legumes ovate-oblong, short, reticulated; seeds globose, warted, purple. ⊙. H. Native of the south of Europe; Italy, and France. L. prostràtus, Brign. pl. foro-juliens. 1. p. 28.?—J. Bauh. hist. 2. p. 308. with a figure. Flowers small, rose-coloured, or scarlet.

Bristle-leaved Lathyrus. Fl. Ju. Jul. Clt. 1739. Pl. ½ to 1 ft.

43 L. AMPHICA'RPOS (Lin. spec. 1029.) stems winged, diffuse; leaflets lanceolate; tendrils simple; stipulas semi-sagittate, 1-toothed, longer than the petioles; peduncles 1-flowered, longer than the leaves; cauline as well as subterraneous legumes ovate, 2-winged in front, and a little compressed on the sides, 2-seeded. ⊙. H. Native of Syria. Brot. fl. lus. 162. t. 66. Sweet, fl. gard. 236.—Moris. hist. 2. p. 61. sect. 2. t. 25. f. 1. Flowers pink, tinged with blue. In this singular plant there are underground stems, which are whitish, and bear flowers and legumes absolutely perfect, and resembling those on the stems above-ground, except that the flowers are smaller and do not expand.

Both-sides-fruited Lathyrus, or Underground or Earth-pea. Fl. June, July. Clt. 1680. Pl. ½ to 1 foot.

44 L. SATI'VUS (Lin. spec. 1030.) plant smoothish; stems winged; leaflets linear-oblong; tendrils trifid; stipulas semi-sagittate, ovate, ciliated, hardly the length of the petioles; peduncles 1-flowered, longer than the petioles, bracteolate and articulated at the apex; calycine segments lanceolate, foliaceous, almost 3-times the length of the tube; legumes ovate, broad, short, irregularly reticulated, winged on the back; seeds trigonal, smooth, rather truncate. ⊙. H. Native of Spain, France, and Italy. Jacq. fil. ecl. 116. Curt. bot. mag. t. 115. —Riv. tetr. irr. t. 47. Cicércula alàta, Mœnch. meth. p. 163. Flowers white.

Var. β, angustàtus (Ser. mss. in D. C. prod. 2. p. 373.) leaflets and stipulas linear, and very narrow.

Var. γ, coloràtus (Ser. mss. l. c.) corolla white, having the vexillum violaceous on the under side in front, and with deeper veins, and with the wings having each a large blue spot. ⊙. H. Native of Teneriffe. L. sativus β, Hoffm. verz. fl. 1824. p. 235.

The seeds of *L. satìvus* are commonly sown in Switzerland for soiling horses, under the name of *Gesse.* In several parts of the continent a white, light, pleasant bread is made from the flour of the pulse, but it produced such dreadful effects in the seventeenth century, that the use of it was forbidden by an edict of George, duke of Wirtemberg, in 1671, and was enforced by two other edicts under his successor Leopold, in 1705 and 1714. Mixed with wheat-flour in half the quantity makes a very good bread, and appears to be harmless. But bread made with this flour exclusively has brought on a most surprising rigidity of the limbs in those who have used it for a continuance, insomuch that the exterior muscles could not by any means be reduced, or have their natural action restored. These symptoms usually appeared on a sudden without any previous pain. The disease was regarded as incurable, and being neither very painful nor fatal, those who were seized with it usually submitted to it with patience. "Swine fattened with this meal lost the use of their limbs, but grew very fat lying on the ground. A horse fed some months on the dried herb was said to have his legs perfectly rigid. Kine are reported to grow lean on it, but sheep not to be affected. Pigeons, especially young ones, lose the power of walking by feeding on the seeds. Poultry will not readily touch it, but geese eat it without any apparent damage. In some parts of Switzerland cattle feed on the herb without any apparent harm." Duvernoy Fabbroni, of Florence, says, that the government there had cautioned the peasants against the use of *Láthyrus satìvus,* in 1786, swine having lost the use of their limbs, and become pitiable monsters, by being fed on this pulse exclusively. The peasants, however, eat it boiled or mixed with wheat flour, in the quantity of one-fourth, without any harm.

Cultivated Lathyrus or Chickling-vetch. Fl. June, July. Clt. 1640. Pl. cl.

45 L. CÍCERA (Lin. spec. 1030.) plant smoothish; stems diffuse, winged; leaflets linear-oblong; tendrils trifid or quadrifid; stipulas semi-sagittate, lanceolate, a little toothed, ciliated, length of the petiole; peduncles 1-flowered, longer than the stipulas; bracteoles small; calycine segments lanceolate, foliaceous, nearly 3 times the length of the tube; legumes oblong, irregularly-reticulated, channelled on the back, not winged; seeds trigonal, somewhat truncate, bay-coloured, smooth. ⊙. H. Native of Spain. Jacq. fil. eclog. t. 115. L. sativus β, Lam. dict. 2. p. 705. Cicércula ánceps, Mœnch. meth. 163. Flowers purple or red, rather variable.

Cicer-like or Flat-podded Lathyrus or Dwarf Chickling-vetch. Fl. June, July. Clt. 1633. Pl. cl. 1 to 2 feet.

46 L. A'NNUUS (Lin. spec. 1032.) plant glabrous; stems diffuse, winged; leaflets linear, elongated; tendrils trifid; stipulas semi-sagittate, very narrow, much shorter than the petioles; peduncles 1-2-flowered, length of the leaves; bracteoles small; calycine segments lanceolate, hardly longer than the tube; legumes oblong-linear, densely-reticulated, not winged; seeds roundish. ⊙. H. Native of Spain.—Buxb. cent. 3. t. 42. f. 1. —Riv. tetr. irr. t. 42. Flowers small, yellow.

Annual Lathyrus. Fl. June, July. Clt. 1621. Pl. cl.

47 L. HIRSU'TUS (Lin. spec. 1032.) stems winged; leaflets linear-lanceolate, 3-nerved; stipulas semi-sagittate, linear, about equal in length to the petiole; peduncles usually 2-flowered, hardly longer than the leaves; calyx hairy; segments ovate, acuminated, length of the tube; legumes oblong, hairy; seeds globose, warted. ⊙. H. Native of the south of Europe, in corn-fields. In Britain, but rare, in various places, at Rochford Hundred, Essex; at Southend, Essex; between Bath and Bristol. Sims, bot. mag. 1255. Smith, engl. bot. 1255. J. Bauh. hist. 2. p. 305. with a figure.—Riv. tetr. irr. t. 41. Corolla with a bright crimson standard, pale blue wings, and whitish keel.

Hairy Lathyrus. Fl. June, July. Britain. Pl. cl.

48 L. HIRTUS (Lam. dict. 2. p. 706.) stems tetragonal, not winged; leaflets oblong or obovate; stipulas semi-sagittate, linear, about equal in length to the petioles, or sometimes shorter; peduncles 1-flowered, hardly longer than the leaves; calycine segments ovate, length of the tube; legumes oblong-obovate, hairy; seeds globose, warted with dots. ⊙. H. Native country unknown. Flowers purplish. Perhaps a variety of *L. hirsùtus*, with short pods, and 1-flowered peduncles. Habit of *L. tuberòsus*.

Hairy-podded Lathyrus. Fl. Ju. Aug. Clt. 1800. Pl. cl.

49 L. ODORA'TUS (Lin. spec. 1032.) plant hairy; stems winged; leaflets ovate, mucronulate; stipulas semi-sagittate, lanceolate, much shorter than the petioles; peduncles 2-3-flowered, much longer than the leaves; calycine teeth broad, longer than the tube; legumes oblong-linear, compressed, hairy; seeds roundish. ⊙. H. Native of Sicily. Flowers sweet-scented.

Var. α, *purpùreus*; vexillum purple. Native of Sicily. Curt. bot. mag. t. 60.

Var. β, *ròseus*; vexillum rose-coloured. Native of Ceylon. New Painted Lady Sweet-pea.

Var. γ, *álbus*; flowers white. White Sweet-pea.

Var. δ, *píctus*; wings and keel white; vexillum flesh-coloured. Old Painted Lady-pea. [illegible] glabro

Var. ε, *cærùleus*; wings and [illegible] pairs of [illegible] ro-
purple. [illegible]ate; tend[illegible]

Var. ι, *violàceu*[illegible]ate, small [illegible] keel pale blue; vexillum dark
lum dark pur[illegible] leaves; c[illegible]
[illegible]be; l[illegible] keel pale violet; wings deep violet; vexil-
[illegible] of Euro[illegible]ple.

Smith [illegible]*et-peas* are a great ornament to flower-borders in autumn. The seeds only require to be sown in drills or in clumps in April. Gardeners who raise *Sweet-peas* for the London markets, sow them in the autumn in pots, and secure them from severe weather by placing them in hot-bed frames, by which means they can bring them early to market. They may be continued in flower the whole summer by repeated sowings in the spring. When sown in pots they require to be frequently refreshed with water.

Sweet-pea or Sweet-scented Lathyrus. Fl. July. Aug. Clt. 1700. Pl. cl.

50 L. TINGITA'NUS (Lin. spec. 1032.) plant quite smooth; stems winged; leaflets ovate, obtuse, mucronulate; stipulas ovate, semi-sagittate, much shorter than the petioles; peduncles 2-flowered, longer than the leaves; calycine teeth nearly equal, shorter than the tube; legumes oblong-linear, much reticulated, compressed, tomentose, with the sutures thick; seeds hardly angular, variegated with black and brown. ⊙. H. Native of the north of Africa, at Tangiers. Curt. bot. mag. t. 100. Jacq. hort. vind. t. 46. Flowers with a large purple vexillum, and with the wings and keel bright red. This species of *Láthyrus* is usually sown in gardens with other annuals, but the flowers have not the agreeable scent or variety of colours of the sweet-pea.

Tangier Pea. Fl. June, July. Clt. 1680. Pl. cl.

51 L. BRU'TIUS (Tenore, ex Spreng. syst. append.) leaflets 2, elliptic-oblong; stipulas semi-sagittate, setaceous; stem angular, smooth; legumes glabrous. ⊙. H. Native of Calabria.

Brutian Lathyrus. Pl. cl.

* * * *Leaves with 2 or 3 pairs of leaflets.*

52 L. CLYMENOÌDES (D. C. prod. 2. p. 374.) plant smoothish; stems winged; leaves with 2 pairs of linear-lanceolate mucronate leaflets; stipulas semi-sagittate, lanceolate, much shorter than the petioles; peduncles 1-flowered, filiform, shorter than the leaves; calycine segments lanceolate, twice the length of the tube; legumes lanceolate. ⊙. H. Native of the Mauritius. Flowers purple.

Clymenum-like Lathyrus. Pl. cl.

53 L. CIRRHÒSUS (Ser. mss. in D. C. prod. 2. p. 374.) plant quite smooth; stems tetragonal, winged; petioles winged, bearing 5 or 6 leaflets; tendrils much branched; leaflets alternate, elliptic, mucronulate, reticulately veined; stipulas semi-sagittate, linear, acute; peduncles many-flowered, longer than the leaves; calycine segments unequal, narrow, shorter than the tube; legumes oblong, finely reticulated; style arched. ⊙. H. Native of the Pyrenees, about Olette.

Tendrilled Lathyrus. Pl. cl.

54 L. TU'RGIDUS (Lam. dict. 2. p. 706.) plant pilose; stems tetragonal; lower leaves with one pair of ovate-oblong mucronate leaflets, upper ones with 2 pairs of linear-lanceolate leaflets; stipulas semi-sagittate, toothed; peduncles short or elongated, 1-2-flowered; calycine segments linear, length of tube or longer; style bearded; legumes oblong, compressed, villous, reticulated, turgid; seeds roundish. ⊙. H. Native of the Levant, and the south of France. L. túmidus, Willd. spec. 3. p. 1082. Flowers with a purple vexillum, and white wings.

Turgid-podded Lathyrus. Fl. June, Jul. Clt. 1817. Pl. cl.

55 L. PURPU'REUS (Presl. del. prag. p. 39. Guss. pl. rar. 297.) leaves with 2 pairs of linear leaflets; stipulas semi-sagittate; peduncles 1-flowered, bracteate, articulated beyond the middle, longer than the stipulas; legumes lanceolate. ⊙. H. Britain [illegible]e of Calabria, in corn-fields. Flowers purplish.

Pur[illegible]ple-flowered Lathyrus. Fl. May. Pl. cl.

5[illegible] L. CILIA'TUS (Guss. pl. rar. p. 296.) leaves with 2, rarely 3, pairs of leaflets; leaflets cuneiform[illegible]-obovate, retuse, mucronate, ciliated, superior ones linear [illegible] elongated, acute; petioles ending in a bristle; pedun[illegible]cles 1-flowered, articulated beyond the middle, short[illegible] than the petioles; legumes linear, compressed, 4-5-se[illegible] [illegible]ve of Monte V[illegible]ded; seeds small, globose, smooth. ⊙. H. Native of Calabria, on hills. Corolla small, with a greenish vexillum marked with purple veins; the keel and wings greenish-yellow.

Ciliated-leaved Lathyrus. Fl. May. Pl. dec. or cl.

SECT. II. CLY'MENUM (the Latin name for *Water Betony*, or from κλυμενος, *clymenos*, clear). D. C. prod. 2. p. 375. Vexillum furnished with a conical gibbosity on each side at the base. Lower petioles leafless, upper ones bearing 2-6, usually alternate leaflets. Petioles usually winged.

57 L. DIFFU'SUS; plant glabrous; stems furrowed; leaves with numerous alternate leaflets, which are lanceolate or elliptic-lanceolate, retuse, and mucronate; stipulas small, semi-sagittate, bidentate on one side; racemes shorter than the leaves; flowers secund; calycine segments short and broad, lower one elongated; calyx pubescent. ♃. H. Native of North America, on the Missouri. O'robus diffùsus, Nutt. in Fraser. cat. Flowers large, bluish-purple.

Diffuse Lathyrus. Pl. cl.

58 L. INCU'RVUS (Roth. abh. 13. t. 4.) stems tetragonal, subulate; leaflets elliptic-lanceolate, mucronulate, glabrous, rugged from dots; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; calycine teeth unequal, much shorter

than the tube; legumes curved. ♃. H. Native of Siberia. Willd. spec. 3. p. 1091.—Buxb. cent. 4. p. 27. t. 46. This plant is said to have the habit of and flowers of *O'robus tuberòsus.* Two of the angles of the stem are more winged than the other two, but all ciliated.

Incurved-podded Lathyrus. Fl. Ju. Jul. Clt. 1808. Pl. cl.

59 L. ALA'TUS (Tenore, prod. 42. but not of Smith,) stems tetragonal, winged; leaflets 6-8, oblong-lanceolate, mucronulate, alternate; petioles winged; stipulas lanceolate, unequal, somewhat sagittate; peduncles 2-3-flowered, longer than the leaves; calycine teeth unequal, shorter than the tube; legumes compressed, flat, many-seeded. ⊙. H. Native of Italy. Flowers large, purple. This plant comes very near *L. Clýmenum.*

Winged-stemmed Lathyrus. Fl. Ju. Aug. Clt. 1823. Pl. cl.

60 L. CLY'MENUM (Lin. spec. 1032.) stem tetragonal, winged; lower petioles dilated, leafless, linear-lanceolate, upper ones bearing 5-6 linear leaflets; stipulas semi-sagittate, linear; peduncles 1-6-flowered, about equal in length to the leaves; calycine teeth unequal, longer than the tube; legumes oblong, compressed, finely reticulated, with the seminiferous suture tumid; seeds compressed, variegated. ⊙. H. Native of the south of Europe. Clýmenum uncinàtum, Mœnch. meth. 150. Flowers blue. There is also a variety having the vexillum red and the wings blue.

Clear Vetchling. Fl. June, July. Clt. 1713. Pl. cl.

61 L. ARTICULA'TUS (Lin. spec. 1031.) stem tetragonal, winged; lower petioles leafless, linear, acuminated, upper ones bearing 5-6 linear leaflets; stipulas lanceolate, semi-sagittate; peduncles 1-3-flowered, about equal in length to the leaves; calycine teeth nearly equal, shorter than the tube; legumes rather turgid, finely reticulated and nodose at the seeds, having the seminiferous suture tumid; seeds compressed, dark purple, rather velvety. ⊙. H. Native of the south of Europe. Gærtn. fruct. 2. p. 331. t. 152. f. 2. Curt. bot. mag. 253. Tourn. inst. t. 218. Mill. fig. t. 96. Clýmenum bícolor, Mœnch. meth. 150.—Riv. tetr. irr. t. 48. Corolla with a bright red standard, and white wings and keel.

Articulated-podded Lathyrus. Fl. Ju. Jul. Clt. 1640. Pl. cl.

62 L. AURICULA'TUS (Bert. pl. rar. dec. 2. p. 38.) stem tetragonal, winged; lower petioles leafless, broadly auricled; upper ones with 5-6 linear leaflets; stipulas lanceolate, semi-sagittate; peduncles few-flowered; calycine teeth unequal; legumes torulose, thickened at the seminiferous suture; seeds velvety. ⊙. H. Native of Italy. L. articulàtus β, auriculàtus, Ser. in D. C. prod. 2. p. 375. Flowers purple, but at length becoming blue.

Auriculate-petioled Lathyrus. Fl. Ju. Jul. Clt. 1800. Pl. cl.

63 L. SPU'RIUS (Willd. enum. 760.) stems winged; petioles broadly winged, bearing about 4 leaflets, terminating in a branched tendril; stipulas lanceolate; peduncles 1-flowered; legumes compressed. ⊙. H. Native country unknown. Perhaps only a variety of *L. articulàtus.* Flowers purplish-blue.

Spurious Lathyrus. Fl. June, July. Clt. 1815. Pl. cl.

64 L. TENUIFÒLIUS (Desf. fl. atl. 2. p. 160.) stem simple, tetragonal, winged; lower petioles leafless, linear, acuminated, upper ones bearing 4 or 6 linear leaflets; lower stipulas small or wanting, upper ones large, semi-sagittate; peduncles usually 2-flowered, longer than the leaves; calycine teeth unequal, shorter than the tube; legumes oblong, compressed, glabrous. ⊙. H. Native of Algiers. Corolla blue, about the size of those of *L. satìvus.*

Fine-leaved Lathyrus. Fl. June, Aug. Clt. 1820. Pl. cl.

65 L. PURPU'REUS (Desf. cor. p. 81. t. 61.) stem and petioles winged; lower petioles leafless, lanceolate; upper ones bearing 4-6 ovate-lanceolate leaflets; stipulas lanceolate, semi-sagittate; peduncles 1-flowered, shorter than the leaves. ⊙. H. Native of Greece and Candia. L. alàtus, Smith, fl. græc. t. 697. prod. 2. p. 66.? but not of Tenore. Flowers purple, about the size of those of *L. odoràtus.*

Purple-flowered Lathyrus. Fl. June, Aug. Clt.? Pl. cl.

66 L. CORNU'TUS (Horn. hort. hafn. 686.) stems unknown; lower petioles leafless, winged, upper ones bearing 4-6, lanceolate alternate leaflets; legumes unknown. ⊙. H. Native country unknown. Flowers purple.

Horned Lathyrus. Fl. June, Aug. Clt. 1818. Pl. cl.

† *Species not sufficiently known.*

67 L. AMERICA'NUS (Mill. dict. no. 19.) stems procumbent; leaves kidney-shaped, simple, veiny beneath; peduncles 2-flowered. ♃. H. Native of North America. Flowers yellow. Perhaps *Baptísia perfoliàta.*

American Lathyrus.

68 L. PARISIE'NSIS (Mill. dict. no. 4.) leaves with many pairs of leaflets; stipulas lanceolate; peduncles 1-flowered. ⊙. H. Native country unknown.

Parisian Lathyrus. Fl. July. Clt.? Pl. cl.

69 L. MAGNOFLÒRE (Mill. dict. no. 14.) stems winged; leaves with one pair of ovate-lanceolate leaflets; peduncles many-flowered. ♃. H. Perhaps only a variety of *L. latifòlius.*

Large-flowered Lathyrus. Fl. June, Aug. Clt.? Pl. cl.

70 L. ERE'CTUS (Lag. nov. gen. 22.) leaflets linear; peduncles awnless, 1-flowered, short; legumes linear, many-seeded. ♂. H. Native about Madrid.

Erect Lathyrus. Pl. 1 foot.

† *Species only known by name from the catalogues of gardens, which are probably identical with some of those described above.*

1 *L. Hallersteinii,* Baumg. 2 *L. helòdes,* Link. 3 *L. Itálicus,* Fisch. 4 *L. Lusitánicus,* Martius. 5 *L. Sinénsis,* Martius.

Cult. The greater part of the species of *Láthyrus* are very handsome when in bloom, the larger kinds are very fit for arbours or shrubberies, and being mostly climbing plants, should be supported by branches stuck in round their roots, or other supports. They all grow in any common soil, and are increased by seeds, and some of the perennial kinds by dividing at the root.

CLXXIII. O'CHRUS (from *ωχρος, ochros,* yellow; in reference to the colour of the flowers, which are of a pale yellow). Pers. ench. 2. p. 305.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, 5-cleft, the 2 superior lobes the shortest and conniving. Stamens diadelphous. Vexillum furnished with a tooth on each side. Style flattened, villous in front at the apex. Legumes with a longitudinal membranous wing on each side of seminiferous suture, few-seeded. Seeds globular.—A herb, with bifoliate tendrilled leaves, and axillary, solitary, cream-coloured flowers and ovate stipulas.

1 O. PA'LLIDA (Pers. l. c.) stem prostrate, tetragonal, winged; petioles winged, lower ones for the most part leafless, upper ones bearing usually 2 leaflets, cirrhiferous; lower stipulas wanting, upper ones ovate; teeth of calyx rather unequal, length of tube. ⊙. H. Native of the south of Europe. Písum òchrus, Lin. spec. 1027. Láthyrus òchrus, D. C. fl. fr. 4. p. 578.—Tourn. inst. t. 219. Flowers pale yellow. Leaves glaucous.

Pale-flowered Yellow-pea. Fl. Ju. Aug. Clt. 1790. Pl. cl. 1 ft.

Cult. The seeds of this plant only require to be sown in the open border, in any light soil.

CLXXIV. O'ROBUS (*οροβος* of Theophrastus and Dioscorides, from *ορω, oro,* to excite, and *βους, bous,* an ox; the present genus, however, has nothing to do with the plant of Theophrastus and Dioscorides, which whatever it was, was used for fattening oxen). Tourn. inst. t. 214. Lin. gen. no. 871. D. C. fl. fr. 4. p. 586. D. C. prod. 2. p. 376.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, 5-cleft, the 2 superior lobes shortest. Corolla papilionaceous. Stamens diadelphous. Style slender, linear, villous at the apex. Legume cylindrical, oblong, 1-celled, 2-valved, many-seeded. Seeds with a linear hylum.—Erect herbs, with semi-sagittate stipulas. Petioles ending in a short simple bristle. Leaves abruptly pinnate, with few pairs of leaflets. Racemes of flowers axillary, pedunculate.

§ 1. *Leaves with only one pair of leaflets, which are either ovate, lanceolate, or linear.*

1 O. LAXIFLÒRUS (Desf. cor. p. 83. t. 62. ann. mus. par. 12. p. 57. t. 8.) plant villous; leaflets ovate, acute, with parallel nerves; stipulas unequally ovate-sagittate, rather larger than the leaflets; racemes axillary, few-flowered; calycine segments nearly equal, setaceously-subulate, much longer than the tube, but much shorter than the corolla; legumes compressed, villous, many-seeded. ♃. H. Native of Candia. Flowers violaceous.

Loose-flowered Bitter-Vetch. Fl. May, Jul. Clt. 1820. Pl. 1 ft.

2 O. HIRSU'TUS (Lin. spec. 1027.) plant hairy; leaflets ovate, acute, with parallel nerves; stipulas unequally sagittate, lanceolate, about the size of the leaflets; racemes axillary, few-flowered, longer than the leaves; calycine segments nearly equal, setaceously-subulate, much longer than the tube, but much shorter than the corolla; legume compressed, hairy. ♃. H. Native of Thrace. Sims, bot. mag. 2315. Buxb. cent. 3. p. 22. t. 41. Flowers red or purple.

Var. β, glabriúsculus (Ser. mss. in D. C. prod. 2. p. 376.) stems, leaves, and peduncles quite smooth; calyx pilose. ♃. H. Native of Tauria.

Hairy Bitter-Vetch. Fl. May, June. Clt. 1822. Pl. 1 ft.

3 O. FORMÒSUS (Stev. mem. soc. mosq. 4. p. 50. Lin. soc. trans. 11. p. 413. t. 36.) plant quite smooth; leaflets ovate, mucronulate; stipulas small, semi-sagittate, acute, denticulated, with diverging nerves; peduncles axillary, usually 2-flowered, longer than the leaves; calycine segments lanceolate, length of tube, but much shorter than the corolla; legumes lanceolate, glabrous. ♃. H. Native of the alps of Caucasus. Corollas beautiful purple, about the size of those of *O. vérnus.*

Var. β, microphýllus (Ser. mss. in D. C. prod. 2. p. 377.) leaflets roundish, much smaller; stipulas hardly toothed. ♃. H.

Beautiful Bitter-Vetch. Fl. May, Jul. Clt. 1818. Pl. ¾ ft.

4 O. LATHYROÌDES (Lin. spec. 1027.) plant smoothish; leaflets ovate, mucronate, with divaricate nerves; stipulas semi-sagittate, a little toothed, smaller than the leaflets; peduncles many-flowered, axillary, about equal in length to the leaves; calycine teeth shorter than the tube; legumes compressed, glabrous, 2-3-seeded. ♃. H. Native of Siberia.—Amm. ruth. 151. t. 7. f. 2. Stems branched a little. Flowers crowded, of a beautiful blue colour, usually 3 or 4 racemes standing together. An elegant plant, with broad, shining leaflets and black roots.

Lathyrus-like Bitter-Vetch. Fl. Ju. Jul. Clt. 1758. Pl. 1 to 2 ft.

5 O. SESSILIFLÒRUS (Smith, in Rees' cycl. vol. 25.) root creeping, branched; stems weak, undivided, angular, but not winged; leaflets narrow, almost linear, nearly sessile; stipulas very narrow, semi-sagittate, entire; racemes few-flowered. ♃. H. Native country unknown. Flowers purple.

Sessile-flowered Bitter-Vetch. Pl. ½ to 1 foot.

6 O. FISCHE'RI (Sweet, fl. gard. t. 289.) stem tetragonal, almost simple, smoothish; leaflets linear, bluntish, mucronulate, nerved lengthwise, rather silky beneath; stipulas linear, acute, a little toothed, with one auricle at the base; racemes pedunculate, many-flowered; flowers secund; legumes reticulately veined, 6-7-seeded. ♃. H. Native of Siberia. O. atropurpùreus, Fisch. in litt. but not of Desf. Flowers large, beautiful purple.

Fischer's Bitter-Vetch. Fl. May, Jul. Clt. 1827. Pl. 1 ft.

7 O. QUADRA'NGULUS (Spreng. syst. 3. p. 258.) stem simple, quadrangular; leaves with 1 pair of linear, glabrous leaflets; stipulas semi-sagittate, setaceous; peduncles many-flowered; flowers secund. ♃. H. Native of Sicily.

Quadrangular-stemmed Bitter-Vetch. Pl. 1 foot.

§ 2. *Leaves with many pairs of broadish leaflets. Stipulas much smaller than the leaflets.*

8 O. VE'RNUS (Lin. spec. 1028.) plant rather pubescent; stems simple, flexuous; leaves with 2-3 pairs of ovate-lanceolate, acuminated, shining leaflets, with rather parallel nerves; stipulas semi-sagittate, entire; peduncles axillary, many-flowered, shorter than the leaves; flowers secund, nodding; calycine segments broad, hardly the length of the tube, lower one longest; legumes rather compressed, obliquely and reticulately veined, many-seeded; style jointed; seeds roundish, smooth. ♃. H. Native of Europe, in groves, in many parts, particularly in the south. Sturm, deutschl. fl. 7. with a figure. Curt. bot. mag. 521. Riv. tetr. irr. t. 58. Schmidel, t. 59. f. 79. Flowers handsome, singular in the different shades of colour, the upper part of the vexillum is purple, with blood-red veins; the wings blue, and the keel is blue tinged with green; the colours change as the corolla advances, and becomes blue. The roots are black.

Var. β, ruscifòlius (Ser. mss. in D. C. prod. 2. p. 377.) leaflets stiff, elongated, taper-pointed. O. ruscifòlius, Willd. in herb. Desf. ex Poir. suppl. 4. p. 203.

Var. γ, fláccidus (Ser. mss. in D. C. l. c.) leaflets very narrow and flaccid. ♃. H. Native of Croatia and Switzerland.

Spring Bitter-Vetch. Fl. Mar. April. Clt. 1629. Pl. ¾ to 1 ft.

9 O. VENÒSUS (Willd. herb. ex Link. enum. 236.) stem simple; leaves with 2 pairs of lanceolate, taper-pointed leaflets, with divaricate veins; stipulas semi-sagittate; racemes few-flowered. ♃. H. Native of Siberia.—Gmel. fl. sib. t. 5. f. 1. Flowers blue and veined with purple.

Veiny-flowered Bitter-Vetch. Fl. May, Ju. Clt. 1820. Pl. 1 ft.

10 O. ALPE'STRIS (Waldst. et Kit. hung. 2. p. 133. t. 126.) plant glabrous; stems angular, simple; leaves with 2-3 pairs of oblong-lanceolate, acuminated leaflets, with somewhat parallel nerves; stipulas semi-sagittate, entire, or toothed; peduncles axillary, many-flowered, about equal in length to or a little longer than the leaves; flowers secund, nodding; calycine segments broad, hardly the length of the tube; legumes rather compressed: style hooked; seeds roundish, brown. ♃. H. Native of Hungary. Flowers purple, having the vexillum veined with crimson, fading to blue.

Alp Bitter-Vetch. Fl. June, Jul. Clt. 1817. Pl. 1 to 2 ft.

11 O. MULTIFLÒRUS (Sieb. in fl. 1821. p. 97.) stem almost simple; leaves with 3-4 pairs of ovate, acuminated leaflets; stipulas semi-sagittate; peduncles elongated, incurved, many-flowered. ♃. H. Native of Italy, near Naples. Flowers pale red, about the size of those of *O. níger.*

Many-flowered Bitter-Vetch. Fl. My. Jul. Clt. 1820. Pl. 1 to 2 ft.

12 O. VARIEGA'TUS (Tenore, prod. suppl. 1. p. 62. and cat. 1819. p. 57. fl. neap. t. 68. but not of Lapeyr.) plant pilose; stems simple, flexuous; leaves with 2-3 pairs of lanceolate, acuminated leaflets, with parallel nerves; stipulas ovate, semi-sagittate, quite entire, acute, much smaller than the leaflets; calycine segments narrow, acute, length of tube; legumes compressed, nerveless, dotted; style straight. ♃. H. Native near Naples, in woods. Colúmn. phytob. p. 59. with a figure. O. seròtinus, Presl. according to Gussone in litt. Flowers purple and variegated.

Variegated-flowered Bitter-Vetch. Fl Ju. Jul. Clt. 1821. Pl. 1 ft.

13 O. VICIOÌDES (D. C. prod. 2. p. 377.) plant smoothish; stems simple, flexuous; leaves with 2-3 pairs of ovate-lanceolate,

acuminated leaflets, with diverging nerves; stipulas ovate-lanceolate, small; peduncles few-flowered, axillary, shorter than the leaves; calycine segments narrow, acute, deflexed, length of tube; legumes compressed, almost nerveless; style flexuous, bearded at the apex; seeds globose. ♃. H. Native of the alps of Croatia and Carniola. Vícia oroboìdes, Wulf. in Jacq. coll. 4. p. 323. Waldst. et Kit. hung. 3. p. 269. t. 242. O. Clùsii, Spreng. syst. 3. p. 259. Flowers yellow.

Vicia-like Bitter-Vetch. Fl. June, July. Clt. 1819. Pl. 2 ft.

14 O. LU'TEUS (Lin. spec. 1028.) plant smoothish; stems simple, angular; leaves with 3-5 pairs of elliptic-lanceolate, mucronulate leaflets, which are glaùcous beneath; stipulas roundish, semi-sagittate, toothed at the base, much smaller than the leaflets; peduncles elongated, many-flowered, about equal in length to the leaves; calyx smoothish, with short unequal teeth; legumes compressed, longitudinally and reticulately veined, sessile; seeds globose, variegated. ♃. H. Native of the alps of Switzerland, France, Italy, and Siberia. Lodd. bot. cab. 783. Sweet, fl. gard. 2. series t. 115. Mill. fig. t. 193. f. 1. O. Gmelìni, Fisch. in litt.—Gmel. sib. 4. p. 13. no. 17. t. 4. Flowers from orange to pale yellow.

Yellow-flowered Bitter-Vetch. Fl. June, July. Clt. 1759. Pl. 1 to 2 feet.

15 O. TOURNEFÓRTII (Lapeyr. mem. mus. 2. p. 298. t. 10.) plant glabrous; stem quadrangular, simple; leaves with usually 4 pairs of alternate, elliptic, lanceolate, parallel-nerved leaflets, which are glaucous beneath; stipulas large, roundish, semi-sagittate, stem-clasping, undulated; peduncles many-flowered, rather longer than the leaves; calycine segments linear, the two superior ones very short; legumes linear, flat. ♃. H. Native of the Pyrenees. Flowers purple; the wings and keel having a white base.

Tournefort's Bitter-Vetch. Fl. Ju. Jul. Clt. 1821. Pl. 1 to 2 ft.

16 O. LÆVIGA'TUS (Waldst. et Kit. hung. 3. p. 270. t. 243.) plant quite smooth; stem simple; leaves with 3-4 pairs of ovate, mucronate leaflets; stipulas semi-sagittate, toothed at the base, much smaller than the leaflets; peduncles elongated, many-flowered, inclined, shorter than the leaves; calyx with short teeth; legumes erect, compressed, flat, smooth; style jointed. ♃. H. Native of Hungary. Flowers pale yellow. Very like *O. lùteus.*

Smooth Bitter-Vetch. Fl. May, Jul. Clt. 1820. Pl. $1\frac{1}{2}$ ft.

17 O. TRANSYLVA'NICUS (Spreng. syst. 3. p. 260.) stem villous; leaves with usually 4 pairs of oblong, obtuse, mucronate rather ciliated leaflets; stipulas broad, semi-sagittate, quite entire; peduncles axillary, few-flowered; superior teeth of calyx very short. ♃. H. Native of Transylvania. O. lævigàtus, Baumg. but not of Waldst ex Kit.

Transylvanian Bitter-Vetch. Pl. 1 foot.

18 O. AURA'NTIUS (Stev. in Bieb. fl. taur. suppl. 462.) plant pilose; stems simple, angular; leaves with 5-6 pairs of lanceolate, bluntish leaflets, with diverging nerves; peduncles elongated, shorter than the leaves; calyx pilose, with unequal teeth, 4 very short and 1 very long; legumes pedicellate. ♃. H. Native of western Iberia. Corolla deep yellow. Very like *O. lùteus.*

Orange-coloured-flowered Bitter-Vetch. Fl. June, Jul. Clt. 1818. Pl. $1\frac{1}{2}$ foot.

19 O. CRÒCEUS (Desf. cor. p. 85. t. 63. ann. mus. 12. p. 59. t. 9.) plant pilose; stem simple, angular; leaves with 3 pairs of leaflets, floral ones deflexed; leaflets ovate, obtuse; stipulas unequal, ovate; peduncles many-flowered, about equal in length to the leaves; calycine teeth nearly equal; length of tube; style jointed. ♃. H. Native of Cappadocia. Flowers copper-coloured, about the size of those of *O. lùteus.*

Copper-coloured-flowered Bitter-Vetch. Pl. 2 foot.

20 O. SYLVA'TICUS (Lin. amœn. 4. p. 284. spec. 1029.) stems branched, decumbent, hairy as well as the leaves; leaves with many pairs of small, ovate-oblong, acute, or elliptic mucronate leaflets; stipulas semi-sagittate, single-toothed; peduncles many-flowered, about equal in length to the leaves; calycine teeth unequal, short; legumes ovate-oblong, glabrous, pedicellate; style jointed. ♃. H. Native of several parts of Europe. In Britain, in mountainous woods and thickets, at Gamblesby, Cumberland, about 6 miles from Penrith, on the way to Newcastle; plentiful in several parts of Wales and the lowlands of Scotland; also of Ireland. Smith, engl. bot. 518. Lightf. fl. scot. t. 16. Petioles ending in tufts of hairs. Three lower teeth of calyx fringed. Flowers crowded, cream-coloured, streaked and tipped with purple on the outside, white and veined within.

Wood Bitter-Vetch. Fl. May, July. Britain. Pl. proc.

21 O. OCHROLEU'CUS (Waldst. et Kit. hung. 2. p. 123. t. 118.) stems branched, rather ascendent, villous; leaves hairy, usually with about 10 pairs of ovate-lanceolate, obtuse leaflets; stipulas ovate, upper ones linear; peduncles many-flowered, shorter than the leaves; teeth of calyx unequal, short; legumes compressed, sessile; style jointed; seeds globose, brown. ♃. H. Native of Hungary. Flowers cream-coloured.

Cream-coloured-flowered Bitter-Vetch. Fl. May, July. Clt. 1816. Pl. 2 to 3 feet.

22 O. 'NÌGER (Lin. spec. 1028.) plant smoothish; stem branched, angular, flexuous; leaves with 3-6 pairs of elliptic, mucronulate leaflets, with parallel nerves; stipulas linear-lanceolate, acute; peduncles many-flowered, longer than the leaves; calycine teeth unequal, shorter than the tube; legumes compressed, obsoletely and reticulately veined; style jointed; seeds globose. ♃. H. Native of many parts of Europe in sub-alpine places. In Scotland in the den of Airly, Forfarshire, and on Craiganain near Moy-house, Inverness-shire. Oed. fl. dan. t. 1170. Sims, bot. mag. 2261.—Riv. tetr. irr. t. 60. Flowers purple, easily changing colour. Herb turning black on drying.

Black Bitter-Vetch. Fl. June, July. Britain. Pl. 2 feet.

23 O. JORDA'NI (Tenore, fl. neap. prod. append. 5.) root tuberously fasciculate; leaves with 3-4 pairs of oblong-lanceolate, cuspidate leaflets; stipulas semi-sagittate, subulate; peduncles 4-6-flowered, twice the length of the leaves; style jointed. ♃. H. Native of Lucania, in humid meadows. Flowers blue.

Jordan's Bitter-Vetch. Fl. May, June. Clt. 1830. Pl. pr.

24 O. HU'MILIS (Ser. mss. in D. C. prod. 2. p. 378.) plant quite smooth; stem simple, striated; leaves with 3 pairs of ovate, mucronulate leaflets, with diverging nerves; stipulas semi-hastate; peduncles few-flowered, about equal in length to the leaves; calycine teeth unequal, shorter than the tube. ♃. H. Native of Dahuria. Láthyrus hùmilis, Fisch. in litt.

Humble Bitter-Vetch. Fl. July, Aug. Clt. 1825. Pl. $\frac{1}{2}$ ft.

25 O. TUBERÒSUS (Lin. spec. 1028.) plant quite smooth; stem winged, erect, or prostrate, tuberculate at the base; leaves with 2-3 pairs of elliptic-lanceolate, mucronulate, dotted leaflets, with rather parallel nerves; stipulas semi-sagittate, jagged at the base; peduncles few-flowered, hardly exceeding the leaves; calycine teeth unequal, ovate, bluntish, shorter than the tube; legumes terete, obsoletely and reticulately veined; style jointed, seeds globose. ♃. H. Native of almost every part of Europe, in woods and among bushes; plentiful in Britain. Sturm, deutschl. fl. fasc. 21. Oed. fl. dan. 781. Smith, engl. bot. 1153.—Riv. tetr. irr. t. 59. Roots creeping, swelling into tubers at irregular intervals. Calyx purple. Corolla elegant, variegated and veined with purple crimson, and shades of blue and flesh-colour, changing to blue as it fades. The highlanders of Scotland have a great esteem for the tubercles of the roots; they dry and chew them to give a better relish to their whisky;

they also affirm that they are good against most diseases of the thorax, and that by the use of them, they are enabled to repel hunger and thirst for a long time. In Breadalbane and Rosshire, they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are well flavoured and nutritive, and in times of scarcity have served as a substitute for bread. Boiled well a fork will pass through the tubers, and dried slightly and roasted they are served up in Holland and Flanders in the manner of chestnuts. The plant is called *Wood-pea* or *Heath-pea* in England, and *Knapperts* in the lowlands of Scotland. In Gaelic it is called *Cor-meille*.

Tuberous-rooted Bitter-Vetch. Fl. May, July. Britain. Pl. ½ to 1 foot.

26 O. TENUIFÒLIUS (Roth. fl. germ. 1. p. 305.) plant quite smooth; leaves with 2-3 pairs of very narrow, linear leaflets; stem winged, erect; stipulas narrow, semi-sagittate, ciliated, bidentate behind; peduncles few-flowered, hardly longer than the leaves; calycine teeth unequal; legumes terete; roots swelling in tubers at intervals. ♃. H. Native of most parts of Europe, in woods, along with *R. tuberòsus.* O. tuberòsus, var. δ, tenuifòlius, Ser. mss. in D. C. prod. 2. p. 376. Roots and flowers like those of *O. tuberòsus.* Leaflets channelled above, and mucronate.

Fine-leafletted Bitter-Vetch. Fl. May, Jul. Brit. Pl. ½ to 1 ft.

27 O. PYRENA'ICUS (Lin. spec. 1029.) stem simple, terete; leaves with 2-3 pairs of ovate, nerved, mucronate leaflets, which are glaucous beneath; stipulas semi-sagittate, linear, awned on both sides; peduncles 1-2-flowered; teeth of calyx triangular, the lowest one the longest; style jointed. ♃. H. Native of the Pyrenees. O. Plukenètii, Lapeyr. mem. mus. 2. p. 299.—O. tuberòsus var. β, Pyrenàicus, Ser. in D. C. prod. 2. p. 376.—Pluck. phyt. t. 200. Flowers pure purple.

Pyrenean Bitter-Vetch. Fl. May, July. Clt. 1622. Pl. 1 ft.

28 O. DIVARICA'TUS (Lapeyr. in mem. mus. 2. p. 302. t. 2.) stem branched, divaricate, winged in the middle, but naked at both extremities; leaves with 2-3 pairs of elliptic-lanceolate, obtuse, mucronate leaflets; stipulas of the lower leaves acute, entire, of the upper ones sharply and deeply toothed at the base; peduncles few-flowered; calycine segments triangular, acute, lower one longest. ♃. H. Native of the Pyrenees. O. tuberòsus γ, divaricàtus, Ser. in D. C. prod. 2. p. 376. Flowers purple.

Divaricate Bitter-Vetch. Fl. May, July. Clt. 1816. Pl. ? ft.

29 O. ERE'CTUS (Poir. in Lam. dict. 4. p. 627.) stem branched; leaves with 4-6 pairs of elliptic, glabrous, mucronate leaflets; stipulas semi-sagittate, acute; peduncles villous, 4-6-flowered. ♃. H. Native country unknown.

Erect Bitter-Vetch. Fl. July, Aug. Pl. 1 foot.

30 O. VICIÆFÓRMIS (Lag. gen. et spec. p. 22.) leaves pinnate; leaflets oblong, bluntish; stipulas bifid, somewhat stipitate; peduncles 1-7-flowered; legumes lanceolate, glabrous. ♃. H. Native of Spain. Flowers pale blue.

Var. α, calcaràtus; peduncles 1-flowered, furnished with a short awn. Vìcia calcaràta, Desf. fl. atl. 2. p. 166. Lagasc. l. c.

Var. β, multiflòrus; peduncles 2-7-flowered. Lagasc. l. c.

Vicia-flowered Bitter-Vetch. Pl. decumbent.

31 O.? PISCI'DIA (Spreng. pl. min. cogn. 1. p. 47.) stem unknown; leaves impari-pinnate; leaflets cuneate, retuse; stipulas subulate; peduncles racemose, few-flowered, longer than the leaves.—Native of New Caledonia. Vicia Piscídia, Forst. mss. The plant from the name appears to be used in New Caledonia for intoxicating fish.

Fish-poison Bitter-Vetch. Pl.

§ 3. *Leaves with many pairs of very narrow leaflets.*

32 O. VA'RIUS (Soland. in Sims's bot. mag. t. 675.) stems simple, angular; leaves with 3-4 pairs of linear-lanceolate, mucronulate leaflets; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; calycine teeth lanceolate, unequal, shorter than the tube; style almost filiform. ♃. H. Native of Italy. O. versícolor, Gmel. syst. 2. p. 1108. Flowers having the vexillum rose-coloured, and the keel and wings yellowish.

Various-flowered Bitter-Vetch. Fl. May, June. Clt. 1759. Pl. 1½ foot.

33 O. CANE'SCENS (Lin. fil. suppl. p. 327.) stem tetragonal; leaves with usually 2-3 pairs of linear, bluntish, pubescent, or dotted leaflets, with parallel nerves; stipulas semi-sagittate, linear, acute; peduncles many-flowered, longer than the leaves; calycine teeth lanceolate, unequal, shorter than the tube; legumes straight, compressed, glabrous, reticulately veined lengthwise; style jointed, rhomboid. ♃. H. Native of the south of Europe. O. filifórmis, Lam. fl. fr. 2. p. 568. Flowers white, with a tinge of blue.

Var. β, tènuis (Ser. l. c.) leaflet linear; flowers dark-purple. ♃. H. Native of the Pyrenees. O. atropurpùreus, Lapeyr. abr. 413.

Canescent Bitter-Vetch. Fl. May, June. Clt. 1816. Pl. 1½ ft.

34 O. PALLE'SCENS (Bieb. fl. taur. 2. p. 152. suppl. p. 463.) stem simple, pubescent, tetragonal; leaves with 2 pairs of linear, subulate, pubescent leaflets; stipulas semi-sagittate, subulate, almost entire; peduncles many-flowered, longer than the leaves; style very thick at the apex. ♃. H. Native of Tauria. O. canéscens β palléscens, Ser. in D. C. prod. 2. p. 376. Flowers white. Perhaps a species of *Platýstylis.*

Pale-flowered Bitter-Vetch. Fl. May, Ju. Clt. 1823. Pl. 1 ft.

35 O. ENSIFÒLIUS (Lapeyr. in mem. mus. 2. p. 303. t. 12.) stem terete, striated; leaves with 2-3 pairs of ensiform, acute, erect, nerved, crowded leaflets; stipulas semi-sagittate, acute; peduncles many-flowered, twice the length of the leaves; calycine teeth ovate, acute, lower ones longest; wings and keel coadunate. ♃. H. Native of the Pyrenees. O. canéscens var. γ, ensifòlius, Ser. in D. C. prod. 2. p. 376. Flowers white.

Sword-leafletted Bitter-Vetch. Fl. May, June. Pl. 1 foot.

36 O. A'LBUS (Lin. fil. suppl. 327.) stem simple; leaves with 2-3 pairs of linear mucronate leaflets, with parallel nerves; stipulas broadish, semi-sagittate, shorter than the petiole, which is winged; peduncles many-flowered, longer than the leaves; calycine teeth lanceolate, very unequal, lower ones much the longest; legumes compressed, glabrous, rather flexuous; style linear. ♃. H. Native of the south of Europe, Austria, Hungary, &c. Sweet, fl. gar. t. 22. O. Pannónicus, Jacq. austr. 1. t. 39. O. læ'tus, Bieb. fl. taur. 2. p. 152.—J. Bauh. hist. 2. p. 326. f. 2. Flowers white, tinged with rose-colour.

Var. β, asphodeloìdes (Ser. in D. C. prod. 2. p. 376.) leaflets shorter and broader, tubers of root oblong. O. asphodeloìdes, Gouan. ill. p. 48. Perhaps a distinct species.

White-flowered Bitter-Vetch. Fl. May, June. Clt. 1794. Pl. 1 foot.

37 O. ANGUSTIFÒLIUS (Lin. spec. 1028.) stem simple; leaves with 2 pairs of narrow, ensiform, acute leaflets; stipulas subulate, semi-hastate; peduncles many-flowered, longer than the leaves. ♃. H. Native of Siberia.—Gmel. fl. sib. 4. p. 14. t. 5. Flowers yellow. The leaflets are remarkably narrow.

Narrow-leafletted Bitter-Vetch. Fl. May, June. Clt. 1766. Pl. 1 foot.

38 O. ATRO-PURPU'REUS (Desf. fl. atl. 2. p. 157. t. 196. but not of Lapeyr.) stem simple or branched, striated or angular; leaves with 3 pairs of linear acute leaflets; stipulas semi-sagittate, very narrow, awned; peduncles many-flowered, longer than the leaves; flowers secund, drooping; teeth of calyx almost equal, obtuse, and very short; style filiform, crowned by a glo-

bose stigma; legumes compressed, somewhat elliptic, irregularly and reticulately veined. ♃. H. Native of Algiers, in uncultivated fields, and of Calabria. O. Sículus, Rafin. O. Rafinésquii, Presl. del. pr. p. 41. Petals elongated, purple.

Dark-purple-flowered Bitter-Vetch. Pl. 1 to 2 feet.

39 O. SAXA'TILIS (Vent. hort. cels. t. 94.) stems simple, weak; leaves with 2 pairs of linear leaflets; stipulas small, semi-sagittate; peduncles 1-flowered, much shorter than the leaves, articulated, and bracteolate; calycine segments lanceolate, nearly equal, shorter than the tube; legumes nearly cylindrical, grey. ⊙. H. Native of Provence, on arid hills. D. C. fl. fr. 4. p. 589. Flowers blue and white mixed.

Rock Bitter-Vetch. Fl. June, Aug. Clt. 1820. Pl. ½ foot.

40 O. LONGIFÒLIUS (Nutt. gen. amer. 2. p. 95.) plant clothed with silky villi; leaves ternate, and with 2 pairs of leaflets, uppermost ones simple; leaflets very long, filiform-linear; stipulas undivided, ovate-lanceolate, acuminated; racemes pedunculate, filiform, shorter than the leaves; 2 upper teeth of calyx shortest. ♃. H. Native of North America, on the plains of the Missouri. Psoràlea longifòlia, Pursh. fl. sept. amer. 2. p. 741. Racemes usually solitary. Flowers pale-red. Roots creeping.

Long-leafletted Bitter-Vetch. Pl. 1 foot.

41 O.? DI'SPAR (Nutt. gen. amer. 2. p. 95.) leaves unequally pinnate, with 6-8 pairs of linear obtuse leaflets; stipulas simple, ovate; racemes sessile, twin or tern; segments of the calyx equal, the superior indenture, however, more profound and wider than the rest; legumes, glabrous. ♃. H. Native of North America, on arid hills about Fort Mandan. Flowers cream-coloured, having the wings longer than the keel. Habit of a species of *Astrágalus*.

Unlike Bitter-Vetch. Pl. decumbent.

† *Species not sufficiently known.*

42 O.? PROCU'MBENS (Mill. dict. no. 11.) stems procumbent; leaves impari-pinnate, tomentose; outer leaflets largest; leaflets 5 pairs. Native of Mexico, about Vera Cruz. Flowers bright purple, disposed in short axillary racemes. Legumes compressed. Seeds 6, roundish.

Procumbent Bitter-Vetch. Pl. procumbent.

43 O. VENE'TUS (Mill. dict. no. 8. fig. t. 193. f. 2.) stems simple; leaves with 4 pairs of ovate acute leaflets; legumes tumid, containing 3-4 roundish seeds; peduncles 4-flowered. ♃. H. Native of Germany and Italy. Flowers purple. Perhaps a variety of *O. vérnus*.

Venetian Bitter-Vetch. Fl. March, April. Pl. 1 foot.

44 O. MONTA'NUS (Scop. fl. carn. 2. p. 80. t. 41.) stem simple, striated; leaves with 3-4 pairs of ovate leaflets; racemes 5-6-flowered, a little longer than the leaves; legumes glabrous, purple. ♃. H. Native of Carniola. Flowers yellowish-white. Perhaps a variety of *O. vérnus*.

Mountain Bitter-Vetch. Pl. 1 foot.

45 O.? COCCI'NEUS (Mill. dict. no. 12.) stems procumbent; flowers axillary and terminal; leaves abruptly-pinnate, with 3-4 pairs of linear villous leaflets. ♃. S. Native of Mexico, about Vera Cruz. Peduncles short, 3-4-flowered. Flowers small, scarlet, succeeded by short taper pods, containing 3-4 small roundish seeds each.

Var. β, *unijùgus* (Ser. in D. C. prod. 2. p. 380.) stipulas semi-hastate; leaves with one pair of linear-lanceolate leaflets; flowers solitary, length of the pedicels. Lodd. bot. cab. 883.

Scarlet-flowered Bitter-Vetch. Fl. April, May. Pl. procumbent.

46 O.? ARGE'NTEUS (Mill. dict. no. 10.) stems erect, tomentose; leaves pinnate; leaflets oblong-ovate, silky beneath; flowers disposed in terminal spikes. ♄. S. Native of Mexico, about Vera Cruz. Leaves with 4-8 pairs of leaflets, hairy on the upper surface. Flowers deep purple, succeeded by long, woolly, compressed pods, each containing 4-5 seeds.

Silvery Bitter-Vetch. Shrub 5 to 6 feet.

47 O.? AMERICA'NUS (Mill. dict. no. 9.) stem much branched, frutescent; leaves pinnate, with 5-6 pairs of linear-lanceolate leaflets, which are tomentose beneath; legumes compressed, glabrous. ♄. G. Native of Jamaica. Flowers pale purple, disposed in loose terminal spikes.

American Bitter-Vetch. Clt. 1731. Shrub 3 feet.

Cult. *O'robus* is a genus of very elegant pea-flowering plants, and being all hardy, deserve to be cultivated in every flower border. They thrive best in light soil, and are easily propagated by seeds, or by dividing the plants at the roots in spring.

CLXXV. PLATY'STYLIS (from πλατυς, *platys*, broad, and στυλος, *stylos*, a style; in reference to the dilated style, which separates the genus from *O'robus*). Sweet. fl. gard. 239.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, 5-cleft, the 2 upper lobes shortest. Corolla papilionaceous. Stamens diadelphous. Style broad, spatulate, villous at the apex. Legumes oblong, many-seeded; seeds nearly globose.—Erect herbs, with semi-sagittate stipulas. Leaves abruptly-pinnate, with few pairs of leaflets. Petioles ending in a bristle.

1 P. CYANE'A (Sweet, fl. gard. 239.) stem simple, striated; leaves with 2-3 pairs of approximate, linear-lanceolate, acute leaflets; stipulas about equal in length to the petioles; peduncles few-flowered, longer than the leaves; calycine segments lanceolate, hardly the length of the tube. ♃. H. Native of Eastern Caucasus, in subalpine places. O'robus cyanæ'us, Stev. in mem. soc. cur. mosq. 4. p. 51. Bieb. fl. taur. suppl. p. 464. Flowers large, bluish purple.

Blue-flowered Platystylis. Fl. May, June. Clt. 1823. Pl. 1 ft.

2 P. SESSILIFÒLIA (Sweet. l. c. in a note,) stems simple, striated; leaves with 1 pair of linear-subulate approximate leaflets; stipulas semi-sagittate, subulate, much longer than the petioles; peduncles few-flowered. [illegible]ger than the leaves; calycine segments linear, hardly the l[illegible] of the tube; style jointed, spatulate; legumes narrow. ♃. H. Native of Tauria, in woods, and about Athens in Greece. O'robus sessilifòlius, Smith, fl. græc. t. 692. ex prod. 3. p. 64. O. digitàtus, Bieb. fl. taur. 2. p. 153. et suppl. 462.—Buxb. cent. 2. p. 36. t. 38. Flowers large, bluish purple.

Sessile-leafletted Platystylis. Fl. May, Ju. Clt. 1823. Pl. 1 ft.

3 P. STIPULA'CEA; stem erect, angular, branched above; leaves with 2-3 pairs of linear, attenuated, very long leaflets, which are obscurely 3-nerved, and glabrous; stipulas large, semi-sagittate; peduncles axillary and terminal, few-flowered, shorter than the leaves; calycine teeth unequal, lower ones the longest. ♃. H. Native of Siberia? O'robus stipulàceus, Hook. bot. mag. 2937. Flowers with a purple vexillum, blue wings, and purple keel.

Large-*stipuled* Platystylis. Fl. May. Pl. 1 foot.

Cult. Elegant plants, well adapted for the front of flower borders. A light sandy soil suits them best, and they are easily increased by seeds, or by dividing the plants at the roots in spring.

Tribe V.

PHASEO'LEÆ (plants agreeing with *Phasèolus* in some important characters). Bronn. diss. p. 133. D. C. legum. mem. ix. prod. 2. p. 381.—Phasèoli, Adans. fam. 2. p. 325. exclusive of numerous genera. Corolla papilionaceous (f. 47. c. f. 48. *b.*). Stamens monadelphous (f. 49. *a.*), but usually diadelphous (f. 48. *c.* f. 47. *g.*), 9 joined together, and 1 free. Legume many-seeded, dehiscent, continuous, usually subdivided internally into

1-seeded cells by cellular transverse membranes, never truly articulated. Radicle curved back upon the fissure formed by the cotyledons (f. 21. *e. f.*). Cotyledons thick, filled with fecula, and destitute of cortical pores, and do not undergo any change at the time of germination, but nourish the young plant by means of that supply of food they already contain; they rise above the earth, and are usually protruded from the spermaderm. Primordial leaves opposite, all the rest of the leaves are furnished with an odd leaflet; the leaflets always pinnately disposed, rarely disposed palmately. This tribe of plants is more natural than the preceding; it is allied to *Hedysàreæ*, from the pods being divided into transverse cells by cellular membranes, and to *Vicièæ* in the cotyledons being thick, and protruding from the spermaderm.

CLXXVI. A'BRUS (from *αβρος*, *abros*, soft; in reference to the extreme tenderness of the leaves). Lin. gen. no. 1286. Gærtn. fruct. 2. p. 328. t. 151. D. C. prod. 2. p. 381.

Lin. syst. *Monadélphia, Enneándria.* Calyx bluntly 4-lobed, upper lobe broadest. Corolla papilionaceous, with an acute vexillum. Stamens 9, monadelphous at the base, having the tube or sheath gaping in front. Stigma obtuse. Legume oblong, compressed, 4-6-seeded. Seed roundish, separated by cellular membranes.—A delicate twining shrub, with abruptly-pinnate leaves, bearing many pairs of leaflets. This genus differs from the rest of the present tribe in the leaves being abruptly-pinnate.

1 A. precatòrius (Lin. syst. 533.) ♄. ⌒. S. Native of the East Indies, from whence it has probably migrated to the tropical parts of Africa and America.—Rumph. amb. 5. t. 32.—Rheed. mal. 8. t. 39. Flowers pale purple, disposed in axillary bunches. There are different varieties of this plant, varying in the colour of the seeds, which are probably as many distinct species; some are red, with a black spot, some blood-coloured, others white, rufous, and black. The leaves and roots of this plant taste like liquorice, whence the inhabitants of the West Indies call it *wild liquorice*, and they use the roots for the same purposes as we do liquorice. The seeds of the commonest variety are of a glossy scarlet-colour, with a black spot or eye at the hylum, or that part which is fixed to the pod; they are commonly strung, and used as ornaments by the inhabitants of those countries where the herb grows wild; they are frequently brought to Europe from Guinea, and the West and East Indies, bored, and used as beads, with other hard seeds and shells; they are also used as beads for rosaries, hence the trivial name, and in Egypt as pulse, but they are the hardest and most indigestible of the whole pea tribe.

Prayer Wild-liquorice. Fl March, May. Clt. 1686. Sh. tw.

Cult. This plant requires a strong heat to keep it in a growing healthy condition. A mixture of sand and loam is the best soil for it, and it is increased by cuttings under a hand-glass in sand, or by seeds, which should be raised on a hot-bed.

CLXXVII. SWEE'TIA (named by De Candolle in honour of Robert Sweet, F.L.S. author of Hortus Suburbanus Londinensis, Hortus Britannicus, British Flower-garden, and Flora Australasica, &c.) D. C. legum. mem. ix. prod. 2. p. 381.

Lin. syst. *Diadélphia, Decándria.* Calyx 4-cleft, naked at the base, with lanceolate, acuminated, nearly equal lobes. Corolla papilionaceous, with an obtuse wedge-shaped vexillum, and an obtuse 2-edged keel. Stamens diadelphous. Ovary sessile. Legumes linear, compressed, many-seeded, 1-celled.—Slender twining herbs, which are frutescent at the base. Leaves pinnately-trifoliate. Stipulas subulate. Peduncles axillary, filiform. Flowers purple. Legumes pubescent. Style filiform, glabrous.

1 S. longifòlia (D. C. prod. 2. p. 381.) leaflets oblong-lanceolate; legume straight; racemes axillary, few-flowered. ♄. ⌒. S. Native of South America. Galèga longifòlia, Jacq. icon. rar. t. 572. coll. 2. p. 349. Tephròsia longifòlia, Pers. Spreng.

Long-leafletted Sweetia. Fl. June, Aug. Clt. 1818. Pl. tw.

2 S. filifórmis (D. C. prod. 2. p. 382.) leaflets oval-oblong, hardly twice the length of the breadth; legumes falcate; peduncles few-flowered. ♄. ⌒. S. Native of South America. Galèga filifórmis, Jacq. coll. 2. p. 348. icon. rar. 573.

Filiform Sweetia. Fl. July, Aug. Clt. 1820. Shrub tw.

3 S. veluti'na; leaflets oblong, obtuse, villous on both surfaces; racemes few-flowered; legumes lanceolate, pubescent. ♄. ⌒. S. Native of St. Domingo. Tephròsia velutìna, Spreng. syst. 3. p. 232.

Velvety Sweetia. Shrub tw.

4 S.? uliginòsa; leaflets oblong, acuminated, glabrous; peduncles 3-flowered. ♄. ⌒. S. Native of the East Indies. Robínia uliginòsa, Roxb. Willd. Tephròsia uliginòsa, Spreng. syst. 3. p. 232.

Bog Sweetia. Shrub tw.

5 S.? lignòsa (D. C. prod. 2. p. 382.) leaflets cuneate-obovate, emarginate, rather coriaceous, glabrous; racemes longer than the leaves; bracteas setaceous; legumes rather falcate. ♄. ⌒. S. Native of St. Domingo. Glýcine lignòsa, Turp. in Pers. ench. 2. p. 301. Calycine segments 4, acute, of these the two lateral ones are the shortest. Vexillum very broad, green at the base.

Woody Sweetia. Clt. 1824. Shrub tw.

Cult. See *A'brus* for culture and propagation.

CLXXVIII. MACRA'NTHUS (from *μακρος*, *makros*, long, and *ανθος*, *anthos*, a flower; in reference to the long flowers). Poir. suppl. 3. p. 569. D. C. prod. 2. p. 382.—Marcánthus, Lour. fl. coch. p. 461. from a typographical error.

Lin. syst. *Diadélphia, Decándria.* Calyx tubular, coloured, permanent, 4-cleft; lobes acute, the 2 lateral ones the shortest. Corolla papilionaceous, with an ovate, concave, emarginate vexillum, which is not half the length of the oblong wings. Stamens 10, diadelphous, of these 4 are thicker than the rest, bearing ovate anthers, and the other 6 slender, bearing oblong anthers. Style filiform, pilose, crowned by an obtuse stigma. Legume straight, nearly terete, thick, acuminated, many-seeded.—Twining herbs, with trifoliate leaves, ovate-rhomboid pilose leaflets, filiform stipulas, axillary peduncles, bearing many white flowers, and eatable legumes.

1 A. Cochinchine'nsis (Lour. l. c.) ♄. ⌒. G. Native of Cochin-china, and where also it is cultivated for the legumes, which are dressed and eaten by the inhabitants, as we do French beans.

Cochin-china Long-flowered Bean. Fl. July, Aug. Pl. tw.

Cult. A mixture of loam and peat will suit this plant. It is increased by seeds, which should be raised on a hot-bed.

CLXXIX. RO'THIA (in honour of Alb. Wilh. Roth, of Bremen, author of Tentamen Floræ Germanicæ, 3 vols. 8vo. Leipsic, 1788, 1789, 1793, and 1801, and a great number of other botanical works). Pers. ex D. C. prod. 2. p. 382. Dillwýnia, Roth, cat. bot. 3. p. 71. Pers. ench. 2. p. 302. but not of Smith.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-cleft, the 2 superior segments arched, falcate, and coadunate, pressing down upon the vexillum, which is deflexed. Corolla papilionaceous, with a 2-edged keel. Stamens monadelphous, with the tube or sheath gaping on the back. Legume linear-ensiform, many-seeded. Seeds reniform.

1 R. trifolia'ta (Pers. l. c.) ⊙. H. Native country unknown. Dillwýnia trifoliàta, Roth, l. c. Glýcine humifùsa, Willd. enum. 756. ex Roth, nov. spec. 349. Cleòme prostràta,

Hortul. ex Steud. nom. Herb prostrate. Leaflets rather fleshy, oval, shining. Flowers usually solitary, at first sulphur-coloured, but at length changing to reddish.

Trifoliate Rothia. Fl. June, July. Pl. prostrate.

Cult. The seeds of this plant only require to be sown in a warm border, in the front of a stove or green-house.

CLXXX. TERA'MNUS (from *τεραμνος*, *teramnos*, soft; in reference to the soft pods and leaves of the species). P. Browne, jam. 290. Swartz, fl. ind. occid. 3. p. 1238. t. 25. D. C. prod. 2. p. 382.

Lin. syst. *Monadélphia, Decándria.* Calyx bilabiate, upper lip the longest, and bifid, lower lip 3-parted, with all the lobes acute. Corolla papilionaceous, with a small keel, which is hidden by the calyx.* Stamens 10, monadelphous, the 5 alternate ones sterile. Stigma capitate, sessile on the top of the ovary. Legume linear, compressed, 2-valved, many-seeded.—Twining subshrubs, natives of the West Indies, with angular branches, pinnately-trifoliate leaves, stipellate leaflets, axillary racemes, which are longer than the leaves, and small remote reddish flowers.

1 T. UNCINA'TUS (Swartz, l. c.) branches clothed with retrograde silky down; leaves clothed with silky down beneath, and pubescence above; leaflets ovate or oblong. ♄. ⌒. S. Native of Jamaica, in arid bushy places. Dólichos uncinàtus, Lin. spec. 1019.—Plum. ed. Burm. t. 221.

Hooked Teramnus. Clt. 1822. Shrub tw.

2 T. VOLU'BILIS (Swartz, l. c.) branches clothed with fine retrograde hairs; leaves pubescent beneath; leaflets lanceolate. ♄. ⌒. S. Native of Jamaica, in humid bushy places on the mountains, and of New Granada, near Mompox, on the banks of the river Magdalena. All the synonymes cited under this plant by Willdenow are referrible to the first species.

Twining Teramnus. Clt. 1824. Shrub tw.

Cult. See *Abrus*, p. 342. for culture and propagation.

CLXXXI. AMPHICARPÆ'A (from *αμφι*, *amphi*, on both sides, and *καρπος*, *karpos*, a fruit; the plants bear pods both on the roots and the stems). D. C. legum. mem. ix. prod. 2. p. 383.—Amphicárpa, Ell. journ. act. sci. philad. 1818. vol. 1. p. 372. Nutt. gen. amer. 2. p. 113.—Sàvia, Rafin. Falcàta, Gmel. syst. 2. p. 1131.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, 4-toothed, bractless at the base, the teeth equal, and rather bluntish. Corolla papilionaceous. Petals oblong. Vexillum broad, incumbent, and nearly sessile. Stamens diadelphous. Style filiform. Stigma capitate. Stipe of ovary covered by a cylindrical sheath. Legume compressed, stipitate, 2-4-seeded.—Plants, with herbaceous twining stems, pinnately-trifoliate leaves, ovate glabrous leaflets, and axillary racemes, having 2 flowers to each bractea. Flowers usually apetalous, those on the stems sterile, or bearing legumes dissimilar to those on the root; those on the roots usually fertile.

1 A. MONOI'CA (Ell. et Nutt. l. c.) racemes pendulous; flowers with petals. ⊙. ⌒. H. Native of North America, from New York to Carolina, on the sides of rivulets, and in shady humid places. Glycine monoíca, Lin. spec. 1023. Wendl. in Rœm. arch. 1. p. 3. t. 103. f. 2. Glýcine bractèata, Lin. spec. ed. 1. p. 754. Glýcine comòsa, Lin. spec. 1024. ex Nutt. Stem covered with retrograde villi. Radical flowers apetalous. Flowers with a pale violet vexillum, and white keel and wings.

Monoecious Amphicarpæa. Fl. June, Sept. Clt. 1781. Pl. tw.

2 A. SARMENTÒSA (Ell. et Nutt. l. c.) racemes filiform, 3-flowered; flowers apetalous. ⊙. ⌒. H. Native of Carolina and Virginia, in low places among bushes. Glýcine sarmentòsa, Roth, cat. p. 87. Willd. spec. 3. p. 1055. Glýcine monoica, Schkuhr, ann. bot. 12. p. 20. t. 2. Glýcine heterocárpa, Hegetsw. comm. p. 5. t. 5. Gl. ellíptica, Smith in Abbot, hist. nat. geogr. t. 21. ex Rœm. arch. 2. p. 402. Perhaps Glýcine filòsa, Horn. cat. hort. hafn. is sufficiently distinct from this plant.

Sarmentose Amphicarpæa. Fl. July, Sept. Clt. 1820. Pl. tw.

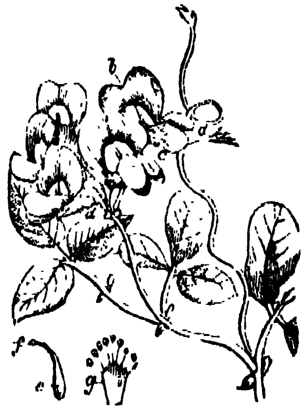
Cult. The seeds of these plants only require to be sown in the open border in spring, in a warm sheltered situation.

CLXXXII. KENNE'DYA (a name given by Ventenat in honour of Mr. Kennedy, formerly of the firm of Lee and Kennedy, Nurserymen, Hammersmith). Vent. malm. t. 104. R. Brown, in hort. kew. ed. 2. vol. 4. p. 299. D. C. prod. 2. p. 383. Caulínia, Mœnch. suppl. 47. but not of D. C. nor Willd.

Lin. syst. *Diadélphia, Decándria.* Calyx bilabiate, upper lip bidentate, lower one trifid, equal (f. 47. *a.*). Corolla papilionaceous (f. 47. *c.*), with the vexillum emarginate, recurved (f. 47. *b.*), but not bent back from the carina. Stamens diadelphous (f. 47. *g.*). Stigma obtuse (f. 47. *f.*). Legume linear (f. 47. *c.*), compressed, transversely many-celled from cellular membranous dissepiments. Seeds strophiolate.—Twining shrubs, native of New Holland, with axillary peduncles, and scarlet or violaceous flowers, having the vexillum bimaculate at the base.

§ 1. *Leaves trifoliate. Keel straight, rather longer than the vexillum.*

FIG. 47.



1 K. RUBICU'NDA (Vent. malm. t. 104.) leaflets 3, ovate; stipulas ovate-lanceolate, spreadingly reflexed; peduncles usually 3-flowered; legumes hairy. ♄. ⌒. G. Native of the eastern and southern coasts of New Holland. Glýcine rubicúnda, Curt. bot. mag. 268. Caulínia rubicúnda, Mœnch. Keel about equal in length to the wings, 15 lines long, acute. Flowers dark red.

Rubicund-flowered Kennedya. Fl. March, May. Clt. 1788. Shrub tw.

2 K. PROSTRA'TA (R. Br. in Ait. hort. kew. 4. p. 299.) leaflets 3, obovate, villous, undulated, and rather repand; stipulas and bracteas cordate, apiculated, spreading; peduncles 1-2-flowered; legumes pubescent. ♄. ⌒. G. Native of New Holland, on the eastern coast. Glýcine coccínea, Curt. bot. mag. 270. Willd. spec. 2. p. 1065. Carina 8-9 lines long, longer than the wings. Leaflets hardly 6 lines long. Flowers scarlet.

Var. β, màjor (D. C. prod. 2. p. 383.) leaflets obovate, emarginate, when young they are hairy, as well as the branches. ♄. ⌒. S. Native of New Holland, on the eastern coast. Carina 10-12 lines long. Leaflets an inch long. Flowers scarlet.

Prostrate Kennedya. Fl. March, June. Clt. 1790. Shrub prostrate.

§ 2. *Leaves trifoliate. Keel shorter than the vexillum and wings.*

3 K. BRACTEA'TA (Gaud. in Freycenet, voy. part. bot. p. 486. t. 113.) leaflets elliptic, obtuse, somewhat emarginate, with undulately curled margins, clothed with silky pubescence beneath; stipulas broad, ovate, acute; peduncles few-flowered, bracteate; bracteas connate, funnel-shaped. ♄. G. Native of the western coast of New Holland. Shrub apparently erect.

Bracteate Kennedya. Shrub cl.?

4 K. SERÍCEA; leaflets obovate, emarginate, mucronate, clothed with silky hairs, particularly when young; peduncles elon-

gated, many-flowered; calyx very villous. ♄. ⌒. G. Native of New Holland. Flowers scarlet. Keel shorter than the vexillum.

Silky Kennedya. Fl. March, June. Clt. 1823. Shrub tw.

5 K. cocci'nea (Vent. malm. t. 105. exclusive of the synonymes,) leaflets 3, obovate; stipulas lanceolate, spreading; peduncles bearing 3-9 flowers, in an umbellate head; legumes smoothish. ♄. ⌒. S. Native of New Holland, on the western coast. Flowers scarlet.

Scarlet-flowered Kennedya. Fl. May, Aug. Clt. 1803. Sh. twining.

6 K. Comptonia'na (Link. enum. 2. p. 235.) leaflets 3, oblong-ovate, obtuse, with a mucrone; stipulas ovate, ending in an awn-like acumen; racemes many-flowered, longer than the leaves. ♄. ⌒. G. Native of New Holland. Glýcine Comptoniàna, Ker. bot. reg. 298. Flowers bluish purple.

Compton's Kennedya. Fl. March, June. Clt. 1803. Sh. tw.

7 K. tabaci'na (Labill. cal. p. 70. t. 70.) leaflets 3, ovate-oblong, acuminated, rather pilose; flowers racemose; stems, petioles, and peduncles beset with retrograde hairs; legume hairy. ♃. ⌒. G. Native of New Caledonia.

Tabacco-like Kennedya. Shrub tw.

8 K. inophy'lla (Cunningh. mss. Lindl. bot. reg. t. 1421.) leaflets 3, cuneate, mucronate, attenuated at the base, rather pilose above, and silky beneath; stipulas ovate, acute; peduncles longer than the leaves; flowers 15-20, disposed in dense umbellate heads at the apexes of the peduncles; calyx clothed with black hairs. ♄. ⌒. G. Native of New Holland. K. dilatàta, Cunningh. mss. Flowers beautiful scarlet; the vexillum with a greenish yellow mark at the base.

Nerved-leaved Kennedya. Fl. May, Jul. Clt. 1824. Sh. tw.

§ 3. *Leaves simple. Keel of flowers shorter than the wings and vexillum.*

9 K. monophy'lla (Vent. malm. t. 106.) leaves ovate, glabrous, rather cordate at the base; stipulas lanceolate, erect; racemes many-flowered, much longer than the petioles. ♄. ⌒. G. Native of New Holland, on the eastern coast. Glýcine bimaculàta, Curt. bot. mag. 263. Flowers bluish-purple or violaceous. There are varieties of this species with narrow oblong leaves, and cordate lanceolate leaflets.

Var. β, longiracemòsa (Lindl. bot. reg. 1336.) racemes slender, longer than the leaves; flowers smaller.

One-leaved Kennedya. Fl. Mar. June. Clt. 1790. Sh. tw.

10 K. ova'ta (Sims, bot. mag. 2169.) leaves broad-ovate, cordate, acute; upper stipulas ovate, erect; racemes many-flowered, longer than the petioles. ♄. ⌒. G. Native of New Holland. K. cordàta, Lindl. bot. reg. t. 944. Flowers bluish violet. Habit of *K. monophýlla*.

Ovate-leaved Kennedya. Fl. May, Aug. Clt. 1818. Sh. tw.

Cult. *Kennèdya* is an elegant genus of shrubs, well fitted for the climbers of a conservatory or greenhouse. A mixture of sandy loam and peat is the best soil for them, and young cuttings root freely if planted in a pot of sand, in a little bottom heat, with a bell-glass placed over them.

CLXXXIII. RHYNCHO'SIA (from ῥυγχος, *rhynchos*, a beak; in reference to the keel, which ends in a beak). Lour. coch. p. 460. D. C. legum. mem. ix. prod. 2. p. 384.—Arcyphýllum, Ell. in journ. act. sc. philad. 1818. vol. 1. no. 13. p. 371.—Glýcine, Nutt. gen. amer. 2. p. 114. H. B. et Kunth, nov. gen. amer. 6. p. 419.—Glýcine spec. of Lin. and others.

Lin. syst. *Diadélphia, Decándria.* Calyx 5-cleft, somewhat bilabiate. Corolla papilionaceous, usually shorter than the calyx. Stamens diadelphous, having the free filament jointed at the base. Style filiform, usually variously bent. Legume sessile, compressed, 2-valved, 1-celled, rather falcate, 2-seeded.—Climbing subshrubs or herbs, with simple, but usually trifoliate leaves, having the terminal leaflet petiolulate. Flowers yellow, axillary, racemose or solitary.

§ 1. *Leaves all, or for the most part, simple, roundish, standing on long petioles.*

1 R. menispérmoìdes (D. C. in ann. sc. nat. 4. p. 102. legum. mem. ix. t. 55.) stems trailing, covered with spreading pubescence; stipulas ovate; leaves reniform, very obtuse; racemes few-flowered, almost sessile; calycine segments lanceolate, acutish, 3-nerved. ♃. ◡. S. Native of Mexico, near Acapulco and Vera Cruz, on sandy hills. Legume oval-lanceolate, compressed, acute, 1-2-seeded, hardly pubescent.

Moon-seed-like Rhynchosia. Pl. cl.

2 R. renifórmis (D. C. prod. 2. p. 384.) stem erect, humble, hairy; stipulas oblong-lanceolate; leaves roundish; racemes sessile, many-flowered, conglomerate; calycine segments lanceolate, acuminated. ♃. H. Native of North America, from Carolina to Florida, in the pine forests. Trifòlium simplicifòlium, Walt. car. 184. Glýcine tomentòsa monophýlla, Michx. fl. bor. amer. 2. p. 63. Glýcine renifórmis, Pursh. fl. sept. amer. 2. p. 86. Glýcine monophýlla, Nutt. gen. amer. 2. p. 115. but not of Lin. Arcyphýllum simplicifòlium, Ell. l. c. Flowers yellow.

Reniform-leaved Rhynchosia. Fl. July, Aug. Clt. 1806. Pl. ½ foot.

3 R. diffórmis (D. C. prod. 2. p. 384.) stem twining, velvety; stipulas oblong-lanceolate, lower leaves simple, upper ones trifoliate; racemes on long peduncles; flowers crowded, spicate; segments of the calyx lanceolate, acuminated. ♃. ⌒. H. Native of Carolina, in dry and cultivated places. Glýcine tomentòsa, var. volùbilis, Michx. fl. bor. amer. 2. p. 63. This appears an intermediate species between this and the following division.

Difformed Rhynchosia. Fl. June, Sept. Clt. 1732. Pl.

§ 2. *Leaves all on long petioles, trifoliate. Phascoloìdeæ.*

4 R. ere'cta (D. C. prod. 2. p. 384.) stem erect, angular, velvety; branches twining a little; leaflets ovate, rather obtuse, reticulately veined; racemes axillary, longer than the leaves; calycine segments linear, acute. ♃. H. Native of North America, from Carolina to Florida. Trifòlium eréctum, Walt. car. 184. Glýcine tomentòsa erécta, Michx. fl. bor. amer. 2. p. 63. Glýcine erécta, Nutt. gen. amer. 2. p. 114. Arcyphýllum eréctum, Ell. l. c. Flowers fulvous. Leaves clothed with silky villi.

Erect Rhynchosia. Fl. June, Sept. Clt. 1820. Pl. 2½ feet.

5 R. Caribæ'a (D. C. prod. 2. p. 384.) twining, pubescent; leaflets ovate-rhomboid, acute, covered with resinous dots beneath; racemes longer than the leaves; legumes acinaciform, hispid. ♃. ⌒. S. Native of the West Indies and on the banks of the river Orinoco, according to Kunth, nov. gen. amer. 6. p. 125. as well as of Western Florida. Glýcine Caribæ'a, Jacq. icon. rar. t. 146. coll. 1. p. 66. Glýcine refléxa, Nutt. gen. amer. 2. p. 115. ex Nutt. in Sill. journ. Flowers yellow, with the vexillum striated. Legume 12-16 lines long, tapering at the base.

Caribbean Rhynchosia. Fl. Sept. Oct. Clt. 1742. Pl. tw.

6 R. puncta'ta (D. C. mem. leg. ix. t. 56.) stem twining, angular, beset with retrograde pubescence; leaflets ovate-rhomboid, acute, dotted beneath; racemes filiform, longer than the leaves; flowers deflexed; legumes pubescent. ♃. ⌒. S. Native of Cayenne. Glýcine littoràlis, Vahl. ined. in herb. Puer. Legumes 6 lines long. Style filiform, inflexed. Flowers 3 lines long; vexillum not striated. This species comes very near *R. minima*, but the down on the stems is turned backwards, and the flowers are larger.

Dotted-leaved Rhynchosia. Pl. cl.

7 R. MÍNIMA (D. C. prod. 2. p. 385.) stem twining, slender, angular, and rather pubescent; leaflets rhomboid, acute, smoothish, dotted beneath; racemes longer than the leaves; flowers reflexed; legumes oblong, tapering at the base, clothed with fine velvety down. ♃. ⌒. S. Native of the West Indies. Dólichos mínimus, Lin. spec. 1020. Jacq. obs. 1. t. 22.—Glýcine Lamárckii, H. B. et Kunth, nov. gen. amer. 6. p. 424.—Sloan. hist. jam. t. 115. f. 1. Flowers yellow.

Smallest-flowered Rhynchosia. Fl. July, Aug. Clt. 1776. Pl. tw.

8 R. NU'DA (D. C. legum. mem. ix.) stems twining, angular, having the angles beset with retrograde pubescence; leaflets roundish, mucronulate, glabrous, dotted beneath; racemes filiform, longer than the leaves; flowers deflexed; legumes pubescent. ♃. ⌒. S. Native of the East Indies, at Nandaradah. Hedýsarum nùdum, Rottl. in herb. Puer. Legumes 9 lines long.

Naked Rhynchosia. Pl. tw.

9 R. VOLU'BILIS (Lour. coch. p. 460.) stems herbaceous, twining, terete; leaflets roundish-obovate, reticulated, clothed with velvety down; racemes longer than the leaves; legumes ovate, rather velvety. ♃. ⌒. G. Native of China, in the suburbs of Canton. Peduncles twin (Lour.). Flowers yellow. Legume black. Seeds 2, black, shining.

Twining Rhynchosia. Pl. tw.

10 R. PHASEOLOÌDES (D. C. prod. 2. p. 385.) stems twining, terete, pubescent; leaflets broad-ovate, acuminated, glabrous above, but villous and dotless beneath; racemes axillary and somewhat terminal; legumes tightened in the middle. ♄. ⌒. S. Native of Cayenne, Jamaica, and St. Domingo. Glýcine phaseoloìdes, Swartz. fl. ind. occ. 3. p. 1248. Sims, bot. mag. 2284. Abrus, Lam. ill. t. 608. f. 2. Dólichos pyramidàlis, Lam. dict. 2. p. 296. Austèrium, Poit. in herb. Deless. Seeds compressed, partly red and partly black. Legumes clothed with rusty velvety down, but at length becoming glabrous. Racemes longer than the leaves, rarely shorter. Flowers brown.

Kidney-bean-like Rhynchosia. Fl. Ju. Jul. Clt. 1818. Pl. tw.

11 R. PRECATÒRIA (D. C. prod. 2. p. 385.) stems twining, villous; leaflets rhomboid-ovate, acuminated, obtuse at the base, and 3-nerved, clothed with soft pubescence; racemes axillary, many-flowered, about equal in length to the leaves; legumes oblong. ♄. ⌒. S. Native of Mexico, near Acapulco. Glýcine precatòria, Humb. in Willd. enum. 755. H. B. et Kunth, nov. gen. amer. 6. p. 425. Indigófera volùbilis, Wendl. obs. 55. ex Willd. The hairs on the plant are tipped with glands, but the legumes are articulated, according to Wendland; according to Kunth the seeds are scarlet, and are strung for rosaries, whence the specific name.

Prayer or Rosary Rhynchosia. Fl. June, Aug. Clt. 1825. Shrub. tw.

12 R. MACROPHY'LLA (D. C. prod. 2. p. 385.) branches twining, triangular, clothed with soft villi; leaflets rhomboid-ovate, acuminated, somewhat cordate, 3-nerved, clothed with soft pubescence on both surfaces, canescent and beset with glandular dots beneath; racemes many-flowered, on short peduncles; calyxes silky. ♄. ⌒. S. Native of Cuba, near Havannah. Glýcine macrophýlla, H. B. et Kunth, nov. gen. amer. 6. p. 426. Allied to *R. reticulàta*, but the terminal leaflet is 4 inches long and about 2 inches broad.

Large-leafletted Rhynchosia. Shrub tw.

13 R. ERYTHRINOÌDES (Schlecht. et Cham. in Linnæa. vol. 5. p. 587.) shrubby, climbing, smoothish; leaflets ovate-rhomboid, acuminated, acute, 3-nerved, beset with resinous dots on both surfaces; racemes axillary, when in fruit about equal in length to the leaves; calyx 5-cleft; legume sessile, 2-seeded, torulose; seeds nearly globose, a little compressed, girded at the hylum by a scarlet arillus. ♄. ⌒. S. Native of Mexico, between Masantla and Nantla, in woods. Plant pubescent in its parts when young.

Coral-tree-like Rhynchosia. Shrub tw.

14 R. RETICULA'TA (D. C. prod. 2. p. 385.) stems twining, angular; leaflets ovate-rhomboid, acuminated, velvety, reticulately veined beneath; racemes axillary, shorter than the leaves; legumes rather pubescent. ♄. ⌒. S. Native of Jamaica, Santa Cruz, and Guadaloupe, on the mountains among bushes, and of Mexico, near Jalapa. Glýcine reticulàta, Vahl. symb. 3. p. 88. Swartz, prod. 105. Corolla brownish yellow, shorter than the calyx.

Reticulated-leaved Rhynchosia. Fl. July, Sept. Clt. 1779. Shrub tw.

15 R. PARVIFÒLIA (D. C. legum. mem. ix. prod. 2. p. 385.) stem twining; branches angular, and are as well as the leaves clothed with soft, short, velvety down; leaflets elliptic, very blunt, reticulately veined beneath; peduncles 2-flowered; legumes clothed with short down, intermixed with a few stiff hairs. ♄. ⌒. S. Native of St. Domingo. Leaflets hardly 4-5 lines long. Legumes 2-seeded, hardly half an inch long.

Small-flowered Rhynchosia. Shrub tw.

16 R. PUBE'SCENS (D. C. legum. mem. ix. prod. 2. p. 386.) stems twining, villous, terete; leaflets broad-ovate, acuminated, pubescent on both surfaces, and reticulated beneath; racemes few-flowered, axillary, about equal in length to the leaves; legumes oblong, rather pubescent, 2-seeded. ♄. ⌒. S. Native of Abyssinia. Glýcine pubéscens, Balb. ined. Glýcine Abyssínica, Juss. ex Lher. herb.? Corolla longer than the calyx. Vexillum velvety on the outside. Legume about an inch long. Seeds brown.

Pubescent Rhynchosia. Shrub tw.

17 R. MEMNO'NIA (D. C. prod. 2. p. 386.) stems twining, terete, and are as well as the leaves clothed with soft, hoary, velvety down; leaflets obovate, obtuse, reticulately veined beneath; racemes axillary, longer than the leaves; flowers nodding; legumes compressed, constricted in the middle, villously tomentose. ♃. ⌒. G. Native of Egypt, about Thebes. Glýcine Memnònia, Delil. fl. ægypt. 100. t. 38. f. 3. Vexillum rather pubescent, yellow, lined with black veins.

Memnon's Rhynchosia. Pl. tw

18 R. DENSIFLÒRA (D. C. prod. 2. p. 386.) stem twining, clothed with short hoary down; leaflets ovate-roundish, acuminated, pubescent on both surfaces, and full of resinous dots; racemes axillary, ovate, dense-flowered, on short peduncles; corolla smaller than the calyx. ♄. ⌒. S. Native of the East Indies. Glýcine densiflòra, Roth. nov. spec. 348. Corolla glabrous. Legume unknown.

Dense-flowered Rhynchosia. Pl. tw.

19 R. CAPITA'TA (D. C. prod. 2. p. 386.) stems twining, angular, hairy; leaflets roundish, puberulous on the nerves and margins; peduncles axillary, length of leaves, bearing branches under the capitate raceme; corolla *length of calyx*; legumes sessile within the calyx, almost orbicular, compressed, 2-seeded, pilose. ♄. ? ⌒. S. Native of the East Indies. Glycine capitàta, Roth. nov. spec. 346.

Capitate-flowered Rhynchosia. Pl. tw.

20 R. ELONGA'TA (D. C. prod. 2. p. 386.) stems twining; leaflets roundish, somewhat acuminated; racemes axillary, somewhat capitate, shorter than the petioles; lower tooth of calyx elongated, longer than the corolla; legumes pedicellate within the calyx, nearly orbicular, compressed, 2-seeded, pilose. ♃. ⌒. S. Native of the East Indies. Glýcine elongàta, Roth. nov. spec. 347. Allied to *R. nummulària*.

Elongated Rhynchosia. Shrub tw.

21 R. NUMMULA'RIA (D. C. prod. 2. p. 386.) stems twining,

angular, pubescent; leaflets cuneate-orbicular, very obtuse, rather pubescent; racemes filiform; flowers twin; legumes sessile within the calyx, orbicular, compressed, 1-seeded. ♃. ⌒. S. Native of the East Indies. Glýcine nummulària, Lin. mant. 571. The racemes are said to be longer than the leaves, but according to the specimens they are shorter.

Money-wort Rhynchosia. Pl. tw.

22 R. ERVOÌDEA (D. C. legum. mem. ix. prod. 2. p. 386.) stems twining, rather angular, and a little pubescent; leaflets cuneate-roundish, very blunt, smoothish, dotted beneath; racemes few-flowered, sessile, or on short peduncles, and branching; legumes oblong, glabrous, 2-seeded, rather falcate, compressed. ♃. ⌒. S. Native of the East Indies, where it is called *Kataare*, according to Leschenault.

Ervum-like Rhynchosia. Pl. tw.

23 R. AU'REA (D. C. prod. 2. p. 386.) leaflets roundish-rhomboid; racemes shorter than the petioles; legumes villous, 1-seeded. ♃. ⌒. S. Native of the East Indies. Glýcine aùrea, Willd. nov. act. nat. cur. berol. 4. 1803. p. 18. Hedýsarum aùreum, Kœn. Rottl. Flowers golden yellow.

Golden-flowered Rhynchosia. Pl. tw.

24 R. RHOMBIFÒLIA (D. C. prod. 2. p. 386.) stems twining, terete, and are as well as the leaves glabrous; leaflets roundish-rhomboid, dotted beneath; racemes filiform, longer than the leaves; legumes oblong, 2-seeded, glabrous. ♃. ⌒. S. Native of the East Indies. Glycine rhombifòlia, Willd. spec. 3. p. 1065.

Var. β, Timoriénsis (D. C. prod. 2. p. 386.) leaflets acuminated, lateral ones an inch long. ♃. ⌒. S. Native of the Island of Timor.

Rhomb-leafletted Rhynchosia. Fl. May, Aug. Clt. 1815. Pl. tw.

25 R. CA'NA (D. C. prod. 2. p. 386.) stem erect, pubescent; leaflets ovate-roundish, clothed with hoary tomentum beneath; peduncles axillary, 2-flowered, shorter than the petioles; legumes oblong, smoothish, 2-seeded. ♄. S. Native of the East Indies. Glýcine càna, Willd. spec. 3. p. 1063.

Hoary Rhynchosia. Shrub 1 to 2 feet.

26 R. MEDICAGI'NEA (D. C. prod. 2. p. 386.) stems twining, filiform; leaflets obovate, obtuse, glabrous; racemes longer than the leaves; legumes oblong, mucronate, glabrous, constricted between the seeds. ⊙.? ⌒. S. Native of Ceylon. Burm. zeyl. 188. t. 88. Dólichos medicagíneus, Lam. dict. 2. p. 297. Allied to *R. minima*. Legume 2-seeded.

Medick-like Rhynchosia. Pl. tw.

27 R. SUAVE'OLENS (D. C. prod. 2. p. 378.) stem erect, clammy; leaflets ovate, acute, clothed with clammy pili; peduncles 1-2-flowered, filiform, articulated in the middle; legumes oblong, 2-seeded, hoary. ♄. S. Native of the East Indies, on rocks near Madras. Glýcine suavèolens, Lin. fil. suppl. 326. Hedýsarum venòsum, Rottl. Calyx 4-parted, with the upper segment bifid, and it is therefore probably a species of *Cylista*. The whole shrub is sweet-scented. The vexillum is streaked with red.

Sweet-scented Rhynchosia. Fl. July, Sept. Clt. 1816. Sh. 1 to 3 feet.

28 R. VI'SCIDA (D. C. prod. 2. p. 387.) stems? leaflets ovate-roundish, clothed beneath with silky hoary down; racemes axillary, very long; legumes pubescent. ♃.? ⌒.? S. Native of the East Indies. Glýcine víscida, Willd. in nov. act. nat. cur. 4. 1803. p. 208. Pers. ench. 2. p. 300. Hedýsarum víscidum, Lin. Rottl.

Viscid Rhynchosia. Pl. tw.?

29 R. VISCÒSA (D. C. l. c.) stems twining, clothed with clammy pili; leaflets ovate-roundish, acuminated, scabrous on both surfaces, lateral ones broadest on the outside; racemes axillary, shorter than the leaves; corolla with a pilose vexillum; legumes oblong, setose, compressed, 2-seeded. ♄. ⌒. S. Native of the East Indies. Glýcine viscòsa, Roth. nov. spec. 349. Hedýsarum glutinòsum, Rottl. *in* herb. Puer. Dólichos glutinòsus, Leschen. herb. Legume an inch long, apiculated by the style.

Clammy Rhynchosia. Fl. July, Sept. Clt. 1820. Sh. tw.

30 R. FRIDERICIA'NA (D. C. prod. 2. p. 387.) stems twining, decumbent, angular; leaflets ovate-rhomboid, obtuse, clothed with soft pubescence on both surfaces; racemes longer than the leaves; legumes pubescent, 2-seeded. ♄. ⌒. S. Native of the Island of Manilla. Glýcine Fridericiàna, Weinm. in flora. 1821. p. 29. Flowers small, yellow.

Frideric's Rhynchosia. Fl. July, Aug. Clt. 1820. Sh. tw.

31 R. RÒSEA (D. C. prod. 2. p. 387.) stems twining; leaflets ovate, cordate, acute, quite entire; peduncles 3-flowered; legumes compressed, keeled, 1-seeded. ♃. ⌒. G. Native of the Society Islands. Glýcine ròsea, Forst. prod. no. 271.

Rose-coloured-flowered Rhynchosia. Pl. tw.

32 R. LU'CIDA (D. C. l. c.) stems twining; leaflets ovate, acuminated, quite entire; racemes terminal, glandular; pedicels tern; legumes inflated, 2-seeded. ♃. ⌒. G. Native of the Society Islands. Glýcine lùcida, Forst. prod. no. 272. Perhaps this plant belongs to a different genus.

Lucid Rhynchosia. Pl. tw.

33 R. CROTALARIOÌDES (D. C. l. c.) branches terete; leaflets oblong-ovate, 3-nerved, pubescent beneath; racemes axillary, aggregate, shorter than the petioles; legumes oblong, acute, usually 1-seeded. ♄. ⌒.? S. Native of the East Indies. Crotalària macrophýlla, Willd. spec. 3. p. 982.

Crotalaria-like Rhynchosia. Shrub tw.

34 R. RUFE'SCENS (D. C. l. c.) leaflets roundish-ovate, clothed with hoary pubescence; racemes axillary; legumes ovate, 1-seeded, longer than the calyx. ♃. ⌒. S. Native of the East Indies. Glýcine rufèscens, Willd. nov. act. nat. cur. b[illegible] p. 1803. p. 222. Hedýsarum rufèscens, Rottl. ex Willd.

Rufescent Rhynchosia. Pl. tw.

35 R. GLA'BRA (D. C. prod. 2. p. 387.) stems twining, filiform, angular; leaflets lanceolate, ciliated, beset with resinous dots beneath, and hairy on the nerves; racemes axillary, usually 4-flowered; legumes oblong, mucronate, 2-5-seeded. ♃. ⌒. G. Native of the Cape of Good Hope. Glýcine glàbra, Spreng. neue. entd. 3. p. 54. Flowers yellow.

Glabrous Rhynchosia. Pl. tw.

36 R.? GALACTIOÌDES (D. C. prod. 2. p. 387.) stems twining; branches beset with retrograde pili; leaflets oval-oblong, obtuse at the base and mucronate at the apex, glabrous and shining above, but pubescent beneath; racemes shorter than the leaves, 5-8-flowered; legumes villous, 3-seeded, somewhat constricted between the seeds. ♄.? ⌒. S. Native of South America, near Hacienda de Blandin, in Caraccas. Glýcine galactioìdes, H. B. et Kunth, nov. gen. amer. 6. p. 427. t. 575. Lobes of calyx nearly equal, much acuminated.

Galactia-like Rhynchosia. Shrub tw.

37 R.? SCARABÆOÌDES (D. C. l. c.) stems twining, scabrous; leaflets ovate, obtuse at both ends, clothed with soft silky down on both surfaces; veiny beneath; peduncles 1-flowered; legumes oblong, constricted between the seeds; seeds furnished with a thick bifid arillus. ⊙. ⌒. S. Native of the East Indies, Madagascar, and the Mauritius. Dólichos scarabæoìdes, Lin. suppl. 1020. Burm. ind. 159. exclusive of the synonyme of Garcin. Càjan scarabæoìdes, Pet. Th. dict. sc. nat. 6. p. 167.—Pluk. alm. t. 52. f. 3. Lin. fl. zeyl. no. 182. According to the figure in Plukenet alm. the legume is 4-seeded, and the seeds separated by cellular substance, but according to M. Petit Thouars, it is 9 lines long and 2 lines broad.

Beetle-like-seeded Rhynchosia. Fl. Ju. Jul. Clt. 1773. Pl. tw.

38 R. DE'BILIS; plant twining, villous; leaflets roundish, almost glabrous; petioles long; racemes axillary, sessile, crowded with small flowers; legumes short, villous. ♃. ⌒. S. Native of Guinea and of the Island of St. Thomas. Flowers small, yellow.

Weak Rhynchosia. Pl. tw.

39 R. STRIA'TA; plant twining; leaflets ovate, acuminated, entire, glabrous, 3-nerved at the base; racemes lateral, sessile; calyx 4-cleft, and is as well as the pedicels hairy; corolla about equal in length to the calyx. ♃. ⌒. S. Native of Sierra Leone. Flowers yellow and striped with red.

Striated-flowered Rhynchosia. Pl. tw.

40 R. BIFLÒRA (D. C. l. c.) stems twining, clothed with velvety villi; leaflets oval, acutish at both ends, reticulated above, but clothed with soft velvety villi beneath; racemes 2-flowered, shorter than the petioles; legumes ovate, mucronate, villous, constricted between the seeds; seed furnished with a thick bifid arillus. ⊙. ⌒. S. Native of the East Indies. Dólichos scarabæoìdes, Roxb. hort. beng. 57. Legume 5-6 lines long and 3 lines broad, 2-seeded. Seeds ovate, blackish brown, separated by cellular transverse membranes.

Two-flowered Rhynchosia. Fl. Jul. Aug. Clt. 1816. Pl. tw.

41 R. GARCI'NI (D. C. prod. 2. p. 388.) stems twining, clothed with velvety villi: leaflets roundish-obovate, very blunt, clothed with soft villi on both surfaces; racemes shorter than the leaves; legumes oblong, covered with fine velvety down, mucronate, 2-seeded, not constricted between the seeds. ⊙. ? ⌒. G. Native of Persia. Phasèolus Pérsicus móllis, Garcin, in herb. Burm. Flowers yellow, striated.

Garcin's Rhynchosia. Pl. tw.

42 R. ANGUSTIFÒLIA (D. C. l. c.) stems twining, terete, villous; stipulas ovate, acute; leaflets linear-lanceolate, silky; pedicels axillary, very short, 1-flowered; segments of the calyx [illegible]late; legumes pubescent, 2-seeded. ♄. ⌒. G. Native of the Cape of Good Hope. Glýcine angustifòlia, Jacq. hort. schœnbr. 2. t. 231. Flowers yellow. Anthers pilose.

Narrow-leafletted Rhynchosia. Fl. June, Aug. Clt. 1795. Shrub tw.

43 R. GLANDULÒSA (D. C. prod. 2. p. 388.) stems twining, rather angular, smoothish; leaflets oblong, glabrous, but full of resinous dots beneath as well as the calyx; peduncles axillary, 1-3-flowered, longer than the leaves. ♄. ⌒. G. Native of the Cape of Good Hope. Phasèolus Capénsis, Burm. cap. p. 81. but not of Thunb. Glýcine glandulòsa, Thunb. cap. prod. 131. fl. cap. 591. Pedicels nearly an inch long, according to Thunb.

Glandular Rhynchosia. Shrub tw.

44 R. TÓTTA (D. C. l. c.) stems twining, terete, glabrous; branches clothed with adpressed silky down; leaflets ovate or oblong, mucronate, rather puberulous, fringed a little at the base, dotless beneath; pedicels axillary, jointed in the middle, 1-flowered, length of petioles: segments of the calyx and stipulas subulate. ♄. ⌒. S. Native of the Cape of Good Hope. Burch, cat. pl. afr. aust. no. 2040. Glýcine Tótta, Thunb. fl. cap. 591. Flowers yellow.

Hottentot Rhynchosia. Shrub tw.

45 R. MOLLÍSSIMA; plant twining, very soft and hoary from down; leaflets ovate-roundish, mucronate, 3-nerved at the base; racemes axillary, spike-formed. ♃. ⌒. S. Native of Guinea, very common among grass. Flowers small, brown.

Very-soft Rhynchosia. Pl. tw.

46 R. HOOKE'RI; plant pubescent; stems twining; leaflets ovate, acute, somewhat rhomboidal, dotted; racemes shorter than the leaves; legumes scymitar-shaped, swollen, 2-seeded. ♃. ⌒. S. Native of the West Indies. Glýcine móllis, Hook. exot. fl. t. 201. Flowers yellow.

Hooker's Rhynchosia. Fl. July, Aug. Clt. 1824. Pl. tw.

47 R. MÓLLIS (D. C. prod. 2. p. 388.) stems twining; leaflets elliptic, obtuse at both ends, pubescent above but tomentose and reticulately veined beneath; pedicels 1-flowered, one-half shorter than the petioles; legumes 3-seeded, clothed with rufous villi. ♃. ⌒. S. Native of Guinea. Glýcine móllis, Willd. spec. 3. p. 1063. Lateral leaflets about an inch long, and the middle one about an inch and a half long. Flowers yellow.

Soft Rhynchosia. Fl. Jul. Aug. Clt. 1823. Pl. tw.

48 R. RIGÍDULA (D. C. l. c.) stems erect, clothed with retrograde, hoary pubescence; leaflets linear, mucronate, pubescent, and beset with resinous dots beneath; pedicels axillary, 1-flowered, bent in the middle, length of petioles; legumes rather villous, oblong, 1-seeded. ♄. G. Native of the Cape of Good Hope. Burch. cat. afr. aust. no. 2587.

Stiffish Rhynchosia. Shrub 1 to 2 feet.

Cult. This genus is composed of plants of no beauty. For the culture and propagation of the species see *Eriosèma*, p. 348.

CLXXXIV. ERIOSE'MA (from *εριον*, *erion*, wool, and *σημα*, *sema*, a standard; in reference to the vexillum, which is clothed with silky hairs). Desv. in Schlecht. Linnæa. vol. 2. p. 512.

LIN. SYST. *Diadélphia, Decándria.* Calyx 5-cleft, somewhat bilabiate, usually inclosing the corolla. Stamens diadelphous. Style filiform. Vexillum clothed with silky villi. Legume straight, 1-celled, 1 or few-seeded.--Erect subshrubs, with digitately trifoliate leaves, with the 3 leaflets rising from the same dot or centre from the tip of the petiole, rarely solitary. Racemes or fascicles of flowers axillary. Flowers yellow.

1 E. GRANDIFLÒRA (Schlecht. et Cham. in Linnæa. 5. p. 588.) shrubby, erect; branches angular, somewhat trigonal; petioles very short, and are as well as the nerves and veins on the under surface of the leaves clothed with silky rufous down, but the calyxes and legumes are clothed with silky rufous villi; leaves and corollas covered with soft pubescence on both surfaces; leaflets oblong-elliptic, mucronate; bracteas roundish-ovate, acute, rather silky, ciliated and bearded; racemes terminal and axillary, panicled; legumes ovate, compressed, obliquely beaked. ♄. S. Native of Mexico, near La Hacienda de la Laguna. Very like *E. rùfa*.

Great-flowered Eriosema. Fl. Oct. Shrub 1 to 2 feet.

2 E. RU'FA; plant suffruticose, erect; branches somewhat tetragonal, clothed with rufous velvety down as well as the petioles, which are very short; leaflets 3, elliptic-oblong, clothed with soft velvety down on both surfaces, but with rufous down on the nerves on the under surface, which are rather prominent, the odd leaflet remote from the lateral ones; racemes many-flowered, shorter than the leaves; legumes oval, compressed, mucronate, clothed with rufous villi. ♄. S. Native of New Andalusia, in humid places near Caripe, and on Cerro del Cocollar. Glýcine rùfa, H. B. et Kunth, nov. gen. amer. 6. p. 423. t. 574. Rhynchòsia rùfa, D. C. prod. 2. p. 388.

Var. β, macrostàchya (D. C. prod. 2. p. 388.) racemes longer than the leaves.

Rufous Eriosema. Shrub 2 to 3 feet.

3 E. VIOLA'CEA; plant suffruticose, erect; branches and leaves clothed with very short ferruginous villi; leaflets 3, oblong-linear, acute, greenish above and velvety, but clothed with rusty villi beneath, the odd leaflet rather remote from the lateral ones; racemes axillary and terminal, many-flowered; legumes ovate, villous, 2-seeded. ♄. S. Native of Guiana, in meadows. Cýtisus violàceus, Aubl. guian. 2. p. 766. t. 306. Crotalària lineàta, Lam. dict. 2. p. 200. Glýcine pícta, Vahl. symb. 2. p. 814. Rhynchòsia violàcea, D. C. prod. 2. p. 388. Flowers violaceous.

Violaceous Eriosema. Fl. July, Aug. Clt. 1820. Sh. 4 ft.

4 E. DIFFU'SA; branches diffusely procumbent, tetragonal,

when young clothed with hoary adpressed villi; leaflets 3, lanceolate, somewhat mucronate, pubescent above and glabrous beneath, and a little dotted, but having the nerves clothed with hoary villi; the terminal leaflet hardly remote from the lateral ones; racemes very short, crowded, axillary; legumes ovate, mucronate, beset with rufous villi. ♄. S. Native of South America, on the mountains of Popayan, near the river Putes, and of Mexico. Glýcine diffùsa, H. B. et Kunth, nov. gen. amer. 6. p. 420. t. 572. Rhynchòsia diffùsa, D. C. prod. 2. p. 388. Flowers yellow.

Var. β, oblongifòlia (D. C. prod. 2. p. 389.) leaflets oblong and a little broader.

Diffuse Eriosema. Shrub 3 to 4 feet.

5 E. CRINÌTA; plant suffruticose, erect, pilose; hairs long, spreading, and soft; stems angular; leaflets 3, linear-lanceolate, acute, mucronate; racemes short. ♄. S. Native of New Andalusia, on Cerro del Cocollar, in open places. Glýcine crinìta, H. B. et Kunth, nov. gen. amer. 6. p. 421. t. 573. Rhynchòsia crinìta, D. C. prod. 2. p. 389. Flowers yellow.

Hairy Eriosema. Shrub 2 to 3 feet.

6 E. PULCHE'LLA; plant suffruticose, erect? branches angular, clothed with silky pili; leaflets 3, oblong-lanceolate, acute, rounded at the base, and clothed with soft pubescence on both surfaces; peduncles short, usually 6-flowered; calyx beset with soft pili. ♄. S. Native of New Granada, near Honda, and on the banks of the Orinoco. Glýcine pulchélla, H. B. et Kunth, nov. gen. amer. 6. p. 422. Rhynchòsia pulchélla, D. C. prod. 2. p. 389. Flowers yellow.

Neat Eriosema. Shrub 2 feet.

7 E. PSORALEOÌDES; stem flexuous, angular, velvety at the apex; leaflets 3, oblong, obtuse, clothed with silky tomentum beneath; stipulas lanceolate, length of the petiole, which is very short; spikes axillary, slender, longer than the leaves; legumes ovate-rhomboid, villous. ♄. S. Native of Madagascar. Crotalària psoraleoìdes, Lam. dict. 2. p. 201. H. B. et Kunth, nov. gen. amer. 6. p. 418. in a note. Rhynchòsia psoraleoìdes, D. C. prod. 2. p. 389. Flowers yellow.

Psoralea-like Eriosema. Shrub 2 to 3 feet.

8 E. SESSILIFLÒRA; plant suffruticose, erect; branches terete, clothed with silky villi as well as the under side of the leaflets; petioles almost wanting; leaflets 3, oblong-linear, obtuse, quite smooth above; flowers 2-3, axillary, almost sessile. ♄. S. Native of Porto Rico. Cýtisus sessiliflòrus, Poir. suppl. 2. p. 439. Rhynchòsia sessiliflòra, D. C. l. c. Flowers yellow.

Sessile-flowered Eriosema. Shrub 1 to 2 feet.

9 E. SIMPLICIFÒLIA; stems diffuse, angular, clothed with adpressed pili; petioles very short; leaves linear-lanceolate, rather mucronate, cordate, glabrous; peduncles short, 3-4-flowered; calyx clothed with adpressed pili. ♄. S. Native near Atures, at the cataracts of the Orinoco. Glýcine simplicifòlia, H. B. et Kunth, nov. gen. amer. 6. p. 419. Rhynchòsia simplicifòlia, D. C. l. c. Flowers yellow.

Simple-leaved Eriosema. Shrub diffuse.

Cult. None of the species of this genus are worth cultivating except in botanical gardens; they grow well in any light rich soil, and are easily increased by cuttings or seeds.

CLXXXV. FAGE'LIA (evidently the name of some botanist or naturalist). Neck. elem. no. 1257. D. C. legum. mem. ix. prod. 2. p. 389. but not of Schwenk.

LIN. SYST. *Diadélphia, Decándria.* Calyx cleft into 5 parts beyond the middle, with the segments linear, acute, and straight, the two superior ones joined together a little higher up than the others. Corolla with a reflexed vexillum, and a very blunt keel, which is longer than the wings. Stamens diadelphous. Legume ovate-cylindrical, turgid, 6-seeded, 1-celled, 2-valved. Seeds ovate, with a lateral hylum.—A decumbent twining subshrub, clothed with glandular clammy hairs, and rather hairy on the stems, leaves, calyxes, and legumes. Stipulas ovate, acuminated. Leaves petiolate, pinnately-trifoliate; leaflets rhomboid, the terminal one remote from the lateral ones. Racemes axillary, longer than the leaves. Flowers yellow, but with the carina tipped with violet, on long distant pedicels, which are at length deflexed.

1 F. BITUMINÒSA (D. C. prod. 2. p. 389.) ♄. ⌒. G. Native of the Cape of Good Hope. Herm. lugd. 493. with a figure. Glýcine bituminòsa, Lin. spec. 1024. Lam. ill. t. 609. f. 2. Burm. fl. cap. prod. 21. Thunb. fl. cap. 591. Ker. bot. reg. 261. Glýcine viscòsa, Mœnch. Dólichos hírtus, Hortul. Crotalària glycínea, Lam. dict. 2. p. 200. ex herb. Juss. and mus. par.

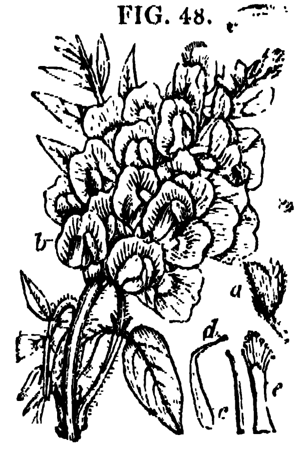
Clammy Fagelia. Fl. April, Sept. Clt. 1774. Shrub tw.

Cult. See *Kennèdya*, p. 344. for culture and propagation.

CLXXXVI. WISTA'RIA (in honour of Caspar Wistar, late professor of anatomy in the university of Pennsylvania). Nutt. gen. amer. 2. p. 115. D. C. legum. mem. ix. prod. 2. p. 389.—Thyrsánthus, Ell. journ. acad. sci. philad. 1818. 1. no. 13. p. 371. but not of Schranck.—Kraúnhia, Rafin.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, somewhat bilabiate (f. 48. *a.*), upper lip with 2 short teeth, lower one with 3 subulate teeth (f. 48. *a.*). Corolla papilionaceous (f. 48. *b.*). Vexillum bicallose. Wings conforming to the keel, which is 2-edged. Stamens diadelphous (f. 48. *c.*). Nectariferous tube girding the stipe of the ovary. Legume standing on a short stipe, coriaceous, 2-valved, 1-celled, rather torulose at the seeds.--Shewy climbing shrubs, with impari-pinnate exstipulate leaves, and terminal and axillary racemes of bluish lilac flowers, which when in a young state appear like aments from bracteas, which fall off before the flowers expand.

FIG. 48.



1 W. FRUTE'SCENS (D. C. prod. 2. p. 390.) wings of flower biauriculate; ovary glabrous. ♄. ◡. H. Native of Virginia, Carolina, and Illinois, in boggy places. Sweet, fl. gard. 2d series, t. 104. Glýcine frutéscens, Lin. spec. 1067. Sims, bot. mag. 2103. A'pios frutéscens, Pursh. fl. amer. sept. 2. p. 474. Wistària speciòsa, Nutt. l. c. Thyrsánthus frutéscens, Ell. l. c. Phaseoloìdes, hort. ang. 55. t. 15. Flowers sweet-scented, bluish purple; the vexillum with a greenish yellow spot at the base. An elegant climber when in flower. (f. 48.)

Shrubby Wistaria. Fl. Ju. Sept. Clt. 1724. Shrub cl.

2 W. CHINE'NSIS (D. C. l. c.) wings of flower with one auricle each; ovary villous. ♄. ◡. H. Native of China. Sweet, fl. gard. 211. Glýcine Chinénsis, Sims, bot. mag. 2083. G. Sinénsis, Ker. bot. reg. t. 650. Lodd. bot. cab. 773. Wistària Consequàna, Loudon, hort. brit. p. 315. Flowers larger than those of the preceding species, of a bluish purple-colour. This is a most elegant climber when in flower.

China Wistaria. Fl. May, June. Clt. 1818. Shrub cl.

3 W. FLORIBU'NDA (D. C. prod. 2. p. 390.) stems and leaves glabrous. ♄. ◡. H. Native of Japan. Too vulgo Fudsi, Kœmpf. amœn. 5. p. 856. Dólichos polystàchyos, Thunb. jap. 281. Houtt. pfl. syst. 8. p. 563. t. 64. f. 2. but not of Lin. Glýcine floribúnda, Willd. spec. 3. p. 1066. Dólichos Japónicus, Spreng. syst. 3. p. 252. Racemes of flowers long, very elegant. Corolla purple and white mixed.

Bundle-flowered Wistaria. Shrub cl.

Cult. All the species of *Wistària* are very elegant when in flower, and being all hardy climbers, deserve to be cultivated in every collection of plants. They grow best in light rich earth, and they should be nailed against a south wall, where they will flower in great profusion. The China species being an early flowerer, has a beautiful appearance when planted in a border in the green-house, and the shoots trained to the rafters. They are all easily increased by cuttings planted either in sand or mould, but they are generally propagated by layers.

CLXXXVII. A'PIOS (from *απιον*, *apion*, a pear; in reference to the form of the tubers of the roots). Boerh. lugd. 2. p. 53. Mœnch. meth. 165. Pursh. fl. amer. sept. 2. p. 459. Nutt. gen. amer. 2. p. 113.—Glýcine, sect. 1. Ell. act. soc. phil. 1818. vol. 1. p. 385.—Bradlèa, Adans. fam. 2. p. 324.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, with 4 almost obsolete teeth, and one acute elongated one under the keel. Corolla papilionaceous, with a falcate linear carina, bent back upon the top of the vexillum. Stamens diadelphous. Stipe of ovary sheathed by a little tube. Stigma emarginate. Legume many-seeded, and 2-celled; the seeds intercepted by dissepiments.—Climbing smooth herbs, with tuberous eatable roots, impari-pinnate leaves, and axillary racemes of brownish-purple sweet-scented flowers. Bracteoles closely adpressed to the calyx, but very soon falling off.

1 A. tuberòsa (Mœnch. l. c.) ♃. ⌒. H. Native from Pennsylvania to Carolina, on the mountains, in hedges, and among bushes. Glýcine A'pios, Lin. spec. 1067. Sims, bot. mag. 1198. Schkuhr, handb. 198.—Moris. hist. 2. t. 9. f. 1. Flowers brown, sweet-scented. Tubers of the roots edible, and farinaceous, much like those of *Láthyrus tuberòsus* sold in some of the German markets, and seldom larger, though more numerous, growing, however, sometimes to a large size.

Tuberous-rooted Apios. Fl. Aug. Sept. Clt. 1640. Pl. tw.

Cult. *A'pios* is an elegant climbing plant, which grows freely in common garden soil, and is easily increased by the tubers from the roots. Its branches require to be supported by stakes like peas.

CLXXXVIII. PHASE'OLUS (from *phaselus*, a little boat; supposed resemblance in pods). Lin. gen. 866. Lam. ill. 610. Savi. diss. in 8vo. 1824. D. C. prod. 2. p. 390.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, bilabiate; upper lip bidentate, lower one 3-parted. Corolla papilionaceous. Keel, style, and stamens spirally twisted together, rarely incurved. Stamens diadelphous. Style of ovary sheathed by the tubular torus. Legume compressed or cylindrical, 2-valved, many-seeded; the seeds separated by a kind of cellular substance, and furnished with an oval-oblong hylum.—Herbs or subshrubs, with usually twining stems. Leaves pinnately-trifoliate, with the leaflets stipellate at the base. Racemes axillary. Pedicels usually twin, always 1-flowered. The most part of the species are not well defined.

Sect. I. Euphase'olus (from *eu*, well, and *phaseolus*; this section contains the genuine species). D. C. prod. 2. p. 390. Legumes compressed.

§ 1. *Caracálla* (from the Celtic words *car*, a head, and *cal*, a covering; was the name of a hooded dress worn by the Gauls). *Stems frutescent. Roots fasciculately-tuberous. Leaflets entire. Vexillum twisted.*

1 P. Caraca'lla (Lin. spec. 1017.) plant twining, hardly pubescent; leaflets ovate-rhomboid, acuminated; racemes longer than the leaves; teeth of calyx nearly equal; vexillum and carina spirally twisted; legumes straight, torulose, pendulous. ♃. ⌒. S. Native of the East Indies. Andr. bot. rep. t. 341. Delaun. herb. amat. t. 31, Savi. mem. p. 11.—Triumph. obs. t. 94.—Trew. pl. rar. p. 14. t. 10. Flowers large, purple and yellowish mixed. This plant is cultivated in many parts of the south of Europe and north of Africa. It is a very curious plant, and will grow and flower freely, if kept free of the red spider. It was named *caracalla* by the Portuguese, who first brought it from South America, in consequence of its hooded flower.

Caracalla Kidney-bean or Snail-flower. Fl. Aug. Sept. Clt. 1690. Pl. tw.

2 P. tuberòsus (Lour. coch. p. 434.) plant twining, shrubby; leaflets unknown; stipulas 2-horned; racemes almost terminal; upper lip of calyx emarginate, lower one 3-parted, nearly equal; vexillum revolute; legume compressed. ♄. ⌒. G. Native of Cochinchina. Roots tuberous; tubers large, in fascicles, eatable. Flowers yellow.

Tuberous-rooted Kidney-bean. Shrub tw.

3 P. rostra'tus (Wall. pl. asiat. rar. 1. p. 50. t. 63.) plant perennial, pilose; leaflets ovate, acute; racemes axillary, few-flowered, on long peduncles; wings variously twisted; keel with a very long spiral beak; legume flat, linear, arched. ♄. ⌒. S. Native of the mountains contiguous to Bengal, and of the Burman empire on mountains near the banks of the Irawaddi, at Paghamew and Frome. Flowers pale violet: wings ornamented with white veins.

Beaked-flowered Kidney-bean. Pl. tw.

§ 2. *Perénnes* (*perennis*, perennial; roots permanent). *Stems herbaceous. Roots perennial. Racemes of flowers somewhat panicled. Leaflets entire.*

4 P. pere'nnis (Walt. fl. car. 182.) plant twining, pubescent; leaflets ovate, acuminated, triple-nerved; racemes 1-3-together, axillary, panicled, longer than the leaves; bracteoles small; legumes broad, pendulous, falcate, mucrònate. ♃. ⌒. H. Native of Carolina and Georgia. Ell. sketch. 2. p. 228. P. paniculàtus, Michx. fl. bor. amer. 2. p. 60. Dólichos polystàchyus, Lin. spec. 1022. Flowers purplish-violet. Vexillum bicallous.

Perennial Kidney-bean. Fl. July, Aug. Clt. 1824. Pl. tw.

5 P. macrosta'chyus (Ell. in journ. sc. nat. phil. 1818. p. 384.) plant twining, pubescent; leaflets ovate, acuminated, villous beneath; racemes very long, simple; pedicels in fascicles. ♃. ⌒. H. Native of North America. Like *P. perénnis*, but more robust, and with the leaflets thick, not membranous. Racemes of flowers 12-14 inches long. Flowers purplish violet.

Long-spiked Kidney-bean. Pl. tw.

§ 3. *Macropòdii* (from *μακρος*, *makros*, long, and *πους ποδος*, *pous podos*, a foot; in reference to the peduncles being longer than the leaves). *Roots annual. Leaflets entire. Peduncles longer than the leaves.*

6 P. bractea'tus (Spreng. syst. 3. p. 250.) branches angular, pubescent; leaflets obovate-oblong, glabrous, rather coriaceous, reticulately-veined; peduncles axillary, few-flowered; bracteas lanceolate, few-nerved; legumes linear. ⊙. ⌒. S. Native of Brazil. Flowers purple.

Bracteate-flowered Kidney-bean. Pl. tw.

7 P. ala'tus (Lin. spec. 1017.) plant twining, rather pilose; leaflets ovate, acuminated; peduncles very long, spicate; flowers twin, sessile; upper lip of calyx broad, entire; wings of corolla equal to the vexillum in length; legume linear, compressed, deflexed. ⊙. ⌒. H. Native country unknown.—Dill. hort. elth. p. 314. t. 235. f. 303. Flowers at first purple, but at length becoming violaceous. Seeds compressed, of a brownish red-colour, with a white eye.

Winged Kidney-bean. Fl. July. Clt. 1732. Pl. tw.

8 P. bracteola'tus (Nees et Mart. in nov. act. bonn. 12. p.

27.) plant twining, hairy; leaflets ovate-trapezoid, mucronate; peduncles spicate, longer than the leaves, bearing a fascicle of sterile bracteas on both sides at the base; legumes linear, hairy, many-seeded. ⊙. ⌒. S. Native of Brazil. Flowers dark purple.

Bracteolate Kidney-bean. Pl. tw.

9 P. LEPTOSPE'RMUS (Lag. nov. gen. 22.) plant twining, hairy, much branched; leaflets deltoid, obtuse; spikes axillary, and terminal; peduncles many-flowered. ⊙. ? ⌒. S. Native of New Spain.

Slender-seeded Kidney-bean. Pl. tw.

10 P. LINEA'RIS (H. B. et Kunth, nov. gen. amer. 6. p. 445.) plant twining a little; branches and petioles beset with retrograde stiff hairs; leaflets linear, obtuse, mucronate, somewhat cordate at the base; the odd leaflet 3-toothed and acuminated; peduncles very long, few-flowered; bracteoles oblong, 5-nerved. ⊙. ⌒. S. Native of South America, on the banks of the Orinoco. Pedicels alternate. Flowers purplish, about the size of those of *Láthyrus odoràtus*. Peduncles 6-8 inches long.

Linear-leafletted Kidney-bean. Pl. tw.

11 P. LEPTOPHY'LLUS; plant twining; stems smooth; leaflets linear, obtuse, mucronate, with revolute margins; peduncles long, hispid, few-flowered; stipulas small, ovate; bracteas small, sagittate from 2 descending auricles at the base; pedicels opposite; legume linear, pubescent. ♃. ⌒. S. Native of Mexico. P. linearis, Sesse et Moc. in herb. Lamb. Flowers about the size of those of *Vicia sativa*, apparently purplish.

Slender-leafletted Kidney-bean. Pl. tw.

12 P. TRUXILLE'NSIS (H. B. et Kunth, nov. gen. amer. 6. p. 451.) plant twining; branches and petioles beset with retrograde pili; leaflets ovate, ending in a narrow acumen, obsoletely cordate at the base, and clothed with adpressed pubescence; racemes on long peduncles, upper lip of calyx broad, emarginate, lower lip 3-lobed, acute, lateral lobes falcate. ⊙. ⌒. S. Native of Peru, near Truxillo. Flowers about the size of those of *Láthyrus odoràtus*, of a pale rose-colour or yellowish violet.

Truxillo Kidney-bean. Pl. tw.

13 P. PILÒSUS (H. B. et Kunth, nov. gen. amer. 6. p. 453.) plant twining; branchlets and petioles beset with retrograde pili; leaflets rhomboid-ovate, obtuse, cuneated at the base, and clothed with adpressed pili on both surfaces; racemes pedunculate, many-flowered, longer than the leaves; bracteoles linea[illegible] calyxes, hairy; upper lip of calyx broad, emarginate, lower one 3-lobed, acute; legumes villous. ⊙. ⌒. S. Native of South America, on the banks of the river Magdalena near Morales. Corolla yellow.

Pilose Kidney-bean. Pl. tw.

1[illegible]. PORTORICE'NSIS (Spreng. syst. 3. p. 352.) plant climbing, smooth; racemes rather compound, elongated: pedicels somewhat verticillate, villous; calyxes bractless, truncate; wings about equal in length to the vexillum. ⊙. ? ⌒. S. Native of Porto-Rico.

Porto-Rico Kidney-bean. Pl. cl.

15 P. SPECIÒSUS (H. B. et Kunth, nov. gen. amer. 6. p. 452.) plant twining; branches and petioles pubescent; leaflets ovate, somewhat acuminately-mucronate, puberulous above, and tomentosely pubescent beneath; peduncles long, few-flowered; lobes of calyx ciliated, superior one broad, emarginate, lower ones acute, lateral ones falcate. ⊙. ⌒. S. Native on the banks of the Orinoco, and of Mexico near Misantla. P. grandiflòrus, Sesse et Moc. Flowers large, shewy. Legumes unknown.

Shewy Kidney-bean. Fl. July, Aug. Clt. 1830. Pl. tw.

16 P. PEDUNCULA'RIS (H. B. et Kunth, nov. gen. amer. 6. p. 447.) plant twining; branches scabrous from retrograde stiff hairs; leaflets ovate, acuminated; racemes on very long, ascending peduncles; upper lip of calyx short, emarginate, lower one 3-lobed, acute; legume elongated, erect, linear, pubescent, mucronate. ⊙. ⌒. S. Native of New Granada. Allied to *P. semi-erécta.*

Long-*peduncled* Kidney-bean. Pl. tw.

17 P. CIRRHÒSUS (H. B. et Kunth, nov. gen. amer. 6. p. 448.) plant twining, cirrhiferous, glabrous; leaflets ovate, obtuse, roughish, rounded at the base; racemes on long peduncles; two upper lobes of calyx rounded and short, lateral ones falcate, and the one under the keel straight. ⊙. ⌒. H. Native of Mexico, near Vera-Cruz. Legume unknown.

Tendrilled Kidney-bean. Pl. tw.

18 P. SYLVE'STRIS (H. B. et Kunth, nov. gen. amer. 6. p. 450.) plant twining; branches beset with retrograde pili; leaflets deltoid-ovate, acuminately-mucronate; racemes twin, on long peduncles; bracteoles large, elliptic; upper lip of calyx broad, entire, lower one 3-parted, obtuse. ⊙. ⌒. H. Native of Mexico, in woods between Valladolid and Ario. Flowers scarlet. Legumes unknown. Very like *P. multiflòrus.*

Wood Kidney-bean. Fl. July, Aug. Clt. 1825. Pl. tw.

19 P. COCCI'NEUS (Sesse et Moc. in herb. Lamb.) plant twining; leaves and peduncles pubescent; leaflets broad-ovate, oblique, acuminated, strongly 3-nerved; stipulas lanceolate; peduncles length of leaves; flowers umbellate; bracteas forming an involucrum to the umbel of flowers; upper segment of the calyx very broad, and much nerved. ♃. ⌒. S. Native of Mexico. Flowers about the same size and colour as those of the scarlet-runner.

Scarlet-flowered Kidney-bean. Pl. tw.

20 P. FORMÒSUS (H. B. et Kunth, nov. gen. amer. 6. p. 449.) plant twining; branches beset with retrograde hairs; leaflets deltoid-ovate, acutish, mucronate; racemes on long peduncles; bracteoles ovate-orbicular; upper lip of calyx broad, entire, lower one 3-parted, acute; young legumes hairy. ⊙. ⌒. H. Native of New Spain, in frigid places near Tolluca. Fl[illegible] scarlet. Very nearly allied to *P. multiflòrus.*

Beautiful Kidney-bean. Pl. tw.

21 P. MULTIFLÒRUS (Willd. spec. 3. p. 1030.) *plant twining,* smoothish; leaflets ovate, acuminated; racemes pedunculate, longer than the leaves; pedicels twin; bracteoles rather shorter than the calyx, and adpressed to it; legumes pendulous, rather falcate, torulose, scabrous. ⊙. ⌒. H. Native of South America. Savi, diss. 2. p. 11. The *scarlet-bean* was only regarded as a variety of the kidney or French-bean by Linnæus, but now found to be specifically distinct. The seeds are large, purple, marked with black, and sometimes pure white. The culture and use of the *scarlet-bean* are the same as that of *P. vulgàris* or French-bean, which see, no. 22.

Var. α, coccineus; corolla deep scarlet. P. vulgàris coccíneus, Lin. P. coccíneus, Kniph. cent. 12. no. 71. Lam. dict. 3. p. 70.—Moris. hist. 52. t. 5. f. 4.—Corn. can. t. 185. Ger. emac. 1215. This variety is called the *scarlet-runner.*

Var. β, albiflòrus; flowers white. To this variety belong the *white-runner, white-Dutch-runner,* and perhaps the *variable-runner.*

Many-flowered Kidney-bean or Scarlet-runner. Fl. Jul. Sep. Clt. 1633. Pl. tw.

§ 4. *Brachypòdii* (from βραχυς, *brachys*, short, and πους ποδος, *pous podos*, a foot; in reference to the peduncles being shorter than the leaves). *Roots annual. Leaflets entire. Peduncles shorter than the leaves. Most of the species of this division are cultivated in the gardens under the name of French-beans or kidney-beans.*

22 P. VULGA'RIS (Savi, mem. 3. p. 14.) plant twining, smoothish: leaflets ovate, acuminated; racemes pedunculate, shorter than the leaves; pedicels twin; legumes pendulous, straight,

rather torulose, ending in a long mucrone; seeds ovate, a little compressed: ⊙. ^. H. Native of the East Indies, but has been cultivated in the gardens from time immemorial. It is a very variable plant, either twining or dwarf, with white or lilac flowers, and the seeds are very variable both in colour and shape. P. vulgàris and P. nàna, Lin.—Lob. icon. t. 59. Moris. oxon. sect. 2. t. 5. f. 1. Riv. tetra. irr. t. 30 and 29. f. 1, 2, and 3.—Park. par. t. 523. f. 2.—Savi, mem. 3. p. 14. where he distributes the varieties into the three following series, marked *A. B. C.*

A. unicolor; seeds of one colour only, black, blue, white, cream-coloured, lilac, yellow, pale red, greenish yellow, or reddish, but never with the colours mixed. P. Nigérrimus and P. lilácinus of Zucc. obs. no. 81. To this series belong the *early-yellow, dwarf, early-black* or *negro, early-white, Battersea-white, Canterbury-white, dun-coloured, tawny, large white-dwarf, Canterbury and Battersea small-white runners,* &c.

B. fasciàtus; seed lined with different colours, the lines broad and curved. The ground-colour of the seeds is either bluish, cream-coloured, bay colour, grey or liver-coloured, &c. To this series belong the *Zebra, streaked or striped,* and the *variable runner,* &c.

C. variegàtus; seeds variegated, white spotted with rust colour, lead colour, or violet, blue spotted with olive colour, or yellow spotted with brown. To this series belong *early-red-speckled, black-speckled,* and *brown-speckled,* &c.

The common *dwarf kidney-bean* or *French-bean, Haricot* of the French, *Schminkbohne* of the Germans, and *Fagiuolo* of the Italians, is a rather tender annual plant, flowering from June to September. The *scarlet* and *white runners, P. multiflòrus,* are rather tenderer than the varieties of *P. vulgàris* or *kidney-bean;* they produce flowers from July to September. The stems of both species twine more or less, though little of this propensity is shown by the dwarfer kinds. The flowers are white, red, or purple. The pods swelling slightly over the seeds, which are generally kidney-shaped, smooth, and shining; when ripe varying much in colour and shape, according to the variety, and either white, black, blue, or spotted; some of the most distinct of these have been considered by Savi as distinct species, which we have described as such. The pods of both the *kidney-beans* and *runners* may be had in perfection from June to October. Speechly suggests (Practical Hints on Domestic Economy, p. 15.), that the culture of the *kidney-bean* might become an object of national or field culture in this country, and be particularly useful in times of scarcity, more especially as on good land it will flourish and grow luxuriantly even in a dry parching season; in which respect it differs from most other culinary vegetables. It is an article of field culture in most warm countries, especially France and America.

Use. The unripe pods are chiefly used in Britain as a legume, for which they are in great estimation throughout the year, being produced by forcing when they cannot be grown in the natural ground. They are also used as a pickle. On the continent the ripe seeds are much used in cookery, forming what are called *Haricots,* of different kinds, and entering into some sorts of soups. In the end of the season, when frost is expected, the haulm of the *kidney-bean* crop is gathered and dried like that of the pea in this country, and the ripe beans afterwards threshed out, and preserved for use through the winter.

Constitution and habit. The varieties of both species, *P. vulgàris* and *P. multiflòrus,* and all those belonging to the present division of the genus, are tender in their nature, unable to grow freely in the open garden before April or May, the seeds being liable to rot in the ground from the effects of wet and cold, if planted before the beginning of the former month, even in a dry soil. The plants make but little progress till settled warm weather. However, when sown in the proper season from April or May through the course of summer till the beginning of August, they succeed well, making liberal returns of fruit from June or July to October. The dwarf kinds require no support; but the runners, rising with twining stems 8 or 10 or more feet, require tall sticks or poles to climb upon, or lines suspended from a contiguous building or fence, or from poles. They produce pods their whole length. It deserves notice, that the tendrils of the twining stems turn to the right, or in a direction contrary to the apparent diurnal course of the sun, a circumstance, however, not uncommon among papilionaceous twiners.

Estimate of sorts. The dwarf kinds, or the varieties of *P. vulgàris,* bear sowing a little sooner than the runners, or varieties of *P. multiflòrus,* and make quicker returns. They are besides more convenient to cultivate on a large scale, and the smaller pods which they produce are esteemed by many to have more delicacy of flavour. On this account it is usual to raise the larger supply from the varieties of *P. vulgàris,* or dwarf kinds. The *early-yellow, early-black,* and *early-red-speckled* are among the most hardy and most forward: the *early-white* comes in a few days later, but it is of superior flavour. The *Canterbury, Battersea, black-speckled, brown-speckled, dun-coloured, striped,* and *tawny* are plentiful lasting bearers. Growers for sale in general depend on the *Canterbury* and *Battersea* for main crops; but the others just named are also profitable sorts, and acceptable to the consumer. The dwarf *kidney-bean* continues to produce young pods in abundance and in perfection only about 3 weeks or a month. The runners, or varieties of *P. multiflòrus,* yield a succession of fruit from the same sowing a much longer time than the dwarfs. The *scarlet-runner* ranks first for its prolific property and long continuance in fruit; the pods are thick, fleshy, tender, and good, if gathered while moderately young. The *white* variety is equally eligible for the principal crop. The *Dutch-runner* is also a great bearer, in fine long pods, but not so lasting as the former. As to the smaller runner kinds, they are rather degenerate varieties of the *Canterbury* and *Battersea white-dwarfs,* casually shooting into runners; they bear in tolerable abundance slender neat pods, which are very good and tender eating, though not so eligible for the principal crop of runners as the scarlets.

Quantity of seed. Half a pint will sow a row 80 feet in length, the beans being placed from 2½ to 3 inches apart.

Soil. The soil for all the kinds should be light and mellow, inclining to a dry sand for the early sowings, and to a moist loam for the sowing in summer.

Culture of dwarf kidney-beans, or varieties of P. vulgàris. About the beginning of April, if the weather be temperate, fair, and settled, make the first sowing, in a dry south border, or other sheltered compartment with a good aspect, or sow in a single row close under a south fence, beginning with a small proportion of the most hardy early sorts. It is a good method to follow in a week with a second sowing, in case the former should fail. You may sow for a larger crop about the middle or 20th of April. For the early crops make the drills 2 feet asunder. The common depth is an inch or inch and a half for the smaller sized beans. Drop in the beans in each row at this season pretty close together, as many may fail, from 1 to 2 inches apart. Cover them in evenly the full depth of the drill. For the main crops you may sow more fully towards the end of April; and in full crops in May and June, a portion once every fortnight or three weeks of the *Canterbury* or other sorts approved, for a main supply. Draw drills 2 or 2½ feet asunder, an inch and a half or 2 inches deep. Drop the beans 3 inches apart, and cover them with earth the full depth of the drills. For supplies in succession, sow in July once or twice, and make a moderate sowing at the beginning of August for a late and last crop. In the drought of summer it is advisable to accelerate the germination of the seed, by laying it in damp mould till it begins to sprout, or by soaking it in soft water for 6 or 8 hours previous to sowing, and by watering the drills to receive them. Crops sown after the middle of July should be favoured in situation, or the time of their bearing will be much shortened by the decline of summer. From this course of sowings, a regular succession of young green pods will be produced from June and July till October. As the plants of the different crops advance in growth, occasionally hoe and stir the ground between the rows. Cut down all weeds as they spring. Draw some earth to the stems of the plants as they rise in height, which will strengthen and forward them considerably. When advanced to full bearing, it is advisable to gather the pods in moderate, young, or medium growth.

Culture of runners, or varieties of P. multiflorus. The *runners* may be sown in a small portion towards the end of April, if the weather is tolerably warm and dry; but as the seeds of the *runners* are rather more tender than those of the dwarf *kidney-beans*, they are more liable to rot in the ground by wet or cold, especially those of the *scarlet* and *white runners*, therefore the beginning or middle of May will be time enough to sow a considerable crop, and you may sow a full crop about the beginning of June. Allot principally the *scarlet* and large *white runners*. Some *Dutch-runners* are very eligible as a secondary crop. The first crops should have the assistance of a south wall. Intermediate crops may be sown in any open compartment, or against any fence, not looking north. The latest-sown will continue bearing the longer under a good aspect and shelter. In sowing, draw drills about 1½ or 2 inches deep. Let parallel rows be at least 4 feet asunder, to admit in the intervals tall sticks or poles for the plants to climb upon. Place the beans in the drills 4 inches apart, and earth them in evenly, the depth of the drills. A row contiguous to a fence or building may ascend upon lines. Some may be sown in a single row along a border, or on each side of a walk; and have the support of a slight trellis of laths and lines, or poles may be placed at certain distances, having a rope drawn along their tops, having lines suspended from it, or they might be arched over with similar materials, so as to form a shady walk or bower. In cold wet seasons, or when requisite to have a few plants more forward than the general crop, some *scarlet-runners* may be sown in April, either in a slight hot-bed, or in pots under frames or hand-glasses, to raise and forward the plants till 2 or 3 inches high, then, at the end of May, transplant them into a garden. As the plants in the open ground advance from 3 to 6 inches in growth, hoe up some earth to the stems, cutting down all weeds at the same time, and when they begin to send forth runners, place suitable supports to each, such as are mentioned above, and conduct the tendrils to the sticks or lines, turning the stems in a contrary direction to the sun. The ascending stems will soon come into flower, podding at the joints in long succession. They are so prolific that the returns, from 3 sowings made in May, June, and July, will last from July till October.

Taking the crop. Gather the pods, both from the dwarfs and runners, while they are young, fleshy, brittle, and tender, for then are they in highest perfection for the table; and the plants will bear more fully, and last longer in fruit, under a course of clean gathering, not leaving any superabundant pods to grow old.

To save seed. Either sow a portion for that object, or leave rows wholly ungathered of the main crops, or preserve a sufficiency of good pods promiscuously. The beans saved should be the first fruits of a crop sown at a period which throws the entire course of growth into the finest part of summer. Let them hang upon the stalks till they are fully ripe, till August or September; then let the haulm be pulled up and placed in the sun to dry and harden the seed, which should be afterward cleared out of the husks, bagged up, and housed.

Forcing the kidney-bean. It is often partially forced in hot-houses or frames, with a view to its fruiting in the open garden; and supplies of green pods are also kept up throughout the winter and spring months, by forcing in hot-houses and pits. The *kidney-bean* may be successfully forced in pits, hot-houses, or forcing-houses, and hot-beds. The more general mode is to force in pine-stoves; the same heat which suits the pine-apple suits the *kidney-bean*, which is a native of India. Nicol prefers a flued pit, such as that used for nursing pine-apple plants; and Abercrombie says, "Where there are not hot-houses, or where *kidney-beans* are to be raised in quantities for the market, the most economical and successful mode will be found a flued pit, with rather a strong bottom heat, and covering the bed with light vegetable mould."

Sorts. Abercrombie recommends the *Early-speckled*, *Early-negro*, and *Dun-coloured dwarfs*. Nicol says the *Speckled-dwarf* is the best sort.

Sowing. Sow in flat boxes or pans filled with fine light earth, and cover the seed the depth of an inch. Let them be placed in a stove or hot-bed, and have moderate supplies of water, and they will be fit to transplant when about 3 inches in height. Plant them in rows across the bed of the pit, 15 inches apart and 3 inches distant in the line.

Culture. Water after planting, and afterwards as required; give abundance of air every fine day, and earth up the plants as they advance in growth, in order to give them strength.

Time of beginning to force. M'Phail says, "if you wish to endeavour to have *kidney-beans* green all the year, you should plant the seeds and begin to force in August." Abercrombie observes, "some forcers, quite in opposition to the season, raise *kidney-beans* in August, and thence to the 21st of December, which day may be regarded as the boundary between late and early forcing."

Temperature. The heat by fire at night need not exceed 50°, according to Nicol, but Abercrombie recommends 60° for the minimum, and 75° for the maximum.

Successional supplies, are to be obtained by sowing every month or 6 weeks, for which purpose the pits may be divided, in a temporary way, by fitting a board neatly under the middle rafter. By this means the one half of the pit may be kept cooler by matting or not matting, or by the admission of more or less air; this will protract the growth of the *beans* more in one part than the other.

Forcing kidney-beans in a hot-house. "The most early fruit in perfection is obtained by culture in a stove, sowing from mid-winter till the end of March. Sow in pots or oblong boxes, containing a mixture of light fresh earth and vegetable mould, depositing the seeds either in a triangular or quincunx order, and full an inch deep. If the plants are to fruit where sown, the cradles should be 10 inches deep; but if they are to be transplanted, which admits a greater number in the same space, the seed-pots or boxes may be shallow. Do not fill the cradles with mould at first, to allow of gradually earthing up. When the *beans* have germinated, sprinkle the earth with water; after the plants have risen, give moderate waterings every other day; the last crops may want water every day. Sprinkle also the leaves with water, warmed by standing some time in the house. Those plants raised in shallow pans should be transplanted for fruiting when 2 or 3 inches high. It is sometimes proper to stop luxuriant runners. These incidental crops may stand in rows on the flues, or on shelves; but take care that they do not shade the pines and other principal plants. For succession sow every fortnight or 3 weeks."—*Abercrombie.*

Insects. Nicol observes "that the thrips often attack *French* *beans* in the hot-house, and therefore the plants should be fumigated with tobacco, which destroys that insect."

Forcing kidney-beans in a peach or cherry-house. *French-beans*, Nicol observes, "may be successfully planted out in the borders of an early cherry-house or peach-house, so as that they may not be overmuch shaded by the trees; but they seldom do much good in a vinery, where they are shaded by the foliage of the vines."

Forcing kidney-beans in a common hot-bed. "Under the deficiency of a house, you may have recourse to a hot-bed and frame, but the culture will be attended with more trouble, the course will be longer, and the fruit rarely so fine or so plentiful; nor without fire-heat can the difficulties of late or very early forcing be so well contended with. From the middle of February to the beginning of April, is the most successful period for forcing the *kidney-bean* in a hot-bed. The *Early-white-dwarf*, from its low growth, is to be sown in preference to the kinds recommended for the stove, unless it be intended to fruit the plants in a deeper frame than ordinary. The *Early-yellow* and *Early-black* are next, as not growing very high. The temperature for the *kidney-bean* is 60° for the minimum and 75° for the maximum of the fruiting-bed. In forcing soon in the spring, raise the plants on a smaller bed, earthed over with light rich compost, 6 inches deep. Sow the *beans* thickly, covering them to the depth of an inch. The second hot-bed should be earthed over to the depth of 8 or 9 inches. Into this transplant the seedlings, as soon as they are 2 or 3 inches high, setting them in cross rows 12 or 15 inches asunder, and 2 or 3 inches in the line, or when the season is so far advanced that one bed, with the help of linings, will bring the plants well into fruit, you may sow at once, at the full distance, in a similar hot-bed, to continue for podding. Cover the glasses every night with garden-mats, also particularly in severe weather. Admit fresh air moderately every mild day, and give occasional gentle waterings. The plants raised in February will come into bearing in April and May, making moderate returns; a new crop every three weeks will keep up the succession; those sown at the beginning of April will last till the middle or end of June, when they will be succeeded by the early half-sheltered crops in the open garden." *Abercrombie.*

Crop raised under glass, to fruit in the open garden. At the end of March you may sow a small portion under glasses, for transplanting into the open ground in the first or second week of May. It is not so well to sow in patches on the surface of the ground, as in small pots, because the plants can be turned from the latter with less check to their growth, when transplanted. Sow 3 beans in each pot, and when the seedlings are 2 or 3 inches high, harden them by degrees to the full air, and plant them on a good open border as soon in May as the season will suit. They will yield about a fortnight sooner than the earliest raised under exposure to the weather.

Crop raised on slight heat. A crop to fruit early in the open garden may be accelerated with more certainty by plunging the pots containing the seed *beans* in a gentle hot-bed, or some sown in shallow pans or boxes may be set on the shelves of a stove. Just at the opening of April will be early enough to begin, as the plants will otherwise get too forward for the weather to proceed well without a continuance of artificial heat. Having nursed them to the proper stage, plant out under a south fence, either 3 inches apart, if in a single line, or 18 inches by 3 if in 2 lines; or it may be better to set the plants in patches of 7 or 9, to receive the temporary shelter of a hand-glass, lest the transition from a hot-bed all at once to the fluctuating air of spring be too violent. *Abercrombie.*

Field culture of the kidney-bean. In this country the culture of the *kidney-bean* has been confined to gardens, but it might be grown equally well in dry, warm, rich, and sheltered soils, being grown in the fields of Germany, Switzerland, and similar climates. The sort generally used for this purpose is the small *Dwarf-white.* The ground is prepared by several turnings, and the seed is dibbled in rows 18 inches or 2 feet asunder, in the beginning of May. The ground is hoed and weeded during the summer, and the crop is ripe in August. It is usually harvested by pulling up the plants, which being dried are stacked or threshed. The haulm is of little bulk or use, but the grain is used in making the esteemed French dish called haricot, which it were desirable the cottagers of this country were made acquainted with. There is perhaps no dish so easily cooked, and at the same time so agreeable and nourishing. The beans are boiled and then mixed with a little salt and butter, or other fat, and a little milk or water and flour. From 3840 parts of *kidney-beans*, Einhoff obtained 1805 parts of matter analogous to starch, 851 of vegeto-animal matter, and 799 parts of mucilage. Haricots and lentils are much used in all Catholic countries during Lent and maigre days, as they, from their peculiar constituents, form so excellent a substitute for animal food. During the prevalence of the Roman religion in this country they were probably much more generally used than at present.

Common Kidney-bean or French-bean. Fl. June, Sept. Clt. 1597. Pl. 1 foot or tw.

23 P. COMPRE'SSUS (D. C. prod. 2. p. 392.) plant twining a little; smoothish; leaflets ovate, acuminated; racemes pedunculate, shorter than the leaves; pedicels twin; legumes compressed, somewhat torulose, mucronate; seeds compressed. ⊙. ◡. H. Native country unknown. Legume 5-6 inches long. Flowers white. Seeds white, ovate, obtuse, straight, or concave on the side of the hylum. P. Romànus, Savi, mem. 3. p. 17. t. 10. f. 20. This plant is called *Haricot de Soissons*, and *Haricot d'Hollande*, in French.

Var. α, hùmilis (D. C. l. c.) stem humble, erect; seeds smaller. Called in French *Le Soissons nain.*

Var. β, màjor (D. C. l. c.) stems taller; legumes twisted a little.

Compressed-seeded Kidney-bean. Fl. Ju. Sept. Clt. ? Pl. 1 ft.

24 P. OBLÓNGUS (Savi, mem. 3. p. 17. t. 10. f. 14.) plant twining a little, smoothish; leaflets ovate, acuminated; racemes shorter than the leaves; legumes straight, rather cylindrical, ending in a long acumen; seeds rather cylindrical, obtuse, or truncate. ⊙. H. Native country unknown. Flowers usually of a pale violet colour. Seeds of one colour or variegated, twice the length of the breadth, purple, whitish, or chestnut-coloured.

Oblong-seeded Kidney-bean. Fl. June, Sept. Pl. 1 to 2 ft.

25 P. SAPONA'CEUS (Savi, mem. 3. p. 19. t. 10. f. 15.) plant humble, glabrous; leaflets ovate, acuminated; racemes shorter than the leaves; legumes straightish, mucronate, more or less torulose; seeds oblong, obtuse, compressed, spotted on the side next the hylum. ⊙. H. Native country unknown. Seeds convex on the back, and rather concave in front, marbled, or clouded with black, red, and bay-coloured marks. Flowers white. Legume 5-6 inches long.

Soapy Kidney-bean. Fl. June, Sept. Clt. ? Pl. 1 foot.

26 P. TU'MIDUS (Savi, mem. 3. p. 19. f. 16.) plant dwarf, climbing a little, and smoothish; leaflets ovate, acuminated; racemes shorter than the leaves; legumes straightish, more or less torulose; seeds spherical, or ovate, turgid, white, spotless, with a convex front. ⊙. H. Native country unknown. Flowers white. Legumes 3 inches long. To this species belong the garden *French-beans* called *Princess, Nain flageolet, Nain d'Amérique.*

Tumid-seeded Kidney-bean. Fl. Ju. Sept. Clt. ? Pl. [illegible] 2 ft.

27 P. HÆMATOCA'RPUS (Savi, mem. 3. p. 20. f. 17.) plant twining, tall, smoothish; leaflets ovate, acuminated; racemes

shorter than the leaves; legume straight, torose, mucronate, when in an immature state it is spotted with blood colour; seeds ovate, turgid, variegated. ☉. ⌒. H. Native country unknown. Flowers pale violet. Legume 4-5 inches long. Called the *Cape kidney-bean* by gardeners.

Bloody-fruited Kidney-bean. Fl. July, Sept. Clt.? Pl. tw.

28 P. sphæ'ricus (Savi, mem. 3. p. 20. f. 17.) plant tall, twining, smoothish; leaflets ovate, acuminated; racemes shorter than the leaves; legumes straightish, torose, mucronate; seeds roundish. ☉. ⌒. S. Native country unknown. Flowers pale violet. Legume 4-5 inches long. Seeds red, brown, flesh-coloured, or violaceous, zonate, with an areola round the margin. To this species belong the garden *kidney-beans* called *Haricot d'Orleans, Haricot de Prague*, &c.

Spherical-seeded Kidney-bean. Fl. Jul. Aug. Clt.? Pl. tw.

29 P. gonospe'rmis (Savi, mem. 3. p. 21. f. 19.) plant tall, twining, smoothish; leaflets ovate, acuminated; racemes shorter than the leaves; legumes torulose, nearly straight, mucronate; seeds compressed, irregularly angled. ☉. ⌒. H. Native country unknown. Flowers white or very pale violet. Legume 3-4 inches long, sometimes spotted with red. Seeds small, white, flesh-coloured, or chestnut-coloured.

Angular-seeded Kidney-bean. Fl. July, Aug. Clt.? Pl. tw.

30 P. dera'sus (Schranck, hort. mon. 1. t. 89.) plant twining, smoothish; leaflets ovate, acuminated; peduncles 2-4-flowered, shorter than the leaves; bracteoles small; vexillum concave, roundish, shorter than the wings; legumes linear-oblong. ☉. ⌒. H. Native of Brazil. Corolla greenish white. Seeds black, with a white hylum.

Scraped-off or Black-seeded Kidney-bean. Fl. June, Aug. Clt. 1819. Pl. tw.

31 P. luna'tus (Lin. spec. 1016.) plant twining, smoothish; leaflets ovate, acuminated; racemes pedunculate, shorter than the petioles; pedicels twin; bracteas small, adpressed; vexillum concave, roundish; legume acinaciform, rather lunate, smooth, 2-4-seeded. ☉. ⌒. S. Native of Bengal. Houtt. pfl. syst. 8. t. 63. P. rùfus, Jacq. hort. vind. 1. t. 34. P. lunàtus, of Lour. probably distinct from the plant of Linnæus. Flowers small, white. Seeds dark purple, streaked with white, large. The seeds are cooked and eaten in Cochin-china as well as in the East Indies, but the plant is grown more for the beauty of the seeds than for their flavour.

Lunate-podded Kidney-bean. Fl. Jun. Jul. Clt. 1779. Pl. tw.

32 P. inamœ'nus (Lin. hort. cliff. 359.) plant twining, glabrous; leaflets ovate-lanceolate, much taper-pointed; racemes pedunculate, shorter than the leaves; pedicels twin or tern; vexillum concave, shorter than the wings; legume acinaciform, acuminated. ☉. ⌒. H. Native of Africa. Jacq. hort. vind. t. 66. P. macrocárpus, Mœnch. meth. 141. but not of Poir. Flowers with a greenish vexillum and whitish wings. Seeds compressed, variegated with white and blood-red or scarlet.

Unpleasing Kidney-bean. Fl. July, Aug. Clt. 1794. Pl. tw.

33 P. Xuare'sii (Zucc. cent. no. 81. A.) plant twining, pubescent; leaflets ovate-lanceolate, ending each in a long taper point, lateral ones dependent; racemes pedunculate, shorter than the leaves; wings of corolla elongated; legume acinaciform; seeds compressed. ☉. ⌒. H. Native country unknown. Nearly allied to *P. inamœ'nus*.

Xuares's Kidney-bean. Fl. June, Aug. Clt. 1818. Pl. tw.

34 P. puberulus (H. B. et Kunth, nov. gen. amer. 6. p. 451.) plant twining; branches and leaves pubescent; leaflets ovate, acuminately-mucronate; peduncles many-flowered, shorter than the leaves; legumes lanceolately-cultriform, glabrous. ☉. ⌒. S. Native of South America, at Rio Guayre, near Caraccas. Flowers bluish white. Seeds chestnut-coloured.

Puberulous Kidney-bean. Pl. tw.

35 P. adena'nthus (Meyer, prim. esseq. 239.) plant twining, glabrous; leaflets ovate, acuminately cuspidate, middle one lanceolate-oblong; racemes rather longer than the leaves; pedicels twin, rising from the base of glands; bracteoles ovate-roundish; legumes incurved, with scabrous margins. ☉. ⌒. S. Native of Guiana, in shady humid places. Flowers large, white painted with blue.

Gland-flowered Kidney-bean. Pl. tw.

36 P. Tunkine'nsis (Lour. coch. 435.) plant twining, branched, glabrous; leaflets small, thick; racemes axillary; legume somewhat lunate, compressed, smooth, pendulous, 3-seeded. ☉. ⌒. H. Native of Cochin-china. Flowers white, but the vexillum is revolute and greenish. Seeds ovate, pale, variegated with red. The plant is cultivated in Cochin-china for the sake of the seeds, which are dressed and eaten by the inhabitants.

Tunquin Kidney-bean. Fl. June, July. Pl. tw.

37 P. macroca'rpus (Poir. suppl. 3. p. 6.) plant twining, smoothish; leaflets ovate-roundish, or acuminated; peduncles axillary, short, few-flowered; legume very long, glabrous, ending in a hooked mucrone. ☉. ⌒. H. Native country unknown. Flowers and seeds white.

Long-fruited Kidney-bean. Pl. tw.

38 P. fu'scus (Wall. pl. asiat. rar. 1. p. 6. t. 6.) plant annual, clothed with hoary pubescence and pili, twining, much branched; root fibrous; branches filiform, furrowed; leaflets ovate, acute, entire; racemes pedunculate, shorter than the leaves; flowers lurid on the outside; calyx beset with resinous dots, 4-toothed, lower tooth elongated; keel a little beaked, incurved; legume hairy, flat, linear. ☉. ⌒. S. Native of the Burman Empire, at Prome. Flowers crowded; the vexillum dark brown beneath and shining, but opaque above and yellowish, with brown lines. Keel and wings yellow.

Brown-flowered Kidney-bean. Pl. tw.

§ 5. *Heterophýlli* (from ἕτερος, *heteros*, and φυλλον, *phyllon*, a leaf; in reference to the variable shape of the leaflets, some being lobed and others entire). *Leaflets all or some of them lobed.*

39 P. microspe'rmus (Ort. dec. 130.) stem erect, angular, and is as well as the leaves glabrous; leaflets rhomboid-ovate, 3-lobed; peduncles axillary, very long, racemose; bracteoles subulate; wings of corolla orbicular, legumes linear, compressed, pendulous. ☉. S. Native of Cuba. Flowers of a dirty purple colour. Seeds grey, lined with black.

Small-seeded Kidney-bean. Fl. Jul. Aug. Clt. 1825. Pl. 1 ft.

40 P. gibbosifòlius (Ort. dec. 25.) plant twining, hairy; leaflets rhomboid-ovate, lateral ones gibbously 2-lobed on the outer side; peduncles 3 times the length of the leaves; flowers twin, disposed in something like a spike; bracteoles coloured; legume linear, dependent, incurved. ☉. ⌒. S. Native of Cuba. Corolla vermilion-coloured. Seeds small, olive-coloured, and variegated.

Gibbous-leafletted Kidney-bean. Pl. tw.

41 P. heterophy'llus (Willd. enum. 753. H. B. et Kunth, nov. gen. amer. 6. p. 446.) plant twining; branches beset with retrograde pili; leaflets hispid beneath and on the margins, middle one oblong and repand, lateral ones ovate-oblong, having one lobe each above the base; peduncles longer than the petioles; flowers somewhat spicate; bracteoles small; lobes of calyx 5, acute, nearly equal; legumes linear-falcate. ☉. ⌒. H. Native of Mexico, near Valladolid. Flowers small, red.

Various-leaved Kidney-bean. Fl. Jul. Aug. Clt. 1820. Pl. tw.

42 P. vestìtus (Hook. bot. misc. 2. p. 216.) plant twining, and clothed with dense pubescence; leaflets rhomboid, retuse, lateral ones somewhat lobed; racemes twice the length of the leaves; teeth of calyx broad-subulate, nearly equal; legumes

linear, acuminated, very villous. ⊙. ⌒. S. Native of Peru, near Lima.

Clothed Kidney-bean. Pl. tw.

43 P. ACONITIFÒLIUS (Jacq. obs. 3. p. 2. t. 52.) plant twining a little, hairy; leaflets palmatifid beyond the middle, lateral ones 3-4-lobed, terminal one 5-lobed; peduncles usually 3-flowered, shorter than the leaves. ⊙. ⌒. S. Native of Tranquebar. Dólichos disséctus, Lam. dict. 3. p. 300. Dólichos palmàtus, Forsk. ex Steud. nom.—Pluk. alm. t. 120. f. 7. Legume unknown. Perhaps belonging to the following section.

Aconite-leaved Kidney-bean. Fl. Jul. Aug. Clt. 1731. Pl. tw.

SECT. III. STROPHÓSTYLES (from *στροφος*, *strophos*, a twist, and *στυλος*, *stylos*, a style; in reference to the style, which is twisted). Ell. sketch. 2. p. 229.—Phasìolus and Phaséllus, Mœnch. meth. 240. Legume terete.

§ 1. *Lobatifòlii* (from *lobatus*, lobed, and *folium*, a leaf; leaflets lobed). *Leaflets all or some of them lobed.*

44 P. DIVERSIFÒLIUS (Pers. ench. 2. p. 296.) stems prostrate, scabrous; leaflets angular, 2 or 3-lobed; peduncles many-flowered, longer than the leaves; flowers capitate; legumes terete, pubescent. ⊙. H. Native of Carolina, by the sea-side. Glýcine angulàta, Muhl. in Willd. spec. 3. p. 1056. P. trílobus, Michx. fl. bor. amer 2. p. 60. but not of Roth. Strophóstyles angulòsa, Ell. sketch. 2. p. 229. Flowers purplish. Seeds reniform, cylindrical.

Diverse-leaved Kidney-bean. Fl. Ju. Jul. Clt. 1806. Pl. pr.

45 P. TRÍLOBUS (Roth. nov. spec. 344.) stem almost erect; branches prostrate, glabrous; lateral leaflets 2-lobed, terminal one 3-lobed; peduncles usually 3-flowered, longer than the leaves: legume declinate, cylindrical; stipulas ovate. ⊙. S. Native of the East Indies. Dólichos trílobus, Lin. spec. 1021. Burm. ind. t. 50. f. 1. Dólichos stipulàris, Lam. dict. 2. p. 300. Glýcine tríloba, Lin. mant. 516.—Pluk. alm. t. 214. f. 3. Flowers green? The leaves are considered by the native practitioners of India to be cooling, sedative, antibilious, and tonic, and useful as an application to weak eyes.

Three-lobed-leaved Kidney-bean. Fl. July, Aug. Clt. 1777. Pl. prostrate.

46 P. ANGULÒSUS (Ort. dec. p. 24.) plant twining, hairy; leaflets ovate, lateral ones gibbous or 2-lobed on the outside, middle one 3-lobed; peduncles angular, rather longer than the leaves; flowers capitate; bracteoles ovate; wings shorter than the carina; legumes linear, terete, drooping a little, glabrous; seeds tetraquetrous. ⊙. ⌒. H. Native of North America. Flowers pale flesh-coloured and white. Savi, diss. 2. p. 1.

Angular-seeded Kidney-bean. Fl. Ju. Aug. Clt. 1820. Pl. tw.

47 P. FARINÒSUS (Lin. spec. 1017.) stems twining; leaflets rhomboid-ovate, acute, somewhat 3-lobed; peduncles axillary, rather longer than the petioles; flowers subcapitate; legumes terete, smooth; seeds cylindrical, truncate at both ends, covered with farinose tomentum. ⊙. ⌒. S. Native of the East Indies. Niss. act. acad. par. 1730. p. 557. t. 42. Savi, diss. p. 3. P. lunàtus, Mœnch. meth. 140. Flowers rose-coloured, but the vexillum is deep red.

Mealy-seeded Kidney-bean. Fl. Jul. Aug. Clt. 1759. Pl. tw.

48 P. STIPULA'RIS (Lam. dict. 3. p. 74.) stem erect, glabrous; leaflets oval, obtuse, lateral ones sinuated, terminal one 3-lobed; peduncles spicate, longer than the leaves; stipulas ovate; legumes terete, horizontal, smoothish. ⊙. H. Native of Peru. Flowers with a brown vexillum, yellow wings, and a white keel. Like *P. trílobum.*

Stipular Kidney-bean. Fl. July, Aug. Clt. 1805. Pl. 1 ft.

49 P. ATROPURPU'REUS (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 395.) stem twining, clothed with adpressed pubescence; leaflets ovate-lanceolate, acuminated, mucronate, lateral ones 2-lobed; peduncles bearing something like spikes of flowers, longer than the leaves; wings of corolla stipitate, orbicular, longer than the vexillum; legumes terete, pendulous. ⊙? ⌒. H. Native of New Spain, on the mountains of Chilapa. Flowers rose-coloured, but the wings are dark purple.

Dark-purple-flowered Kidney-bean. Pl. tw.

§ 2. *Integrifòlii* (from *integer*, entire, and *folium*, a leaf; in allusion to the leaflets being entire). *Leaflets entire.*

50 P. HE'LVOLUS (Lin. spec. 1017.) stems twining; leaflets deltoid-oblong, a little sinuated; peduncles longer than the leaves, bearing 3 flowers at the apex; vexillum short, but the wings are expanded, and large; legumes terete, erect. ⊙. ⌒. H. Native of North America, from Carolina to New York. Strophóstyles hélvola, Ell. sketch. 2. p. 230. Glýcine hélvola, Ell. journ. act. sc. phil. 1818. 1. p. 385. Glýcine umbellàta, Willd. spec. 3. p. 1058.—Dill. hort: elth. 312. f. 300. Flowers of a pale rose-colour. Seed small, turgid, of a blackish bay colour.

Pale-red-flowered Kidney-bean. Fl. July, Aug. Clt. 1732. Pl. tw.

51 P. VEXILLA'TUS (Lin. spec. 1017. Jacq. hort. vind. t. 102.) stems prostrate or twining, rather pilose; leaflets oblong-ovate; peduncles very long; flowers 5-7 in a head; vexillum large, emarginate; wings small; legumes terete, rather pilose; seeds woolly. ⊙.? ⌒. H. Native of Carolina and about Havannah, on the sea coast. P. hélvolus, Michx. fl. bor. amer. 2. p. 60. P. vexillàtus, Pursh, fl. amer. sept. 2. p. 470. Strophóstyles pedunculàris, Ell. sketch. 2. p. 230. Glýcine pedunculàris, Muhl. cat. 64.—Dill. hort. elth. 313. f. 302. Perhaps the Carolina plant is the same as that from Havannah. Flowers green before expansion, afterwards very pale purple; as they fade the purple changes to pale violet, and finally to a dusky lurid-colour or yellowish brown.

Large-bannered Kidney-bean. Fl. July, Aug. Clt. 1732. Pl. tw.

52 P. TUBERÒSUS (Sesse et Moc. in herb. Lamb.) plant canescent; stems beset with retrograde villi; petioles, and under side of leaves strigose; leaflets small, elliptic, entire, sometimes the lateral ones are slightly 2-lobed; peduncles longer than the leaves; stipulas ovate-lanceolate; stipels and bracteas subulate; teeth of calyx setaceous; root tuberous. ♃. ⌒. S. Native of Mexico.

Tuberous-rooted Kidney-bean. Pl. tw.

53 P. MU'NGO (Lin. mant. 101.) stem flexuous, terete, hispid; leaflets ovate, acute, rather repand; peduncles a little longer than the leaves; flowers 6-7 in a head; carina putting forth a little horn from the left side; legume terete, hairy, rather torulose; seeds cylindrical, truncate. ⊙. H. Native of the East Indies. Savi, diss. 1. p. 9. P. hírtus, Retz, obs. 3. p. 38.—Múngo, garc. arom. l. 2. c. 21. Flowers yellow. Seeds eatable, Lour. *Muong-an* is the vernacular name of the plant.

Mungo Kidney-bean. Fl. June, July. Clt. 1790. Pl. 1½ ft.

54 P. GLYCINEFÓRMIS (Weinm. in flora, 1821. p. 29.) stem decumbent, twining, pilose, rather scabrous; leaflets oblong, obtuse; peduncles axillary, 1-2-flowered, longer than the leaves; legumes terete, pilose. ⊙. ⌒. S. Native of Chili and Peru. Flowers with a bluish violet vexillum, marked with yellow at the base. Said to be allied to *P. Múngo.*

Glycine-formed Kidney-bean. Pl. tw.

55 P. HERNANDE'SII (Savi, diss. 1. p. 11.) stem flexuous, hispid; leaflets ovate-rhomboid, somewhat repand; peduncles shorter than the petioles, 4-6-flowered; legumes rather torulose, pilose, beaked, straightish; seeds oblong, cylindrical. ⊙. H. Native of Mexico. Hern. mex. 887. with a figure. Vex-

illum yellow on the inside, and the wings are yellow. Seeds chestnut-coloured.

Hernandez's Kidney-bean. Pl. 1½ foot.

56 P. PAUCIFLÒRUS (Sesse, et Moc. in herb. Lamb.) plant twining; stems villous; leaflets ovate, mucronate, pubescent, entire; stipulas broad-cordate, ciliated, as well as the bracteas; peduncles more than twice the length of the leaves, 2-flowered; segments of the calyx lanceolate, ciliated, upper one emarginate; vexillum obovate, emarginate; stigma broad, spiral. ♃. ⌒. S. Native of Mexico. Flowers large, with the wings and keel blue, and the vexillum pale.

Few-flowered Kidney-bean. Pl. tw.

57 P. CHRYSA'NTHOS (Savi, diss. 1. p. 15.) stem flexuous, glabrous; leaflets rhomboid-ovate; peduncles a little longer than the leaves, many-flowered; legumes terete, glabrous, rather torulose, horizontal, acuminated by a beak; seeds almost cylindrical. ⊙. H. Native country unknown. Flowers yellow. Seeds rust-coloured.

Golden-flowered Kidney-bean. Fl. July, Aug. Pl. 1 to 2 ft.

58 P. RADIA'TUS (Lin. spec. 1017.) stem erect, terete, beset with retrograde pili; leaflets ovate, acute; peduncles hardly longer than the leaves; flowers 7-8 in a head; legumes terete, hairy, horizontal. ♂. S. Native of China and Ceylon.—Dill. hort. elth. 315. f. 304. Flowers pale purple, but changing to ochraceous as they fade.—Reich, act. stockh. 1742. p. 202. t. 7. f. 2. Seeds greenish yellow, ovate, small.

Rayed Kidney-bean. Fl. June, July. Clt. 1732. Pl. 1 to 2 ft.

59 P. SCA'BER (Steud. nom. 610.) stem erect, hispid; leaflets broad-ovate; peduncles very short, hispid; flowers somewhat capitate; legumes erect, terete, scabrous; seeds cylindrical. ⊙. H. Native country unknown.—Moris. oxon. sect. 2. t. 5. f. 8. Phasèllus scàber, Mœnch. meth. 140. Flowers greenish yellow. Seeds rusty.

Scabrous Kidney-bean. Pl. 1 to 2 feet.

60 P. LATHYROÌDES (Lin. spec. 1018.) stem erect, glabrous; leaflets oblong, acuminated; peduncles longer than the leaves; flowers somewhat spicate; vexillum concave, much shorter than the wings; legumes terete, subulate. ⊙. H. Native of Jamaica, in humid sandy places.—Sloan. hist. 1. t. 116. f. 1. Phasèllus lathyroides, Mœnch. meth. 140. Flowers red; the keel whitish.

Lathyrus-like Kidney-bean. Fl. July, Aug. Clt. 1786. Pl. 2 ft.

61 P. SEMIERE'CTUS (Lin. spec. 1016.) stems twining at the apex, terete, pubescent; leaflets ovate-lanceolate, acute, glabrous; peduncles elongated; flowers twin, disposed in a kind of spike; keel of flower awnless, hooked, turned to the right; legumes rather spreading, straight, subulate, compressed, acuminated by a beak; seeds oblong. ⊙. ⌒. H. Native of South America. Savi, diss. 2. p. 6. Jacq. icon. rar. t. 558.—Dill. hort. elth. t. 233. f. 301. Ker, bot. reg. 743. Phaseolus semi-eréctus, Mœnch. meth. 141. Flowers with a greenish vexillum, tinged with purple, and with the keel purple in the middle, but white on the sides, but the wings are deep purple. Seeds brown, spotted with black.

Half-erect Kidney-bean. Fl. July. Clt. 1781. Pl. tw.

62 P. VIOLA'CEUS (Steud. nom. 610.) stem erect, flexuous, glabrous; leaflets ovate-lanceolate, acute; peduncles 2-3-flowered, length of the petioles; legumes erect, linear, terete. ⊙. H. Native of Africa. Phasèllus violàceus, Mœnch. meth. 141. P. Abyssínicus, Hortul. Flowers sessile, white, but with the vexillum and wings violaceous on the outside.

Violaceous-flowered Kidney-bean. Fl. July, Aug. Clt. 1808. Pl. 2 feet.

† *Species not sufficiently known.*

63 P. MAX (Lin. spec. 1017. exclusive of the synonyme of Hern.) stem erect, angular, hispid; leaflets ovate, acute; legumes torulose, pendulous, hairy, 3-4-seeded, beaked. ⊙. H. Native of Moluccas.—Rumph. amb. 5. p. 388. t. 140? Flowers greenish yellow. Seeds black, about the size of coriander-seeds. *Max* is the Spanish name of the plant.

Max Kidney-bean. Fl. June, July. Clt. 1758. Pl. 1½ ft.

64 P. CAPE'NSIS (Thunb. fl. cap. 589. but not of Burm.) plant filiform, decumbent, flexuous, villous; leaflets ovate or lanceolate; peduncles 1-flowered, flexuous, axillary, longer than the petioles.—Native of the Cape of Good Hope. Corolla large, flesh-coloured. Legume unknown.

Cape Kidney-bean. Pl. decumbent.

65 P. PA'LLAR (Mol. chili. ed. gall. p. 335.) stem twining, very pilose; leaflets obliquely-oblong, villous; peduncles racemose, very long; flowers small, remote; legumes pendulous, cylindrical, torulose, villous.—Native of Chili.

Pallar Kidney-bean. Pl. tw.

65 P. ASE'LLUS (Mol. l. c.) stem twining; leaflets sagittate; seeds globose.—Native of Chili.

Ass's Kidney-bean. Pl. tw.

Cult. The species of this genus are not worth cultivating for ornament. They all grow well in light rich soil, and the perennial, herbaceous, and shrubby kinds are easily increased by cuttings.

CLXXXIX. CYRTO'TROPIS (from κυρτος, *kyrtos*, curved, and τροπις, *tropis*, a carina; in allusion to the carina of the flower, which is much curved). Wall. pl. asiat. rar. 1. p. 49. t. 62.

LIN. SYST. *Diadélphia, Decándria.* Calyx bilabiate; upper lip unidentate, lower one tridentate. Corolla papilionaceous. Vexillum reflexed, bicallous at the base; keel linear, falciform, very long, ascending, 2-petalled; wings cuneiform, short, divaricate. Stamens diadelphous. Legume sessile, linear, compressed, covered on the inside by a spongy membrane, which aftery separates from it, the seeds intercepted by cellular spongy dissepiments.—A tall climbing herb, with perennial roots, impari-pinnate leaves, loose axillary racemes of flesh-coloured flowers, and long, pendulous, many-seeded legumes.

1 C. CA'RNEA (Wall. pl. asiat. rar. 1. p. 50. t. 62.) ♃. ⌒. G. Native of Nipaul, on the high mountains of Sheopore and Chundaghiry. Shrub quite smooth. Leaflets 5. Flowers large, pale red, shewy; the vexillum ornamented with dark feathered lines.

Flesh-coloured-flowered Cyrtotropis. Shrub tw.

Cult. An elegant twining plant, very proper for a greenhouse conservatory. It will grow in rich light soil, and cuttings will strike root in sand under a hand-glass.

CXC. SO'JA (*sooja* is the name of a sauce prepared from the seeds by the Japanese). Mœnch. meth. 153. Savi, diss. 1824. p. 16. D. C. legum. mem. ix. prod. 2. p. 396.

LIN. SYST. *Diadélphia, Decándria.* Calyx bibracteolate at the base, 5-cleft, the 3 lower segments straight and acute, but the 2 upper ones are joined together beyond the middle. Corolla with an ovate vexillum, which stands on a short stipe, and with an oblong straight keel. Stamens diadelphous, the tenth one approximate, but certainly distinct. Stipe of ovary not surrounded by a sheath at the base. Style short. Legume oblong, 2-5-seeded, membranous; the seeds intercepted by cellular dissepiments. Seeds ovate, compressed.—A hispid erect herb, with pinnately-trifoliate leaves, and with the flowers either aggregate in the axils of the leaves on short pedicels, or disposed in short pedunculate racemes.

1 S. HI'SPIDA (Mœnch. l. c.) ⊙. H. Native of Japan, East Indies, and the Moluccas. Dólichos Sòja, Lin. spec. 1621. Jacq. icon. rar. t. 145. Sòja Japonica, Savi, diss. l. c. Kœmpf. amœn. 837 and 838, with a figure. Corolla violaceous, hardly longer than the calyx. The seeds, which are usually called

Miso in Japan, are put into soups, and are the most common dish there, insomuch that the Japanese frequently eat them three times a day. The *Soja* of the Japanese, which is preferred to the *Kitjap* of the Chinese, is prepared from the seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favourite dish made of these seeds, called *ten-hu* or *tau-hu*, which looks like curd, and though insipid in itself, yet with proper seasoning is agreeable and wholesome.

Var. β, pállida (D. C. prod. 2. p. 396.) flowers yellow; seeds white. Roxb. hort. beng. p. 55.

Hispid Soja. Fl. July, Aug. Clt. 1790. Pl. 1½ foot.

Cult. The seeds of this plant only require to be sown in a warm sheltered situation in the month of May.

CXCI. DO'LICHOS (from δολιχος, *dolichos*, long; in reference to the length of the twining stems, which in some species extend to the tops of the loftiest trees). Lin. gen. no. 867. exclusive of many of the species. Adans. fam. 2. p. 325. Savi, diss. 1824. p. 15. D. C. legum. mem. ix. prod. 2. p. 396.

Lin. syst. *Diadélphia, Decándria.* Calyx bibracteolate at the base, campanulate, 5-toothed, with 2 of the teeth approximate or joined at the base. Corolla papilionaceous, with a roundish vexillum, which is furrowed at the base, and furnished with 2 or 4 diverging callosities. Wings oblong, obtuse. Carina obtuse, incurved, forming almost a straight angle, never spirally twisted. Stamens diadelphous. Anthers roundish. Style compressed, bearded from the middle to the apex. Legume compressed, linear, 2-valved, having the valves neither winged nor nerved; the seeds intercepted by a kind of cellular substance. Seeds ovate, more or less compressed, with a small oval hylum.—Herbs or subshrubs, usually with twining stems, acute stipulas, pinnately-trifoliate leaves, stipellate leaflets, and axillary racemes of flowers. The species of this genus are not well defined, and are therefore worthy of a monograph, the only mode by which genera containing a great number of species can be well distinguished.

Sect. I. Eudólichos (from *eu*, well, and *dólichos*; this section contains the genuine species). D. C. prod. 2. p. 397. Legume compressed, apiculated by the short permanent style.

1 D. lignòsus (Lin. spec. 1022.) stems woody; branches twining, rather villous; leaflets ovate, acute, smooth, glaucous beneath; peduncles longer than the leaves; flowers umbellate; legumes linear, straight, smoothish. ♄. ⌒. G. Native of the East Indies. Lin. hort. cliff. t. 20. Smith, spic. t. 21.—Rumph. amb. 5. t. 136. Flowers rose-coloured, with a purplish keel. Legume white inside. Seeds black, with a white hylum.

Woody Dolichos. Fl. July, Aug. Clt. 1776. Shrub tw.

2 D. Curti'sii; stem woody; branches twining, rather villous; leaflets rhomboid, acute, glaucous beneath, smooth; peduncles long; flowers umbellate; legume linear, falcate. ♄. ⌒. G. Native of the East Indies. Dólichos lignòsus, Curt. bot. mag. 382. Flowers rose-coloured, with a purplish keel. Perhaps this is the edible variety of D. lignòsus mentioned in Roxb. cat. hort. beng. p. 7.

Curtis's Dolichos. Fl. July, Aug. Clt. 1776. Shrub tw.

3 D. Jacqui'ni (D. C. prod. 2. p. 397.) stem woody; branches twining, hispid; leaflets ovate, acute; peduncles shorter than the leaves; flowers umbellate; legumes linear, straight, very pilose. ♄. ⌒. S. Native of the West Indies, in woods. D. lignòsus, Jacq. amer. 205. pict. 100. exclusive of the synonymes. Flowers white. Seeds 18, black, with a white hylum.

Jacquin's Dolichos. Fl. July, Aug. Clt. 1800. Shrub tw.

4 D. galea'tus (Gaud. in Freycenet, et voy. part. bot. p. 486. t. 15.) plant procumbent or twining; branchlets and petioles puberulous; leaflets ovate-elliptic, acuminated, rounded at the base, reticulately-veined, membranous, smooth; peduncles axillary, 3-flowered; the 2 superior lobes of the calyx large and roundish, lower ones lanceolate, acute; legumes 3-keeled. ♃. ⌒. G. Native of the Sandwich Islands. Perhaps a species of *Canavàlia.*

Helmetted Dolichos. Pl. tw.

5 D.? spu'rius (Mey. prim. esseq. 242.) stem shrubby, climbing; branches tomentose; leaflets ovate, obtuse at both ends, tomentose beneath; peduncles 2-flowered, length of the petioles; legumes linear, ending in a long acumen, tomentose. ♄. ⌒. S. Native of Guiana, in the island of Arowabish. Flowers large, purplish-violet. Vexillum without any callosity, having the unguis thickened with the calyx. Seeds imbedded in dry pulp.

Spurious Dolichos. Shrub tw.

6 D.? subracemòsus (Jacq. amer. 205.) stems permanent, twining, and are, as well as the leaves, glabrous; leaflets ovate-lanceolate; peduncles racemose, 3-4-flowered; legumes linear, acuminated, rather torose, glabrous. ♄. ⌒. S. Native of the West Indies, among bushes. Flowers bluish-purple. Style spatulate at the apex. Stigma ciliately bearded.

Somewhat-racemose-flowered Dolichos. Shrub tw.

7 D. undula'tus (Sesse et Moc. in herb. Lamb.) plant pubescent; leaflets elliptic, acuminated, mucronate; calyx and vexillum clothed with rusty down; vexillum a little shorter than the keel; lateral leaflets oblique; peduncles shorter than the leaves; flowers large, racemose. ♃. ⌒. S. Native of Mexico.

Waved-leaved Dolichos. Pl. tw.

8 D. tuberòsus (Lam. dict. 2. p. 296.) stem shrubby, twining; root tuberous; leaflets roundish, acuminated; racemes pedunculate, elongated; legumes straight, pendulous, compressed, torulose, clothed with rufous villi. ♄. ⌒. S. Native of Martinique.—Plum. ed. Burm. t. 220. Both the root and the seeds are eaten when dressed by the inhabitants of Martinico.

Tuberous-rooted Dolichos. Shrub tw.

9 D. hirsu'tus (Thunb. in Lin. trans. 2. p. 339.) stems twining, tomentose; leaflets broad, ovate, acute, villous on both surfaces, lateral ones somewhat 2-lobed; racemes very long; legume hairy, ending in a hooked mucrone. ♃. ⌒. G. Native of Japan. Banks, icon. Kœmpf. t. 41. Root thick, creeping. Flowers purple.

Hairy Dolichos. Fl. June, July. Clt. 1802. Pl. tw.

10 D. pube'scens (Lin. spec. 1021.) stems twining, and are, as well as the leaves, clothed with soft hairs; flowers axillary, 1-3-together, almost sessile; legumes compressed, linear-lanceolate, pubescent, erect, but at length drooping. ⊙. ⌒. S. Native of South America. Glýcine tomentòsa β, Willd. spec. 3. p. 1061. ex enum. 2. p. 754. Flowers cream-coloured.

Pubescent Dolichos. Pl. tw.

11 D. Sesse'i; plant clothed with soft, woolly, canescent pubescence; leaflets ovate, acuminated, entire; calycine segments lanceolate; vexillum villous, shorter than the keel; flowers disposed in elongated racemes, which are 5 or 6 times longer than the leaves. ♃. ⌒. S. Native of Mexico. Flowers red, secund. (v. s. in herb. Lamb.)

Sesse's Dolichos. Pl. tw.

12 D. pilòsus (Klein, in Willd. spec. 3. p. 1043.) stem twining, with a few adpressed hairs; leaflets ovate-lanceolate, scabrous above, and pubescent beneath; racemes 3-6-flowered; legumes linear, clothed with rusty pili, hooked at the apex. ♃.? ⌒. S. Native of the East Indies. Racemes an inch or 1½ inch long. Flowers purple.

Pilose Dolichos. Fl. July. Clt. 1790. Pl. tw.

13 D. tetraspe'rmus (Willd. spec. 3. p. 1044.) stem twining: leaflets rhomboid, mucronate, glabrous; racemes longer than the

leaves; legumes acinaciform, oblong, cuspidate, 4-seeded. ♃. ⌒. S. Native of the East Indies. Flowers usually twin, almost sessile, small, pale yellow ?

Four-seeded Dolichos. Fl. May, June. Clt. 1816. Pl. tw.

14 D. PAVÒNII; plant smooth, herbaceous; leaflets ovate, acuminated, obtuse, mucronate; peduncles long, few-flowered at the top; legumes flat, puberulous, villous; calyx smooth, green, with ovate ciliated segments, uppermost one broad; vexillum very broad, covering the rest of the petals. ♃. ⌒. S. Native of Peru. D. pubéscens, Ruiz et Pav. in herb. Lamb.

Pavon's Dolichos. Pl. tw.

15 D. GLYCINOÌDES (H. B. et Kunth, nov. gen. amer. 6. p. 410.) stems twining; branches and petioles beset with retrograde pili; leaflets ovate-oblong, obtuse, mucronate, rounded at the base, 3-nerved, strigose; peduncles very long, few-flowered; lobes of calyx acutish, with the upper lip very broad, and somewhat emarginate. ♃. ⌒. S. Native of Peru, in sandy places near Truxillo. Legume compressed.

Glycine-like Dolichos. Pl. tw.

16 D. CAPE'NSIS (Lin. amœn. 6. afr. 22.) stems twining, herbaceous, and are, as well as the leaves, glabrous; leaflets ovate, lateral ones a little lobed; peduncles usually 2-flowered. ♃. ⌒. G. Native of the Cape of Good Hope. Flowers yellow, ex. Herm. afr. 17. solitary, ex Thunb. fl. cap. 590. Legume elliptic, compressed, ex Lin. short, depressed, ex Herm. acinaciform, attenuated at both ends, an inch long, and glabrous, ex Thunb. Perhaps many species are confused under the name of *D. Capénsis*, and they are probably all species of *Rhynchòsia*.

Cape Dolichos. Fl. July, Aug. Clt. 1823. Pl. tw.

17 D. ARBORE'SCENS; pubescent; leaflets ovate, acuminated, entire, many-nerved; racemes many-flowered, longer than the leaves, spicate; calycine segments lanceolate, lower one inflexed, and longer. ♄. S. Native of Mexico. A strong shrub, with yellow flowers. (v. s. in herb. Lamb.)

Arborescent Dolichos. Shrub 10 to 12 feet.

18 D. FALCA'TUS (Klein, in Willd. spec. 3. p. 1047.) stems twining, pilose; leaflets roundish-ovate, acuminated, glabrous, terminal one 3-lobed, lateral ones with a lobe on the outer side; peduncles 2-flowered, shorter than the leaves; legumes falcate. —Native of the East Indies. Rottl. et Willd. nov. act. cur. ber. 4. 1803. p. 211. Flowers probably purple.

Falcate-podded Dolichos. Pl. tw.

19 D. ARISTA'TUS (Lin. spec. 1021.) stems twining, herbaceous; leaflets ovate-oblong, acuminated, smooth; peduncles 2-flowered; legumes linear, straight, ending in a long awn. ⊙. ⌒. S. Native of South America. Awn of pod nearly an inch long.

Awned-podded Dolichos. Pl. tw.

20 D. GEMINIFLÒRUS; plant herbaceous, quite smooth, middle leaflet sagittate, lateral ones oblique, and only bulged out on one side, all mucronate; stipulas spatulate; bracteas ovate, acuminated, membranous, drawn out at the base; peduncles very long, usually 2-flowered; legumes very long, narrow, compressed, on short pedicels. ♃. ⌒. S. Native of Mexico. (v. s. in herb. Lamb.)

Twin-flowered Dolichos. Pl. tw.

21 D. FILIFÓRMIS (Lin. amœn. 5. p. 402.) stems twining, herbaceous; leaflets linear, obtuse, mucronate, glabrous, pubescent beneath; stigma almost naked. ♃. ⌒. S. Native of Jamaica, among bushes about Old Harbour. P. Browne, jam. 206. where it is called *cat's-claws*. It is used as a purgative ingredient in diet drinks, and is said to answer in cases of dropsy.

Filiform Dolichos. Pl. tw.

22 D. CILIA'RIS (Klein, in Willd. spec. 3. p. 1049.) stems twining, filiform; leaflets oblong, obtuse, mucronate, glabrous, but ciliated on the margins; peduncles shorter than the petioles, usually 4-flowered; legumes acinaciform, glabrous.—Native of the East Indies.

Ciliated-leaved Dolichos. Pl. tw.

23 D. HETEROPHY'LLUS (Horn. hort. hafn. suppl. p. 80.) stems twining; lateral leaflets broad, cordate, terminal one lanceolate and elongated; legumes racemose, acinaciform, with the back entire. ⊙. ⌒. H. Cultivated in the Canary Islands. Perhaps a species of *Láblab*.

Variable-leaved Dolichos. Fl. July, Aug. Clt. 1810. Pl. cl.

24 D. LU'TEUS (Swartz, fl. ind. occ. 3. p. 1246.) stems twining, herbaceous, glabrous; leaflets roundish or ovate-rhomboid, glabrous; racemes spicate, longer than the leaves; legumes somewhat cylindrical, glabrous. ♃. ⌒. S. Native of the south of Jamaica, among grass in wet places by the sea-side. Flowers yellow.

Yellow-flowered Dolichos. Fl. July, Aug. Clt. 1812. Pl. tw.

25 D. OBTUSIFÒLIUS; plant pubescent; leaflets broad, roundish, obtuse, middle one bulged out on both sides, and attenuated at both ends; racemes long; flowers in fascicles; teeth of calyx narrow, lower ones subulate. ♃. ⌒. S. Native of Mexico. Flowers apparently purple. (v. s. in herb. Lamb.)

Blunt-leafletted Dolichos. Pl. tw.

26 D. HASTA'TUS (Lour. coch. 442.) stems procumbent, herbaceous; leaflets glabrous, somewhat hastate; peduncles erect, many-flowered; legumes linear, rather terete, straight. ♃. ⌒. S. Native of the east coast of Africa, where it is also cultivated for the sake of the seeds, which are eaten by the natives. Flowers yellow. Perhaps this and the preceding species are referrible to section II. *Catiáng*.

Hastate-leafletted Dolichos. Pl. tw.

27 D. ANGULA'RIS (Willd. spec. 3. p. 1051.) stem erect, hairy; leaflets rhomboid-ovate, acuminated, lateral ones rather angular; peduncles 2-flowered, shorter than the leaves; legumes linear, nearly terete, torose, acute, pendulous.—Native o Banks, icon. Kœmpf. t. 40.

Angular-leaved Dolichos. Pl. 1 to 2 feet.

28 D. BIFLÒRUS (Lin. spec. 1023.) stem erect, perennia smooth; leaflets oval-lanceolate, acute, glabrous; peduncles very short, 2-flowered; legumes erectish, hairy. ♃. S. Native of the East Indies.—Pluk. alm. t. 213. f. 4. Flowers yellow. D. biflòrus, Burm. ind. 161. which was collected in Persia by Garcin, is a distinct plant, but the specimen of it which is preserved in the herbarium of Delessert is so incomplete as to preclude giving a description of it.

Two-flowered Dolichos. Fl. July, Aug. Clt. 1776. Pl. 1½ ft.

29 D. UNIFLÒRUS (Lam. dict. 2. p. 299.) stem erect, woody at the base; branches villous, twining; leaflets oval, acute, clothed with soft villi; flowers solitary, almost sessile in the axils of the leaves; legumes nearly erect, falcate, 5-seeded, pubescent. ♄. ⌒. S. Native of the East Indies. Flowers yellow.

One-flowered Dolichos. Shrub tw.

SECT. II. CATIA'NG (*Cat-jang* is the name of some species in Malabar). D. C. prod. 2. p. 398. Legumes cylindrical.

* *Leaflets entire.*

30 D. CATIA'NG (Lin. mant. 259.) stem erect, herbaceous; leaflets broad-lanceolate, glabrous; peduncles very long, 2-3-flowered; legumes linear, terete, glabrous, straight. ⊙. S. Native of the East Indies, where it is called *cat-jang*.—Rumph. amb. 5. t. 139. f. 1.—Rheed. mal. 3. t. 41.—Lour. coch. 442. Seeds small, brown, black, or pale. There are several varieties of this plant differing in the colour of the flowers and seed, all of which are much cultivated in the places of their natural growth for food.

Cat-jang Dolichos. Fl. July, Aug. Clt. 1793. Pl. 1½ foot.

31 D. MONACHA'LIS (Brot. fl. lus. 2. p. 125.) stem herbaceous, erect, twining a little; leaflets ovate, acute, glabrous; peduncles 4-6-flowered, longer than the leaves after flowering; legumes almost terete, a little arched, glabrous, at length pendulous. ⊙. ⌒. H. Native of Portugal, and cultivated in moist valleys for the sake of its seeds, which are dressed and eaten by the inhabitants. Flowers pale yellow striped with purple. Stigma ending in a callous spur. Seeds white, girded by a black ring around the hylum. Said to be a hybrid between *D. Catiáng* and *D. Sinénsis.*

Monk's Dolichos. Fl. July, Aug. Clt. 1816. Pl. ¾ foot.

32 D. SINE′NSIS (Lin. amœn. 4. p. 326. but not of Forsk.) stems twining, herbaceous, glabrous; leaflets ovate, acuminated; peduncles 2-flowered, shorter than the leaves; legumes terete, torulose, pendulous. ⊙. ⌒. H. Native of the East Indies and China. Jacq. hort. vind. t. 71. Lour. coch. 436. Sims, bot. mag. 2232. Rumph. amb. 5. p. 134. Dólichos cylíndricus, Mœnch. Flowers pale violet or flesh-coloured. Seeds white or red. Legume 1-2 feet long, eatable when young.

China Dolichos. Fl. July, Aug. Clt. 1776. Pl. tw.

33 D. NILÓTICUS (Delil. fl. ægypt. 109. t. 38. f. 1.) stems twining, herbaceous, pubescent; hairs adpressed, reflexed; leaflets ovate, acuminated; peduncles naked at the base; flowers spicate; legumes almost cylindrical, villous, pendulous. ⊙. ⌒. H. Native of Egypt. D. Sinénsis, Forsk. descr. 132. but not of Lin. Flowers yellow, with the vexillum painted with lines.

Nile Dolichos. Pl. tw.

34 D. LU'BIA (Forsk. descr. 133.) stems diffuse, glabrous; leaflets ovate; peduncles very long; flowers disposed in spicate racemes; legumes straight, terete, compressed, scabrous, 10-seeded. ⊙. H. Native of Egypt, and where it is cultivated for the sake of the legumes, which are dressed and eaten by the inhabitants. Flowers yellow. *Lubia* is the Arabic name of the plant.

Lubia Dolichos. Fl. July, Aug. Clt. 1818. Pl. diffuse.

35 D. VEXILLA'TUS (H. B. et Kunth, nov. gen. amer. 6. p. 440.) stems twining, and are, as well as the petioles, clothed with retrograde hairs; leaflets oblong-lanceolate, mucronate, strigose, somewhat 3-nerved; peduncles longer than the leaves; lobes of calyx subulately-acuminated; legumes terete, hairy. ⊙. ⌒. S. Native of South America. Flowers greenish.

Var. α; leaflets acuminated; peduncles 3-4-flowered. ⊙. ⌒. S. Native of Cuba, about the Havannah. Phasèolus vexillàtus, Lin. spec. 1017.—Dill. hort. elth. 2. f. 302.

Var. β; leaflets obtuse; peduncles 2-flowered. H. B. et Kunth, l. c. Native of Caraccas.

Large-bannered Dolichos. Fl. July, Aug. Clt. 1732. Pl. tw.

36 D. CYLI′NDRICUS (Hamilt. prod. fl. ind. occid. p. 61.) stems woody, twining, hairy; leaflets oblong, acute, beset with a few rusty pili beneath; pedicels elongated; flowers sub-umbellate; legume cylindrical, elongated, hairy; seed dark, numerous, 15-20, minute. ♄. ⌒. S. Native of Guiana.

Cylindrical-podded Dolichos. Shrub tw.

37 D. RE'PENS (Lin. amœn. 5. p. 402.) stems creeping; leaflets pubescent, ovate; flowers twin, disposed in racemes; legumes linear, terete. ♃. S. Native of Jamaica, by the sea-side. The root is a strong purgative.

Creeping-stemmed Dolichos. Pl. cr.

* * *Leaflets lobed.*

38 D. LOBA'TUS (Willd. spec. 3. p. 1047.) stem twining; lateral leaflets 2-lobed, terminal one 3-lobed, with the middle lobe mucronate; flowers racemose.—Native of the Cape of Good Hope. D. trílobus, Houtt. pfl. syst. 8. p. 860. t. 64. f. 1. Thunb. prod. 130? Flowers yellow or purple.

Lobed-leafletted Dolichos. Fl. July, Aug. Clt. 1800. Pl. tw.

39 D. ARGE′NTEUS (Willd. spec. 3. p. 1047.) stems twining, clothed with rusty villi; leaflets rather angular, clothed with silky villi beneath, terminal one 3-lobed; peduncles 2-flowered, shorter than the petioles. ♃. ⌒. S. Native of Guinea. Flowers yellow?

Silvery Dolichos. Pl. tw.

40 D.? TRILOBA'TUS (Lin. mant. 1. p. 101.) stems prostrate; leaflets lobed; peduncles 3-flowered, longer than the leaves. ⊙. S. Native of the East Indies. Glýcine tríloba, Lin. mant. 510.—Pluk. alm. t. 120. Flowers small, yellow. Perhaps a species of *Glýcine.*

Three-lobed-leafletted Dolichos. Pl. pros.

41 D.? ANGULÓSUS (D. C. prod. 2. p. 399.) stems decumbent; lateral leaflets 2-lobed, terminal one parabolical; peduncles longer than the leaves; flowers capitate.—Native of Pennsylvania. Phasèolus vexillàtus, Walt. fl. car. but not of Lin. ex Pursh. Glýcine angulòsa, Muhl. in Willd. spec. 3. p. 1056. Flowers rose-coloured.

Angular-leafletted Dolichos. Fl. Ju. Aug. Clt. 1820. Pl. dec.

42 D. PALMATI′FIDUS (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 399.) stem twining, glabrous; leaflets 3-nerved, 3-lobed, rarely 5-lobed; lobes ovate, mucronate; peduncles longer than the leaves; flowers racemose. ♄. ⌒. S. Native of Mexico. Coen or Cocntic, Hern. mex. 252. f. 2. Flowers bluish. Legume teretely-compressed, straight.

Palmatifid-leaved Dolichos. Shrub tw.

SECT. III. UNGUICULA'RIA (from *unguicularis*, of a claw or unguis; in reference to the legumes being terminated by an unguiculate callous beak). Legumes almost cylindrical, obtuse at the apex, and ending in a depressed, callous, somewhat unguiculate beak, which is rather concave beneath. Leaflets entire.

43 D. UNGUICULA'TUS (Jacq. hort. vind. 1. t. 23.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing at the apex 2-3 flowers in a kind of umbel; legume ending in a recurved beak. ⊙. ⌒. S. Native of Barbados. Flowers whitish. Seeds ovate, white, or pale brown, with a snow white hylum.

Unguiculated-podded Dolichos. Fl. Ju. Jul. Clt. 1780. Pl. tw.

44 D. TRANQUEBA′RICUS (Jacq. hort. vind. 3. t. 70.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing 3-4 flowers at the apex in a kind of umbel; legumes ending in a straight beak. ⊙. ⌒. S. Native of Tranquebar. Flowers bluish violet, with a white keel. Legumes more slender than those of the preceding species. Seeds pale brown, but rather blackish around the white hylum.

Tranquebar Dolichos. Fl. June, July. Clt. 1801. Pl. tw.

45 D. MELANOPHTHA′LMUS (D. C. prod. 2. p. 400.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing 2-3 flowers at the apex in a kind of umbel; legumes ending in a straight or somewhat recurved beak. ⊙. ⌒. H. Cultivated in Vascony, where it is called *Habine*, and in Italy, where it is called *Faseola à l'occhio nero.* D. unguiculàtus, Thor. chl. land. 306. Seeds white, but marked with a black circle around the snow white hylum.

Black-eyed-seeded Dolichos. Fl. Jul. Aug. Clt. 1800. Pl. tw.

46 D. SESQUIPEDA'LIS (Lin. spec. 1019.) stem twining, glabrous; leaflets broad, ovate; legumes almost cylindrical, smooth, very long, torulose, and ending in a hooked mucrone. ⊙. ⌒. S. Native of South America. Jacq. hort. vind. 1. t. 67. Flowers of a purplish blue colour. Legumes a foot and a half in length.

Foot-and-a-half-long-podded Dolichos. Fl. Aug. Clt. 1781. Pl. tw.

47 D. UMBELLA'TUS (Thunb. in Lin. trans. 2. p. 339.) stems twining, and are villous, as well as the leaves; peduncles flexuous, longer than the leaves; flowers disposed in a kind of um-

bellate raceme; legumes straight, glabrous. ♃. ⌒. G. Native of Japan. D. unguiculàtus, Thunb. fl. jap. 279. Lour. coch. p. 436. Flowers variegated with white, yellow, and violet.

Umbellate-flowered Dolichos. Pl. tw.

48 D. sphærospe'rmus (D. C. prod. 2. p. 400.) stem erect, branched, glabrous; leaflets ovate, acutish; peduncles elongated, bearing few flowers at the apex; legumes straight; seeds spherical. ⊙. S. Native of Jamaica, where it is called *Calavana* or *Black-eyed-pea*. Sloane, hist. jam. 184. t. 117. Phasèolus sphærospérmus, Lin. spec. 1018. Flowers white. Legumes terete according to P. Browne, but compressed according to Sloane. Seeds white, with a black hylum, and are sweet, and as good for food as any of the kidney-beans.

Round-seeded Dolichos or Black-eyed-pea. Fl. July, Aug. Clt. 1816. Pl. 1 foot.

49 D. Brune'lli (Zucc. obs. 1. no. 82.) stems erect, much branched, and are, as well as the leaves, glabrous; lateral leaflets lobed on the outside; peduncles 4-6-flowered, longer than the leaves; legumes erect, ending in a spoon-shaped beak. ⊙. ? S. Native country unknown. Flowers blue, but with the keel white. Seeds dark blue, with a white hylum.

Brunelli's Dolichos. Pl. 1 to 2 feet.

† *Species not sufficiently known.*

50 D. reticula'tus (Ait. hort. kew. 3. p. 33.) stems twining; leaflets ovate, rugose, reticulated, villous; racemes few-flowered. ♄. ⌒. G. Native of New Holland. Flowers purple?

Reticulated-leaved Dolichos. Fl. Ju. Jul. Clt. 1781. Sh. tw.

51 D. sca'ber (Rich. in act. soc. h. n. paris. p. 111.) twigs rough and woody; leaflets ovate, coriaceous, quite smooth; spike many-flowered; receptacle of flower hooked. ♄. ⌒. S. Native of Cayenne.

Scabrous-stemmed Dolichos. Shrub tw.

52 D. virga'tus (Rich. l. c.) woody; leaves and spikes of flowers hairy; leaflets obovate, abruptly acuminated; spikes of flowers very long and slender. ♄. ⌒. S. Native of Cayenne. Perhaps a species of *Mucùna*.

Twiggy Dolichos. Shrub tw.

53 D. funa'rius (Mol. chil. ed. gall. 335.) stems twining, perennial; legumes pendulous and 5-seeded; leaflets oval, glabrous on both surfaces. ♄. ⌒. G. Native of Chili, where the inhabitants make ropes of the stems.

Rope Dolichos. Shrub tw.

54 D. gibbòsus (Thunb. fl. cap. 590.) stems herbaceous, twining, and are as well as the leaves glabrous; leaflets acuminated, lateral ones very short, terminal one ovate and gibbous at the base; peduncles longer than the leaves; racemes oblong. ⊙. ? ⌒. G. Native of the Cape of Good Hope, on the mountains.

Bulged-leafletted Dolichos. Pl. tw.

55 D. decu'mbens (Thunb. l. c.) stems herbaceous, decumbent, hardly pubescent; leaflets ovate, obtuse, glabrous; peduncles length of leaves, bearing an umbel of flowers at the apex. ⊙. G. Native of the Cape of Good Hope. Legume unknown.

Decumbent Dolichos. Pl. decumbent.

56 D. tomentòsus (Roth, nov. spec. 345.) plant clothed with grey tomentum; stem erect; leaflets ovate-roundish, acuminated; racemes axillary, usually solitary, many-flowered; flowers distich; vexillum pubescent. Native of the East Indies. Legume unknown.

Tomentose Dolichos. Pl. 1 to 2 feet.

57 D. frute'scens (Hamilt. in D. Don, prod. fl. nep. 240.) stem shrubby, erect; leaflets rhomboid-ovate, mucronate, glabrous; racemes axillary, compound, longer than the leaves; calycine teeth roundish, and are as well as the pedicels covered with silky pubescence; carina equal in length to the vexillum. ♄. G. Native of Nipaul. Leaflets large. Flowers cream-coloured.

Shrubby Dolichos. Shrub.

Cult. None of the species are worth cultivating for ornament except the *D. lignòsus*, *D. Jacquìni*, and *D. Curtísii*. A light rich soil answers all the species, and they are either increased by seeds or cuttings; cuttings planted in a pot of sand root freely, those of the stove species require heat.

CXCII. TÆNIOCA'RPUM (*ταινια*, *tænia*, a riband, and *καρπος*, *karpos*, a fruit; shape of pods). Desv. obs. legum. in Schlecht. Linnæa. 2. p. 512.

Lin. syst. *Diadélphia*, *Decándria*. Calyx bractless, bilabiate, 4-cleft; upper lip bidentate, lower one 3-parted. Vexillum ovate. Wings spurred Keel obtuse, concave, compressed. Stamens diadelphous. Style elongated, filiform. Legume hispid, compressed, many-celled, somewhat articulated or torulose. Seeds kidney-shaped, shining.

1 T. articula'tum (Desv. l. c.). ♄. ⌒. S. Native of St. Domingo.—Plum. ed. Burm. t. 222. Dólichos articulàtus, Lam. dict. 2. p. 296. A frutescent twining plant, clothed with rufous villi, with angularly-toothed leaflets; pedunculate racemes of violaceous-purple flowers, and straight legumes. Racemes of flowers a foot and a half long.

Jointed-legumed Tæniocarpum. Shrub tw.

Cult. A light rich soil will suit this plant, and cuttings will root freely if planted in a pot of sand placed under a hand-glass, in heat.

CXCIII. VI'GNA (in memory of Dominic Vigna, a commentator on Theophrastus). Savi, diss. phas. 1824. p. 16. D. C. prod. 2. p. 401.

Lin. syst. *Diadélphia*, *Decándria*. Calyx 4-cleft, upper lip entire, or of two divisions, which are joined to the apex. Corolla with a broad reflexed vexillum, furnished with converging callosities above the base. Wings rhomboid. Stamens diadelphous. Stipe of ovary sheathed. Legume terete, incurved. Seeds nearly globose, without any caruncle, but having the umbilicus on the side.—Twining herbs, like *Dólichos*. Perhaps sufficiently distinct from that genus in the terete legumes.

1 V. gla'bra (Savi, mem. phas. 3. p. 8.) plant twining, smooth; upper lip of calyx obtuse. ⊙. ⌒. S. Native of South America (ex Jacq.) and of North America, in the rice-fields of Georgia (ex Pursh). Dólichos lutèolus, Jacq. hort. vind. 1. p. 39. t. 90. Leaves pinnately trifoliate; leaflets ovate, acute. Peduncles longer than the leaves. Flowers yellow, disposed in heads at the top of the peduncles. Seeds black, with a white hylum. Stigma much bearded.

Glabrous Vigna. Fl. July, Aug. Clt. 1805. Pl. tw.

2 V. villòsa (Savi, l. c.) plant twining, villous; upper lip of calyx acuminated. ⊙. ⌒. H. Native of Chili. Flowers golden yellow. Legume 2 inches long. Seeds black.

Villous Vigna. Pl. tw.

Cult. The seeds of the species of this genus should be sown in May, in a warm sheltered situation in the open ground.

CXCIV. LA'BLAB (*Lablab* is the Arabic name of Convólvulus, with which the present genus has no other affinity, unless in the twining habit). Adans. fam. 2. p. 325. Mœnch. meth. 153. Savi, diss. 1821. p. 15 and 19. D. C. prod. 2. p. 401.—Dólichos, Gært. fruct. 2. p. 322. t. 150.

Lin. syst. *Diadélphia*, *Decándria*. Calyx campanulately-tubular, 4-cleft; the segments erect, 3 lower ones acute, superior one broader, entire, composed of 2 joined segments. Corolla with a spreading vexillum, which is channelled, and furnished with 4 parallel callosities at the base. Keel so much curved as to form a right angle. Stamens diadelphous, the tenth one free, and received between the callosities of the vexillum. Stipe of ovary sheathed at the base. Style compressed, bearded beneath. Stigma terminal. Legume flat, acinaciform, muricated from tubercles at the sutures; the seeds separated by transverse cellular dissepiments. Seeds 4 or fewer from abortion, ovate, a little compressed, with a linear callosity rising from the umbilicus, as well as being marginate at both extremities.—Twining herbs, with spreading stipulas, pinnately-trifoliate leaves, stipellate entire leaflets, pedunculate racemes of flowers, each peduncle bearing a single leaf. Pedicels somewhat verticillate. Seeds black or brown, with the hylum and callosity white.

1 L. VULGA'RIS (Savi, l. c. p. 19. f. 8. *a. b. c.*) legumes oblong, ventricose, acinaciform; pericarp easily separated? seeds ovate, somewhat compressed; gland basilar, hemispherical, furrowed. ♃. ⌒. S. Native of the East Indies, and Egypt; and now cultivated in several of the West India islands. Dólichos Láblab, Lin. spec. 1019. Sims, bot. mag. 896. Lam. dict. 2. p. 293. L. niger, Mœnch.—Riv. tetr. irr. t. 29. f. 4.—Alp. ægypt. t. 71. Leaflets roundish-ovate, ending in a point furnished with a bristle. Stipulas lanceolate. This plant is cultivated for the sake of the legumes, which are cooked and eaten.

Var. α, *nìger* (D. C. prod. 2. p. 401.) flowers violaceous; seeds black. P. Alp. ægypt. 74. t. 75.

Var. β, *purpùreus* (D. C. l. c.) flowers purple; seeds blackish purple. Lin. spec. 1021. Smith, exot. bot. t. 74. Lindl. bot. reg. 830. Dólichos purpùreus, Jacq. fragm. 45. t. 55. Stems purplish. Bracteoles equal in length to the tube of the calyx. Wings spreading. The legumes when fresh and young are sapid and salubrious, and are cooked and eaten in the manner of kidney-beans.

Var. γ, *albiflòrus* (D. C. l. c.) flowers white; seeds of a pale rust colour. Dólichos Bengalénsis, Jacq. hort. vind. 2. t. 124. Willd. spec. 3. p. 1038. Stems pale. Bracteoles shorter than the tube of the calyx. Wings of flower rather adpressed. The legumes are dressed and eaten like those of the last variety.

Common Lablab. Fl. July, Aug. Clt. 1790. Pl. tw.

2 L. NANKI'NICUS (Savi, l. c. p. 22. f. 8. *d. g.*) legumes oblong, ventricose, acinaciform; pericarp easily separated; seeds ovate, turgid; gland basilar, hemispherical, furrowed, acuminated downwards. ⊙. ⌒. G. Native of China, and cultivated in the West Indies for the sake of its legumes, which are dressed and eaten when young in the manner of kidney-beans. Flowers white. Legume 2½ inches long, and 10 lines broad. Seeds milk-coloured. This and the former species are called *Tul-Trangi* or European-bean by the Egyptians. The inhabitants make pleasant arbours of them. Alpinus says they grow wild in Egypt. Hasselquist is, however, certain that they do not grow wild in Lower Egypt, but are only cultivated there in gardens.

Nankin Lablab. Fl. July, Aug. Clt. 1714. Pl. tw.

3 L. LEUCOCA'RPOS (Savi, l. c. f. 9. *a. d.*) legumes somewhat lanceolate, compressed, torose; pericarp undulately curled, and separated with difficulty; seeds nearly globose; gland basilar, hemispherical, blunt. ⊙. ⌒. S. Native of the East Indies. Dólichos Láblab, Gærtn. fruct. 150. Flowers white, very like those of the preceding species. Legume white, 2½ inches long, and 8 lines broad. Seeds black or blackish red.

White-fruited Lablab. Fl. July, Aug. Clt. 1816. Pl. tw.

† *Species not sufficiently known.*

4 L. CULTRA'TUS (D. C. prod. 2. p. 402.) legumes hooked at the apex. ⊙. ⌒. G. Native of Japan. Dólichos cultràtus, Thunb. in Lin. trans. 2. p. 340. Willd. spec. 3. p. 1029. Dólichos ensifórmis, Thunb. jap. 279.—Banks, icon. Kœmpf. t. 25. Lateral leaflets 2-lobed. Flowers purple.

Cultrate-podded Lablab. Fl. July, Aug. Clt. 1816. Pl. tw.

5 L. MICROCA'RPUS (D. C. l. c.) legumes short, hardly twice the length of the breadth. ⊙. ⌒. S. Native of the Moluccas, on the sea-shore. Dólichos spicàtus, Kœn. mss. in Roxb. hort. beng. p. 55.—Rumph. amb. 5. t. 141. f. 1. Flowers purple, disposed in spikes. Seeds black. Perhaps only a variety of *L. vulgàris.*

Small-podded Lablab. Fl. July, Aug. Clt. 1818. Pl. tw.

6 L. PERE'NNANS (D. C. l. c.) leaves pubescent; seeds nearly spherical. ♃. ⌒. G. Native of Cochin-china and the Moluccas. Dólichos álbus, Lour. coch. p. 439.—Rumph. amb. 5. t. 137. Flowers as well as seeds white. This is only a variety of *L. vulgàris* according to Roxburgh.

Lasting Lablab. Fl. June, July. Clt. 1820. Pl. tw.

Cult. The seeds of all the species may be sown in pots, and placed in a hot-bed; and in the course of May, when the plants will be several inches high, they may be planted out into the open ground in a warm sheltered situation, in the manner of scarlet-runners, and supported in the same way.

CXCV. PACHYRHI'ZUS (from παχυς, *pachys*, thick, and ῥιζα, *rhiza*, a root; in reference to the thick tuberous roots of the plants). Rich. herb. D. C. legum. mem. ix. prod. 2. p. 402. —Cacàra, Pet. Th. dict. sc. nat. 5. p. 35.

LIN. SYST. *Diadélphia, Decándria.* Calyx urceolate, 4-lobed, upper lobe broad, and somewhat emarginate. Petals connected at the base? Vexillum roundish, spreading, without any callosity, biplicate at the base; the plaits involving the stipes of the wings. Stamens diadelphous, with the tube or sheath tumid at the base, and gaping widely. Ovary girded by a little sheath, which rises from the torus. Style beardless, incurved, tumid at the apex. Legume compressed, elongated. Seeds 7-8, reniform.—Twining suffruticose plants, with tuberous eatable roots, pinnately-trifoliate leaves, and axillary racemes of bluish violet flowers.

1 P. ANGULA'TUS (Rich. herb. D. C. prod. 2. p. 402.) leaflets angular, toothed, glabrous; stems suffruticose. ♄. ⌒. S. Native of the Moluccas, and elsewhere in the East Indies, and of the Mauritius, where it is cultivated for the sake of its roots. Dólichos bulbòsus, Lin. spec. 1020.—Rumph. amb. 5. t. 132.—Pluk. alm. t. 52. f. 4. Root a single turnip-formed tuber, usually ending in a single tail, but sometimes divided; when young it is eaten both raw and boiled by the inhabitants of India and the Mauritius.

Angular-leaved Pachyrhizus. Fl. June, July. Clt. 1781. Shrub tw.

2 P. TRI'LOBUS (D. C. prod. 2. p. 402.) leaflets 3-lobed, pubescent; stems suffruticose, hairy. ♄. ⌒. G. Native of China and Cochin-china. Dólichos trílobus, Lour. cochin. 439. exclusive of the synonymes. Flowers bright purple, with a yellow spot in the centre of the vexillum. Tubers of root few, about 2 feet long, nearly terete, for which the plant is cultivated in China and Cochin-china, where they are boiled and eaten by the inhabitants.

Three-lobed-leafletted Pachyrhizus. Shrub tw.

3 P. MONTA'NUS (D. C. l. c.) leaflets rhomboid-ovate, entire, tomentose; stems suffruticose. ♄. ⌒. G. Native of Cochin-china. Dólichos montànus, Lour. coch. 440. Flowers purple, disposed in spikes. Anthers 5 oblong, and 5 roundish. Roots with bundles of hard tubers.

Mountain Pachyrhizus. Shrub tw.

Cult. A light rich soil will suit these plants, and cuttings will root in sand under a hand-glass, or the plants may be increased by the tubers of the roots, or by seeds.

CXCVI. PARO'CHETUS (from παρα, *para*, nigh, and οχετος, *ochetos*, a brook; in reference to the habitat of the plants). Hamilt. in D. Don, prod. fl. nep. 240. D. C. prod. 2. p. 402.

LIN. SYST. *Diadélphia, Decándria.* Calyx 4-cleft, naked. Corolla papilionaceous, with an incumbent 2-lobed vexillum, and an obtuse keel, which is covered by the wings. Stamens diadelphous. Style smooth. Stigma obtuse. Legume gibbous, many-seeded. Seeds roundish.- Perennial creeping herbs, with trifoliate leaves, which stand on long petioles, membranous stipulas, and axillary, shewy, purple, solitary flowers, on long pedicels.

1 P. COMMU'NIS (Hamilt. l. c.) leaflets truncate, dentately-serrated. ♃. G. Native of Nipaul, at Narainhetty.

Common Parochetus. Fl. July. Clt. 1820. Fl. creeping.

2 P. MA'JOR (D. Don, l. c.) leaflets obovate, retuse, crenated. ♃. G. Native of Nipaul, at Narainhetty. Larger than the preceding species, and with the habit of a species of *O'xalis.*

Larger Parochetus. Pl. creeping.

Cult. A light rich soil will answer the species of this genus, and as they are creeping plants, they are easily increased by dividing.

CXCVII. DIO'CLEA (in memory of Diocles Carystinus, an ancient Greek botanist). H. B. et Kunth, nov. gen. amer. 6. p. 437. but not of Spreng.

LIN. SYST. *Diadélphia, Decándria.* Calyx half-4-cleft, bracteolate at the base; the segments acuminated, 2 lateral ones narrowest. Corolla with an obovate-oblong reflexed vexillum, destitute of callosities. Stamens diadelphous, the tenth one sometimes adhering to the others a little. Stigma somewhat clavate. Disk somewhat urceolate. Legume linear, compressed, many-seeded, furnished with a membranous margin on both sides towards the seminiferous suture. Seeds with a linear hylum.—Twining shrubs, with pinnately-trifoliate leaves, stipellate leaflets, axillary elongated pedicels, and red flowers.

1 D. JACQUINIA'NA (D. C. prod. 2. p. 403) leaflets ovate, acute; stems and legumes glabrous. ♄. ⌒. S. Native of Martinique, in woods and among bushes. Dólichos rùber, Jacq. amer. p. 204. t. 123. Flowers red.

Jacquin's Dioclea. Shrub tw.

2 D. SERI'CEA (H. B. et Kunth, l. c. t. 576.) leaflets elliptic, cordate at the base, acute at the apex, pubescent above, but clothed with silky-silvery pubescence beneath; legumes clothed with yellowish silky down. ♄. ⌒. S. Native of New Granada, near Honda. Flowers blue.

Silky Dioclea. Shrub tw.

3 D. APURE'NSIS (H. B. et Kunth, l. c.) leaflets elliptic-oblong, rounded at the base, glabrous, acuminately-mucronate at the apex, strigose on the nerves and veins beneath. ♄. ⌒. S. Native on the banks of the Orinoco, at the confluence of the Apures. Flowers red.

Apures Dioclea. Shrub tw.

4 D.? MÓLLIS (D. C. prod. 2. p. 403.) leaflets rhomboid-ovate, acuminated, and are, as well as the branches, clothed with very soft down; peduncles shorter than the leaves, 3-6-flowered. ♄. ⌒. S. Native country unknown. Dólichos móllis, Jacq. fragm. 6. t. 88. Flowers pale yellow. Legume unknown. This plant differs from *Dólichos* in the calyx being 4-cleft, and from *Vigna* in the vexillum being without callosities.

Soft Dioclea. Fl. July. Clt. 1824. Shrub tw.

Cult. The species of this genus will grow well in light rich soil, and they are easily increased by cuttings planted in sand, with a hand-glass placed over them, in heat.

CXCVIII. PSOPHOCA'RPUS (from ψοφος, *psophos*, a sound, and καρπος, *carpos*, a fruit; in reference to the seeds rattling in the pods when ripe on being shaken). Neck. elem. no. 1362. D. C. prod. 2. p. 403.—Bòtor, Adans. fam. p. 326. exclusive of the synonymes of Plum. Pet. Th. dict. sc. nat. 5. p. 241.

LIN. SYST. *Diadélphia, Decándria.* Calyx urceolate, unequally bilabiate. Corolla with a roundish reflexed vexillum, bearing 2 cylindrical callosities at the base. Wings stipitate, the stipes received within the margins of the vexillum. Keel oblong, 2-edged. Stamens diadelphous. Legume oblong, furnished with 4 longitudinal wings, 7-8-seeded. Seeds roundish.—A climbing herb, with tuberous roots, pinnately-trifoliate leaves, axillary twin racemes, and bluish flowers.

1 P. TETRAGONÓLOBUS (D. C. l. c.) ⊙. ◡. S. Native of the Mauritius, where it is cultivated under the name of *Pois-carré.* Dólichos tetragonólobus, Lin. spec. 1021.—Rumph. amb. 5. t. 133. There is a smaller kind which was gathered along the banks of rivulets in Madagascar by M. Aubert Du Petit Thours. The plant is cultivated in the Mauritius for the sake of its seeds, which are used in the same way as we do peas.

Four-angled-podded Psophocarpus. Fl. Sept. Nov. Clt. 1816. Pl. cl.

Cult. See *Lablab*, p. 361, for culture and propagation.

CXCIX. CANAVA'LIA (*Canavali* is the name of one of the species in Malabar). D. C. legum. mem. ix. prod. 2. p. 403.—Canavàli, Adans. fam. 2. p. 326.—Malòchia, Savi, diss. 1824. p. 15. and 1825. p. 1.—Dólichos species of Lin.

LIN. SYST. *Monadélphia, Decándria.* Calyx tubular, bilabiate (f. 49. *b.*), lower lip with 3 small acute teeth, upper lip with 2 large rounded lobes. Corolla with a large vexillum (f. 49. *d.*), bearing 2 parallel callosities at the base; wings stipitate, oblong, auricled. Keel of 2 petals (f. 49. *c.*). Stamens monadelphous (f. 49. *a.*), or the tenth one adhering but slightly to the others. Legume compressed (f. 49. *c.*), with 3 prominent nerves, especially with a prominent nerve on each side of the seminiferous suture, and terminating in an inflexed mucrone (f. 49. *e.*); the seeds separated by cellular membranes. Seeds oval-oblong (f. 49. *e.*), with the hylum linear.—Herbs or subshrubs, with twining branches, pinnately-trifoliate leaves, axillary many-flowered racemes, tern pedicels, and large purple flowers.

1 C. OBTUSIFÒLIA (D. C. prod. 2. p. 404.) leaflets ovate, obtuse; legumes straight, twice the length of the breadth. ♄. ⌒. S. Native of Malabar. Dólichos obtusifòlius, Lam. dict. 2. p. 295. Dólichos rotundifòlius, Vahl. symb. 2. p. 81.—Rheed. mal. 8. t. 42.—Pluk. alm. t. 51. f. 2. Flowers purple.

Obtuse-leaved Canavalia. Fl. July, Aug. Clt. 1820. Sh. tw.

2 C. EMARGINA'TA; leaflets ovate, obtuse, emarginate; legumes straight, twice the length of the breadth. ♄. ⌒. S. Native of Malabar. Dólichos emarginàtus, Jacq. hort. schœnbr. 2. t. 221.

Emarginate-leafletted Canavalia. Fl. July, Aug. Clt. 1800. Shrub tw.

3 C. MINIA'TA (D. C. prod. 2. p. 404.) leaflets ovately-orbicular, rounded at both ends, reticulately veined, coriaceous, and are smooth, as well as the petioles; peduncles very long, and many-flowered; legumes generally 3-seeded, on short stipes. ♃.? ⌒. S. Native of Cuba. Dólichos miniàtus, H. B. et Kunth, nov. gen. amer. 6. p. 441. Flowers vermilion-coloured.

Vermilion-flowered Canavalia. Pl. tw.

4 C. GLADIA'TA (D. C. prod. 2. p. 404.) leaflets ovate, acute; legumes 8 times longer than broad; racemes longer than the leaves; vexillum oblong. ♄. ⌒. S. Native of the East Indies. Dólichos gladiàtus, Jacq. icon. rar. t. 560. Malòchia gladiàta, Savi, mem. 1825. p. 4. Nattamàme, Banks, icon. Kœmpf. t. 39. Flowers white, pendulous, suffused with red. Legume nearly a foot long. Seeds brown.

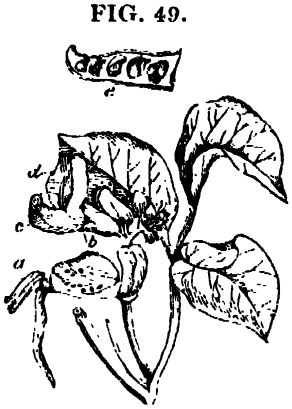
Var. β, machæroides (D. C. prod. 2. p. 404.) racemes length of the leaves; legumes 3 times longer than broad, ascending, and incurved at the apex; flowers erect. ♄. ⌒. S. Native of the East Indies. Lòbus machæroìdes, Rumph. amb. 5. p. 135. f. 1.—Rheed. mal. 8. t. 45. Perhaps a proper species.

Sword-podded Canavalia. Fl. June, July. Clt. 1790. Sh. tw.

5 C. ENSIFÓRMIS (D. C. prod. 2. p. 404.) leaflets ovate, acute; legumes 10 times or more longer than they are broad. ⊙. ? ⌒. S. Native of Malabar and the West Indies. Dólichos ensifórmis, Lin. spec. 1022. Lam. dict. 2. p. 295. Dólichos acinacifórmis, Jacq. coll. 1. p. 114. icon. rar. t. 559.—Rheed. mal. 8. t. 44.—Sloan. hist. jam. 1. t. 114. f. 1, 2, 3. Malòchia ensifórmis, Savi, mem. 1825. p. 1. Flowers pale purple. Seeds white, but having the hylum girded with brick-colour.

Var. β, *álbida* (D. C. l. c.) flowers and seeds white. Mucùna álbida, Moc. et Sesse, fl. mex. icon. ined.

FIG. 49.



Ensiform-podded Canavalia. Fl. July, Aug. Clt. 1778. Pl. tw.

6 C. LOURE'IRII; leaflets ovate, acute, wrinkled, glabrous; legumes large, broad, thickest on the back; stamens diadelphous. ♄. ⌒. S. Native of China and Cochin-china, where it is cultivated for adorning arbours. Dólichos ensifórmis, Lour. coch. 437. Flowers purplish violet.

Loureiro's Canavalia. Shrub tw.

7 C. RU'TILANS (D. C. l. c.) leaflets oval-oblong, obtuse; legumes straight, 4 times longer than broad. ♄. ⌒. S. Native of Mexico. Mucùna rùtilans, Moc. et Sesse, fl. mex. ined. Flowers and seed of a reddish scarlet colour.

Glittering Canavalia. Shrub tw.

8 C. INCU'RVA (D. C. l. c.) leaflets oblong, acute; flowers axillary, solitary; legumes ensiform, incurved, acuminated. ♃. ⌒. G. Native of Japan, about Nagasaki. Dólichos incúrvus, Thunb. fl. jap. 280. Herb glabrous. Legumes a span long. Flowers purple. Perhaps sufficiently distinct from *C. gladiàta.*

Incurved-podded Canavalia. Pl. tw.

9 C. LINEA'TA (D. C. l. c.) leaflets ovate, obtuse, ending in a lined acumen; flowers racemose; legumes oblong, acute, with a straight back, but rounded in front. ♄. ⌒. G. Native of Japan, about Nagasaki. Dólichos lineàtus, Thunb. fl. jap. 280. Flowers purple. Legumes 2 inches long.

Lined-leaved Canavalia. Pl. tw.

10 C. RÒSEA (D. C. l. c.) stems creeping, and ascending; leaflets roundish, shining; racemes longer than the leaves; legumes oblong, ending in a short acumen. ♄. S. Native of Jamaica, in sand by the sea-side. Dólichos ròseus, Swartz, fl. ind. occ. 3. p. 1243. Flowers of a reddish blue-colour, rather coriaceous.

Rose-coloured-flowered Canavalia. Fl. July, Aug. Clt. 1812. Pl. creeping.

11 C. BONARIE'NSIS (Lindl. bot. reg. 1199.) leaflets ovate, obtuse, coriaceous, glabrous, acuminate; racemes drooping, longer than the leaves; lower lip of calyx furnished with one tooth-like process; ovary falcate, pubescent, 6-ovulate, on a long villous stipe. ♄. ⌒. G. Native of Buenos Ayres. Flowers purple, large.

Buenos Ayrean Canavalia. Fl. Ju. Aug. Clt. 1824. Sh. tw.

Cult. Elegant twining or climbing plants, well adapted for training up the rafters in a stove or greenhouse; their culture and propagation are the same as those for *Dióclea*, p. 362.

CC. A'MPHODUS (from αμφι, *amphi*, on both sides, and οδους, *odous*, a tooth; in reference to the vexillum being furnished with a tooth on each side at the base). Lindl. bot. reg. 1101.

LIN. SYST. *Diadélphia, Decándria.* Calyx bractless, thrust in at the base, bilabiate; upper lip bidentate, lower one trifid, with subulate segments. Corolla with a reflexed vexillum, which is furnished with an inflexed tooth on each side at the base; wings and keel linear. Stamens diadelphous. Style filiform, glabrous, crowned by a capitellate stigma. Legume linear-oblong, compressed, wingless, torulose, many-seeded. Seeds oblong, compressed, greenish brown, with a small linear hylum, and girded by a thick white arillus. Cotyledons oblong. Radicle obtuse, inflexed.—A twining shrub, with pinnately-trifoliate leaves, stipellate ovate leaflets, ending in a spine-like mucrone, and short axillary racemes of large purple flowers.

1 A. OVA'TUS (Lindl. l. c.) ♄. ⌒. S. Native of Trinidad. Plant hairy in every part except the upper surface of the leaves.

Ovate-leaved Amphodus. Fl. July, Aug. Clt. 1820. Sh. tw.

Cult. See *Mucùna* for culture and propagation, p. 364.

CCI. MUCU'NA (*Mucuna-guaca* is the Brazil name of *M. ùrens*). Adans. fam. 2. p. 325. Juss. ann. mus. 11. p. 76. D. C. prod. 2. p. 404.—Hornèra, Neck.—Stizolòbium, Pers. ench. 2. p. 299.—Negrètia, Ruiz et Pav. prod. t. 21. Cítta, Lour. Labràdia, Swed. mat. med.—Carpopògon, Roxb. hort. beng.—Macroceratìdes, Raddi.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, bilabiate; lower lip trifid, with acute segments, the middle segment drawn out most, upper lip broad, entire, and obtuse. Corolla with assurgent vexillum, shorter than the wings and keel; wings oblong, length of the keel, which is oblong, straight, and acute. Stamens diadelphous, with 5 of the anthers oblong-linear, and the other 5 ovate and hairy. Legume oblong, torose, 2-valved; the seeds separated by cellular dissepiments. Seeds round, with a linear hylum girded by a circular mark.—Climbing herbs or shrubs, with pinnately-trifoliate leaves, and axillary racemes, which are usually pendulous when bearing the fruit. Legumes hispid from innumerable brittle, stiff, stinging caducous bristles, which easily penetrate the cuticle.

SECT. I. ZOOPHTHA'LMUM (from ζωον, *zoon*, an animal, and οφθαλμος, *opthalmos*, an eye; in reference to the form of the seeds, which resemble the eye of an animal). P. Browne, jam. D. C. prod. 2. p. 405. Legumes with the furrows transversely lamellose.

1 M. U'RENS (D. C. prod. 2. p. 405.) flowers racemose; legumes covered with stinging bristles; leaflets clothed with shining tomentum beneath. ♄. ⌒. S. Native of the West Indies and South America. Mucùna, Marcgr. bras. 19. Plum. amer. t. 107. Pluk. phyt. t. 213. f. 2. Dólichos ùrens, Lin. spec. 1020. Jacq. amer. 202. t. 182. f. 84. Stizolòbium ùrens, Pers. ench. 2. p. 299. Flowers large, white or yellow, with the lower edge of the wings red. The seeds from their resemblance to an eye are called by the French *Yeux-bourrique*, or ass's eye, and for the same reason they have the name *ox-eye-bean* in our colonies in the West Indies.

Burning Cow-itch or Ox-eye-bean. Fl. June, July. Clt. 1691. Shrub cl.

2 M. MÓLLIS (D. C. l. c.) flowers disposed in globose heads on the tops of the peduncles; bracteas ovate, acutish; legumes clothed with dense silky tomentum, oblong, acinaciform, 6-celled; leaflets ovate, acuminated, hairy above, but clothed with silky rufescent tomentum beneath. ♄. ⌒. S. Native of New Granada, on mount Quindiu, in temperate places. Negrètia móllis, H. B. et Kunth, nov. gen. amer. 6. p. 444.

Soft Cow-itch. Shrub cl.

Sect. II. Stizolòbium (from στιζω, *stizo*, to sting, and λοβος, *lobos*, a pod; in allusion to the stinging hairs with which the pods are clothed). P. Browne, jam. D C. prod. 2. p. 405. Legumes destitute of the transverse lamellæ.

3 M. ALTI'SSIMA (D. C. prod. 2. p. 405.) flowers racemose; legumes beset with stinging hairs; leaflets glabrous on both surfaces. ♄. ⌒. S. Native of Martinique, in mountain woods. Dólichos altíssimus, Jacq. amer. 203. t. 182. f. 85. exclusive of the synonyme of Rheed. Flowers with a bluish violet vexillum, and a rather yellowish carina.

Tallest Cow-itch. Fl. summer. Clt. 1779. Shrub cl.

4 M. PRU'RIENS (D. C. prod. 2. p. 405.) flowers racemose; legumes stinging, with the valves somewhat keeled; leaflets hairy beneath, acuminated, middle one rhomboid, lateral ones dilated on the outside. ♄. ⌒. S. Native of Malabar, Rheed. mal. 8. t. 85.; of the Moluccas, Rumph. amb. 5. p. 112.; of the West Indies, P. Browne, jam. 290. t. 31. f. 4.; and of Guinea. Dólichos prùriens, Lin. spec. 1020. Lam. dict. 2. p. 290. Stizolòbium prùriens, Pers. Carpopògon prùriens, Roxb. Flowers violaceous, becoming black when dried. Perhaps the American, Asiatic, and African plants are the same. A decoction of the roots is said to be a powerful diuretic. The pods are about 4 inches long, thickly beset on the outside with stiff brown hairs, which, when applied to the skin, occasion a most intolerable itching. In the choice of *Cow-itch*, all those pods which are brown or shrivelled, rusty, or of a bad colour or diminutive size, ought to be rejected. In medicine, the ripe pods are dipped in syrup, which is again scraped off with a knife. When the syrup is rendered as thick as honey by the hairs, it is fit for use. It acts mechanically as an anthelmintic, occasions no uneasiness, and may be safely taken from a tea-spoonfull to a table-spoonfull in the morning, fasting. The worms are said to appear with the second or third dose. A vinous infusion of the pods (12 to a quart) is said to be a certain remedy for the dropsy. A strong infusion of the roots sweetened with honey is used in India by the native practitioners in cases of cholera morbus.

Common or *Stinging* Cow-itch. Fl. summ. Clt. 1681. Sh. cl.

5 M. GIGA'NTEA (D. C. prod. 2. p. 405.) flowers umbellate; legumes covered with stinging hairs, 3-4-seeded; leaflets glabrous, acuminated, lateral ones dilated on the outside, middle one ovate. ♄. ⌒. S. Native of Malabar and of Chittagong. --Rheed. mal. 8. t. 36. Carpopògon gigánteum, Roxb. hort. beng. p. 54. Dólichos gigánteus, Willd. spec. 3. p. 1041. Flowers of a pale greenish colour.

Var. β, *nigricans* (D. C. prod. 2. p. 405.) corolla black marked with a white spot. ♄. ⌒. G. Native of Cochin-china, in hedges. Cítta nígricans, Lour. coch. 456.—Rumph. amb. 5. t. 6. ex Lour. but Rumphius's plant has greenish white flowers, and is therefore referrible to the species.

Giant Cow-itch. Fl. July, Aug. Clt. 1815. Shrub cl.

6 M. MACROCA'RPA (Wall. pl. asiat. rar. 1. p. 41. t. 47.) leaves sparingly pilose; flowers large, racemose; keel longer than the wings, of a different colour; legumes very long, ensiform, torulose, tomentose, many-seeded. ♄. ◡. G. Native of Nipaul, on the mountains. Flowers party-coloured; vexillum green; wings purple and keel brown.

Long-fruited Mucuna. Shrub tw.

7 M. INFLE'XA (D. C. l. c.) flowers umbellate; pedicels inflexed; legumes covered with stinging hairs; seeds globose; lateral leaflets cordate. ♄. ⌒. S. Native of the Andes. in woods. Negrètia infléxa, Ruiz, et Pav. syst. 176. Peduncles pendulous, 2 or 4 yards long. Flowers dark purple, becoming black when dry.

Inflexed-pedicelled Cow-itch. Shrub cl.

8 M. ELLI'PTICA (D. C. l. c.) flowers umbellate; legumes covered with very stinging hairs, 2-seeded; seeds convex on both ends; lateral leaflets ovate. ♄. ◡. S. Native of Peru, on mountains. Negrètia ellíptica, Ruiz. et Pav. syst. 176. Flowers dark purple, drying black.

Elliptic-leafletted Cow-itch. Shrub cl.

9 M. MÌTIS (D. C. l. c.) racemes very long; legumes unarmed; seeds compressed; leaflets obliquely ovate. ♄. ⌒. S. Native of Peru, in groves. Negrètia mìtis, Ruiz, et Pav. syst. 177. Flowers dark purple, becoming black on drying.

Mild Cow-itch. Fl. summer. Clt. 1820. Shrub cl.

10 M. COMÒSA (D. C. l. c.) racemes erect, dense-flowered; legumes oblong, unarmed; seeds compressed, with the hylum girded; leaflets elliptic, mucronate, glabrous. ♄. ⌒. S. Native of Guiana, near Essequibo, in groves. Dólichos comòsus, Mey. prim. esseq. 241. Corolla white, tipped with purple.

Tufted Cow-itch. Shrub cl.

11 M. PLATYCA'RPA (D. C. l. c.) legumes compressed; seeds flat; leaflets ovate, cordate, intermediate one oblong-linear, acute. ♄. ⌒. S. Native of Peru, in groves. Negrètia platycárpa, Ruiz, et Pav. syst. 177.

Broad-podded Cow-itch. Shrub cl.

12 M. MACROCERATÌDES (D. C. prod. 2. p. 406.) flowers spicate; legumes compressed, torulose, pilose on the back, and furnished with 2 margins; seeds reniform; leaflets ovate, glabrous above, villous beneath. ♄. ⌒. S. Native of Brazil, on the Mandiocca mountains, near Rio Janeiro. Macroceratìdes pseudo-stizolòbium, Radd. mem. add. bras. 13. f. 5. Flowers rather small, of a violaceous colour. Peduncles and calyxes black. Seeds black, except the concave part.

Long-horned Cow-itch. Clt. 1824. Shrub cl.

13 M. MUTISIA'NA (D. C. l. c.) racemes pedunculate, somewhat capitate; bracteas ovate, rounded at the apex, clothed with rusty tomentum; leaflets smoothish, membranous, elliptic-oblong, acuminated, lateral ones with very unequal sides. ♄. ⌒. S. Native of South America, near Santa Fe de Bogota. Negrètia Mutisiàna, H. B. et Kunth, nov. gen. amer. 6. p. 442. Legume unknown.

Mutis's Cow-itch. Shrub cl.

† *Species indicated in Roxburgh's Hortus Bengalensis, but not described.*

14 M. MONOSPE'RMA (D. C. l. c.), ♄. ⌒. S. Native of the East Indies. Carpopògon monospérmum, Roxb. hort. beng. p. 54.

One-seeded Cow-itch. Clt. 1816. Shrub tw.

15 M. ATROPURPU'REA (D. C. l. c.). ♄. ⌒. S. Native of the East Indies, in Travancore. Carpopògon atro-purpùreum, Roxb. l. c. Flowers dark purple, almost black.

Dark-purple-flowered Cow-itch. Clt. 1820. Shrub tw.

16 M. NÍVEA (D. C. l. c.). ♄. ⌒. S. Native of Bengal. Carpopògon níveum, Roxb. l. c. Flowers white.

Snowy-flowered Cow-itch. Clt. 1816. Shrub tw.

17 M. IMBRICA'TA (D. C. l. c.). ♄. ⌒. S. Native of Silhet. Carpopògon imbricàtum, Roxb. l. c.

Imbricated Cow-itch. Clt. 1815. Shrub tw.

18 M. BRACTEA'TA (D. C. l. c.). ♄. ⌒. S. Native of Chittagong. Carpopògon bracteàtum, Roxb. l. c.

Bracteated Cow-itch. Clt. 1826. Shrub tw.

19 M. ANGUÌNEA (Roxb. hort. beng., under *Carpopògon*). ♄. ⌒. S. Native of the East Indies.

Snake Cow-itch. Shrub tw.

Cult. A rich soil suits the species of *Cow-itch*, and they are easily increased from cuttings. None of them are worth growing, unless in botanical gardens.

CCII. CALOPO'GONUM (from καλος, *kalos*, beauty, and πωγων, *pogon*, a beard; in reference to hairs on the calycine segments). Desv. obs. legum. in Schlecht. Linnæa. 2. p. 513.

Lin. syst. *Diadélphia, Decándria.* Calyx bractless, deeply 5-cleft, closed, smooth; segments elongated, awl-shaped, nearly equal, pinnately bearded, longer than the corolla. Legume straight, depressed, or rather hooked, pilose, 8-seeded.—An herbaceous twining plant, with trifoliate leaves.

1 C. MUCUNOÌDES (Desv. l. c.). ♃. ⌒. S. Native of Guinea.

Mucuna-like Calopogonum. Pl. tw.

Cult. See *Mucùna* for culture and propagation, p. 364.

CCIII. CAJA'NUS (*Catjang* is the Amboyna name for *C. flàvus*). D. C. cat. hort. monsp. 85. no. 43. H. B. et Kunth, nov. gen. amer. 6. p. 395. D. C. prod. 2. p. 406. Càjan. Adan. fam. 2. p. 326. Pet. Th. dict. sci. nat. 6. p. 166.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, 5-cleft; segments subulate, incurved at the apex, 2 superior ones joined together higher up than the rest. Corolla with ample vexillum, which is bicallous at the base, and an obtuse straight keel. Stamens diadelphous. Legume oblong, compressed, oblique, torulose, 2-valved. Seeds numerous, nearly spherical, separated by membranous partitions.—Erect shrubs, clothed with velvety pubescence, with pinnately trifoliate leaves, stipellate leaflets, and axillary racemes of yellow flowers, with 2 pedicels rising from each bractea. Cotyledons conferruminate in germination.

1 C. BI'COLOR (D. C. l. c.) vexillum discoloured on the outside; legumes 4-5-seeded, spotted; stipels of the lateral leaflets about equal in length to the petiolules. ♄. S. Native of the East Indies. Cýtisus Càjan, var. *β*. Lam. dict. 2. p. 249. Cýtisus pseudo-càjan, Jacq. hort. vind. 2. t. 119.—Rheed. mal. 6. t. 13. Flowers yellow, except the outside of the vexillum, which is purplish. The seeds are eatable, and very delicate when young.

Two-coloured-flowered Pigeon-pea. Fl. Jul. Aug. Clt. 1800. Shrub 3 to 6 feet.

2 C. FLA'VUS (D. C. l. c.) vexillum the same colour on both sides; legumes 4-5-seeded, and are as well as the calyxes spotless; stipels of lateral leaflets one half shorter than the petiolules. ♄. S. Native of the East Indies, but now cultivated in South America and Africa. Cýtisus Càjan, Lin. spec. 1041. Jacq. obs. 1. t. 1. Plum. ed. Burm. 114. f. 2. Burm. zeyl. p. 86. t. 37. Hughes, barb. 199. t. 19. This shrub is cultivated in both Indies, South America, and Africa. In the West Indies it is chiefly planted in rows, as a fence to the sugar plantations. The seed is much eaten by the poorer inhabitants and negroes, and is esteemed a wholesome pulse; in Martinico even the better sort of people hold the seeds in high estimation, and prefer them to common peas. The chief use they are put to in Jamaica is for feeding pigeons, whence the English name. The branches, with the ripe seeds and leaves, are given to feed hogs, horses and other cattle, which grow very fat on them.

Yellow-flowered or Common Pigeon-pea. Fl. July, Aug. Clt. 1687. Shrub 4 to 10 feet.

Cult. A light rich soil will suit the species of *Cajànus*; and young cuttings will root in sand, with a hand-glass placed over them, in heat, but the plants are annually raised from seeds brought or sent from the West and East Indies.

CCIV. LUPI'NUS (of Pliny and other Latin writers, said to be from *lupus*, a wolf, on account of its being supposed to destroy the fertility of the soil; or rather *απο της λυπης*, *apo tes lupes*, whence Virgil calls lupines *tristes lupini*, the bitterness of this pulse contracting the muscles and giving à sorrowful appearance to the countenance, *Vossius*). Tourn. inst. 392. t. 213. Lin. gen. 1176. Gærtn. fruct. 2. p. 150. D. C. prod. 2. p. 406.

LIN. SYST. *Monadélphia, Decándria.* Calyx profoundly bilabiate. Corolla papilionaceous, the vexillum with reflexed sides, and the keel acuminated. Stamens monadelphous, with the tube or sheath entire, 5 of the anthers are smaller, rounder, and earlier, and the other 5 oblong and later. Style filiform. Stigma terminal, roundish, bearded. Legume coriaceous, oblong, compressed, obliquely torulose. Cotyledons thick, but converted into leaves at the time of germination. -Herbs or subshrubs, with digitate leaves, constantly composed of from 5-15 leaflets, very rarely simple. Leaflets complicated before expansion, and while asleep or through the night. Stipulas adnate to the petioles. Peduncles opposite the leaves or terminal. Flowers alternate or verticillate, sessile, or pedicellate, disposed in racemes, and spikes, with one bractea under each pedicel, and with 2 bracteoles adhering laterally to the calyx, which are caducous, or wanting.

§ 1. *Leaves digitate.*

* *Annual herbs.*

1 L. A'LBUS (Lin spec. 1015.) flowers alternate, pedicellate, destitute of bracteoles; upper lip of calyx entire, lower one tridentate; leaflets obovate-oblong, usually 7 or 8, villous beneath. ⊙. H. Native of the Levant, and now cultivated in the south of Europe. Ludw. ect. t. 191. Blackw. icon. t. 282. L. sativus, Gater. montaub. 126.—Clus. hist. 2. p. 228. f. 1. Flowers white, almost sessile. This plant is cultivated in some parts of Italy and other parts of the south of Europe, as other pulse, for food; also in the south of France, on poor, dry, extensive plains, as an ameliorating crop, to be ploughed in where no manure is to be had, and the ground is too bad for clover or other better plants. In Tuscany, it is not only cultivated for food, but also for improving the land by ploughing it in, a practice continued from the time of the ancient Romans, as may be seen by consulting Pliny and Columella. With us it is used only among other annuals in the flower-border.

Var. β; keel of flower tipped with violet. L. álbus, Ægyptìacus, Mœnch, meth. 152.

White Lupine. Fl. June, Aug. Clt. 1596. Sh. 1 to 2 feet.

2 L. TE'RMIS (Forsk. descrip. 131.) flowers alternate, pedicellate, bracteolate; upper lip of calyx entire, lower one somewhat tridentate; leaflets 5-6, obovate-oblong, villous beneath. ⊙. H. Native of Egypt. L. prólifer, Desrous. in Lam. dict. 3. p. 622. Flowers white but with the vexillum tipped with blue. Like *L. álbus* and *L. vàrius*. *Termis* is the Arabic name of the plant. The peduncles, after being peeled, are eaten raw, and the seeds are boiled as other pulse by the Arabians.

Termis or Egyptian white Lupine. Fl. Ju. Aug. Clt. 1802. Pl. 1 to 2 feet.

3 L. VA'RIUS (Lin. spec. 1015.) flowers somewhat verticillate or alternate, pedicellate, bracteolate; upper lip of calyx bidentate, lower one slightly tridentate; leaflets oblong-lanceolate, villous beneath, usually 5-6 in number. ⊙. H. Native of Spain, South of France, Corsica, Egypt, and in the islands of the Archipelago of Europe, &c. L. semi-verticillàtus, Desrous. in Lam. dict. 3. p. 623. L. sylvéstris *α*, Lam. fl. fr. Flowers large, blue or purplish.

Variable Lupine. Fl. Jul. Aug. Clt. 1596. Pl. 2 to 3 feet.

4 L. HIRSU'TUS (Lin. spec. 1015.) flowers alternate, bracteolate; upper lip of calyx bipartite, lower one trifid; leaflets 5, oblong-spatulate, hairy on both surfaces; legumes very hairy. ⊙. H. Native of Spain, South of France, Egypt, Corsica, and the islands of the Archipelago of Europe. L. digitàtus, Forsk. descript. 131.—J. Bauh. hist. 289. with a figure.—Park. parad. 335. t. 337. f. 1.—Gerard. emac. 1217. f. 4. Flowers smaller than those of *L. vàrius*, blue, lower ones sometimes axillary. Plant clothed with ferruginous hairs.

Hairy Lupine. Fl. June, July. Clt. 1629. Pl. 1 foot.

5 L. PILÒSUS (Lin. spec. 1015.) flowers verticillate, pedicellate, bracteolate; upper lip of calyx bipartite, lower one entire; leaflets 9-11, oblong-lanceolate, villous on both surfaces, as well

as the stems and calyxes. ⊙. H. Native of the south of Europe. Flowers rose-coloured, with the middle of the vexillum red.

Var. β, *cœrùleus*; flowers bluish-purple. The Great Blue Lupine.

Pilose or Rose Lupine. Fl. Jul. Aug. Clt. 1710. Pl. 2 to 4 ft.

6 L. BRACTEOLA'RIS (Desrous. in Lam. dict. 3. p. 622.) flowers alternate, pedicellate, bracteolate; upper lip of calyx bipartite, lower one trifid; stipulas ovate-lanceolate; leaflets 5-6, obovate-oblong, villous on both surfaces. ⊙. H. Native of Monte Video. Said to be allied to *L. hirsùtus*, according to Desrouseaux. Perhaps the same as *L. rupéstris* of Kunth. Flowers probably purplish.

Bracteolate Lupine. Fl. June, July. Clt. 1820. Pl. 1 foot.

7 L. ANGUSTIFÒLIUS (Lin. spec. 1016.) flowers alternate, on short pedicels, without bracteoles; upper lip of calyx bifid, lower one entire; leaflets 7-8, linear, clothed with adpressed pubescence; legumes villous, usually 6-seeded. ⊙. H. Native of Spain, south of France, Italy, Sicily, and Corsica, in corn-fields. Knor. del. 2. t. L. f. 7. Riv. tetr. irr. t. 28.—J. Bauh. hist. 2. p. 291. with a figure, exclusive of the description. L. vàrius, Savi, fl. pis. 2. p. 178. Flowers blue. Seed variegated.

Narrow-leafletted Lupine. Fl. July, Aug. Clt. 1696. Pl. 2 to 3 feet.

8 L. LINIFÒLIUS (Roth. abhand. 14. t. 5.) flowers alternate; upper lip of calyx bifid; lower one rather trifid; leaflets linear, very narrow, channelled. ⊙. H. Native country unknown. Willd. spec. 3. p. 1025. Flowers blue, smaller than those of the preceding species.

Flax-leaved Lupine. Fl. Jul. Aug. Clt. 1791. Pl. 1 to 2 ft.

9 L. LINEA'RIS (Desrous. in Lam. dict. 3. p. 625.) flowers alternate, on short pedicels, bracteolate; upper lip of calyx bifid, lower one tridentate; leaflets 8-11, linear, very narrow. ⊙. H. Native of Monte Video. Flowers small, blue, but with the outside of the vexillum yellowish. The stems are said to be herbaceous, but perhaps the root is perennial.

Linear-leafletted Lupine. Pl. 1 to 2 feet.

10 L. LU'TEUS (Lin. spec. 1015.) flowers verticillate, sessile, bracteolate; upper lip of calyx bipartite, lower one tridentate; leaflets 7-9, oblong, lower ones obovate. ⊙ H. Native of Spain, south of France, and Sicily. Curt. bot. mag. 140.—Riv. tetr. irr. t. 26.—J. Bauh. hist. 2. p. 290. with a figure. L. odoràtus, Hortul. Flowers yellow, sweet-scented. Bracteas ovate, erect.

Yellow Lupine. Fl. June, Aug. Clt. 1596. Pl. 1 to 1½ ft.

11 L. HUMIFU'SUS (Sesse et Moc. in herb. Lamb.) plant clothed with hairs in every part, except the leaves; leaflets 7-9, linear-lanceolate, pubescent, mucronate; flowers alternate; calyx villous, with the upper lip entire and shorter than the lower one, which is tridentate. ⊙. H. Native of Mexico. Flowers purplish blue.

Trailing Lupine. Pl. ½ foot.

12 L. MICROCA'RPUS (Sims, bot. mag. t. 2413.) flowers verticillate, sessile, bracteolate; upper lip of calyx very short, emarginate, superior one tridentate; bracteas reflexed; leaflets oblong-linear; legumes rhomboid, 2-seeded, hairy. ⊙. H. Native of Chili. Flowers blue, with a purplish apex. Keel ciliated on the inside at the base.

Small-podded Lupine. Fl. May, June. Clt. 1821. Pl. ½ ft.

13 L. PUSÍLLUS (Pursh. fl. amer. sept. 2. p. 468.) flowers alternate, without bracteoles; upper lip of calyx bipartite, lower one entire; leaflets 5-7, linear-elliptic, glabrous above, but hairy beneath, as well as the stems and petioles; legumes very hairy, 2-seeded. ⊙. H. Native of North America, on the plains between the Missouri and the White River. Nutt. gen. amer. 2. p. 93. Flowers small, blue mixed with red.

Small Lupine. Fl. June, Aug. Clt. 1817. Pl. ½ foot.

14 L. BI'COLOR (Lindl. bot. reg. 1109.) stems branched, corymbous, and are as well as the leaves clothed with silky pili; leaflets 5-7, linear spatulate; flowers few, verticillate; calyx clothed with silky wool, inappendiculate, having the upper lip bifid, and the lower one elongated and entire; wings longer than the vexillum; legumes many-seeded. ⊙. H. Native of North America, in the interior of the country, about the Columbia River, from Fort Vancouver to the branches of Lewis and Clarke's river. Flowers with a white vexillum, which becomes reddish purple, and the keel and wings bluish purple.

Two-coloured-flowered Lupine. Clt. 1826. Pl. 1 foot.

15 L. MICRA'NTHUS (Doug. in bot. reg. 1251.) flowers somewhat verticillate, bracteolate, sessile; upper lip of calyx bifid, lower one entire; leaflets 5-7, linear, spatulate, ciliated; legumes 6-seeded, furrowed transversely; stem branched; roots granular. ⊙. H. Native of North America, upon the gravelly banks of the southern tributaries of the Columbia, and of the interior of California, in barren ground. Flowers pale bluish purple, the vexillum white in the centre, with 2 or 4 parallel black dots.

Small-flowered Lupine. Fl. May, Jul. Clt. 1826. Pl. ½ to 1 ft.

* * *Perennial herbs.*

16 L. MEXICA'NUS (Cerv. in Lag. nov. spec. 22. no. 288.) herbaceous; flowers alternate, pedicellate, bracteolate; upper lip of calyx emarginate, lower one obscurely tridentate; leaflets oblong-linear, pilose beneath. ♂.? G. Native of Mexico. Ker. bot. reg. 457. Flowers blue, about the size of those of *L. perénnis*.

Mexican Lupine. Fl. Feb. May. Clt. 1819. Pl. 1 to 2 ft.

17 L. PERE'NNIS (Lin. spec. 1015.) herbaceous; flowers alternate, pedicellate, bracteolate; upper lip of calyx somewhat emarginate, lower one entire; leaflets 8-9, lanceolate, mucronulate, rather villous beneath; root creeping. ♃. H. Native of North America, in sandy places, and on sandy hills from Canada to Florida. This is a very common plant in the State of New York, in Long Island, and about Philadelphia, where we have seen it growing in great plenty on sandy banks and in woods. Mill. fig. t. 170. f. 1. Lam. ill. 616. f. 1. Curt. bot. mag. 202. Flowers of a pale bluish purple colour.

Perennial Lupine. Fl. June, July. Clt. 1658. Pl. 1 to 2 ft.

18 L. NOOTKATE'NSIS (Sims, bot. mag. t. 1311. and 2137.) herbaceous; flowers rather verticillate, pedicellate, without bracteoles; both lips of calyx entire; leaflets 7-8, obovate-lanceolate, hairy as well as the stems. ♃. H. Native of North America, on the western coast at Nootka Sound, and of the Island of Unalaschka. Pursh, fl. amer. sept. 2. p. 462. Flowers elegant, blue, mixed with purple, white, or yellow, and streaked with more intense veins.

Nootka Sound Lupine. Fl. May, Jul. Clt. 1794. Pl. 1 to 1½ ft.

19 L. POLYPHY'LLUS (Dougl. in bot. reg. 1096.) herbaceous; flowers rather verticillate, without bracteoles, pedicellate; leaflets 11-15, lanceolate, hairy beneath; both lips of calyx quite entire; stems pilose. ♃. H. Native of North America, on the north-west coast. Corolla purple; the vexillum of a deep bluish purple, and with the keel paler.

Var. β, *albiflòrus* (Lindl. bot. reg. 1377.) flowers white.

Many-leafletted Lupine. Fl. Ju. Sept. Clt. 1826. Pl. 2 to 4 ft.

20 L. ALBICAU'LIS (Dougl. mss.) herbaceous; flowers alternate, pedicellate, bractless; disposed in long racemes; both lips of calyx entire; leaflets 8-9, obovate-lanceolate, mucronate, hairy beneath; stem pubescent. ♃. H. Native of North America, on the north-west coast. Flowers purplish?

White-stemmed Lupine. Pl. 1 to 1½ foot.

21 L. LAXIFLÒRUS (Dougl. in bot. reg. 1140.) plant herbaceous, pilose; flowers alternate, without bracteoles; upper lip of calyx entire, saccate at the base, lower one longer, ovate, and acu-

minated; keel beardless; vexillum obcordate; leaflets 7-9, linear-lanceolate; stipulas small, subulate. ♃. H. Native of North America, about the great rapids of the Columbia River. Racemes loose. Flowers with the vexillum and tips of the wings blue, but the keel and base of the wings are reddish.

Loose-flowered Lupine. Fl. Aug. Sept. Clt. 1826. Pl. 1 to 1½ foot.

22 L. TENE'LLUS (Dougl. mss.) herbaceous; flowers somewhat verticillate, pedicellate, bractless; both lips of calyx entire, lower one linear, elongated; leaflets usually 7, very narrow-linear, clothed with villi as well as the petioles; stem slender; stipulas subulate. ♃. H. Native of North America, on the western coast. Flowers apparently bluish purple.

Slender Lupine. Pl. 1 to 2 feet.

23 L. LE'PIDUS (Dougl. in bot. reg. 1249.) plant herbaceous; flowers alternate, pedicellate, without bracteoles; calyx villous, the upper lip bipartite, the lower one acuminated and elongated; leaflets 5-7, lanceolate, silky on both surfaces; flower bearing stems erect, furnished with 1 or 2 leaves; petioles long. ♃. H. Native of North America, from Fort Vancouver to the great falls of the Columbia river, on the dry elevated banks of streams. Flowers with the vexillum purplish blue inside, with a white spot at the base, and pale outside. Wings purplish blue. Keel dark purple at the apex. Seeds white.

Pretty Lupine. Fl. Aug. Sept. Clt. 1826. Pl. ½ foot.

24 L ORNA'TUS (Dougl. in bot. reg. 1261.) herbaceous; flowers verticillate, appendiculate; upper lip of calyx bifid, lower one entire and elongated; leaflets 7-12, linear-lanceolate, clothed with silvery silky down on both surfaces; legumes 4-5-seeded. ♃. H. Native of North America, in mountain valleys on the banks of the Spokan river, near the Kettle Falls on the Columbia river. Flowers rather large, with a pale vexillum, blue wings, and a ciliated paler keel.

Ornamented Lupine. Fl. May, Nov. Clt. 1826. Pl. 1 to 2 ft.

25 L. MI'NIMUS (Dougl. mss.) herbaceous, dwarf, hairy; stems 1-2-leaved; leaves on long petioles, mostly radical; leaflets 7-8, obovate-lanceolate, clothed with silky villi; flowers somewhat verticillate, bracteolate, almost sessile; bracteas longer than the calyx; upper lip of calyx bipartite, lower one entire, elongated, acuminated. ♃. H. Native of North America, on the western coast. Flowers apparently purple.

Least Lupine. Pl. ⅓ foot.

26 L. LITTORA'LIS (Dougl. in bot. reg. 1198.) herbaceous; flowers verticillate, pedicellate, without bracteoles; both lips of calyx entire; leaflets 5-7, linear-spatulate, silky on both surfaces; legumes 10-12-seeded, furrowed transversely; root granular. ♃. H. Native of North America, on the west coast from Cape Mendocino to Paget's Sound, where it binds together the loose sand by its roots. Flowers with a purple vexillum, blue wings, and a pale keel. The roots are used by the natives about the Columbia river as winter food.

Shore Lupine. Fl. June, Oct. Clt. 1826. Pl. 1 foot.

27 L. A'RIDUS (Dougl. in bot. reg. 1242.) plant herbaceous, very hairy; flowers verticillate, pedicellate, bracteolate; upper lip of calyx bifid, lower one entire; leaflets 5-9, linear-lanceolate, villous; stipulas subulate. ♃. H. Native of North America, growing along with *L. leucophýllus*, where it forms dense tufts. Flowers purplish blue; the vexillum purple, but the wings are darker.

Arid lupine. Fl. Aug. Sept. Clt. 1827. Pl. 1 foot.

28 L. SULPHU'REUS (Dougl. mss.) herbaceous, and clothed with silky villi; flowers somewhat verticillate, pedicellate, without bracteoles; both lips of calyx entire, lower one elongated; leaflets linear-lanceolate, usually 13, silky; stipulas subulate. ♃. H. Native of North America, on the western coast. Flowers sulphur-coloured.

Sulphur-coloured-flowered Lupine. Pl. 1 to 1½ foot.

29 L. PLUMÒSUS (Dougl. in bot. reg. 1217.) plant herbaceous, very villous; flowers alternate, on short pedicels, bracteolate; upper lip of calyx bifid, lower one entire; leaflets 5-7, lanceolate, silky; legumes glabrous, 3-5-seeded; bracteas longer than the flowers, villous, deciduous. ♃. H. Native of Northern California, growing in gravelly soils; it is also found at the sources of the Walla-Wallah river, near the Blue Mountains, on the north-western coast of America. Flowers blue, with the keel and wings pallid.

Feathery Lupine. Fl. June, July. Clt. 1826. Pl. 2 to 3 ft.

30 L. DECU'MBENS (Torrey, in ann. lyc. 2. p. 181.) plant suffruticose, rather decumbent; flowers pedicellate, somewhat verticillate, bracteolate; calyx clothed with silky hairs, having both lips entire; leaflets oblong-lanceolate, acute, and obtuse, silky beneath. ♃. H. Native of North America, on the southern branches of the Arkansa. Flowers small, purple, about half the size of those of *L. perénnis.*

Decumbent Lupine. Pl. procumbent.

31 L. LEUCOPHY'LLUS (Dougl. in bot. reg. 1124.) plant herbaceous, very villous; flowers alternate. pedicellate, bracteolate; upper lip of calyx bifid, lower one entire; leaflets 7-9, oblong-lanceolate; stipulas subulate, woolly. ♃. H. Native of North America. Flowers disposed in long racemes, and are either white or tinged with light pink.

White-leaved Lupine. Fl. June, Nov. Clt. 1826. Pl. 2 to 3 ft.

32 L. SABINIA'NUS (Dougl. bot. reg. 1435.) herbaceous; flowers somewhat verticillate, without bracteoles; racemes many-flowered; calyx villous, with the upper lip ovate and acute, lower one boat-shaped, revolute; wings roundish, size of vexillum; keel acute; leaflets 7-12, lanceolate, acuminated, silky. ♃. H. Native of North America, at the junction of Lewis and Clarke's river with the Columbia. Flowers yellow.

Sabine's Lupine. Fl. May, June. Clt. 1827. Pl. 2 to 3 ft.

33 L. CHAMISSÒNIS (Eschscholtz, in mem. acad. imp. sc. petersb. vol. 10. p. 281. ex Schlecht. Linnæa. vol. 3. p. 147.) stems herbaceous, clothed with cinereous tomentum; leaves on long petioles; leaflets obovate-lanceolate, bluntish, clothed with grey tomentum, but when young with rusty, silky tomentum; flowers verticillate, 3-4 in a whorl; pedicels quadrangular; stipulas linear, villous; upper lip of calyx trifid, lower one lanceolate, entire. ♃. H. Native of California, in sandy places. Flowers purple. Legumes 3-4-seeded, clothed with rusty villi. Bracteas longer than the pedicels.

Chamisso's Lupine. Pl. 3 feet.

34 L. SERI'CEUS (Pursh, fl. amer. sept. 2. p. 468.) herbaceous; flowers rather verticillate, without bracteoles; upper lip of calyx cut, lower one entire; leaflets 7-8, lanceolate, acute, silky on both surfaces; stems clothed with silky tomentum. ♃. H. Native of North America, on the banks of the Kooskoosky river, and of North California, in the sea sand at Port St. Francisco. Flowers pale purple or rose-coloured, according to Pursh, but Chamisso says they are yellow, and fade to a purplish colour in drying.

Silky Lupine. Fl. May, June. Clt. 1826. Pl. 2 to 3 feet.

35 L. ARGE'NTEUS (Pursh, fl. amer. sept. 2. p. 468.) herbaceous; flowers alternate, without bracteoles; upper lip of calyx obtuse, lower one entire; leaflets 5-7, linear-lanceolate, acute, glabrous above, but clothed with silky-silvery down beneath. ♃. H. Native of North America, on the banks of the Kooskoosky river. Flowers cream-coloured.

Silvery Lupine. Fl. May, June. Clt. 1826. Pl. 1 to 2 ft.

36 L. ARGYRÆ'US (D. C. prod. 2. p. 408.) herbaceous; flowers verticillate, pedicellate, bracteolate; upper lip of calyx nearly entire, lower one somewhat tridentate; leaflets oblong, clothed with silky hairs on both surfaces; legumes very hairy, 2-3-seeded. ♃.? G. Native country unknown, but cultivated in

gardens in Teneriffe, where it was gathered by Courant. Flowers blue. It is not known whether this plant is an annual or a perennial.

Silvered Lupine. Pl. 2 to 3 feet?

37 L. E'LEGANS (H. B. et Kunth, nov. gen. amer. 6. p. 477.) plant herbaceous, erect, covered with soft pili; racemes elongated, pedunculate; flowers somewhat verticillate; calyx clothed with silky pili, having the lower lip acute and entire; leaflets lanceolate, acute, clothed with adpressed pili beneath; stipulas setaceous. ♃. ? G. Native of Mexico, between Real del Moran and Totolnico-el-Grande. Flowers violaceous? Legume hairy, 3-6-seeded.

Elegant Lupine. Pl. 1 to 2 feet.

38 L. MONTA'NUS (H. B. et Kunth, nov. gen. amer. l. c.) herbaceous; racemes elongated, pedunculate; flowers somewhat verticillate; calyx clothed with soft pili, having the upper lip acuminated and entire; leaflets 12-13, linear-lanceolate, acute, clothed with adpressed pili beneath. ♃. G. Native of New Spain, at Nevado de Tolucco. Flowers violaceous? Legume hairy, usually 8-seeded.

Mountain Lupine. Pl. ½ foot?

39 L. NUBI'GENUS (Kunth, mim. p. 174. t. 50.) plant herbaceous, dwarf; flowers without bracteoles, on very short pedicels, disposed in very dense spikes; upper lip of calyx bipartite, lower one entire; bracteas longer than the corolla; leaflets oblong, acute, hairy on both surfaces. ♃. G. Native of the Andes, about Quito, at Mount Antisana. Flowers blue.

Cloud-born Lupine. Pl. ¼ foot.

40 L. ALOPECUROÌDES (Desrous. in Lam. dict. 3. p. 626.) plant herbaceous, caulescent, clothed with rusty woolly down; racemes sessile; flowers disposed in very dense spikes, bracteolate; upper lip of calyx bipartite, lower one entire; bracteas longer than the corolla; leaflets oval-lanceolate. ♃. G. Native of the Andes, about Quito. Flowers violaceous.

Fox-tail-like-spiked Lupine. Pl. 2 to 3 feet.

41 L. VAGINA'TUS (Schlecht et Cham. in Linnæa. 5. p. 590.) herbaceous, and clothed with silky villi; stipulas large, adnate to the petioles almost their whole length, 5-nerved, pubescent, drawn out on each side into a tooth, sheathing the axillary branches; the free part of the petiole shorter than the sheath; leaflets 11-13, lanceolate-linear, clothed with silky pili beneath, but glabrous above; stem obtuse-angled, pubescent, fistular; flowers somewhat verticillate; upper lip of calyx deeply bipartite, lower one longer, acuminated, and entire. ♃. F. Native of Mexico, on mount Orizaba. Bracteas oblong, long-acuminated, membranous, deciduous. Corolla blue. Legume in a young state very hairy, 5-6-seeded.

Sheathing-stipuled Lupine. Pl. 1 foot?

42 L. ARBU'STUS (Dougl. in bot. reg. 1230.) suffrutescent; flowers alternate, pedicellate, bracteolate; upper lip of calyx bifid, lower one entire, acute; leaflets 7-13, obovate-oblong, silky on both surfaces; legumes 3-4-seeded; seeds small, white. ♃. F. Native of North California; it is also common near Fort Vancouver. Flowers with a blue vexillum, purple in the centre; wings and carina rose-coloured.

Shrub Lupine. Fl. May, June. Clt. 1826. Shrub 1 to 2 ft.

* * * *Shrubby species.*

43 L. ARBÒREUS (Sims, bot. mag. 628.) shrubby; flowers somewhat verticillate, pedicellate, without bracteoles; both lips of calyx entire; keel ciliated on the inside; leaflets lanceolate-linear, acute, pubescent beneath. ♄. F. Native country unknown. Flowers yellowish.

Tree Lupine. Fl. July, Aug. Clt. 1793. Shrub 6 feet.

44 L. MULTIFLÒRUS (Desrous. in Lam. dict. 3. p. 624.) shrubby; flowers alternate, almost sessile, bracteolate; upper lip of calyx bifid, lower one tridentate; leaflets lanceolate, covered with silky villi. ♄. F. Native of Monte Video. Flowers azure blue, but the vexillum and carina are yellowish on the outside. Spikes very long.

Many-flowered Lupine. Fl. Jul. Sept. Clt. 1810. Sh. 5 to 6 ft.

45 L. MUTA'BILIS (Sweet, fl. gard. 2. t. 130.) shrubby, erect, branched; branches spreading, glaucous, glabrous; leaflets 7-9, glaucescent and rather pubescent beneath, lanceolate, bluntish; flowers somewhat verticillate; calyx without bracteoles, upper lip bifid, lower one keeled, acute, entire. ♄. F. Native of South America. Flowers large, the vexillum white mixed with blue, changing to blue, with a large yellow mark in the centre; wings white, faintly striated; keel white. L. Cruikshánksii, Hook. bot. mag. t. 3056., a native of Peru, is nothing but a slight variety of *L. mutábilis*, differing a little in the colour of the flowers.

Changeable-flowered Lupine. Fl. June, Aug. Clt. 1819. Shrub 3 to 6 feet.

46 L. CANALICULA'TUS (Sweet, fl. gard. 3. p. 283.) shrubby, clothed in every part with silky tomentum; flowers alternate, pedicellate, bracteolate; calyx appendiculate, with the upper lip bifid, and lower one entire and acuminated; leaflets 8-9, linear, canaliculate, obtuse, clothed with silky pubescence beneath; ovary very hairy. ♄. F. Native of Buenos Ayres. Flowers bright blue.

Channelled-leafletted Lupine. Fl. June, Aug. Clt. 1828. Sh. 3 to 6 feet.

47 L. VERSÍCOLOR (Sweet, fl. gard. 2d series, t. 12.) shrubby, erect, branched; branches and leaves pubescent; leaflets 7-9, lanceolate-spatulate, bluntish, and somewhat mucronate, smoothish above, and pubescent beneath; stipulas linear-subulate; racemes elongated, on short peduncles; flowers somewhat verticillate; bracteas caducous, spreading, silky, ciliated, longer than the calyx, which is also silky; upper lip of calyx bifid, lower one entire. ♄. F. Native of Mexico. Flowers small, with the vexillum of a purplish lilac colour above about half-way down, then becoming blue on each side; wings of a fine dark blue, tinged with purple; keel ash-coloured, dark purple towards the point.

Party-coloured-flowered Lupine. Fl. July, Sept. Clt. 1825. Shrub 2 to 4 feet.

48 L. PULCHE'LLUS (Sweet, fl. gard. 2d ser. t. 67.) shrubby, erect, branched; branches erect, clothed with silky pubescence; leaflets 5-7, oblong-lanceolate, acute, mucronate, tapering to the base, pubescent beneath, and with adpressed pili; stipulas setaceous; racemes middle-sized, pedunculate; flowers verticillate; bracteas caducous and setaceous, longer than the pedicels; both lips of calyx entire. ♄. F. Native of Mexico. Flowers disposed in a longish raceme, the vexillum with various shades of purple and blue mixed; wings pale blue, slightly edged with purple. Keel white, tipped with bluish purple.

Neat Lupine. Fl. June, Oct. Clt. 1827. Shrub 3 to 4 feet.

49 L. CAMPE'STRIS (Schlecht et Cham. in Linnæa. 5. p. 589.) shrubby, densely clothed with canescent pubescence; branches angular; leaflets 7, oblong-lanceolate, bluntish, mucronate, green above; stipulas subulate, short; racemes panicled; flowers somewhat verticillate; calyx bibracteolate, with both lips entire, the lowest one longest; legumes hairy. ♄. F. Native of Mexico, between Perote and Plachichuca. Bracteas linear, acuminated, caducous. Flowers violaceous, about the size of those of *L. angustifòlius*.

Field Lupine. Shrub 2 to 4 feet.

50 L. LEPTOPHY'LLUS (Schlecht. et Cham. in Linnæa. 5. p. 589.) shrubby; branches angular, clothed with adpressed pubescence; leaflets 9, linear, acute, with a few silky hairs on both surfaces; stipulas foliaceous, linear; flowers disposed in loose pedunculate racemes, somewhat verticillate; calyx pubes-

cent, with both lips entire, and about equal in length, the upper one broadest; legumes hairy in a young state. ♄. F. Native of Mexico, between Tlachichuca and Tepetitla. Flowers violaceous, about the size of those of *L. lùteus.*

Slender-leaved Lupine. Shrub 1 to 3 feet.

51 L. RUPE'STRIS (H. B. et Kunth, nov. gen. amer. 6. p. 474.) plant shrubby, branched, procumbent or ascendent; flowers somewhat verticillate; calyx clothed with silky pili, with the upper lip bifid, and the lower one tridentate: leaflets lanceolate, acute, clothed with silky pili beneath. ♄. F. Native of South America, on the burning mount Rucu-Pichincha near Quito. Corolla violaceous. Racemes of flowers pedunculate. Legumes clothed with adpressed pili.

Rock Lupine. Shrub proc.

52 L. MICROPHY'LLUS (Desrous. in Lam. dict. 3. p. 624.) shrubby, procumbent, much branched; flowers without bracteoles, disposed in a kind of spicate head; upper lip of calyx bipartite, lower one entire; leaflets 6-9, linear, clothed with silky villi beneath. ♄. F. Native of Peru, on mount Antisana. H. B. et Kunth, nov. gen. amer. 6. p. 473. Flowers blue. Legume oval, acuminated, 6-8 lines long.

Small-leaved Lupine. Shrub proc.

53 L. SMITHIA'NUS (Kunth, mim. p. 177. t. 51.) plant suffruticose, branched, clothed with silky hairs; flowers somewhat verticillate, on very short pedicels, bracteolate; upper lip of calyx bifid, lower one entire; leaflets lanceolate-linear, obtuse, rather villous. ♄. F. Native of South America, on the burning mount Rucu-Pichincha, and in frigid places near Popayan. Stem much branched. Leaflets 3 lines long. Legume oblong, 3-4-seeded, nearly an inch long, clothed with silky hairs. Flowers blue.

Smith's Lupine. Shrub 2 to 3 feet.

54 L. PANICULA'TUS (Desrous. in Lam. dict. 3. p. 625.) plant suffruticose? erect; flowers somewhat alternate, pedicellate, bracteolate; calyx clothed with silky hairs, having the upper lip bifid, and the lower one entire; leaflets 6-7, lanceolate, glabrous above, but rather villous beneath. ♄. F. Native of Peru, and near Santa-Fe-de-Bogota. H. B. et Kunth, nov. gen. amer. 6. p. 476. Flowers blue according to Desrousseux, but according to Kunth they are violaceous, and disposed in loose spikes. Stipulas subulate. Racemes pedunculate.

Panicled-flowered Lupine. Shrub erect.

55 L. SARMENTÒSUS (Desrous. in Lam. dict. 3. p. 626.) plant shrubby, climbing; flowers verticillate, on short pedicels, without bracteoles; upper lip of calyx bifid, lower one entire; leaflets lanceolate, glabrous above, but rather villous beneath. ♄. ◡. F. Native of Peru, on mount Antisana. L. grácilis, Kunth, mim. 182. t. 52. ex H. B. et Kunth, nov. gen. amer. 6. p. 472. Flowers blue. Spikes short, oval, on long peduncles. Legume 8-10 lines long.

Sarmentose Lupine. Shrub 3 feet.

56 L. BIMACULA'TUS (Lam. dict. 3. p. 626.) plant shrubby, sarmentose, and hoary; flowers somewhat verticillate, tern, pedicellate, bracteolate; vexillum bicallous at the base. ♄. F. Native of Peru. Flowers a little smaller than those of *L. vàrius,* bluish violet; the vexillum with 2 yellow marks at the base.

Two-spotted-flowered Lupine. Shrub sarmentose.

57 L. TOMENTÒSUS (D. C. prod. 2. p. 409.) shrub clothed in every part with silky tomentum; flowers verticillate, pedicellate, bracteolate; both lips of calyx entire; leaflets 8-10, oblong, bluntish, mucronulate, tapering to the base; ovary very hairy. ♄. F. Native of Peru. Sweet, fl. gard. 3. t. 261. Flowers large, with the vexillum channelled above, and spotted on each side of the channel with several small blue specks, and a large blue spot on each side near the base; wings about equal in length to the vexillum, striped more or less with blue branched lines; keel with a dark purple point, fringed longitudinally with long white hairs. The vexillum at length changes to a purple, and the wings to pale red, striped with blue at the base.

Tomentose Lupine. Fl. June, Aug. Clt. 1825. Sh. 4 to 5 ft.

58 L.? AFRICA'NUS (Lour. coch. 429.) stem shrubby, diffuse; peduncles many-flowered, terminal; leaflets 3, lanceolate. ♄. S. Native of the Eastern coast of Africa. Flowers yellow.

African Lupine. Shrub 3 feet.

§ 2. *Leaves simple, entire.*

59 L. VILLÒSUS (Willd. spec. 3. p. 1029.) plant herbaceous, decumbent, clothed with wool-like villi; leaves simple, oblong-lanceolate; stipulas filiform; flowers somewhat verticillate or alternate, on short pedicels, bracteolate, upper lip of calyx bidentate, lower one entire; legumes very hairy. ♂. H. Native of South Carolina, Florida, and Georgia, in sandy pine woods. Pursh, fl. amer. sept. 2. t. 21. Nutt. gen. amer. 2. p. 93. L. pilòsus, Walt. car. 180. L. integrifòlius, Desrous. in Lam. dict. 3. p. 627. but not of Lin. Flowers reddish.

Villous Lupine. Fl. July, Aug. Clt. 1787. Pl. proc.

60 L. DIFFU'SUS (Nutt. gen. amer. 2. p. 93.) plant herbaceous, diffusely procumbent, densely clothed with silky villi; leaves simple, oblong-obovate, lower ones alternate; stipulas and petioles short and naked. ♃. F. Native about Wilmington, and elsewhere in both Carolinas, in oak woods.

Diffuse Lupine. Pl. proc.

61 L. INTEGRIFÒLIUS (Lin. amœn. 6. afr. p. 43.) plant herbaceous, villous; leaves simple, oblong, petiolate, acute; flowers alternately pedicellate, bracteolate; upper lip of calyx bifid; lower one entire. ⊙. G. Native of the Cape of Good Hope. Flowers blue.

Entire-leaved Lupine. Pl. 1 foot?

62 L. COCHINCHINE'NSIS (Lour. coch. 429.) plant herbaceous, erect; leaves simple, emarginate, glabrous; flowers bracteolate, disposed in a spike; upper lip of calyx bifid, lower one tridentate; legume glabrous, many-seeded. ⊙. H. Native of Cochinchina and Bengal. Flowers yellow.

Cochin-china Lupine. Pl. 1 to 2 feet.

Cult. Every species of *Lupine* are worth cultivating for the purpose of decorating flower-borders, as they are very ornamental when in flower; they thrive best in light soil, and are most easily increased by seeds. The shrubby kinds require to be protected in severe weather in winter by a glass covering, or by matting. If they are grown against a wall, they can be easily sheltered in winter. Cuttings of them root readily.

CCV. CYLI'STA (from κυλιξ, *kylix,* a calyx; in reference to the calyx being very large). Ait. hort. kew. 3. p. 512. D. C. prod. 2. p. 410.

LIN. SYST. *Diadélphia, Decándria.* Calyx larger than the corolla, 4-cleft; upper segment emarginate or bifid, lower one the largest, and sometimes very large. Corolla papilionaceous, permanent. Keel 2-edged. Stamens diadelphous. Legume usually 2-seeded. Seeds in *C. pychnostàchya* ovate-globose, shining, with a small oval hylum. Embryo with thick cotyledons, and a small incurved radicle. — Twining shrubs, with pinnately-trifoliate leaves, rhomboid or ovate, acute, stipellate leaflets, and axillary simple racemes of yellow flowers. Bracteas large, caducous.

1 C. SCARIÒSA (Ait. l. c. Roxb. cor. 1. t. 92.) calyx very large, scarious, with the upper segment emarginate, lower one very large; legumes 1-celled, 1-2-seeded; bracteas lanceolate, acuminated. ♄. ⌒. S. Native of the East Indies, among the Circars. Flowers pale yellow, mixed with red. Style inflexed at the base, slender, but at length becoming thick and dilated.

Scarious-calyxed Cylista. Pl. tw.

2 C. TOMENTÒSA (Roxb. cor. t. 221.) calyx villous; the seg-

ments cuneated, upper one bifid, lower and lateral ones equal; legume divided transversely into 2 1-seeded cells, somewhat constricted in the middle; bracteas broad, ovate, mucronulately acuminated. ♃. ⌒. S. Native of Mysore. Flowers yellow. Seeds spherical, bluish violet, polished, lower one usually abortive.

Tomentose Cylista. Clt. 1820. Pl. tw.

3 C.? ALBIFLÒRA (Sims, bot. mag. 1859.) calyx half-5-cleft, with nearly equal segments, shorter than the corolla; bracteas ovate, acuminated. ♄. ⌒. S. Native of the Mauritius. The plant is clothed in every part with ferruginous pubescence. Perhaps a species of *Rynchòsia*. Flowers white.

White-flowered Cylista. Fl. April, May. Shrub tw.

4 C. VILLÒSA (Ait. hort. kew. ed. 2. vol. 4. p. 300.) calyx membranous; upper segment bifid. ♄. ⌒. G. Native of the Cape of Good Hope. Dólichos hírtus, Andr. bot. rep. t. 416. Flowers yellow.

Villous Cylista. Fl. April, May. Clt. 1776. Shrub tw.

5 C. PYCHNOSTA'CHYA (D. C. prod. 2. p. 410.) calyx with one of the lips bipartite, and with the other bluntly tridentate. ♄. ⌒. S. Native of Sierra Leone. Leaves unknown. Pedicels twin, densely racemose. Calyx and legume permanent, clothed with velvety down. Petals and stamens permanent. Corolla probably resupinate. The tridentate lip is usually under the vexillum. Perhaps a proper genus.

Slender-spiked Cylista. Shrub tw.

Cult. See *Eriosèma*, for culture and propagation, p. 348.

CCVI. ERYTHRI'NA (from ερυθρος, *erythros*, red; in reference to the colour of the flowers). Lin. gen. 855. Lam. ill. t. 608. D. C. prod. 2. p. 410.—Corallodéndron, Tourn. inst. t. 446.—Mouricòu, Adans.

LIN. SYST. *Diadélphia, Decándria.* Calyx tubular (f. 50. *a.*), with a truncate, somewhat dentate border (f. 50. *a.*), or spathaceous. Corolla with a very long oblong vexillum (f. 50. *b.*); wings as well as the dipetalous keel much shorter than the vexillum. Stamens diadelphous (f. 50. *c.*), straight, the tenth one adhering more or less to the rest, but sometimes free, much shorter than the wings, rarely deficient. Legume long (f. 50. *d.*), torulose, many-seeded, 2-valved. Seeds ovate, having a lateral hylum.—Trees or shrubs, rarely herbs, with small stipulas, which are distinct from the petiole, pinnately-trifoliate leaves, having the leaflets furnished with glands at the base instead of stipels. Stems and petioles usually furnished with prickles. Racemes of flowers elongated, with the pedicels usually approximating by threes. Flowers red, scarlet, or crimson. Seeds shining, usually black and red mixed, or pure black or red.

§ 1. *Acaùles* (from *a*, without, and *caulis*, a stem; in reference to the species contained in this division having nothing but annual stems, rising from a subterraneous trunk). *Both the floriferous and leaf bearing branches dying down yearly, and rising again from an underground stump or trunk.*

1 E. HERBA'CEA (Lin. spec. 992.) branches herbaceous, annual, and are, as well as the leaves, unarmed and glabrous; leaflets rhomboid; racemes elongated; flowers distant, tern; calyx truncate; vexillum lanceolate. ♃. F. Native of Carolina, Florida, and about the Mississippi, in sandy fields and woods. Trew. ehr. t. 58. Sims, bot. mag. 877. Lodd. bot. cab. 851. Floriferous branches sometimes furnished with one or two leaves. Corolla deep scarlet. The tenth or loose stamen free and short.

Herbaceous Coral-tree. Fl. June, Sept. Clt. 1724. Pl. 2 to 3 feet.

2 E. HEDERÆFÒLIA (Spreng. syst. 3. p. 244.) leaflets somewhat 3-lobed, acuminated; pedicels rising in the racemes by threes; calyx 5-toothed; stem prickly; root tuberous. ♃. F. Native of Louisiana. Xyphânthus hederæfòlius, Rafin. Flowers scarlet.

Ivy-leaved Coral-tree. Pl. 1 to 2 feet.

3 E. RESUPINA'TA (Roxb. cor. 3. t. 220.) branches herbaceous, annual, and are, as well as the petioles, rather prickly; leaflets roundish; racemes crowded with flowers, short; calyx bilabiate; vexillum oval-oblong. ♃. S. Native of the East Indies. Vexillum of a lurid scarlet colour. Racemes 2 or 3 inches long, rising before the leaves.

Resupinate-flowered Coral-tree. Clt. 1823. Pl. 1 foot.

§ 2. *Species the stems of which are only herbaceous in the gardens, or when not protected in winter by a stove, but in their native countries become small trees.*

4 E. HO'RRIDA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stems almost herbaceous, angular, and are, as well as the petioles and ribs of leaves, very prickly; leaflets ovate, cordate, acute; calyx 5-toothed; legume stipitate, pendulous, prickly. ♃. F. Native of Mexico, on mount Ayahual-tempos. Flowers unknown, but probably crimson.

Horrid Coral-tree. Clt. 1824. Pl. 2 to 3 feet.

5 E. LO'NGIPES (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stems nearly herbaceous, prickly; petioles unarmed; leaflets ovate; racemes lateral, on long peduncles; calyx obliquely truncate, somewhat bilabiate; vexillum oblong; stamens 9 connected, the tenth free. ♃. F. Native of Mexico. Flowers of a coppery scarlet colour. Root fibrous.

Long-peduncled Coral-tree. Pl. 2 to 3 feet.

6 E. LEPTORHI'ZA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stems herbaceous, and are, as well as the petioles, unarmed; leaflets ovate, rather cordate; calyx spathaceous; vexillum oblong, bidentate at the apex; legume rather villous. ♃. F. Native of Mexico. Racemes terminal. Flowers of a pale scarlet colour. Stamens 9 connected, and one free. Legume stipitate, cuspidate at the apex.

Slender-rooted Coral-tree. Pl. 2 to 3 feet.

7 E. CRI'STA-GA'LLI (Lin. mant. 99.) stems woody; petioles prickly, glandular; leaflets oval or ovate, glaucescent, coriaceous, bluntish; calyx truncate, somewhat bidentate; stamens 9 connected, but with the tenth free; keel 3 times the length of the calyx. ♄. F. Native of Brazil. Smith, exot. bot. 2. p. 95. Sweet, fl. gard. 214. A stout shrub. Flowers of a bright deep scarlet colour.

Cock's-comb Coral-tree. Fl. May, July. Clt. 1771. Shrub 6 to 8 feet, or tree 20 feet.

8 E. LAURIFÒLIA (Jacq. obs. 3. p. 1. t. 51.) stems suffruticose, branched; branches glabrous, rather prickly; leaflets petiolate, oblong, acuminated; petioles rather prickly, glandular; calyx truncate, unidentate; keel monopetalous; stamens monadelphous. ♄. F. Native of South America. Sweet, fl. gard. 2. t. 142. E. crísta-gálli, Ker. bot. reg. 313. exclusive of the synonymes. Flowers of a rich dull crimson.

Laurel-leaved Coral-tree. Fl. July, Sept. Clt. 1800. Pl. 6 feet, or tree 20 feet.

§ 3. *Arboreous or shrubby species, with the branches bearing the racemes as well as the leaves.*

9 E. CA'RNEA (Ait. hort. kew. 3. p. 8.) stem shrubby, prickly; petioles unarmed; leaflets rhomboid-ovate, acute, glabrous; vexillum linear, elongated; calyx campanulate, truncate. ♄. S. Native of South America, in Vera Cruz and St. Martha. Lindl. bot. reg. 1327. Trew. ehr. 2. t. 3. E. Americàna, Mill. dict. no. 2. Flowers pale red, not large, about 2 inches long.

Var. β; leaves puberulous beneath. Ker. bot. reg. 389.

Flesh-coloured-flowered Coral-tree. Fl. May, July. Clt. 1733. Shrub 4 to 10 feet.

10 E. CORALLODE'NDRON (Lin. spec. 992. exclusive of var. *α*.) stem arboreous, prickly; petioles unarmed; leaflets broad, rhomboid-ovate, acute, glabrous; calyx truncate, 5-toothed; vexillum oblong; the tenth stamen free, and about equal in length to the rest. ♄. S. Native of the West Indies. Comm. hort. amst. 1. t. 108. E. spinòsa, Mill. dict. no. 1. Flowers deep scarlet, about 2 inches long. The flowers do not appear until the leaves have fallen.

Common *Coral-tree.* Fl. May, June. Clt. 1690. Shrub 6 to 12 feet.

11 E. ENNEA'NDRA (D. C. cat. hort. monsp. 109.) stem arboreous, and is, as well as the petioles, prickly; leaflets rhomboid, pubescent beneath; calyx truncate; vexillum linear-oblong; stamens 9 joined together, the tenth absent. ♄. S. Native of South America. E. velutina, Jacq. hort. schœnbr. 4. t. 466. Flowers of a deep scarlet colour. The leaves push forth when the flowers begin to decay, and fall before they rise. In Jacquin's *E. velutina* the calyx is somewhat bluntly toothed, while in this plant it is truncate.

Enneandrous Coral-tree. Fl. May, July. Clt. 1800. Shrub 6 to 12 feet.

12 E. MACROPHY'LLA (D. C. prod. 2. p. 411.) stem shrubby; petioles rather prickly; leaflets broadly ovate, acuminated, glabrous above, pubescent beneath; calyx tubular, bluntly somewhat bilabiate at the apex; vexillum linear-oblong, straight; wings and keel shorter than the calyx; stamens 10, monadelphous. ♄. G. Native country unknown, but is cultivated in the gardens of Teneriffe. Leaflets 9-12 inches long, and 7-9 inches broad. Racemes clothed with velvety villi. Flowers scarlet. This species comes very near *E. corallodéndron*, but differs from it in the tenth stamen being connected to the rest; it is also nearly allied to *E. móllis.*

Long-leafletted Coral-tree. Clt. 1822. Tree 10 to 12 feet.

13 E. MI'TIS (Jacq. hort. schœnbr. t. 216.) stem arboreous, and is, as well as the petioles, unarmed; leaflets rhomboid-ovate, acute, glabrous; calyx tubular, bilabiate at the apex; vexillum elongated, linear-lanceolate; stamens 9 connected, the tenth one almost free, and about equal in length to the others. ♄. S. Native of Caraccas. E. inérmis, Mill. dict. no. 6. ? Flowers either pale or dark scarlet. The leaves rising when the flowers begin to fade.

Mild Coral-tree. Clt. 1790. Tree 10 to 12 feet.

14 E. SUBERÒSA (Roxb. hort. beng. p. 53.) stem prickly; petioles unarmed; leaflets roundish-rhomboid, tomentose beneath; calyx spathaceous, bilabiate; stamens diadelphous, length of the vexillum. ♄. S. Native of the East Indies. Flowers scarlet.

Corky Coral-tree. Tree.

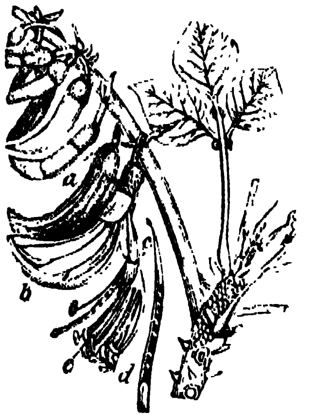
15 E. POIA'NTHUS (Brot. in Lin. trans. 14. p. 342. t. 11.) stem arboreous, prickly; petioles also prickly; lateral leaflets ovate, middle one rhomboid-ovate, all pubescent beneath; calyx obliquely truncate, with the upper side cleft or entire; stamens diadelphous, hardly shorter than the vexillum. ♄. S. Native of South America. Lindl. bot. reg. 1246. Flowers scarlet.

Grass-flowered Coral-tree. Fl. June, Sept. Clt. 1823. Tree 10 to 15 feet.

16 E. SECUNDIFLÒRA (Brot. in Lin. trans. 14. p. 340. t. 12.) stem arboreous, prickly; petioles unarmed; leaflets ovate, somewhat acuminated, glabrous on both surfaces; calyx unopen, obsoletely denticulated, toothless, truncate, and variously cut behind; stamens diadelphous, length of the vexillum; keel equal in length to the wings, but longer than the calyx, and almost 3 times shorter than the vexillum. ♄. S. Native of Brazil. Flowers deep scarlet, secund (f. 50.)

Secund-flowered Coral-tree. Clt. 1820. Tree 10 to 14 feet.

FIG. 50.



17 E. SPECIÒSA (Andr. bot. rep. t. 443.) stems shrubby, prickly; petioles and ribs of leaves prickly; leaflets broad, slightly 3-lobed, acuminated, glabrous; calyx tubular, somewhat bidentate; vexillum linear-lanceolate, elongated. ♄. S. Native of the West Indies. Ker. bot. reg. 750. A. and B. where the petioles are said to be unarmed in the description, but the plant is figured with them. Flowers deep crimson. Stamens undescribed. Racemes and calyxes velvety.

Showy Coral-tree. Fl. Aug. Oct. Clt. 1805. Shrub 6 to 10 feet.

18 E. GUINEE'NSIS; stem much branched, prickly; petioles and ribs of leaves prickly; leaflets oval-lanceolate, entire; calyx spathaceous; legume torulose. ♄. S. Native of Sierra Leone, in the low lands. An elegant species, with long spike-formed racemes of scarlet flowers. The leaves pushing forth when the flowers begin to fade, or as the wet season advances (v. s. herb. Lamb.)

Guinea Coral-tree. Fl. Feb. March. Shrub 6 to 8 feet.

19 E. RUBRINE'RVIA (H. B. et Kunth, nov. gen. amer. 6. p. 454.) stem arboreous, prickly; leaflets roundish-ovate, acuminated, rather cuneated and rounded at the base, 3-nerved, glaucous beneath; calyx tubular, spathaceous, glabrous; vexillum linear, straight; stamens nearly monadelphous. ♄. S. Native of South America, on the western declivities of mountains about Santa-Fe-de-Bogota, where it is called *Chocho.* Flowers flesh-coloured.

Red-nerved-leaved Coral-tree. Clt. 1823. Tree 10 to 20 ft.

20 E. UMBRÒSA (H. B. et Kunth, l. c.) stem arboreous, prickly; leaflets somewhat acuminated, 3-nerved, glabrous, rounded and truncate at the base, the middle one rather deltoid; calyx campanulate, spathaceous; vexillum linear-cuneated, straight, very long; stamens diadelphous. ♄. S. Native of South America, between La Guayra and Caraccas, where it is called *Bucare*, and where it is planted in rows to shade the plantations of *Theobròma Cacào* or chocolate-nut. It is also used in Trinidad for the same purpose. Flowers scarlet.

Shady Coral-tree. Clt. 1817. Tree 40 to 60 feet.

21 E. CA'FFRA (Thunb. prod. 121. fl. cap. 559.) stem arboreous, and is, as well as the petioles and primary ribs of leaves, prickly; leaflets broad-ovate, glabrous, bluntly acuminated; calyx 5-toothed; vexillum oval-oblong, obtuse; stamens 9 connected together, the tenth free. ♄. S. Native of Caffre Land. Ker. bot. reg. 736. A. and B. Sims, bot. mag. 2431. Flowers of a dirty scarlet-colour.

Caffrarian Coral-tree. Fl. June, July. Clt. 1816. Shrub 6 feet.

22 E. HUMEA'NA (Spreng. syst. 3. p. 243.) stem arboreous, prickly; leaflets acute, smooth; petioles prickly, and nerves of leaves beneath; racemes aggregate, straight, terminal; calyx truncate, toothed; stamens diadelphous, shorter than the vexillum. ♄. S. Native country unknown. E. Cáffra, Brot. vag. Flowers scarlet.

Hume's Coral tree. Tree.

23 E. ARBORE'SCENS (Roxb. cor. 3. t. 219.) stem arborescent, prickly; petioles unarmed; leaflets broadly ovate, acutish, pubescent beneath; calyx campanulate, entire; vexillum oval, concave; stamens 10, monadelphous at the base. ♄. S. Native of Nipaul. Flowers of a carmine colour, about an inch and a

half long. Legumes pendulous, pedicellate, villous, cuspidate at the apex.

Arborescent Coral-tree. Clt. 1818. Tree 12 to 15 feet.

24 E. I'ndica (Lam. dict. 2. p. 391. var. α.) stem arboreous, prickly; petioles unarmed; leaflets broad-ovate, acute, glabrous; calyx spathaceous; vexillum spreading, ovate, concave; stamens monadelphous at the base. ♄ . S. Native of the East Indies. E. corallodéndron β, Lin. spec. 992. E. orientàlis, Murr. comm. gœtt. 8. p. 35. t. 1.—Rheed. mal. 6. t. 7.—Rumph. amb. 2. t. 76. Flowers of a splendid scarlet-colour. In Rheede's figure the calyx is acute and much elongated, but in the figure of Rumphius it is short and obtuse; they are therefore probably distinct species.

Indian Coral-tree. Clt. 1814. Tree 20 to 30 feet.

25 E. Loure'iri; stem arboreous, prickly; petioles unarmed; leaflets rather cordate, deltoid, acute, glaucous; calyx spathaceous; vexillum very long, acute; stamens monadelphous at the base, equal in length to the vexillum. ♄ . G. Native of China and Cochin-china. E. corallodéndron, Lour. coch. 427. Flowers scarlet. A decoction of the bark is used against intermittent fevers, and the leaves are used to cleanse ulcers.

Loureiro's Coral-tree. Tree 20 to 30 feet.

26 E. pícta (Lin. spec. 993.) stem arboreous, prickly; petioles and ribs of leaves rather prickly; leaflets broadly ovate, painted with white in the centre; calyx spathaceous; vexillum oval, concave; stamens monadelphous at the base. ♄ . S. Native of the Moluccas. E. I'ndica β, Lam. l. c.—Rumph. amb. 2. t. 77. Flowers of a carmine colour. Seeds dark purple.

Painted-leaved Coral-tree. Clt. 1696. Shrub 6 to 10 feet.

27 E. spatha'cea (D. C. prod. 2. p. 412.) stem arboreous, and is as well as the petioles unarmed; leaflets broad-ovate, acute, glabrous; calyx velvety, spathaceous, acutely 5-toothed at the apex. ♄ . S. Native of St. Domingo. Wings and keel scarlet; vexillum not seen.

Spathaceous-calyxed Coral-tree. Clt. 1824. Sh. 6 to 10 ft.

28 E. veluti'na (Willd. nov. act. scrut. berol. 3. p. 426. spec. 3. p. 914.) stem arboreous, prickly; leaflets rounded at both ends, 3-nerved, rather pilose above, but clothed with soft canescent tomentum beneath, unarmed, terminal one transversely elliptic; calyx spathaceous, slightly 5-toothed, tomentose; vexillum elliptic, reflexed. ♄ . S. Native of South America, near Caraccas. H. B. et Kunth, nov. gen. amer. 6. p. 435. Flowers with a reddish yellow vexillum, and with the wings and keel greenish yellow.

Velvety Coral-tree. Clt. 1810. Tree 60 feet.

29 E. fu'sca (Lour. coch. 427.) stem shrubby, prickly; petioles unarmed; leaflets lanceolate, glabrous; calyx bilabiate; vexillum elongated, convolute; stamens monadelphous at the base. ♄ . G. Native of Cochin-china, on the banks of rivers. Gelàla aquática, Rumph. amb. 2. t. 78. ex Lour. but neither the figure nor description agrees with the present plant. Flowers of a brownish-red colour.

Brownish-flowered Coral-tree. Shrub 8 feet.

30 E. nervòsa (D. C. prod. 2. p. 413.) stem arboreous, and is as well as the petioles unarmed; leaflets oval, acuminated, glabrous above, feather-nerved beneath and clothed with velvety down as well as the petioles; racemes axillary, short; calyx ample, irregularly 5-toothed. ♄ . S. Native of Brazil. Flowers 2 inches long. Leaflets 4-6 inches long, with the nerves elevated beneath. Legumes unknown.

Nerved-leaved Coral-tree. Tree.

31 E. glau'ca (Willd. nov. act. nat. scrut. berol. 3. p. 428. spec. 4. p. 915.) stem arboreous, prickly; petioles almost unarmed; leaflets ovate, glaucous beneath; calyx bilabiate; vexillum cuneiform, spreading; keel longer than the wings; stamens 10, monadelphous at the base. ♄ . S. Native of South America, at Caraccas and near Cumana. Legume glabrous. Seeds grey. Flowers copper-coloured.

Glaucous-leaved Coral-tree. Clt. 1819. Tree 20 feet?

32 E.? isope'tala (Lam. dict. 2. p. 392.) stems sarmentose, and are as well as the petioles unarmed; leaflets ovate-lanceolate, glabrous; calyx campanulate, 5-lobed; petals unguiculate, about equal in length; stamens 10, monadelphous at the base. ♄ . ◡. S. Native of Brazil, at Rio Janeiro. Flowers an inch and a half long. Legume unknown.

Equal-petalled Coral-tree. Shrub cl.

33 E. Senegale'nsis (D. C. prod. 2. p. 413.) stem shrubby, and is as well as the petioles and ribs of leaves prickly; leaflets ovate-oblong, obtuse, coriaceous, glabrous; calyx obliquely truncate, somewhat bilabiate; vexillum oblong-cuneiform, straight, obtuse. ♄ . S. Native of Senegal. Flowers an inch long, deep crimson. Leaflets 3 inches long and 12 or 15 lines broad. The leaves push forth when the flowers begin to fade.

Senegal Coral-tree. Fl. Feb. Mar. Shrub 6 to 8 feet.

34 E. Abyssi'nica (Lam. dict. 2. p. 392.) stem arboreous, prickly; petioles unarmed; leaflets glabrous, obtuse, lateral ones broadly and obliquely ovate, terminal one roundish. ♄ . S. Native of Abyssinia (Bruce). Flowers and fruit unknown. According to Bruce, the seeds of this species of *Coral-tree* are called *Carats* in Abyssinia, and are used in weighing gold and precious stones.

Abyssinian Coral-tree. Tree.

35 E. breviflòra (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stem shrubby, and is as well as the petioles prickly; leaflets ovate, acute; racemes axillary, shorter than the leaves; calyx bilabiate; vexillum oval; legumes pendulous, few-seeded, glabrous, unarmed, mucronate. ♄ . G. Native of Mexico, at the river Ayacapixtla. Flowers scarlet.

Short-flowered Coral-tree. Tree.

36 E. coralloìdes (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stem arboreous, bearing a solitary prickle under each leaf; petioles unarmed; leaflets ovate; calyx truncate; vexillum linear-oblong; legumes glabrous, few-seeded, stipitate at the base, cuspidate at the apex. ♄ . G. Native of Mexico. Flowers scarlet. Seeds red; the hylum girded by a white line; they are commonly called *Colorines*.

Coral-like-seeded Coral-tree. Tree.

37 E. pa'tens (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 414.) stem shrubby, and is as well as the petioles unarmed; leaflets ovate, obtuse; racemes terminal, rather velvety; mouth of calyx dilated and obliquely truncate; vexillum spreading, stipitate, roundish; legume villous. ♄ . S. Native of Mexico. Flowers scarlet.

Spreading Coral-tree. Tree.

38 E. divarica'ta (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 414.) stem shrubby, prickly; petioles unarmed; leaflets cordate, acute; calyx velvety, spathaceous, 5-toothed at the apex; vexillum spreading, oval; stamens diadelphous. ♄ . S. Native of Mexico. Flowers scarlet, large, and very beautiful. Racemes lateral, many-flowered. Perhaps the same as *E. spathàcea*, but differs in the trunk being prickly.

Divaricate Coral-tree. Tree.

39 E. monospe'rma (Gaud. in Freycenet, voy. bot. p. 486. t. 114.) arboreous, unarmed; leaflets broadly ovate, reniform, obtuse, clothed with brownish tomentum beneath; legume 1-seeded. ♄ . S. Native of the Sandwich Islands. Flowers scarlet.

One-seeded Coral-tree. Tree.

† *Species, the names of which are given in garden catalogues, but without any description.*

1 *E. aculeatíssima*, Desf. 2 *E. triacántha*, Willd. 3 *E. incàna*, Willd. 4 *E. piscidioìdes*, Hortul. 5 *E. fúlgens*, Hortul. 6 *E. strícta*, Roxb. 7 *E. ovalifòlia*, Roxb. 8 *E. sublobàta*, Roxb.

Cult. The species of *Coral-tree* have fine large leaves and splendid flowers, and are therefore worth cultivating in every collection of stove plants; they all thrive well in light loamy soil. In order to bring them into flower they should be placed on shelves in the stove, when they have lost their leaves giving them hardly any water, and when they begin to shew flowers they may be watered more freely. Cuttings of all, if taken off at a joint without depriving them of their leaves, strike root readily in sand, under a hand-glass, in moist heat. *E. laurifòlia* and *E. crísta-gálli* will thrive and flower freely if planted in the open ground, in a warm sheltered situation; in such a situation, however, they are always killed to the stump in winter.

CCVII. RUDO'LPHIA (in honour of Charles Asmund Rudolph, a botanist of Jena). Willd. nov. act. scrut. berol. 3. p. 151. spec. 3. p. 918.—Erythrìna, spec. of Lin. and Juss.—Bùtea, spec. of Pers.

LIN. SYST. *Diadélphia, Decándria.* Calyx tubular, bilabiate, 4-cleft; upper lobe largest and obtuse, lower one acute, 2 lateral ones very short. Corolla with an oblong-linear, straight, very long vexillum. Wings very narrow, shorter than the calyx, as well as parts of the carina. Stamens diadelphous. Legume compressed, flat, sessile, many-seeded, mucronate by the style. Seeds flat.—Climbing shrubs with simple leaves, which are furnished with 2 stipels each at the top of the petiole.

1 R. VOLU'BILIS (Willd. l. c. Vahl. ecl. 3. p. 41. t. 30.) branches dotted from tubercles; leaves glabrous, cordate, ovate, acuminated; racemes bearing flowers from the base. ♄. ⌒. S. Native of Porto-Rico, on the highest mountains, and of Mexico. Flowers scarlet, an inch and a half long.

Var. β, pilosiúscula (D. C. prod. 2. p. 414.) branches and petioles pilose. Erythrìna cordifòlia, Juss. ined. Erythrìna Portoricénsis, Desf.

Twining Rudolphia. Shrub tw.

2 R. RÒSEA (Tussac, fl. ant. t 22.) branches smooth, glabrous; leaves ovate-oblong, glabrous, acuminated; racemes pedunculate. ♄. ⌒. S. Native of St. Domingo. Flowers scarlet, hardly an inch long. Legume pubescent. Perhaps the figure in Plum. icon. t. 102. f. 1. is referrible to this species, and all the synonymes to the following, but the leaves in our plant are not peltate as in it, the flowers are smaller and the legume is not glabrous nor torose at the seeds, as represented in the figure of Plumier.

Rose-flowered Rudolphia. Clt. 1826. Shrub tw.

3 R. PELTA'TA (Willd. l. c.) leaves rather cordate, oblong-lanceolate, peltate; raceme on a long peduncle. ♄. ⌒. S. Native of St. Domingo. Plum. ed. Burm. t. 102. f. 1. Erythrìna planisíliqua, Lin. spec. 993. Lam. dict. 2. p. 392. Perhaps the same as the last species. Flowers probably scarlet.

Peltate-leaved Rudolphia. Shrub tw.

4 R. DU'BIA (H. B. et Kunth, nov. gen. amer. 6. p. 432. t. 591.) branches angular, sulcated, glabrous; petioles winged; leaves somewhat deltoid-ovate, and somewhat hastately cordate at the base, and acuminated at the apex, glabrous; peduncles axillary; legume beaked by the style. ♄. ⌒. S. Native of New Granada, in shady places near Turbaco, ex Kunth, and in Cuba, about the Havannah, Willd. Glycine sagittàta, Humb. in Willd. enum. 757. Flowers scarlet or rose-coloured.

Doubtful Rudolphia. Clt. 1815. Shrub tw.

Cult. The species are elegant climbers, bearing large scarlet flowers, and are well adapted for covering the rafters in stoves or stove conservatories. Their culture and propagation are the same as for the species *Erythrìna*, which see.

CCVIII. BU'TEA (in honour of John Earl of Bute, once a munificent patron of Botany). Roxb. cor. 1. p. 22. D. C. prod. 2. p. 414.—Plàso, Rheed. and Adans.

LIN. SYST. *Diadélphia, Decándria.* Calyx campanulate, 5-toothed, the 2 superior teeth approximate and almost connected. Corolla with a lanceolate spreading vexillum; keel incurved, about equal in length to the wings and vexillum. Stamens diadelphous. Legume stipitate, compressed, flat, membranous, indehiscent, 1-seeded at the apex. Seed large, compressed.—Asiatic, unarmed trees, with pinnately trifoliate leaves, and large ovate, roundish, stipellate leaflets. Racemes many-flowered. Flowers 3 together, on short pedicels, and furnished with 2 bracteoles each, under the calyx. Corolla of a deep scarlet colour. Down on the calyxes usually black and velvety. This genus probably agrees better with the tribe *Dalbérgieæ* than with the present.

1 B. FRONDÒSA (Roxb. cor. 1. p. 22. t. 21. asiat. res. 3. p. 469.) branches pubescent; leaflets roundish, obtuse, or emarginate, rather velvety beneath; corolla 4-times the length of the calyx; calycine teeth acutish. ♄. S. Native of the East Indies, on [illegible] mountains.—Rheed. mal. 6. t. 16 and 17. B. frondòsa, Kern. icon. sel. 1. t. 4. Erythrìna monospérma, Lam. dict. 1. p. 391. Stipes and sutures of the legumes clothed with white tomentum, but the valves are hardly pubescent. Flowers 2 inches long. The red juice which flows from the tree evaporates to the consistence of gum, which is astringent, and is called gum-lac or East India kino, but is not so good as the African kino. The expressed juice of the fresh flowers, and infusions of the dried flowers yield a water colour brighter than gamboge; they also yield a fine durable yellow lake in a large proportion. The lac insects are frequently found upon the smaller branches and petioles of the tree; but whether the natural juices of its bark contribute to improve their red colouring matter has not been determined.

Frondose Butea. Clt. 1796. Tree 40 feet.

2 B. SUPE'RBA (Roxb. cor. 1. t. 22.) branches glabrous; leaflets roundish, obtuse, velvety beneath; corolla 4-times the length of the calyx; calycine teeth acute. ♄. ⌒. S. Native of Coromandel, on the mountains. This is a very shewy tree, approaching the preceding species, but is larger in all its parts. It yields similar juice.

Superb Butea. Clt. 1798. Shrub tw.

3 B. PARVIFLÒRA (Roxb. hort. beng. p. 53.) branchlets pubescent; leaflets roundish, obtuse, clothed with silky tomentum beneath; racemes panicled; corolla hardly twice the length of the calyx; calycine teeth acute. ♄. ⌒. S. Native of Coromandel. Flowers 4 lines long.

Small-flowered Butea. Shrub tw.

4 B. BRAAMIA'NA (D. C. prod. 2. p. 415.). ♄. ⌒. G. Native of China. Braam. icon. chin. t. 23. This tree comes very near to *B. frondòsa*, but differs in the leaflets being edged with white, probably with white tomentum, in the calyx being greenish, in the flowers being fewer on the racemes, in the genitals being more exserted, and in the petals diverging more.

Braam's Butea. Tree tw.

Cult. The species of this genus bear large fine leaves, and large shewy scarlet flowers. Their culture and propagation are the same as for the species of *Erythrìna*, which see.

Tribe VI.

DALBERGIE'Æ (plants agreeing in some important characters with *Dalbérgia.* Bronn. diss. p. 134. exclusive of some genera. D. C. mem. legum. x. Corolla papilionaceous (f. 51. *b.*), perigynous. Stamens variously connected. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21. *e. f.*), which are thick (f. 21. *c.*). Legumes 1-2-seeded, indehiscent. —Usually climbing shrubs, with impari-pinnate leaves, rarely, but sometimes pinnately trifoliate or simple. This tribe is probably very distinct from *Phascolièæ*, but the germination of the seeds is not sufficiently known.

CCIX. DE'RRIS (δερρις, *derris*, a skin; in reference to the consistence of the legumes). Lour. coch. p. 432. D. C. prod. 2. p. 415.

Lin. syst. *Monadélphia*, *Decándria*. Calyx tubular, with 5 blunt teeth. Corolla papilionaceous. Keel lunate, of 2 concrete petals. Stamens 10, monadelphous. Legume oblong, obtuse, much compressed, 1-seeded, membranous. Seed oblong, flat.—Unarmed, climbing, glabrous shrubs, with impari-pinnate leaves, having from 1 to many pairs of exstipellate leaflets. Racemes axillary and lateral. Flowers white. Roots fleshy.

1 D. TRIFOLIA'TA (Lour. l. c.) leaves pinnately trifoliate; leaflets ovate-lanceolate; racemes axillary, length of leaves. ♄. ◡. G. Native of China, in the province of Canton, in woods.

Trifoliate Derris. Shrub cl.

2 D. PINNA'TA (Lour. l. c.) leaves impari-pinnate, with many pairs of alternate, ovate-oblong leaflets; peduncles lateral, many-flowered. ♄. ◡. S. Native of Cochin-china, in woods.

Pinnate-leaved Derris. Shrub cl.

Cult. These shrubs are well adapted for the climbers in greenhouses, or greenhouse conservatories. Ripened cuttings will root readily in sand, under a hand-glass.

CCX. ENDESPE'RMUM (from ενδεης, *endees*, indigent, and σπερμα, *sperma*, a seed; in reference to the want of seeds, there being only one in each legume). Blum. ex flora, 1825. p. 132. D. C. prod. 2. p. 415.

Lin. syst. *Monadélphia*, *Enneándria*. Calyx bilabiate, bibracteolate at the base; upper lip bluntly 2-lobed, lower one tridentate. Wings and carina on long claws. Stamens 9, monadelphous, the tenth one absent or deficient. Legume on a very long pedicel, membranous and foliaceous, lanceolate, 1-seeded, indehiscent. Seed linear, compressed. This genus is said to be allied to *Dalbérgia*.

1 E. SCA'NDENS (Blum. l. c.). ♄. ◡. S. Native of Java. Leaves abruptly pinnate; leaflets alternate, oblong, elongated, obtuse at the base, ending in a very short acumen at the apex, villous on both surfaces, but more so beneath. Racemes when bearing the flowers shorter than the leaves, but becoming longer as the pods advance. Flowers small, probably white.

Climbing Endespermum. Shrub cl.

Cult. See *Dalbérgia* for culture and propagation, p. 375.

CCXI. PONGA'MIA (*Pongam* is the Malabar name of the first species). Lam. ill. t. 603. Vent. malm. no. 28. D. C. prod. 2. p. 416.—Galedùpa, Lam. dict. 2. p. 594. exclusive of the synonymes of Rumphius, and therefore the name.

Lin. syst. *Monadélphia*, *Decándria*. Calyx cup-shaped, 5-toothed, obliquely truncate. Petals 5, all unguiculate and disposed into a papilionaceous corolla. Stamens 10, monadelphous, having the sheath or tube cleft above, or the tenth stamen loosened from the rest. Legume somewhat stipitate, compressed, flat, indehiscent, beaked, 1-celled, 1-2-seeded.—East Indian trees, with impari-pinnate leaves, opposite leaflets, axillary racemes of usually white or yellow flowers.

1 P. GLA'BRA (Vent. malm. t. 28.) leaves with 2-3 pairs of ovate, acuminated, glabrous leaflets. ♄. S. Native of the East Indies. Robínia mitis, Lin. spec. 1044. Dalbérgia arbòrea, Willd. spec. 3. p. 901. Galedùpa I'ndica, Lam. dict. 2. p. 594. Burm. fl. ind. 163.—Rheed. mal. 6. t. 3. Calyx red. Corolla white.

Glabrous Pongamia. Clt. 1699. Shrub 5 to 10 feet.

2 P. CHINE'NSIS (D. C. prod. 2. p. 416.) leaves with 2 or 3 pairs of ovate-lanceolate, glabrous leaflets; stem shrubby. ♄. G. Native of China. Robínia mìtis, Lour. coch. 455. Flowers yellow, tern in the raceme.

China Pongamia. Shrub 3 feet.

3 P. ULIGINÒSA (D. C. l. c.) leaves with 1-2 pairs of oval-oblong, acuminated, glabrous leaflets. ♄. ⌒. S. Native of Bengal. Galedùpa uliginòsa, Roxb. hort. beng. 53. Robínia uliginòsa, Willd. spec. 3. p. 1133. Flowers white.

Bog Pongamia. Clt. 1824. Shrub tw.

4 P. GRANDIFLÒRA (Vent. malm. no. 28.) leaves with 3-4 pairs of elliptic, obtuse leaflets, which are pubescent beneath. ♄. S. Native of the East Indies. Galedùpa grandiflòra, Vahl. in herb. Juss. Legume compressed, flat, oval, pubescent. Racemes shorter than the leaves.

Great-flowered Pongamia. Clt. 1818. Shrub.

5 P. SERI'CEA (Vent. l. c.) leaves with 3-4 pairs, or only with 1 pair from abortion, of oblong leaflets, which are silky beneath; racemes elongated, approximating into a panicle. ♄. S. Native of Java. Flowers probably white.

Silky-leaved Pongamia. Shrub.

6 P. ATROPURPU'REA (Wall. pl. rar. asiat. 1. p. 70. t. 78.) leaves with 3-4 pairs of oblong, attenuated, coriaceous, smooth leaflets; flowers disposed in dense racemes, numerous, forming a terminal panicle; legumes broad, ovate-lanceolate, 1-seeded, smooth. ♄. S. Native of the Burman empire, in woods on the shores of Martaban, at Amherst, and Moalmyne, and elsewhere. Flowers deep purple. The wood is much esteemed by the Burmese and Taleyne people, who employ it for beams and rafters in their houses. Dr. Wallich was told that they eat the tender leaves.

Dark-purple-flowered Pongamia. Tree 70 feet.

Cult. See *Dalbérgia* for culture and propagation, p. 375.

CCXII. DALBE'RGIA (in honour of Nicholas Dalberg, a Swedish botanist). Roxb. hort. beng. p. 52. and cor. 2. vol. 2. D. C. prod. 2. p. 416. Dalbérgia, spec. Lin. fil. suppl. 52. Lam. ill. 601. f. 2.—Solòri, Adans. fam. 327.

Lin. syst. *Monadélphia*, *Octándria*, and *Decándria*, or *Diadélphia*, *Decándria*. Calyx campanulate, 5-toothed (f. 51. *a.*). Corolla papilionaceous (f. 51. *c.*); petals of keel connected to the apex (f. 51. *b.*). Stamens 8-10, sometimes all monadelphous, with the tube or sheath cleft in front, sometimes divided into 2 equal opposite bundles. Legume stipitate, membranous, compressed, flat, oblong, tapering to both ends, 1-3-seeded (f. 51. *d.*). Seeds compressed, remote. Radicle inflexed.—Sometimes trees, but usually climbing shrubs, with impari-pinnate leaves.

1 D. OUGEINE'NSIS (Roxb. hort. beng. p. 53.) leaves pinnately trifoliate; leaflets ovate-roundish, rather villous, with undulately curled margins; pedicels 1-flowered, rising in fascicles, and are as well as the calyxes villous. ♄. S. Native of the East Indies. Flowers small. Terminal leaflets obovate.

Ougein Dalbergia. Clt. 1820. Tree 30 feet.

2 D. Sìssoo (Roxb. hort. beng. p. 52.) leaflets 5, alternate, petiolulate, obovate, abruptly acuminated, glabrous above, but pubescent beneath; panicles axillary, puberulous, shorter than the leaves. ♄. S. Native of Bengal. Stamens 8, monadelphous, with a dorsal fissure. Legume linear-lanceolate, tapering to the base, stipitate, glabrous, 1-seeded. Flowers white.

Sissoo Dalbergia. Clt. 1820. Tree 30 feet.

3 D. LATIFÒLIA (Roxb. cor. 2. p. 7. t. 113.) leaflets 3-5, alternate, roundish, emarginate, glabrous above and pubescent beneath; panicles axillary, few-flowered, much shorter than the leaves. ♄. S. Native of Coròmandel, on the mountains. Stamens monadelphous, with a dorsal fissure. Flowers white. Legume oblong-lanceolate. The wood is used in making household furniture in India.

Broad-leaved Dalbergia. Clt. 1811. Tree 40 feet.

4 D. RUBIGINÒSA (Roxb. cor. 2. p. 9. t. 115.) leaflets 7, nearly opposite, oblong, obtuse, glabrous; branches and petioles tomentose; panicles axillary, much shorter than the leaves. ♄.

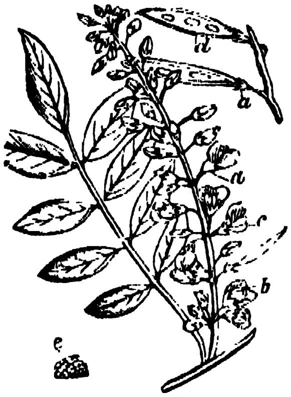
◡. S. Native of Coromandel, on the mountains. Flowers white. Stamens monadelphous, with a dorsal fissure. Legumes unknown.

Rusty Dalbergia. Clt. 1811. Shrub cl.

5 D. ROBU'STA (Roxb. hort. beng. p. 53.) leaflets 7-9, oval, or obovate, obtuse, somewhat mucronulate, minutely pubescent; racemes spike-formed, twice the length of the leaves; pedicels aggregate. ♄. S. Native of the East Indies, in Silhet. Flowers small, white, numerous. Stamens monadelphous, with a dorsal fissure. Legumes unknown.

Robust Dalbergia. Clt. 1816. Tree 30 feet.

FIG. 51.



6 D. SCA'NDENS (Roxb. cor. 2. t. 192.) leaflets 9-11, elliptic-oblong, acutish, glabrous; racemes axillary, spike-formed, longer than the leaves; pedicels in fascicles. ♄. ◡. S. Native of Coromandel. Flowers rose-coloured. Legumes linear-lanceolate, 2-3-seeded, glabrous, tapering to both ends.

Climbing Dalbergia. Clt. 1812. Shrub cl.

7 D. VOLU'BILIS (Roxb. cor. 2. t. 191.) leaflets 11, alternate, oval, mucronate, glabrous; panicles terminal and axillary, divaricate. ♄. ◡. S. Native of Coromandel, on the mountains. Flowers blue. Stamens divided into 2 equal bundles. Legumes linear-oblong, obtuse, 1-2-seeded, glabrous.

Twining Dalbergia. Clt. 1818. Shrub tw.

8 D. FRONDÒSA (Roxb. hort. beng. 53.) leaflets 9-11, alternate, obovate, obtuse, emarginate, glabrous; panicles axillary, usually nearly terminal, length of leaves; pedicels and calyxes hardly pubescent. ♄. S. Native of Coromandel. Flowers white. Stamens divided into two equal bundles. Legume broad, linear, tapering to both ends, 1-3-seeded, glabrous, wingless on both sutures.

Frondose Dalbergia. Tree 30 feet.

9 D. PANICULA'TA (Roxb. cor. 2. p. 8. t. 114.) leaflets 9-11, alternate, elliptic-obovate, obtuse or emarginate, glabrous; panicle terminal; peduncles, pedicels, and calyxes villous. ♄. S. Native of Coromandel, on the mountains. Flowers white. Stamens divided into 2 equal bundles. Legume oval-lanceolate, 1-2-seeded.

Panicled Dalbergia. Clt. 1811. Tree 30 feet.

10 D. TIMORIE'NSIS (D. C. prod. 2. p. 417.) leaflets 9-11, alternate, glabrous on both surfaces; racemes axillary, length of leaves. ♄. S. Native of the Island of Timor. Flowers unknown. D. lanceolària β, Lam. dict. 3. p. 256. ex herb. mus. Paris. Legume linear-lanceolate, attenuated at both ends, glabrous, 1-2-seeded; the seminiferous suture bearing a narrow wing. The figure in Rheed. mal. 6. t. 22. is referrible to this species.

Timor Dalbergia. Clt. 1826. Tree 15 feet.

11 D. LANCEOLA'RIA (Lin. fil. suppl. 316.) leaflets 11-15, alternate, oblong, obtuse, pilose and veinless beneath; racemes axillary, elongated, and are as well as the calyxes pilose. ♄. S. Native of the East Indies. Flowers rusty. Stamens divided into 2 equal bundles. Legume linear-lanceolate, 1-2-seeded, on a long stipe.

Spear-shaped-podded Dalbergia. Tree 30 feet.

12 D. ARBÒREA (Roth nov. spec. 330.) leaflets 17-25, alternate, oval, obtuse, somewhat emarginate, pubescent on both surfaces, when young they are clothed with tomentum; racemes panicled, sub-secund. ♄. S. Native of the East Indies. Stamens equally diadelphous. Legume unknown.

Tree Dalbergia. Tree 30 to 40 feet.

13 D. BARCLA'YII (Telfair, mss. Hook, exot. bot. 188.) leaflets opposite, linear-lanceolate, with revolute margins, silky beneath; racemes terminal, elongated; calyx with subulate teeth; vexillum silky on the back. ♄. S. Native of the Mauritius. Stamens 10, monadelphous. Flowers purple; the pedicels rising 2-3-together from the raceme.

Barclay's Dalbergia. Clt. 1823. Shrub.

14 D. RU'FA; leaflets alternate, elliptic, rather oblique at the base, emarginate at the apex, clothed with rufous pubescence beneath as well as the petioles and branches; racemes or panicles of flowers axillary, short. ♄. S. Native of Sierra Leone. Habit of *Tamaríndus* (v. s. herb. Lamb.).

Rufous Dalbergia. Tree 20 feet.

15 D. AFZELIA'NA; glabrous, smooth; branches warted; leaflets small, alternate, obtuse at both ends, deeply emarginate at the apex; panicles axillary, shorter than the leaves; legumes flat, stipitate, membranous. ♄. S. Native of Sierra Leone. Flowers unknown (v. s. herb. Lamb.).

Afzelius's Dalbergia. Shrub 8 to 10 feet.

16 D. OBLONGIFÒLIA; branches, panicles, and under side of leaves clothed with rufous pubescence; leaflets alternate, elliptic-oblong, glabrous above, obtuse at both ends, and slightly mucronate at the apex; panicles twin, axillary. ♄. S. Native of Sierra Leone. Flowers unknown. (v. s. herb. Lamb.)

Oblong-leaved Dalbergia. Tree.

17 D. SERICEA; branches and panicles clothed with rufescent pubescence; leaflets alternate, when young clothed with silky down, elliptic, tapering to the base, obtuse and mucronate at the apex; panicles sub-corymbous, axillary, much shorter than the leaves. ♄. G. Native of Nipaul. Flowers small. (v. s. herb. Lamb.)

Silky Dalbergia. Shrub.

18 D. MARGINA'TA (Roxb. hort. beng. 53.) glabrous; leaflets alternate, broad, obovate, coriaceous, margined, rather glaucous beneath; panicles 2-3-together, diffuse, shorter than the leaves. ♄. ◡. S. Native of the East Indies.

Margined-leafletted Dalbergia. Shrub cl.

19 D. CAUDA'TA; leaflets numerous, alternate, oblong-lanceolate, emarginate, mucronate, pale beneath; racemes axillary, panicled, pubescent, shorter than the leaves; legumes pubescent, 1-seeded at the base, and hooked, ending in a long coriaceous, obtuse wing. ♄. S. Native of Guiana. (v. s. herb. Lamb.)

Tailed-podded Dalbergia. Tree.

20 D. JAPÓNICA; leaflets opposite, elliptic, tapering to both ends, acuminated, mucronate, glaucous beneath; racemes axillary; flowers secund. ♄. G. Native of Japan. (v. s. herb. Lamb.)

Japan Dalbergia. Tree.

21 D.? LATISÍLIQUA (Desf. cat. hort. par. 198.) leaflets ovate, abruptly acuminated, pubescent beneath; pedicels pubescent; legumes broad. ♄. S. Native of South America. The rest of the plant unknown.

Broad-siliqued Dalbergia. Tree.

22 D.? HETEROPHY'LLA (Willd. spec. 3. p. 901.) leaflets 3-5, ovate, glabrous, obtuse; racemes axillary, longer than the leaves. ♄. S. Native of the East Indies. Stamens 10, monadelphous. Legume reniform-oval, reticulately veined.

Variable-leaved Dalbergia. Tree.

† *Species, the names of which are only known from Roxburgh's Hortus Bengalensis, p. 53. and p. 98. without any description.*

1 *D. emarginàta.* 2 *D. Zeylánica.* 3 *D. tamarindifòlia.* 4 *D. stipulàcea.* 5 *D. rimòsa.* 6 *D. renifórmis.* 7 *D. alàta.* 8 *D. parviflòra.* 9 *D. Cròwei.* 10 *D. spinòsa.*

Cult. The species will all grow freely in a mixture of sand, loam, and peat, and young cuttings of them will strike root freely if planted in a pot of sand, with a hand-glass placed over them, in a little bottom heat. The climbing kinds are well adapted for covering the rafters in stoves or stove conservatories.

CCXIII. PTEROCA'RPUS (from *πτερον*, *pteron*, a wing, and *καρπος*, *carpos*, a fruit; in reference to the pods being girded by a broad wing). Lin. gen. no. 854. Lam. ill. t. 602. exclusive of some species. D. C. prod. 2. p. 418.

Lin. syst. *Monadélphia Decándria*, or *Diadélphia Decándria*. Calyx 5-toothed. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous or diadelphous. Legume indehiscent, irregular, nearly orbicular, usually varicose, 1-seeded, girded by a wing. Cotyledons thick, incurved. Radicle somewhat inflexed at the base.—Unarmed trees or shrubs, with impari-pinnate leaves, and axillary racemes of flowers. This is a very polymorphous genus, and ought to be divided into several genera, but at present the flowers and fruit of the species are too little known to render this practicable.

Sect. I. Moutou'chia (*Moutouchi* is the Caribbean name of *P. suberòsa*). Aubl. guian. 2. p. 748. t. 299. D. C. prod. 2. p. 418.—Griselìnea, Neck. elem. no. 1358. but not of Forst. Stamens monadelphous, with the sheath or tube entire, not cleft above. Legume roundish, suberose, 1-seeded, having the superior suture straight, but not winged.

1 P. Dra'co (Lin. spec. 438.) leaflets 5-7, alternate, ovate, acuminated, glabrous, shining; fruit smoothish. ♄. S. Native of Guadaloupe and others of the West India islands. P. officinàlis, Jacq. amer. 283. t. 183. f. 92. P. Dràco, Willd. exclusive of the synonymes of Aublet and Commerson. P. hemiptera, Gærtn. fruct. 2. p. 351. t. 156. f. 2. The wood of this tree is white and heavy, the bark thick, of a rusty grey colour, being cut transversely it betrays no marks of redness at first, but in a short time it is variegated with many blood red dots, that collect into little globules or tears. The tree itself when cut in different parts in a short time is full of blood-coloured drops, shining and very clear, in the space of 10 minutes they harden, especially if the sun shines hot, and then are collected under the name of *sanguis draconis* or dragon's-blood. The bark, wood, and leaves have an astringent taste. The resin of *P. Dràco* was formerly sent in abundance from Carthagena to Spain; it no longer occurs in commerce on account of the decreased demand for dragon's-blood, and all the dragon's-blood now in commerce is obtained chiefly from the fruit of *Cálamus Dràco vèrus*, and *rudéntum*, the uses of which we shall give under that head.

Dragon's-blood Pterocarpus. Clt. 1820. Tree 30 to 40 ft.

2 P. suberòsus (Pers. ench. 2. p. 277.) leaflets 5-9, alternate, ovate, acuminated, glabrous, shining; fruit reticulately-rugose from elevated nerves. ♄. S. Native of Guiana, in humid woods. Moutoúchia suberòsa, Aubl. guian. 2. p. 748. t. 299. P. Moutoúchia, Lam. ill. t. 602. f. 1. Racemes panicled. Flowers yellow.

Corky-fruited Pterocarpus. Tree 40 feet.

3 P. crispa'tus (Moc. et Sesse, fl. mex. icon. ined.) leaflets 5-9, alternate, ovate, acutish; fruit smoothish; petals curled. ♄. S. Native of Mexico. Racemes panicled. Flowers of a dirty yellow peach colour.

Curled-petalled Pterocarpus. Tree 40 feet.

Sect. II. Amphyme'nium (from *αμφι*, *amphi*, around, and *ὑμην*, *hymen*, a membrane; in reference to the pods being girded round by a membrane). Stamens monadelphous, with the sheath or tube cleft longitudinally on the upper side, sometimes the whole length. Fruit almost orbicular, containing 1 or 2 seeds inside, girded all round by a broad membrane.

4 P. Ro'hrii (Vahl. symb. 2. p. 79.) leaflets 7-9, alternate, ovate-oblong, abruptly acuminated, and are, as well as the branches and fruit, glabrous. ♄. S. Native of French Guiana, in woods. P. Apalatòa, Rich. in act. soc. nat. par. 1. p. 111. P. Róhrii, Willd. spec. 3. p. 905. exclusive of the synonymes of Aublet, according to König in ann. bot. 1. p. 358. Aubl. guian. 2. t. 145. f. 56. fruit, exclusive of the rest of the plate.

Rohr's Pterocarpus. Clt. 1816. Tree 40 feet.

5 P. orbicula'tus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 418.) leaflets 5, opposite, ovate, acute, glabrous; fruit orbicular, emarginate at the base, but mucronate at the apex. ♄. S. Native of Mexico. Flowers yellow.

Orbicular-fruited Pterocarpus. Tree 30 feet.

6 P. amphyme'nium (D. C. prod. 2 p. 418.) leaflets 7, ovate-elliptic, acute, rounded at the base, glabrous above, and pubescent beneath; branches, petioles, calyxes, and fruit clothed with soft tomentum. ♄. S. Native of Mexico, on the western declivities of mountains. Amphymènium pubéscens, H. B. et Kunth, nov. gen. amer. 6. p. 380. Flowers yellow?

Around-membraned Pterocarpus. Tree 50 feet.

7 P. marsu'pium (Roxb. cor. 2. p. 9. t. 116.) leaflets 5-7, alternate, elliptic, somewhat emarginate, coriaceous, glabrous; branches and calyxes glabrous; panicle terminal; legume rather truncate, glabrous. ♄. S. Native of Coromandel, on the mountains. Flowers pale yellow. Stamens disposed in 2 pentandrous bundles, which are rather concrete on the lower side.

Pouch-podded Pterocarpus. Clt. 1811. Tree 40 feet.

8 P. dalbergioi'des (Roxb. hort. beng. p. 53.) leaflets 5-7, alternate, elliptic, bluntish, coriaceous, and are, as well as the branches and calyxes, glabrous; panicles of flowers axillary. ♄. S. Native of the East Indies. Stamens divided into 2 pentandrous bundles. Flowers yellow.

Dalbergia-like Pterocarpus. Tree 40 feet.

9 P. bi'lobus (Roxb. in herb. Lamb.) leaflets broad, glabrous, alternate, ovate-roundish, deeply 2-lobed at the apex; racemes short, axillary; fruit 1-seeded. ♄. S. Native of the East Indies.

Two-lobed-leaved Pterocarpus. Tree 20 feet.

Sect. III. Echinodi'scus (from *εχινος*, *echinos*, a hedge-hog, and *δισκος*, *diskos*, a disk; in allusion to the legumes being beset with stiff bristles in the centre). Fruit almost orbicular, and somewhat falcate, mucronate from the base of the style, which is either lateral or oblique, girded all round by a membrane, and beset with long stiff bristles in the centre. Flowers unknown. The species of this section are not well known, or it would have probably constituted a distinct genus.

10 P. Adansònii (D. C. prod. 2. p. 419.) leaflets 13-15, alternate, petiolulate, oval or rather oblong, acutish or mucronate, adult ones glabrous above, but clothed with adpressed, silky velvety, canescent down beneath, as well as the branches, petioles, peduncles, and legumes; point of legume lateral, somewhat falcate, not reflexed. ♄. S. Native of Senegal. P. Senegalénsis, Vahl. ex herb. Juss.

Adanson's Pterocarpus. Tree 20 to 30 feet.

11 P. echina'tus (Pers. ench. 2. p. 277.) leaflets ovate, somewhat cordate, glabrous; legume smoothish, falcate, with the point directed towards the pedicel. ♄. S. Native at Capo de Solar.

Echinated-fruited Pterocarpus. Tree.

12 P. erina'ceus (Lam. dict. 5. p. 728. ill. 602. t. 4.) leaflets alternate, elliptic, obtuse, glabrous above, but clothed with rusty pubescence beneath; fruit having a short, straight, lateral point. ♄. S. Native of Senegal and other parts of Guinea. The true African kino has been discovered by Mr. Mungo Park to be the produce of this tree. It is known up the rivers Gambia and Senegal by the name of *Pan du Sangue*. Kino is a gum resin

which is a powerful remedy in obstinate chronic diarrhœas and dysenteries, and in all diseases arising from laxity of the solids. Externally it is applied as a styptic to check hæmorrhages from wounds or ulcers, and to diminish the discharge of ichorous matter from ill-conditioned ulcers.

Hedge-hog-fruited Pterocarpus. Tree 20 feet.

13 P. Angole'nsis (D. C. prod. 2. p. 419.) leaflets 11, petiolulate, ovate, ending in a short taper point, glabrous above, but pubescent along the nerves beneath; fruit large, rather villous. ♄. S. Native of the western coast of Africa, in the kingdom of Angola.

Angola Pterocarpus. Tree 30 feet.

Sect. IV. Santala'ria (from *santalum*, the Latin name for Saunder's-wood). D. C. prod. 2. p. 419. Stamens unequally diadelphous, that is, 9 connected, and 1 free. Fruit almost orbicular, containing 2 or 3 seeds inside.

14 P. I'ndicus (Willd. spec. 3. p. 904.) leaflets 5-9, alternate, ovate, acute, glabrous; racemes axillary, simple or branched; fruit acutely mucronate. ♄. S. Native of the East Indies.—Rumph. amb. 2. t. 70. P. I'ndicus, Roxb. hort. beng. p. 53. P. Dràco, Lam. ill. t. 602. f. 2.—Comm. hort. amst. 1. t. 109. Flowers white.

Indian Pterocarpus. Tree 30 feet.

15 P. Santali'nus (Lin. fil. suppl. 318.) leaflets 3-5, alternate, roundish, retuse, glabrous; racemes axillary, simple or branched; petals crenated. ♄. S. Native of India, on mountains. Flowers yellow, streaked with red. This is the true Santàlum rùbrum of Kœnig. The wood is dark red with black veins, heavy, close, capable of a good polish, and sinking in water. The wood is known in commerce by the name of *Saunder's-wood;* it yields a deep red colouring matter, which appears to be of a resinous nature, to ether and alcohol, but not to water. Its colouring matter forms beautifully coloured precipitates with many metallic solutions. It also yields one kind of dragon's-blood.

Saunder's-wood. Clt. 1800. Tree 66 feet.

16 P. Santalinoi'des (Lher. herb. D. C. prod. 2. p. 419.) leaflets 7-9, alternate, oval, acuminated, glabrous; racemes axillary, simple, shorter than the leaves; peduncles clothed with velvety pubescence; bracteoles 2, linear, subulate, longer than the calyx. ♄. S. Native of Sierra Leone. Flowers dirty yellow.

African Saunder's-wood or *Santalum-like* Pterocarpus. Clt. 1793. Tree 60 feet.

17 P. fla'vus (Lour. coch. p. 431.) leaflets 5-7, opposite, ovate, acute; racemes lateral, spiked; vexillum toothed. ♄. G. Native of China and the Moluccas. P. lùteus, Poir. suppl. 4. p. 610.—Rumph. amb. 3. t. 117. Bark yellow, bitter, and is used for dyeing yellow. Flowers yellow.

Yellow-barked Saunder's-wood. Tree 40 feet.

18 P. Roxbu'rghii; leaflets alternate, ovate, obtuse, pubescent beneath; fruit 1-seeded. ♄. S. Native of the East Indies. P. flàvus, Roxb. hort. beng. p. 153. but not of Lour.

Roxburgh's Pterocarpus. Tree 30 feet.

19 P. uliginòsus (Roxb. hort. beng. p. 533.) leaflets opposite, ovate, acuminated, glabrous; racemes long, panicled. ♄. S. Native of the East Indies. Flowers white.

Bog Pterocarpus. Tree.

20 P. Sapindoi'des (D. C. prod. 2. p. 419.) leaflets 11-13, opposite, oval, acuminated, glabrous; panicles axillary, much shorter than the leaves, rather velvety. ♄. S. Native of South America. Stamens diadelphous. Fruit unknown. Perhaps referrible to *Amerímnum.*

Sapindus-like Pterocarpus. Tree 20 feet.

21 P. sca'ndens (Poir. dict. 5. p. 730.) leaflets 7-11, opposite, oblong, acuminated, glabrous; racemes axillary, longer than the leaves; stems climbing. ♄. ◡. S. Native of Caraccas. Amerímnum scándens, Willd. spec. 3. p. 909. Points of leaflets emarginate. Flowers violaceous. Calyx truncate. Legume 2-seeded.

Climbing Pterocarpus. Clt. 1817. Shrub cl.

Sect. V. Atele'ia (from ατελης, *ateles*, imperfect; in reference to *P. Atelèia*, which is without the wings and keel to the flowers). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 419. Legume membranous, samaroid, stipitate, compressed, with the upper suture straight, and furnished with a narrow wing, but the lower suture is convex. Racemes simple. Perhaps a proper genus.

22 P. Atele'ia (D. C. prod. 2. p. 419.) leaflets 13, alternate, ovate, lower ones smallest. ♄. S. Native of Mexico. Atelèia pterocárpa, Moc. et Sesse, fl. mex. icon. ined. Flowers white, disposed in racemose spikes. Corolla with an oblong vexillum, but the wings and keel are wanting. Stamens 10, monadelphous at the base.

Imperfect-flowered Pterocarpus. Tree 20 feet.

23 P. microca'rpus (Pers. ench. 2. p. 277.) leaflets 7, opposite, elliptic, obtuse at both ends, but emarginate at the apex, coriaceous, glabrous; peduncles and petioles pubescent. ♄. S. Native of South America. Flowers unknown. Legume pale, 1-seeded, reticulately veined.

Small-fruited Pterocarpus. Tree.

24 P. gu'mmifer (Bert. in herb. Balb. D. C. prod. 2. p. 419.) leaflets 5-7, opposite, oblong, attenuated at both ends, bluntish, glaucescent; petioles and pedicels glabrous. ♄. S. Native of St. Domingo. D. C. legum. mem. 10. t. 57. f. 1. Flowers unknown. Pods like those of the two preceding species.

Gum-bearing Pterocarpus. Tree.

25 P. pelta'ria (D. C. prod. 2. p. 419.) leaflets 3, oblong-linear, glabrous; legumes stipitate, oval, winged on one side, 1-seeded. ♄. G. Native of the Cape of Good Hope. Clypèola and Peltària Capénsis, Burm. herb.—D. C. legum. mem. 10. t. 57. f. 2. Racemes terminal, almost simple. Flowers pendulous. Calyx acutely 5-toothed, small, permanent. Petals deciduous. Stamens monadelphous, with the sheath or tube permanent, and cleft above.

Buckler-podded Pterocarpus. Tree.

Cult. The species of *Pterocárpus* thrive best in a loamy soil, and young cuttings not deprived of their leaves root readily in sand under a hand-glass, in heat.

CCXIV. DREPANOCA'RPUS (from δρεπανον, *drepanon*, a sickle, and καρπος, *carpos*, a fruit; in reference to the form of the pods, which are falcate). Meyer, prim. esseq. 238. D. C. prod. 2. p. 420.—Nephròsis, Rich. ined.—Orucària, Juss. ined.

Lin. syst. *Monadélphia Decándria*, or *Diadélphia Decándria.* Calyx 5-toothed, with 2 bracteas at the base, lower tooth diverging at the apex. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous, with the sheath or tube cleft in front, or equally diadelphous, that is, disposed in 2 pentandrous bundles. Legume compressed, indehiscent, wingless, falcate, 1-celled, 1-seeded. Seeds fixed to the ventral suture.—Shrubs, with impari-pinnate leaves with usually from 5-9 nearly opposite oval-oblong leaflets. Panicles of flowers terminal.

1 D. luna'tus (Meyer, l. c.) spines stipular, hooked; leaflets 5-9, alternate, glabrous, oblong, obtuse; panicle ferruginous. ♄. S. Native of South America by the sea-side. Pterocárpus lunàtus, Lin. fil. suppl. 317. P. ápterus, Gært. fruct. t. 156. Nephròsis aculeàta, Rich. herb. Orucària lunàta, Juss. herb.—Plum. ed. Burm. t. 201. f. 2. Orucària, Clus. exot. 47 and 48. with a figure.—Bauh. hist. 1. p. 445. with a figure. Flowers white. Legumes crescent-shaped.

Lunate-podded Drepanocarpus. Clt. 1792. Sh. 6 to 10 feet.

2 D. Africa'nus; spines stipular; leaflets alternate, oblong, obtuse, white beneath; racemes terminal. ♄. S. Native of Guinea, on the sea shore. Legume flat, crescent-shaped, as well as the seed. (v. s. herb. Lamb.)

African Drepanocarpus. Fl. Feb. Shrub 6 to 10 feet.

3 D. du'bius (H. B. et Kunth, nov. gen. amer. 6. p. 390.) spines none; leaflets 5-7, puberulous beneath. ♄. S. Native of Caraccas, in the plains. Leaflets elliptic, rounded at both ends, membranous. Legume reniformly semi-lunate, wrinkled reticulately. Flowers unknown.

Doubtful Drepanocarpus. Tree 30 feet.

4 D. ? cyathifo'rmis (D. C. prod. 2. p. 420.) spines none; shrub climbing; leaflets alternate, ovate, acuminated, glabrous; panicles somewhat corymbous; fruit orbicular, rather cup-shaped. ♄. ◡. S. Native of Mexico. Pterocárpus cyathifórmis, Moc. et Sesse, fl. mex. icon. ined.

Cup-shaped-podded Drepanocarpus. Shrub cl.

5 D. microphy'llus (Meyer, in act. soc. nat. cur. bonn. 12. p. 807.) spines stipular, recurved; leaves with many pairs of leaflets; stamens monadelphous. ♄. S. Native of Panama. Very like the following species.

Small-leafletted Drepanocarpus. Shrub 6 to 10 feet.

6 D. isade'lphus (Meyer, l. c.) spines stipular, recurved; leaflets 12-16 pairs; stamens equally diadelphous. ♄. S. Native of Surinam. Ovary hairy, falcate. Fruit unknown.

Isadelphous-stamened Drepanocarpus. Shrub 6 to 10 feet.

7 D. panicula'tus; leaves with 4 pairs of leaflets; leaflets elliptic, coriaceous, pubescent beneath; panicles equal in length to the leaves; fruit lunate. ♄. S. Native of St. Domingo. Pterocárpus paniculàtus, Spreng. syst. 3. p. 192.

Panicled Drepanocarpus. Tree.

Cult. See *Pterocárpus* for culture and propagation, p. 377. The species require to be watered occasionally with salted water to make them thrive.

CCXV. ECASTAPHY'LLUM

CCXV. ECASTAPHY'LLUM (from ἕκαστος, *hecastos*, each, and φυλλον, *phyllon*, a leaf; in reference to the leaves of the two first species being each composed of only one leaflet). P. Browne, jam. 299. Rich. in Pers. ench. no. 1670. D. C. prod. 2. p. 420. —Hecastophýllum, H. B. et Kunth, nov. gen. amer. 6. p. 387.

Lin. syst. *Diadélphia, Octo-Decándria.* Calyx campanulate, somewhat bilabiate, upper lip emarginate, lower one trifid. Corolla papilionaceous. Stamens 8-10, equally diadelphous or 9, and 8 of them equally diadelphous and 1 loose. Legume nearly orbicular, membranous, valveless, biovulate, but only 1-seeded. Seed reniform. Radicle uncinately-inflexed.—Shrubs, with simple, trifoliate, or impari-pinnate leaves, and axillary subcorymbose panicles of flowers.

1 E. Bro'wnei (Pers. ench. 2. p. 277.) petiole bearing only one leaflet; the leaflet broad, ovate, rounded and cordate at the base, acuminated at the apex, and pubescent beneath. ♄. S. Native of the West Indies and South America, as well as of Senegal and Gambia, in swampy places. E. frutéscens, Browne, jam. p. 299. t. 52. f. 1. Pterocárpus Ecastaphýllum, Lin. spec. 1052. exclusive of the synonyme of Plumier. Berg. act. stockh. 1769. p. 116. t. 4. Amerímnum Siebèri, Reichb. in Sieb. pl. exsic. seneg. no. 36. Leaves spreading in a double row, pubescent when young, but glabrous in the adult state. Calyx ferruginous.

Var. β, glàbrum; leaves glabrous beneath.

Browne's Ecastaphyllum. Clt. 1733. Shrub 6 to 8 feet.

2 E. du'bium (H. B. et Kunth, nov. gen. amer. 6. p. 388.) petiole with only one leaflet; leaflet elliptic-oblong, ending in a short blunt acumen, rather cordate at the base, and marked with pellucid lines, and pilose on the nerve beneath; legumes reniform, wrinkled. ♄. S. Native of the province of Caraccas, near Caicara at the Orinoco.

Doubtful Ecastaphyllum. Shrub 6 to 8 feet.

3 E. Plumie'ri (Pers. ench. 2. p. 227.) leaves impari-pinnate, with 3-5 broadly ovate, bluntish, glabrous leaflets. ♄. S. Native of South America.—Plum. ed. Burm. t. 246. f. 2. Pterocárpus Plumièri, Poir. suppl.

Plumier's Ecastaphyllum. Clt. 1820. Shrub 6 to 10 feet.

4 E. pube'scens (D. C. prod. 2. p. 421.) leaves impari-pinnate, with 5-7 alternate, ovate, acuminated leaflets, which are pubescent, as well as the branches and legumes. ♄. S. Native of Cayenne or French Guiana. Panicles axillary, branched, pedunculate. Stamens equally diadelphous. Legume nearly orbicular, almost an inch in diameter.

Pubescent Ecastaphyllum. Shrub.

5 E. Moneta'ria (D. C. prod. 2. p. 421.) leaflets 3, alternate, ovate, acuminated, glabrous; peduncles axillary, numerous, spiked. ♄. S. Native of Surinam in humid places. Dalbérgia Monetària, Lin. fil. suppl. 317. Pterocárpus ternàta, Poir. dict. 5. p. 727. ex Kunth and Richard, Pers. ench. 2. p. 277. Stamens 9, 8 of which are disposed in two equal bundles, but the ninth one is loose, or hardly connected to the others at the base. Legume oval, roundish. Flowers minute, white. The root when cut yields a purple juice. The wood is red, and yields a resin resembling dragon's-blood.

Money-like-podded Ecastaphyllum. Shrub 6 to 10 feet.

6 E. Berte'rii (D. C. prod. 2. p. 421.) leaflets 3, alternate, obovate-orbicular; racemes spike-formed, simple, axillary, solitary; legume coriaceous, glabrous, nearly orbicular. ♄. S. Native of St. Domingo. Pterocárpus Bertèrii, Spreng. syst.

Bertero's Ecastaphyllum. Shrub.

† *A doubtful species.*

7 E. ? microphy'llum (H. B. et Kunth, nov. gen. amer. 7. p. 268.) leaflets 25-45, small, oblong, acute, and somewhat mucronate, rounded at the base, clothed with adpressed pili on both surfaces; legumes falcate, oblong, rather rugulose. ♄. S. Native of Venezuela, near Santa Barbara.

Small-leafletted Ecastaphyllum. Shrub.

Cult. See *Pterocárpus*, p. 377. for the culture and propagation of the species.

CCXVI. AMERI'MNUM

CCXVI. AMERI'MNUM (from *a*, priv. and μεριμνα, *merimna*, care; void of care or in a state of security; but what induced Dr. P. Browne to give this name to the present genus is unknown to us, unless it was the careless flow of the branches, or some medical virtue which the plant is supposed to possess). P. Browne, jam. 288. Adans. fam. 2. p. 320. D. C. prod. 2. p. 421.—Amerímnum species of Swartz, fl. ind. occ. 3. p. 1233. t. 25.

Lin. syst. *Monadélphia, Decándria.* Calyx somewhat bilabiate, 5-toothed. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous, with the sheath or tube cleft in front. Legume compressed, 2-valved, 1-celled, 1-seeded; the superior suture straight, and a little winged; the lower one very convex. —Small trees or shrubs, with alternate, stalked, ovate, somewhat cordate, simple leaves.

1 A. Bro'wnei (Swartz, fl. ind. occ. 3. p. 1234.) leaves ovate, somewhat cordate, acute, glabrous; peduncles axillary, 10-flowered, glabrous or puberulous. ♄. S. Native of Jamaica, St. Domingo, and Carthagena, in dry places among bushes. P. Browne, jam. 288. t. 32. f. 3. Jacq. amer. 199. t. 180. f. 58. Pterocárpus Amerímnum, Poir. dict. 5. p. 729. Flowers white, sweet-scented. The shrub being weak supports itself upon its neighbours.

Browne's Amerimnum. Clt. 1793. Shrub 6 to 10 feet.

2 A. STRIGULÒSUM (H. B. et Kunth, nov. gen. amer. 6. p. 389.) leaves ovate, rather cordate, obtuse, clothed with adpressed pili on both surfaces. ♄. S. Native on the banks of the Orinoco. Branches and petioles clothed with ferruginous tomentum. Racemes axillary, solitary, 3 times longer than the petioles.

Strigulose Amerimnum. Shrub 6 to 10 feet.

Cult. See *Pterocárpus*, p. 377, for culture and propagation.

CCXVII. BRY'A (from *βρυω*, *bryo*, to sprout; the seeds germinate before falling from the tree). P. Browne, jam. 299. Bronn. legum. 135. D. C. prod. 2. p. 421.—Aldina, Adans. fam. 328.

LIN. SYST. *Monadélphia, Decándria.* Flowers the same as those of *Amerimnum*, but the stamens are all monadelphous, the tenth one concrete with the others to the middle. Legume biarticulate; joints 1-seeded, dehiscent, compressed, with the superior suture straight, and the lower one convex, but the upper joint is sometimes wanting.—American trees, furnished with stipular spines, simple crowded leaves, or perhaps trifoliate leaves, with the leaflets sessile.

1 B. E'BENUS (D. C. prod. 2. p. 421.) spines distinct; leaflets aggregate, obovate; peduncles 2-3-together, axillary, 1-2-flowered, shorter than the leaves. ♄. S. Native of the West Indies. P. Browne, jam. 299. t. 31. f. 2. Plum. ed. Burm. t. 246. f. 1. Aspálathus E'benus, Lin. spec. 1001. Amerímnum E'benus, Swartz, prod. 104. Pterocárpus buxifòlius, Murr. syst. 642. Pterocárpus glàbrus, Reichb. Flowers bright yellow. Fruit lunate, hairy. The wood of this tree is cut in the West Indies, and sent to England under the name of ebony, though it is not the true ebony, which is a plant of a very different genus. The wood of this American ebony being of a fine greenish brown colour, and polishing very well, and of a very hard durable nature, is much coveted by musical instrument makers. Dr. Browne says that the small dimensions of this shrubby tree renders it fit only for few purposes, the trunk seldom exceeding 3 or 4 inches in diameter, but that the slender branches being very tough and flexile are frequently used for riding switches, and generally kept at all the wharfs about Kingston to scourge the refractory slaves.

American *Ebony*. Fl. July, Aug. Clt. 1713. Tree 12 to 14 ft.

2 B.? PARVIFLÒRA (D. C. prod. 2. p. 421.) spines connate; leaflets oblong-lanceolate, tapering to the base; racemes bracteate, few-flowered. ♄. S. Native of Brazil. Amerímnum parviflòrum, Spreng. neue entd. 2. p. 159.

Small-flowered Brya. Shrub 12 feet.

Cult. See *Pterocárpus* for culture and propagation, p. 377.

CCXVIII. DEGUE'LIA (abridged from *assa-ha pagara undeguele*, the Caribbean name of the plant). Aubl. guian. 2. p. 750. t. 300. Lam. ill. t. 603. D. C. prod. 2. p. 422.—Cylizòma, Neck. elem. no. 1343.

LIN. SYST. *Diadélphia, Decándria.* Calyx bilabiate, upper lip entire, lower one trifid. Petals 5, disposed into a papilionaceous corolla; wings and carina equal in length, but the vexillum is larger. Stamens 10, diadelphous. Ovary (ex Richard) declinate, narrow, oblong, hispid, straightish. Style stretched out, capillary, hispid on the inner side even to the apex. Stigma terminal, capitate, glandular. Legume (ex Aubl.) globose, small, 2-valved, 1-seeded. Seed spherical, covered with farina.—A sarmentose shrub, with impari-pinnate leaves, furnished with 2 pairs of oval acute leaflets, spike-formed axillary racemes of flowers. This genus, according to its habit, is allied to *Nissòlia* and *Pterocárpus*, but the legume, as it is described by Aublet, belongs probably to a different plant (according to Richard).

1 D. SCA'NDENS (Aubl. l. c.) ♄. ◡. S. Native of Guiana, on the banks of rivers. Branches and leaves glabrous. Peduncles clothed with brown velvety down. Bracteas small, acute. Flowers white.

Climbing Deguelia. Shrub cl.

Cult. See *Pterocárpus* for culture and propagation, p. 377.

Suborder II. or *Tribe* VII.

SWARTZIE'Æ (plants agreeing with *Swártzia* in important characters). D. C. legum. mem. xi. prod. 2. p. 422. Sepals closely joined into an ovate-globose alabastrum before expansion (f. 52. *b.*), which at last bursts valvately, as the flowers expand (f. 52. *g.*). Petals few, irregular or wanting, and are, as well as the stamens, hypogynous (f. 52. *d.*). Radicle incurved (f. 21. *e. f.*). Cotyledons thick. Germination unknown. Leaves simple or simply pinnate. This is a very distinct suborder or tribe, agreeing with *Detarièæ* in the valveless calyx, with tribe *Mimòseæ* in the hypogynous stamens, and in the irregular petals as well as in the habit of the plants with *Dalbergièæ*.

CCXIX. SWA'RTZIA (in honour of Olof Swartz, M.D. a long time resident in the West Indies, and author of Flora Indica Occidentalis, &c.) Schreb. gen. 1227. Willd. spec. 2. p. 1219. D. C. prod. 2. p. 422.

LIN. SYST. *Deca-Polyándria, Monogýnia.* Sepals closely connected into an ovate-globose alabastrum, but bursting afterwards somewhat irregularly and almost valvately almost to the base. Petal one, hypogynous, flat, lateral or wanting. Stamens 10-15-25, variable in number, hypogynous, sometimes with 2 or 4 of them larger than the others, and sterile, and appearing like petals, the rest usually connected a little way at the base. Legume usually stipitate, 2-valved, 1-celled, few-seeded. Seeds arillate, exalbuminous. Embryo with thick cotyledons, and an uncinately, inflexed, short, exserted radicle.—Trees, with simple or impari-pinnate leaves, and with the flowers rising in racemes from the axils of the leaves.

SECT. I. POSSÌRA (the name of *S. arboréscens* in Guiana). Aubl. guian. 2. p. 934.—Rittèra, Schreb. gen. no. 1919.—Hoelzèlia, Neck. elem. no. 1383. Flowers usually with one petal, rarely with 3; when the last is the case, one of them is much larger than the rest.

* *Leaves simple, having the petiole bidentate at the apex. The teeth in place of stipels.*

1 S. SIMPLICIFÒLIA (Willd. spec. 2. p. 1219.) leaves simple, ovate-oblong, obtuse, emarginate; peduncles usually 5-flowered; petal one, roundish, ovate, larger than the calyx; stamens 20-25. ♄. S. Native of the West Indies. Rittèra símplex, Vahl. Possìra símplex, Swartz, prod. 82. Flowers pale yellow.

Simple-leaved Swartzia. Clt. 1818. Shrub 6 to 10 feet.

2 S. GRANDIFLÒRA (Willd. l. c.) leaves simple, oblong-ovate, acuminated; peduncles 3-flowered; petal roundish-reniform, large; stamens 20-25. ♄. S. Native of Trinidad and St. Vincent. Rittèra grandiflòra, Vahl. ecl. 2. p. 37. pl. amer. dec. 1. t. 9. Flowers yellow. Ovary stipitate, arched.

Great-flowered Swartzia. Clt. 1821. Shrub 6 to 8 feet.

3 S. DODECA'NDRA (Willd. l. c.) leaves simple, ovate, drawn out at the apex into an emarginate acumen; peduncles usually 5-flowered; petal oblong, length of calyx; stamens 10-20. ♄. S. Native of South America. Rittèra dodecándra, Vahl. symb. 2. p. 60. t. 34. Ovary stipitate. Flowers yellow.

Dodecandrous Swartzia. Shrub 6 feet.

4 S. PARVIFLÒRA (D. C. legum. mem. xi. t. 60.) leaves simple, on very short petioles, ovate, drawn out into an emarginate

acumen; peduncles usually 3-flowered; petal unguiculate, roundish, a little fringed, length of calyx; stamens 20-25. ♄. S. Native of Cayenne. Legume on a short stipe, ovate, 2-seeded. Seeds ovate-conical, truncate at the central extremity.

Small-flowered Swartzia. Shrub 6 feet.

5 S. ochna'cea (D. C. legum. mem. xi. t. 58.) leaves simple, ovate-elliptic, acutish; peduncles 1-flowered. ♄. S. Native of South America, about Buenos Ayres. Flowers unknown. Legume standing on a stipe half an inch long, obovate, tapering to the base, apiculated by the style. Seed 1, large, reniform.

Ochna-like Swartzia. Shrub 6 feet.

* * *Leaves impari-pinnate, with 3-7 leaflets.*

6 S. triphy'lla (Willd. l. c.) leaves trifoliate, but the lower ones are simple; leaflets oval-lanceolate, acuminated; peduncles 2-5-flowered. ♄. S. Native of Guiana and Cayenne. Possìra arboréscens, Aubl. guian. 2. p. 934. t. 353. Possìra triphýlla, Swartz, prod. 82. Flowers yellow.

Var. β, grandiflòra (Raddi, mem. pl. bras. add. p. 16.) leaflets undulated; petal large. Native near Rio Janeiro.

Three-leafletted Swartzia. Shrub 8 feet.

7 S. a'ptera (D. C. legum. mem. xi. prod. 2. p. 423.) leaves trifoliate; petioles terete, wingless; leaflets ovate-elliptic, drawn out into a blunt, narrow, somewhat emarginate acumen; peduncles 2-5-flowered. ♄. S. Native of Cayenne and Guiana.

Wingless-petioled Swartzia. Shrub 6 feet.

8 S. myrtifòlia (Smith, in Rees' cycl. no. 5.) leaves with 3-5 leaflets; petioles marginated; leaflets lanceolate-oblon[illegible] orbicular, length of calyx; stamens very numer[illegible]; petal [illegible]ous, polyadelphous. ♄. S. Native of the C[illegible]. Petal yellowish.

Myrtle-leaved Swa[illegible]rtzia. Shrub 6 feet.

9 S. [illegible] (Willd. l. c.) leaves with 5 leaflets: petioles terete; leaflets elliptic, acuminated; peduncles rather velvety; racemes twin; petal orbicular, unguiculate, longer than the calyx; stamens numerous. ♄. S. Native of Trinidad. Rittèra pinnàta, Vahl. eccl. 2. p. 38. Corr. ann. mus. 9. p. 289. t. 24. f. 2. Possìra pinnàta, Poir. suppl. 4. p. 533. Legume elongated, many-seeded. Leaflets 7 inches long. Flowers yellowish.

Pinnate-leaved Swartzia. Clt. 1817. Shrub 6 feet.

10 S. longifòlia (D. C. legum. mem. xi. prod. 2. p. 423.) leaves with 5 leaflets; petioles terete; leaflets elliptic-oblong, acuminated, shining; racemes panicled, rather velvety, a little longer than the petioles; petal orbicular; stamens 10. ♄. S. Native of Cayenne. Calyx bipartite, with the lobes reflexed. Petals 3, particularly with a roundish vexillum and 2 wings. Ovary clothed with hoary, adpressed down. Leaflets 7-8 inches long. Perhaps a true species of *Swártzia.*

Long-leaved Swartzia. Shrub 6 to 12 feet.

11 S. brachysta'chya (D. C. legum. mem. xi.) leaves with 5-7 leaflets, and are as well as the branchlets glabrous; petioles terete; leaflets elliptic, acuminated; peduncles smoothish, 5-9-flowered; petal ovate-orbicular, longer than the calyx. ♄. S. Native of Cayenne. Flowers polyandrous. Stamens about 40, nearly equal in length. Leaflets 3 inches long.

Short-spiked Swartzia. Shrub 6 to 10 feet.

12 S. tomentòsa (D. C. legum. mem. xi. t. 59.) leaves with 5-7 leaflets; petioles terete, and are as well as the branchlets velvety; leaflets oval-oblong, acuminated, velvety beneath; stipulas nearly orbicular. ♄. S. Native of Cayenne, on the banks of rivers, where it is called *Bois pagaie blanc.* Robínia Panacòco, Aubl. guian. 2. p. 769. t. 307. Robínia tomentòsa, Willd. spec. 3. p. 1134. Racemes rising beneath the leaves along the branches. Flowers red. The wood is white, and very useful. *Anacoco* is the Guiana name of the tree.

Tomentose Swartzia. Tree 60 feet.

13 S. Flemi'ngii (Raddi, mem. pl. bras. add. p. 18.) leaves pinnate; petioles terete; leaflets oblong, hairy beneath; flowers spicate; petal pilose beneath. ♄. S. Native of Brazil. Flowers white, rising in branches, furnished with orbicular leaves. Ovary covered with silky tomentum.

Flemingia-like Swartzia. Tree 60 feet.

14 S. Langsdórfii (Raddi, l. c. p. 17.) leaves pinnate; petioles marginated; leaflets ovate, acute, glabrous, reticulated with veins; racemes 5-6-flowered. ♄. S. Native of Brazil. Flowers white, rising like those of the preceding.

Langsdorf's Swartzia. Tree 60 feet.

15 S. polyphy'lla (D. C. legum. mem. xi. prod. 2. p. 424.) leaves with 9-11 leaflets; petioles terete, wingless; leaflets ovate, acuminated, glabrous; racemes usually 3-together, slender, somewhat spike-formed; petal roundish. ♄. S. Native of Cayenne. Ovary glabrous, stipitate. From the petal falling off very soon the plant is easily confounded with the next section.

Many-leafletted Swartzia. Tree 20 feet.

Sect. II. Touna'tea (*Tounou* is the Guiana name of *S. alàta*). Aubl. guian. 1. p. 550. t. 218. D. C. prod. 2. p. 424.—Swártzia, Schreb. gen. no. 1227.—Gynanthístrophe, Poit. in. herb. Deless. Flowers apetalous. Legume hooked at the apex.

16 S. ala'ta (Willd. spec. 2. p. 12[illegible]) leaves pinnate, with 5 leaflets; petioles mar[illegible]ginated; leaflets oval-oblong, acute, rather velvety be[illegible]neath; racemes many-flowered, spike-formed. ♄. S. Native of Guiana, in woods. Tounàtea Guianénsis, Aubl. l. c. Ovary hairy, attenuated at the base, containing 4 or 5 ovula, crowned by a short, hooked stigma. Flowers small, green.

Winged-petioled Swartzia. Tree 20 feet.

17 S. ape'tala (Raddi, l. c. p. 19.) leaves pinnate; leaflets ovate-lanceolate, acuminated, glabrous; spikes 20-30-flowered; flowers apetalous. ♄. S. Native of Brazil.

Apetalous Swartzia. Tree 25 feet.

Cult. Sandy loam and peat is the best mixture for the species of this genus; and cuttings, not deprived of any of their leaves, will root if planted in a pot of sand, with a hand-glass placed over them, in heat.

CCXX. BA'PHIA (from βαφη, *baphe*, a dye; the tree produces the cam-wood of commerce). Afz. ex Lodd. bot. cab. 4. p. 367. D. C. prod. 2. p. 424.

Lin. syst. *Decándria, Monogýnia.* Calyx calyptriform, inclosing the corolla, bursting under the carina, and erect under the vexillum, at length falling off altogether. Corolla with a roundish spreading vexillum, linear wings, which are about the length of the vexillum, and an acute carina. Stamens 10, distinct. Legume falciform. Seeds 6, lenticular.—A tree with impari-pinnate leaves. Leaflets 5, oval-oblong, acuminated, shining. Pedicels 2-3-together, 1-flowered, axillary. Flowers white or yellow.

1 B. nítida (Lodd. l. c.). ♄. S. Native of Sierra Leone. The wood is used for dyeing under the name of cam-wood. It is brought from Sierra Leone to this country.

Shining-leaved Cam-wood. Fl. Ju. Nov. Clt. 1793. Tr. 50 ft.

Cult. See *Swártzia* for culture and propagation.

CCXXI. ZOLLE'RNIA (dedicated to Frederick William III. King of Prussia, as we presume from his being descended from the princes of Hohen Zollern). Max. et Nees. in nov. act. bon. 13. p. 1. t. 2 and 3.

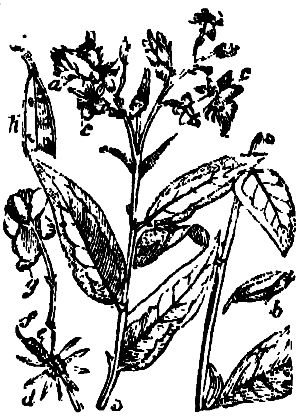
Lin. syst. *Enneándria, Monogýnia.* Calyx entire, cleft laterally (f. 52. *a.*), reflexed. Petals 5, nearly equal (f. 52. *c.*). Stamens 9-13 (f. 52. *d.*), hypogynous; anthers erect, linear (f. 52. *d.*), acuminated, all complete, or 2 a little smaller than the others. Legume (f. 52. *h.*), stipitate, 1-celled, 2-valved, few-seeded. Seeds exalbuminous. Embryo with the radicle uncinately inflexed.—Unarmed trees or shrubs, with simple stipulate leaves, and axillary or terminal, many-flowered racemes, bibracteolate pedicels and yellow flowers.

1 Z. sple'ndens (Max. et Nees. l. C. p. 15. t. C.) stipulas nearly orbicular; leaves ovate-oblong, glabrous. ♄. S. Native of Brazil. Flowers large, yellow.

Splendid Zollernia. Shrub 10 to 15 feet.

2 Z. falca'ta (Max. et Nees. l. c. p. 16. t. D.) stipulas falcate; leaves oblong, acute at the base, attenuated at the apex and bluntish, glabrous. ♄. S. Native of Brazil, on the banks of the river Paraiba. Kramèria glàbra, Spreng. neue entd. 2. p. 157. Flowers yellow, smaller than those of the first species. (f. 52.)

FIG. 52.



Falcate-stipuled Zollernia. Tree 20 feet.

Cult. See *Swártzia* for culture and propagation, p. 380.

Division II. Rectе'mbriæ (from *rectus*, straight, and *embryo*, an embryo; in reference to the radicle and cotyledons being straight). Radicle and cotyledons straight. (f. 21. *i. k. l m.*)

Suborder III. *or Tribe* VIII.

MIMO'SEÆ (plants agreeing with *Mimòsa* in important characters). Embryo straight (f. 21. *m.*), sometimes with the radicle bending a little to the cotyledons. Flowers regular (f. 53. *a.*), usually polygamous (f. 53. *b.*), rarely all hermaphrodite (f. 54. *b.*). Sepals 4-5, valvate in æstivation, usually connected together at the base, the calyx is therefore 4-5-toothed (f. 54. *a.*). Petals 4-5, equal (f. 53. *a.*), also valvate in æstivation, usually hypogynous, rarely inserted in the bottom of the calyx, sometimes more or less connected together into a monopetalous corolla. Stamens inserted with the petals, free (f. 53. *b.* f. 54. *b.*), or monadelphous, equal in number to the petals or multiple that number (f. 53. *b.*). Embryo straight (f. 21. *m.*), with a hardly evident plumule. Umbilical funicle usually twisted. Leaves abruptly pinnate or abruptly bipinnate. Cotyledons in all, except *Entàda*, and perhaps some species of *I'nga*, foliaceous and exserted.

CCXXII. ENTA'DA (the Malabar name of one of the species). Adans. fam. 2. p. 318. Rich. herb. D. C. mem. legum. xii. prod. 2. p. 424.—Gigalòbium, P. Browne, jam. 362.

Lin. syst. *Polygàmia, Monœ'cia.* Flowers polygamous. Petals 5, distinct. Stamens 10-25. Anthers glandular at the apex. Legume compressed, evidently articulated; the valves usually separating into 2 membranes at maturity. Joints of legume 1-seeded, with the ribs permanent. Seeds thick. Cotyledons fleshy, remaining unchanged and inclosed within the spermaderm in germination.—Shrubs with climbing, unarmed stems, bipinnate or conjugately bipinnate leaves, usually with the rachis terminating in a tendril. Flowers white, innumerable, with many abortions, disposed in dense spikes. Legume glabrous, unarmed, very large.

1 E. gigalòbium (D. C. legum. mem. xii. prod. 2. p. 424.) leaves bipinnate, ending in a tendril, with 1-2 pairs of pinnæ, and 2-4 pairs of oblong, emarginate, glabrous leaflets; spikes of flowers axillary; stamens 20-25. ♄. ◡. S. Native of the West Indies, climbing over trees and forming arbours. Mimòsa scándens, Swartz, obs. 389. Lun. hort. jam. 1. p. 137. M. scándens Americàna, Lin. and most other authors. Legume 6-8 feet long, coriaceous, with the sutures very thick. Seeds nearly orbicular, 2 inches in diameter. The shrub is called *Cacoon* in the West Indies.

Giant-podded Entada. Clt. 1819. Shrub cl.

2 E. Pursæ'tha (D. C. legum. mem. xii. prod. 2. p. 425.) leaves bipinnate, ending in a tendril, with 1-2 pairs of pinnæ and 2-4 pairs of ovate, emarginate, glabrous leaflets on each pinna; spikes of flowers axillary; stamens 10. ♄. ◡. S. Native of the Moluccas on the sea-shore, Malabar, and the Mauritius.—Rheed. mal. 8. t. 32, 33, 34.—Rumph. amb. 5. t. 4. Pursæ'tha, Lin. fl. zeyl. 644. Burm. ind. 222. Mimòsa scándens, Roxb. hort. beng. p. 40. M. scándens I'ndica of authors. Legume like that of *E. gigalòbium.* This species is classed among the emetics in Java.

Pursætha Entada. Clt. 1780. Shrub cl.

3 E. monosta'chya (D. C. legum. mem. xii. prod. 2. p. 425.) leaves bipinnate, terminated by a tendril, having 1 or 2 pairs of pinnæ, and with 4 or 5 pairs of oblong-obovate, emarginate, glabrous leaflets on each pinna; spikes of flowers solitary. ♄. ◡. S. Native of Malabar. E. Rheèdii, Spreng. syst. 2. p. 325. Spikes elongated, simple, and axillary, according to Rheede's figure. Flowers decandrous. Entàda, Rheed. mal. 9. t. 77. Mimòsa Entàda, Willd spec. 4. p. 1041. Legume unknown.

One-spiked Entada. Clt. 1800. Shrub cl.

4 E. polysta'chya (D. C. legum. mem. xii. t. 61 and 62. prod. 2. p. 425.) leaves bipinnate, at length ending in a tendril, with 2-3 pairs of pinnæ, and with 7 pairs of oval, emarginate, glabrous leaflets on each pinna; spikes of flowers numerous, in fascicles. ♄. ◡. S. Native of Guiana, Martinico, and Guadaloupe. Mimòsa polystàchya, Lin. spec. 520. Jacq. amer. p. 265. t. 183. f. 93. M. bipinnàta, Aubl. guian. 2. p. 946. E. Parràna, Spreng. syst. 2. p. 325. Legume a foot long, compressed, membranous. Seeds oval, 6 lines long. Flowers apetalous, ex Jacq. but 5-petalled in the specimen. The plant climbs up trees, and often destroys them.

Many-spiked Entada. Clt. 1816. Shrub cl.

5 E. chilia'ntha (D. c. l. c.) leaves bipinnate, with 3-4 pairs of pinnæ, and 7-8 pairs of linear, oblong leaflets on each pinna, which are pubescent beneath; spikes twin, terminal on the branches. ♄. ◡. S. Native of Guiana, in humid places. Mimòsa chiliántha, Meyer, prim. esseq. 163.—Plum. ed. Burm. t. 12. Flowers decandrous.

Lip-flowered Entada. Shrub cl.

6 E.? Adenanthe'ra (D. C. l. c.) leaves with 2 pairs of pinnæ; leaflets ovate, oblique, glabrous; tendrils terminal. ♄. ◡. S. Native of the Island of Mallicocco. Adenanthèra scándens, Forst. prod. no. 117. This plant, from its habit, is related to the present genus.

Adenanthera-like Entada. Shrub cl.

Cult. See shrubby species of *Mimòsa* for culture and propagation, p. 387.

CCXXIII. MIMO'SA (from μιμος, *mimos*, a mimic; the leaves of many of the species, particularly in sensitive plants, mimic animal sensibility). Adans. fam. 2. p. 319. Gærtn. fruct. 2. p. 344. Willd. spec. 4. p. 1028. D. C. prod. 2. p. 425.—Mimòsa species of Lin.

Lin. syst. *Polygàmia, Monœ'cia.* Flowers polygamous. Petals 4-5, connected together into a 4-5-cleft, funnel-shaped corolla. Stamens inserted in the base of the corolla, or in the stipe of the ovary, equal in number to the lobes of the corolla, or double or triple that number, particularly from 4 to 15 in number. Legume compressed, flat, 1 or many-jointed; joints 1-seeded; ribs permanent. Stipulas petiolar. Leaves bipinnate, with 1 or more pairs of pinnæ, each pinna bearing 2 or many pairs of leaflets. Flowers rose-coloured or white, disposed in heads. Leaves usually sensible to the touch, as in the common sensitive plant.

Sect. I. Eumimòsa (from *eu*, well, and *Mimòsa*; genuine species). D. C. legum. mem. xii. prod. 2. p. 425. Legumes compressed, moniliform, particularly with the ribs contracted at the articulations. Flowers rose-coloured.

§ 1. *Sensitìvæ. Leaves with 1 pair of pinnæ, and with 2 pairs of leaflets on each pinna, the inner pair smaller than the outer pair. Stamens 4, rarely 5. Leaves in most of the species sensible to the touch.*

1 M. de'bilis (Humb. et Bonpl. in Willd. spec. 4. p. 1029.) stem herbaceous, simple, rather prickly, glabrous, unarmed at the base of the petioles, but hairy; leaflets obovate, mucronate, clothed on both surfaces with adpressed pubescence; heads of flowers elliptic, solitary. ⊙. S. Native of South America, near Caripe. H. B. et Kunth, nov. gen. amer. 6. p. 248. Flowers rose-coloured. Pods unknown.

Weak Sensitive-plant. Pl. 1 to 2 feet.

2 M. a'lbida (Humb. et Bonpl. in Willd. spec. 4. p. 1030.) branches clothed with canescent pubescence, prickly; leaflets dimidiately-oblong, acute, pubescent; petioles unarmed; heads of flowers twin. ♄. S. Native of Peru, near Moche, in sand by the sea-side. A creeping shrub, very nearly allied to *M. sensitìva*. Legume hispid, 4-celled, hardly constricted between the seeds. Flowers rose-coloured. Kunth, mim. p. 2. t. 1.

Whitish Sensitive-plant. Shrub creeping.

3 M. sensitìva (Lin. spec. 1501.) stem and petioles prickly; leaflets ovate, acute, clothed with adpressed pili beneath, but glabrous above. ♄. S. Native of Brazil. Flowers rose-coloured and tetrandrous, as in the preceding species, however, Linnæus's plant is said to have pentandrous flowers. Trew. ehr. t. 95. Ker. bot. reg. 25. Lindl. bot. reg. Flowers purple. Leaflets broad, but not so sensible to the touch as those of *M. pudìca*.

Sensitive-plant. Fl. April, Sept. Clt. 1648. Sh. 3 to 6 ft.

4 M. obtusifòlia (Willd. enum. p. 1047.) stem and petioles prickly; leaflets dimidiately cordate, ovate, obtuse, glabrous. ♄. S. Native of Brazil. Flowers red. Very like *M. sensitìva*, but more prickly and glabrous.

Blunt-leafletted Sensitive-plant. Fl. June, July. Clt. 1816. Shrub 2 to 4 feet.

5 M. strigòsa (Willd. spec. 4. p. 1030.) branchlets and petioles beset with stiff hairs and prickles; leaflets rather dimidiate, ovate-oblong, acute, strigose on both surfaces; heads of flowers usually solitary. ♄. S. Native of South America, at the Orinoco and of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 248. Flowers purple. Perhaps the same as *M. strigòsa* of Pers. ench. 2. p. 263.

Strigose Sensitive-plant. Fl. June, Jul. Clt. 1818. Sh. 1 ft.

6 M. adhæ'rens (H. B. et Kunth, nov. gen. amer. 6. p. 249.) branches hairy and prickly; petioles villous, unarmed; leaflets dimidiately-obovate, mucronate, clothed above with adpressed pili, and with silky and somewhat strigose hairs beneath; heads of flowers solitary. ♄. S. Native of South America, at the Orinoco. Flowers red. Legume unknown.

Adhering Sensitive-plant. Shrub 3 to 4 feet.

7 M. floribu'nda (H. B. et Kunth, nov. gen. amer. 6. p. 250.) branches and petioles pubescently-pilose and very prickly; leaflets 2-pairs, somewhat dimidiately ovate, acute, clothed with strigose hairs beneath, but glabrous above; heads of flowers twin or tern. ♄. S. Native of South America, near Cumana, and of Mexico, near Jalapa. Flowers red.

Var. β, *Willdenòwii* (D. C. prod. 2. p. 426.) heads of flowers disposed in a terminal panicle. M. floribúnda, Willd. spec. 4. p. 1031. M. Willdenówii, Poir. suppl. 1. p. 50.

Bundle-flowered Sensitive-plant. Fl. June, July. Clt. 1824. Shrub 1 to 1½ foot.

§ 2. *Pudìcæ* (*pudicus*, chaste; in reference to the sensitive qualities of the leaves). *Leaves with 1 or more pairs of pinnæ; when the last is the case, they are disposed in a digitate manner at the top of the common petiole, each pinna bearing many pairs of leaflets, which are about equal in size and shape. Stamens 4, rarely 5. Leaves usually sensible to the touch.*

8 M. pistaciæfòlia (Willd. spec. 4. p. 1028.) unarmed; leaves with 1 pair of pinnæ, each pinna bearing 3 pairs of elliptic, obtuse leaflets, with a gland between the terminal pair. ♄. S. Native of Caraccas. Flowers red. Legume linear, sinuated, 6-7 inches long. Perhaps belonging to a different division of the genus.

Pistachio-leaved Humble-plant. Tree 10 to 15 feet.

9 M. vìva (Lin. spec. 1500.) plant unarmed, herbaceous; leaves with 1 pair of pinnæ, each pinna bearing 4 pairs of roundish leaflets; legume with only one joint. ♃. S. Native of Jamaica, in meadows. Sloan. hist. 2. t. 182. f. 7. Flowers purple.

Lively Humble-plant. Fl. July, Aug. Clt. 1739. Pl. 1 ft.

10 M. pectina'ta (Kunth, mim. p. 5. t. 2. nov. gen. amer. 6. p. 25.) branches prickly, and beset with stiff villi; leaves conjugately pinnate; common petiole rather shorter than the prickles; leaflets many pairs, approximate, linear, acute, with strigosely ciliated margins. ♄. S. Native of the Andes of Quito, in hot places. Flowers red. Fruit unknown.

Pectinate-leaved Humble-plant. Shrub.

11 M. polyca'rpa (Kunth, mim. p. 8. t. 3. nov. gen. amer. 6. p. 25.) branches prickly, striated, pilose; leaves conjugately pinnate; petioles much longer than the prickles; leaflets many pairs, oblong-linear, acute, glabrous above, but clothed with adpressed pili beneath as well as on the margins. ♄. S. Native of Peru, in sandy places. Heads of flowers solitary. Flowers red. Legumes pilose, with very hispid margins.

Many-fruited Humble-plant. Shrub 1 to 2 feet.

12 M. pudi'ca (Lin. spec. 1501.) stem herbaceous, prickly, with the petioles and peduncles more or less beset with stiff hairs or bristles; leaves somewhat digitately pinnate, with 4 pinnæ, each pinna bearing many pairs of linear leaflets. ⊙. S. Native of Brazil. Andr. bot. rep. t. 544. Flowers red. Legumes glabrous in the middle, but with the margins beset with stiff bristles. Superior leaves sometimes the same as the inferior ones. This plant is commonly grown in gardens, under the name of the sensitive plant, the leaves falling on the slightest touch. Sensitive plants were not unknown to the ancients. Theophrastus speaks of the Αισχυνομενη, as growing about Memphis in Egypt, and Pliny of the *Æschynomene*, so called from its contracting the leaves at the approach of the hand. It is thus characterized in the flowery poetry of Darwin:

> " Weak with nice sense the chaste *Mimosa* stands,
> From each rude touch withdraws her timid hands;
> Oft as light clouds o'erpass the summer glade,
> Alarm'd she trembles at the moving shade,
> And feels alive through all her tender form
> The whisper'd murmurs of the gathering storm;
> Shuts her sweet eye-lids to approaching night,
> And hails with freshen'd charms the rising light."

The cause of the well-known motion of the leaves of the sensitive and humble plants has been the subject of many ingenious explanations; but it has not been treated by any botanist with so much ingenuity as by Dr. Dutrochet, whose theory we give as explained in the Botanical Register.

M. Dutrochet states, that having ascertained hot nitric acid to possess the power of separating and reducing to its simplest form the whole mass of vegetable tissue, and that the same acid produced other effects equally advantageous for the examination of the most obscure parts of vegetable structure, he was induced to give his attention to that of *Mimòsa pudìca*, in the hope of gaining some evidence respecting the cause to which its sensibility is to be ascribed. Beginning with the pith he observed a considerable number of minute globules, of a greenish colour, intermingled among the cells, and adhering to them in an irregular manner. After attempting to show the probability of these globules having deceived Mirble in various points of his analysis of vegetation, and especially in regard to the pores, which that botanist supposes to exist in the cellular tissue of plants, Dr. Dutrochet proceeds to remark, that the application of hot nitric acid to these globules renders them perfectly opaque, whence he concludes that they are in fact minute cells, filled with a particular fluid which is subject to become concrete by the application of acids. Now it is known that such fluids as are thus altered by acids are usually dissolved and liquefied again by the application of alkalies. A few drops, therefore, of a solution of hydrate of potass were suffered to fall upon a portion of the pith on which nitric acid had been acting, and the mixture was exposed to the heat of a lamp. Being examined after a few minutes, the globules were found to have resumed their natural appearance. This curious fact indicated, in the opinion of Dutrochet, a strong and unexpected point of analogy between plants and animals. According to the microscopical researches of some modern observers, it has been ascertained that all the organs of animals are composed of a conglomeration of minute corpuscles, similar to those just described; the corpuscles which constitute the muscles are soluble in acids, but those which compose the nervous system are insoluble in the same acids, and only soluble in alkalies. Now, as the chemical properties and external appearance of the particles scattered among the cellular tissue of plants, and constituting the nervous system of animals, are the same, the author is induced to infer, that the spherical particles of plants are in fact the scattered elements of their nervous system. This hypothesis receives additional strength from the great similarity which exists between the medullary substance of the brain of *Molúsca gastropòda* and the cellular medullary tissue of plants. In pursuit of this idea, Dr. Dutrochet made a variety of experiments upon the sensitive plant, the results of which seem to be these:— The principal point of locomotion or of mobility exists in the little swelling which is situated at the base of the common and partial petioles of the leaves; this swelling is composed of a very delicate cellular tissue, in which is found an immense number of nervous corpuscles; the axis of the swelling is formed of a little fascicle of tubular vessels. It was ascertained by some delicate experiments, that the power of movement, or of contraction and expansion, exists in the parenchyma and cellular tissue of the swelling, and that the central fibres have no specific action connected with the motion. It also appeared that the energy of the nervous powers of the leaf depended wholly upon an abundance of sap, and that a diminution of that fluid occasioned an extreme diminution of the sensibility of the leaves. Prosecuting his remarks still further, the author ascertained that in the motion of the sensitive plant two distinct motions take place, the one of locomotion, which is the consequence of direct violence offered to the leaves, and which occurs in the swellings already spoken of; the other is nervimotion, which depends upon some stimulus applied to the surface of the leaflets, unaccompanied by actual violence, such as the solar rays concentrated in the focus of a lens. As in all cases the bending or folding of the leaves evidently takes place from one leaf to another with perfect continuity, it may safely be inferred, that the invisible nervous action takes place in a direct line from the point of original irritation, and that the cause by which this action of nervimotion is produced must be some internal uninterrupted agency. This was, after much curious investigation, determined by the author to exist neither in the pith nor in the bark, nor even in the cellular tissue filled with nervous corpuscles, and on which he supposes the locomotion of the swelling at the base of the petioles to depend. It is in the ligneous part of the central system in certain tubes supplied with nervous corpuscles, and serving for the transmission of sap, that Dr. Dutrochet believes he has found the true seat of nervimotion, which he attributes to the agency of the sap alone, while he considers the power of locomotion to depend upon the nervous corpuscles alone.

Var. β, *glabràta* (D. C. prod. 2. p. 426.) stem glabrous. Native of St. Domingo and St. Thomas. Plum. ed. Burm. t. 202.

Var. γ, *tetrándra* (Willd. spec. 4. p. 1032.) leaflets clothed with adpressed pili beneath. M. pudìca, H. B. et Kunth, nov. gen. amer. 6. p. 252.

Chaste or Common Humble-plant. Fl. April, Sept. Clt. 1638. Pl. 1 foot.

13 M. HISPÍDULA (H. B. et Kunth, nov. gen. amer. 6. p. 252.) stems prickly, and densely beset with stiff hairs; leaves somewhat digitately pinnate, with 4 pinnæ; leaflets linear, acute, ciliated, glabrous; heads of flowers usually twin; legumes very hispid. ♄. S. Native of South America, near Santa Barbara. Very nearly allied to *M. pudìca*. Flowers red.

Hispid Humble-plant. Fl. May, Sept. Clt. 1820. Sh. 1 to 2 ft.

14 M. PUDIBU′NDA (Willd. spec. 4. p. 1032.) stem shrubby, prickly, glabrous; leaves somewhat digitately pinnate, with 4 pinnæ, each pinna bearing many pairs of linear leaflets; heads of flowers elliptic. ♄. S. Native of Brazil, about Bahia. Flowers red.

Blushing Humble-plant. Fl. Ju. Aug. Clt. 1818. Sh. 1 to 2 ft.

15 M. TOMENTÒSA (Humb. et Bonpl. in Willd. spec. 4. p. 1033.) branches unarmed, clothed with silky hairs; leaves somewhat digitately pinnate, with 4 pinnæ, each pinna bearing many pairs of oblong-linear leaflets, which are clothed with hoary silky villi beneath. ♄. S. Native of South America, on the banks of the river Orinoco. Kunth, mim. p. 11. t. 4. H. B. et Kunth, nov. gen. amer. 6. p. 253. Flowers red. Legumes unknown. The specific name is fallacious.

Tomentose Humble-plant. Shrub.

16 M. HIRSU′TA (Moc. et Sesse, in herb. Lamb.) prickles stipular, recurved; leaves with only 1 pair of pinnæ, each pinna bearing numerous linear, mucronate leaflets; stem hispid as well as the pedicels, petioles, and rachis of leaves; peduncles solitary or twin, axillary, about the length of the petioles; calyx hispid; legumes prickly on the margins, 3-4-jointed. ⊙. S. Native of Mexico. Heads of flowers nearly globular, red.

Hairy Sensitive-plant. Pl. 1 to 2 feet.

17 M. TRICE′PHALA (Schlecht. et Cham. in Linnæa. 5. p. 591.) leaves with 1 pair of pinnæ, each pinna bearing 12 pairs of oblique, ovate-elliptic, mucronate leaflets, which are adpressedly ciliated on the margins, shining and glabrous above, but strigose beneath; petiole short; stipulas small, filiform; branches, rachis of leaves, and peduncles scabrous from stiff hairs; heads tern, on long peduncles, axillary, and forming a loose terminal raceme, which is leafy at the base. ♄. S. Native of Mexico, between Laguna, Verde, and Actopan. Flowers pale red. Legumes unknown.

Three-headed Mimosa. Shrub.

18 M. POLYDA′CTYLA (Humb. et Bonpl. in Willd. spec. 4. p. 1033.) stems prickly, glabrous, pilose above; leaves somewhat digitately pinnate, with 8 pinnæ, each pinna bearing many pairs of linear leaflets. ♄. S. Native of Guiana, and about Demerara, as well as in Maranham. Flowers purple. Heads of flowers twin, ovate, pedunculate.

Many-fingered Humble-plant. Fl. June, July. Clt. 1822. Shrub 1 to 2 feet.

§ 3. *Bipinnàtæ* (from *bipinnàtus*, bipinnate leaves). *Leaves bipinnate, with the pinnæ distant, not approximate at the top of the common petiole, as in the last division.*

* *Plants prickly.*

19. M. GEMINA'TA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 427.) stems diffuse, and are as well as the petioles prickly; leaves bipinnate, with 2-3 pairs of pinnæ, each pinna bearing 15-20 pairs of leaflets; heads of flowers axillary, twin. ♃. S. Native of North America, on the western coast. Heads of flowers almost like those of *M. pudica*. Flowers red. Legumes unknown.

Twin-headed Mimosa. Pl. diffuse.

20 M. MONTA'NA (Kunth, mim. p. 31. t. 10. nov. gen. amer. 6. p. 259.) branches prickly, puberulous; leaves bipinnate, short, unarmed, with 2-3 pairs of pinnæ, each pinna bearing 4-6 pairs of elliptic-oblong, puberulous leaflets. ♄. S. Native of Peru, on the Andes, near Caxamarca, at the height of 4310 feet above the level of the sea. Heads of flowers solitary or twin, of a very pale rose colour or white. Legume linear, many-jointed, glabrous.

Mountain Mimosa. Shrub 1 to 2 feet.

21 M. HU'MILIS (Humb. et Bonpl. in Willd. spec. 4. p. 1037.) branches prickly, hispid; leaves bipinnate, with 3-4 pairs of pinnæ, each pinna bearing 6-13 pairs of linear, acutish leaflets, which are puberulous beneath as well as on the margins; prickles straight, subulate, those on the petioles opposite; heads of flowers solitary. ♄. S. Native of Peru. H. B. et Kunth, nov. gen. amer. 6. p. 254. Flowers red. Legume ovate, 2-jointed, beset with bristles.

Humble Mimosa. Shrub ½ foot.

22 M. HAMA'TA (Willd. spec. 4. p. 1033.) branches, petioles, and peduncles pubescent and prickly; leaves bipinnate, with 4 pairs of pinnæ, each pinna bearing 7-8 pairs of leaflets; peduncles longer than the leaves. ♄. S. Native of the East Indies. Legume 5-jointed, sinuated, pubescent.

Hooked Mimosa. Shrub 2 to 4 feet.

23 M. SÓMNIANS (Humb. et Bonpl. in Willd. spec. 4. p. 1036.) branches prickly, rather hispid; leaves bipinnate, with 4-5 pairs of pinnæ, each pinna bearing many pairs of linear, glabrous leaflets; rachis rather prickly; heads of flowers solitary. ♄. S. Native of New Granada, on the Andes. H. B. et Kunth, nov. gen. amer. 6. p. 256. Kunth, mim. p. 20. t. 7. Flowers red. Legume linear, many-jointed, hispid.

Sleeping Mimosa. Shrub 2 to 6 feet.

24 M. PA'LPITANS (Humb. et Bonpl. in Willd. spec. 4. p. 1036.) branches prickly, glabrous; leaves bipinnate, with 5-6 pairs of pinnæ, each pinna bearing many pairs of linear, glabrous leaflets; rachis setose, and rather prickly; heads of flowers usually twin. ♄. S. Native of South America. Flowers red. Legumes linear, 8-12-jointed, rather setose. Perhaps distinct from *M. sómnians*.

Beating Mimosa. Shrub 2 to 4 feet.

25 M. INTERME'DIA (Kunth, mim. p. 16. t. 6. H. B. et Kunth, nov. gen. amer. 6. p. 255.) branches hispid, and are as well as the rachis prickly; leaves bipinnate, with 4-7 pairs of pinnæ, each pinna bearing 9-15 pairs of linear, obtuse, glabrous leaflets; heads of flowers usually twin. ♄. S. Native of the plains of Caraccas. Flowers red. Legume short, 2-4-jointed, oblique, hispid, with the upper joint broader than the rest.

Intermediate Mimosa. Shrub procumbent.

26 M. SOMNICULÒSA (H. B. et Kunth, nov. gen. amer. 6. p. 257.) branches pilose, and are as well as the rachis prickly; leaves bipinnate, with 10-12 pairs of pinnæ, each pinna bearing many pairs of linear, acutish, glabrous leaflets; heads of flowers solitary. ♄. S. Native of South America, within the tropics. Flowers red.

Sleepy Mimosa. Shrub.

* * *Plants unarmed.*

27 M. VI'SCIDA (Willd. enum. p. 1048.) branches and petioles unarmed; but clothed with clammy glands; leaves bipinnate, with 4 pairs of pinnæ, each pinna bearing many pairs of linear, obtuse, glabrous leaflets; heads of flowers globose, solitary. ♄. S. Native of Brazil. Flowers red. Legume unknown. Perhaps belonging to a different section.

Clammy Mimosa. Clt. 1825. Shrub 2 feet.

28 M. MICROCE'PHALA (Humb. et Bonpl. in Willd. spec. 4. p. 1039.) branches and petioles unarmed, but clothed with adpressed pili; leaves bipinnate, with 12-14 pairs of pinnæ, each pinna bearing many pairs of oblong-linear, obtuse, ciliated leaflets; heads of flowers ovate, twin or tern. ♄. S. Native of the banks of the river Orinoco. Kunth, mim. p. 23. t. 8. nov. gen. amer. 6. p. 257. Flowers red. Legume linear, many-jointed, strigose.

Small-headed Mimosa. Fl. June, July. Clt. 1820. Shrub 2 to 4 feet.

SECT. II. HABBA'SIA (*Habbas* is the Egyptian name of *M. polyacántha*). D. C. legum. mem. xii. prod. 2. p. 428. Legume compressed, very hispid, with straight parallel margins, never contracted at the articulations; joints few, shorter than broad. In all the species the branches and petioles are prickly; the prickles on the petioles usually opposite. Leaves bipinnate. Flowers white.

29 M. DO'RMIENS (Humb. et Bonpl. in Willd. spec. 4. p. 1035.) branches prickly, and densely clothed with white hairs; leaves bipinnate, with 5-7 pairs of pinnæ, each pinna bearing 9-12 pairs of linear, rather falcate, acute leaflets, which are pubescent on both surfaces; prickles opposite, subulate, straight, placed between each pinna, and at their base; heads of flowers solitary. ♄. S. Native of South America, in sand on the banks of the river Apures. Flowers white. Legume unknown, but is allied to *M. asperàta*.

Sleeping Mimosa. Fl. June, July. Clt. 1818. Sh. procumb.

30 M. CANE'SCENS (Willd. spec. 4. p. 1038.) leaves bipinnate, with 8-10 pairs of pinnæ, each pinna bearing many pairs of leaflets, which are covered with hoary strigæ; cauline prickles hooked, those on the petioles remote. ♄. S. Native of Guinea. Flowers white. Branches, petioles, and peduncles beset with stiff pubescence.

Canescent Mimosa. Fl. June, July. Clt. 1822. Shrub 1 foot.

31 M. HÍSPIDA (Willd. spec. 4. p. 1037.) leaves bipinnate, with 10 pairs of pinnæ, each pinna bearing many pairs of 3-nerved leaflets; cauline prickles hooked, petiolar ones wanting. ♄. S. Native of Caraccas. Branches, petioles, and peduncles setose. Legume attenuated at both ends, flat, setose, of about 15 joints. Flowers white.

Hispid Mimosa. Tree 10 to 20 feet.

32 M. CILIA'TA (Willd. enum. p. 1048.) leaves bipinnate, with 10 pairs of pinnæ, each pinna bearing many pairs of ciliated leaflets; prickles straight, opposite, a pair between each pair of pinnæ, but solitary at the base of the pinnæ. ♄. S. Native of Brazil. Branches and petioles hairy. Flowers white. Legumes unknown. Allied to *M. asperàta*.

Ciliated-leafletted Mimosa. Shrub.

33 M. PELLI'TA (Humb. et Bonpl. in Willd. spec. 4. p. 1037.) leaves bipinnate, with 8-12 pairs of pinnæ, each pinna bearing many pairs of leaflets, which are hispid on the margins, as well as on the under surface; cauline prickles straight, as well as those at the base of the pinnæ; peduncles twin, 4 times longer than the

heads of the flowers. ♄. S. Native of South America, near Cumana, and on the banks of the river Magdalena near Nares. Branches and petioles hispid. Legumes rather incurved, and hispid, composed of 21-23 joints. Stamens 10-12 in the specimens collected about Cumana, but only 8 in those collected near Nares, ex Kunth, mim. 27. t. 9. H. B. et Kunth, nov. gen. 6. p. 258.

Clad Mimosa. Shrub 3 to 4 feet.

34 M. POLYACA'NTHA (Willd. spec. 4. p. 1034.) leaves bipinnate, with 8-11 pairs of pinnæ, and each pinna bearing many pairs of leaflets; prickles on the stem, as well as those between the pinnæ, hooked, those at the base of the pinnæ straight, and subulate; peduncles 4 times the length of the heads of flowers. ♄. S. Native of Guinea, Abyssinia, and Upper Egypt. Bruce, trav. 5. t. 7. M. Hábbas, Delile, ill. fl. ægypt. p. 31. but not of Link. Peduncles and petioles beset with stiff adpressed villi. Perhaps sufficiently distinct from *A. asperàta.*

Many-spined Mimosa. Shrub 2 to 3 feet.

35 M. ASPERA`TA (Willd. spec. 4. p. 1035.) leaves bipinnate, with 8-12 pairs of pinnæ, each pinna bearing many pairs of leaflets, which are clothed with adpressed bristles beneath, as well as on the margins; prickles on the stem, and between the pinnæ rather hooked, but those at the base of the pinnæ are straight; peduncles usually twin, length of the heads of flowers. ♄. S. Native of Jamaica, Vera Cruz, and about Demerara. D. C. legum. mem. xii. t. 63. Calyx unequally many-toothed. Leaves falling on the slightest touch.

Var. α, hirsùtior (D. C. l. c.) M. asperàta, Lin. spec. 1507. Mill. fig. t. 182. f. 3. Breyn. cent. t. 19.

Var. β, læ`vior (D. C. l. c.) M. pigra, Lin. amœn. 4. p. 274.—Breyn. cent. t. 20.

Roughened Mimosa. Fl. June, July. Clt. 1733. Shrub 3 to 6 feet.

36 M. SICA`RIA (Hoffm. verz. pfl. 1824. p. 221.) leaves bipinnate, with usually 5 pairs of pinnæ, each pinna bearing many pairs of linear, rather ciliated leaflets; prickles straight, subulate, those on the stems scattered, between the pinnæ opposite, and solitary between the pairs. ♄. S. Native of Brazil. Perhaps sufficiently distinct from *M. asperàta.*

Sicaria Mimosa. Shrub 4 to 6 feet.

SECT. III. BATAUCAU'LON (from *βατος, batos*, a bramble, and *καυλος, kaulos*, a stem; stems prickly). D.C. prod. 2. p. 429. Legumes compressed, flat, quite glabrous or hardly pubescent, with parallel ribs, never contracted at the articulations, unarmed or bearing a single row of spines. The leaves of all are bipinnate, and the flowers either white or pale yellow.

37 M. RUBRICAU'LIS (Lam. dict. 1. p. 20.) branch and petiolar prickles scattered and hooked; leaves bipinnate, and are, as well as the branchlets, clothed with adpressed pubescence, having 4-5 pairs of pinnæ, and each pinna bearing 10-12 pairs of oblong-linear leaflets; glands oblong, one situated between each pair of pinnæ when young. ♄. S. Native of the East Indies. M. octándra, Roxb. cor. 2. t. 200. M. Rottlèri, Spreng. syst. 2. p. 206. Heads of flowers yellowish, 3 or 4 rising together from the axils of the upper leaves, which are abortive. Legume compressed, curved, glabrous, obscurely articulated, and furnished with hooked prickles on both sutures, very rarely unarmed.

Red-stemmed Mimosa. Fl. June, July. Clt. 1799. Shrub rambling.

38 M.? CERATÒNIA (Lin. spec. 1508.) branch and petiolar prickles scattered and hooked; leaves bipinnate, and are, as well as the branches, glabrous, with usually 5 pairs of pinnæ, each pinna bearing many pairs of obovate leaflets; legumes quite smooth, obscurely articulated, and bearing hooked prickles on the ribs on both sides. ♄. S. Native of St. Domingo and Porto-Rico. Plum. ed Burm. 17. t. 8. Acàcia Ceratònia, Willd. spec. 4. p. 1091. A rambling shrub.

Ceratonia-like Mimosa. Shrub 1 to 2 feet.

39 M. OLIGACA'NTHA (D. C. prod. 2. p. 429.) cauline prickles hooked, one under each leaf; leaves bipinnate, unarmed, and are, as well as the branches, glabrous; pinnæ 3-4 pairs, and each pinna bearing 3-4 pairs of obovate leaflets; legumes evidently articulated, and hardly aculeated on the ribs. ♄. S. Native of St. Martha. Prickles of legume straight, subulate, and very few.

Few-spined Mimosa. Shrub 3 to 6 feet.

40 M. CA'STA (Lin. spec. 1500.) branch and petiolar prickles scattered and hooked; leaves bipinnate, with only one pair of pinnæ, situated at the top of the petiole, each pinna bearing 4 pairs of obliquely-ovate acute leaflets, which are rough from adpressed strigæ, and ciliated; legumes oval-oblong, with the disks glabrous, but with the sutures very spiny. ♄. S. Native of South America. Comm. hort. 1. t. 28. The lower flowers of the spikes are barren, but the upper ones are fertile.

Chaste Mimosa. Fl. July. Clt. 1741. Shrub.

41 M. LEJOCA'RPA (D. C. legum. mem. xii.) prickles on the branches very few and straightish; leaves unarmed, bipinnate, and are, as well as the branches, glabrous, with 12 pairs of pinnæ, each pinna bearing many pairs of linear leaflets; legumes unarmed, glabrous, evidently articulated, disposed in racemes. ♄. S. Native of St. Martha. Acàcia nùtans, Spreng. in herb. Balb. Perhaps belonging to a different division of the genus.

Smooth-fruited Mimosa. Shrub.

† *Species uncertain to which genus they belong, or to what section of the genus; they are therefore disposed according to the form of the leaves.*

* *Leaves simple.*

42 M. BAUHINIFÒLIA (Salisb. prod. p. 324.) leaves simple, 2-lobed, pubescent.—Native country, flowers, and fruit unknown. Perhaps a species of *Bauhinia* or *Hymenæ`a.*

Bauhinia-leaved Mimosa. Shrub.

* * *Leaves simply pinnate.*

43 M.? PILÒSA (Lour. coch. 650.) unarmed; leaves pinnate, with many pairs of very pilose leaflets; leaflets ovate, obtuse; heads of flowers terminal; legume straight, slender. ♄. G. Native of Cochin-china, in woods. M. crinìta, Pers. ench. 2. p. 261. Flowers white, disposed in large heads, polyandrous. Perhaps a species of *I'nga.*

Pilose Mimosa. Shrub 4 feet.

44 M. FE`RA (Lour. coch. p. 652.) prickles scattered, branched; leaves impari-pinnate; leaflets 5 pairs, oblong-ovate, emarginate; spikes of flowers lateral; corolla 5-cleft, decandrous; legumes curved, flat, many-seeded. ♄. S. Native of Cochin-china and China, where it is planted for hedges, which are impenetrable to animals. From the branched spines we should judge this tree to be a species of *Gleditschia.*

Fierce Mimosa. Tree 50 feet.

* * * *Leaves with one pair of pinnæ.*

45 M. STAMÍNEA (Billb. pl. bras. in flora. 1821. p. 332.) unarmed; leaves with one pair of pinnæ, each pinna bearing about 25 pairs of leaflets; heads of flowers globose, axillary, pedunculate; stamens very long. ♄. S. Native of Brazil.

Long-*stamened* Mimosa. Shrub or tree.

46 M. CASCABELI'LLO (Coll. hort. ripul. 91.) unarmed; leaves with one pair of pinnæ, each pinna bearing 2-3 pairs of elliptic, acutish, glabrous leaflets, with an adpressed gland between the outer pair of leaflets. ♄. S. Native country unknown, as well as the flowers and fruit. Said to be allied to *M. pistaciæfòlia.*

Cascabelillo Mimŏsa. Shrub 3 to 4 feet.

47 M. HIRSUˋTA (Spreng. syst. 2. p. 204.) unarmed; stipulas linear; leaves with one pair of pinnæ, each pinna bearing 12 pairs of oval, marginated, ciliated leaflets; common petiole hairy. ♄ . S. Native of Monte Video.

Hairy Mimosa. Shrub or tree.

48 M. SPRENGEˋLII (D. C. prod. 2. p. 430.) prickles scattered, horizontal; branches strigose, adpressed downwards; leaves with 1 pair of pinnæ, each pinna bearing 6 pairs of obliquely ovate-oblong, nerved leaflets, ciliated at the base; flowers axillary, sessile, pentandrous. ♄ . S. Native of Monte Video. M. ciliàta, Spreng. syst. 2. p. 204. but not of Willd.

Sprengel's Mimosa. Shrub or tree.

* * * * *Leaves pinnate and bipinnate.*

49 M. COCHLIOCAˊRPA (Gomes. obs. pl. bras. p. 30. t. 4. f. 3.) unarmed; leaves doubly and abruptly-pinnate, with 3 pairs of pinnæ, and 3 pairs of leaflets; heads of flowers solitary; legumes compressed, spiral. ♄ . S. Native of Brazil, near Rio Janeiro. Abaremotèma, Pis. bras. 77. Leaflets ovate-lanceolate, 3 or 4 pairs on each pinna, and 3 pairs of pinnæ. Stamens 20, monadelphous. Bark chinky, and very astringent.

Twisted-fruited Mimosa. Shrub 3 to 6 feet.

* * * * * *Leaves bipinnate.*

† *Unarmed shrubs or trees.*

50 M.? CORNICULAˋTA (Lour. coch. 651.) unarmed; leaves bipinnate; leaflets usually 8 pairs; petiole prickly at the base, and propped by a recurved callous horn; panicle terminal, subcorymbose. ♄ . G. Native of China, in the suburbs of Canton. Flowers white, 4-cleft, polyandrous and monadelphous. Perhaps a species of *Acàcia*. Loureiro did not see any hermaphrodite flowers.

Horned-petioled Mimosa. Tree 20 feet.

51 M. BALSAˊMICA (Mol. chil. ed. gall. 338.) unarmed; leaves bipinnate; pinnæ 6 pairs; leaflets somewhat denticulated; flowers octandrous. ♄ . S. Native of Chili.

Balsam Mimosa. Shrub or tree.

52 M. TERMINAˋLIS (Salisb. prod. 325.) leaves bipinnate; petioles acutely angled above; leaflets unequal-sided, ovate-lanceolate, mucronulate, coriaceous. ♄ . G. Native about Port Jackson, in New South Wales.

Terminal Mimosa. Tree.

53 M. AGGREGAˋTA (Pers. ench. 2. p. 263.) leaves bipinnate; leaflets distant, pilose beneath, as well as the petioles; peduncles numerous, aggregate in the axils of the leaves. ♄ . S. Native of the East Indies. Perhaps a species of *Acàcia*.

Aggregate-peduncled Mimosa. Tree.

54 M. RHOMBIFÒLIA (Pers. ench. 2. p. 263.) leaves bipinnate; leaflets large, rhomboid; flowers disposed in spikes. ♄ . S. Native of Trinidad. Perhaps a species of *Acàcia*.

Rhomb-leafletted Mimosa. Tree.

55 M.? TOˊRTILIS (Forsk. descrip. p. 176.) leaves bipinnate, with 5 pairs of pinnæ, the outer pair furnished with a scale between, each pinna bearing 7-9 pairs of oblong, very short leaflets; legumes twisted, glomerated. ♄ . G. Native of Arabia, near Hares. Flowers white, disposed in heads. Perhaps a species of *Acàcia*.

Twisted-podded Mimosa. Tree.

56 M.? GLOMERAˋTA (Forsk. descrip. 177.) leaves bipinnate; legumes black, twisted, glomerated. ♄ . S. Native of Arabia.

Glomerate-podded Mimosa. Shrub.

57 M.? FLAˋVA (Forsk. descript. 176.) leaves bipinnate, with 3-5 pairs of pinnæ, each pinna bearing 7-10 pairs of linear obtuse leaflets, destitute of any glands. ♄ . G. Native of Arabia. Flowers pale yellow.

Yellow-flowered Mimosa. Shrub.

†† *Armed shrubs or trees.*

58 M. LUˋTEA (Mill. dict. no. 17.) prickles very long; leaves bipinnate, glabrous; flowers globose, pedunculate. ♄ . S. Native of South America. Flowers yellow.

Yellow Mimosa. Tree.

59 M. TRINEˊRVIS (Desf. cat. hort. par. 180. Pers. ench. 2. p. 266.) glabrous; rameal and petiolar prickles scattered, and rather hooked; leaves bipinnate, with 3-4 pairs of pinnæ, each pinna bearing 8-10 pairs of oval-rhomboid, mucronulate, veiny leaflets, which are 3-nerved at the base; there is a gland at the base of the petiole, and one between each of the two extreme pairs of pinnæ. ♄ . S. Native country unknown, as well as the legumes and flowers. Acàcia trinérvis, Desv. journ. bot. 1814. 1. p. 70. Perhaps the figure in Breyn. cent. 1. t. 17. appertains to this plant, and therefore it is the same as M. longisíliqua of Lam. dict. 1. p. 21. The species appears to be intermediate between the sections *Habbàsia* and *Bataucaúlon* of the present genus.

Three-nerved-leafletted Mimosa. Tree?

60 M.? ANGULAˋTA (Spreng. neue entd. 2. p. 158.) prickles on the angles of the branches scattered, and bent backwards; leaves bipinnate, with 12 pairs of pinnæ, each pinna bearing many pairs of linear ciliated leaflets; petioles unarmed, and are, as well as the branches, very villous, and bearing glands between the pairs of pinnæ; panicle branched. ♄ . S. Native of Brazil. Legume unknown. Said to be allied to *M. rubricaúlis*.

Angular-branched Mimosa. Shrub or tree.

61 M. RUGAˋTA (Lam. dict. 1. p. 20.) prickles scattered, short, hooked; leaves bipinnate, with 7-8 pairs of pinnæ, each pinna bearing 13-15 pairs of linear leaflets; there is a sessile gland at the base of the petiole; legumes complanate, sinuated, plicate, wrinkled, mucronate. ♄ . S. Native of the East Indies. Legumes 5 inches long, and one inch broad. Flowers unknown.

Wrinkled Mimosa. Tree.

62 M. LATISPINÒSA (Lam. dict. 1. p. 22.) spines petiolar, scattered, very broad, compressed, straight; leaves bipinnate, at length becoming glabrous, glandless, with 12-20 pairs of unarmed pinnæ, each pinna bearing 10-15 pairs of elliptic-oblong leaflets. ♄ . S. Native of Madagascar. Petioles, branches, and under side of leaves pubescent. Flowers and fruit unknown.

Broad-spined Mimosa. Clt. 1823. Shrub.

63 M.? SINUAˋTA (Lour. coch. 653.) shrub climbing and prickly; leaves bipinnate, with many pairs of pinnæ, as well as leaflets; leaflets small, linear; heads of flowers axillary, solitary, small, on long peduncles; legumes compressed, sinuated. ♄ . ◡. G. Native of Cochin-china, in woods. Perhaps a species of *Entàda*. Corolla wanting.

Sinuated-podded Mimosa. Shrub cl.

64 M.? SEMISPINÒSA (Lin. spec. 1508.) prickles crowded at the tops of the internodes; leaves bipinnate. ♄ . S. Native of South America. The rest unknown.

Half-spiny Mimosa. Shrub.

65 M.? CAMPECHIAˋNA (Mill. dict. no. 20.) spinose; leaves bipinnate; leaflets narrow; spines split their whole length. ♄ . S. Native about Campeachy. The rest unknown.

Campeachy Mimosa. Tree.

66 M. KANTUˊFFA (Bruce, trav. ed. gall. 8vo. vol. 13. p. 88. t. 36.) rameal, stipular, and petiolar prickles hooked; leaves bipinnate, with 7-8 pairs of pinnæ, each pinna bearing about 9 or 10 pairs of oblong obtuse leaflets; spikes of flowers cylindrical; stamens 10, free. ♄ . S. Native of Abyssinia. A very prickly bush, with sweet-scented flowers. Pterolòbium, R. Brown, abyss.

whence the legume is probably winged. Perhaps a species of *Acàcia* or *Gagnebìna*.

Kantuffa Mimosa. Shrub 6 feet.

67 M.? AGRE'STIS (Sieb. in Spreng. syst. 2. p. 206.) prickles on the branches horizontal and straight; branches hoary; leaves bipinnate, with 6 pairs of pinnæ, each pinna bearing about 16 pairs of pubescent leaflets; racemes spicate, exceeding the leaves. ♄. G. Native of Palestine. Perhaps the same as M. arvénsis, Sieb. ex Steud. nom.

Field Mimosa. Shrub.

68 M. Æ'MULA (Spreng. syst. 2. p. 206.) prickles much crowded, straight, and rather flexuous; leaves bipinnate, with 8 pairs of pinnæ, each pinna bearing about 12 pairs of roundish leaflets, which are clothed with stellate pubescence, but tomentose beneath; heads of flowers tomentose, hairy. ♄. S. Native of Brazil.

Rival Mimosa. Shrub or tree.

69 M.? ABSTE'RGENS (Roxb. ex Spreng. syst. 2. p. 206.) prickles on the branches crowded, and a little recurved; branches dotted; branchlets villous; leaves bipinnate, with 8 pairs of pinnæ, each pinna bearing many pairs of linear ciliated leaflets; petioles unarmed, pubescent, glandular at the base; heads of flowers panicled. ♄. S. Native of the East Indies.

Cleansing Mimosa. Clt. 1820. Shrub.

70 M.? MADAGASCARIE'NSIS (Spreng. l. c.) prickles on the branches scattered, and a little reflexed; leaves bipinnate, with 10 pairs of pinnæ, each pinna bearing many pairs of minute linear leaflets, which are villous, as well as the branchlets; peduncles lateral, usually twin. ♄. G. Native of Madagascar.

Madagascar Mimosa. Shrub or tree.

71 M.? BRASILIE'NSIS (Spreng. l. c.) prickles stipular, opposite, erect; petioles hairy, almost unarmed; leaves bipinnate, with many pairs of pinnæ, as well as leaflets; leaflets linear, imbricated; heads of flowers shorter than the leaves. ♄. S. Native of Brazil.

Brazil Mimosa. Shrub or tree.

72 M. FERRUGI'NEA (Rottl. in Spreng. l. c.) prickles both of the branches and petioles recurved; petioles and branchlets pubescent; leaves bipinnate, with many pairs of pinnæ, as well as leaflets; leaflets linear, dimidiate, imbricated, glabrous; gland oblong, situated at the base of the petiole; heads of flowers panicled, terminal. ♄. S. Native of the East Indies.

Rusty Mimosa. Clt. 1818. Shrub.

73 M. BARCLAYA'NA (Hort.) There is nothing further known of this plant than that it is a native of Madagascar.

Barclay's Mimosa. Shrub or tree.

Cult. The leaves of most of the species of this genus are sensitive to the touch, and are therefore all worth cultivating for curiosity. They thrive well in a mixture of loam and peat, and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them in heat. Some of the kinds ripen seeds in abundance, by which they are easily increased. The seeds of the annual kinds require to be sown in pots, and the pots placed in a hot-bed, and when the plants rise to the height of 2 or 3 inches they should be potted off separately into small pots, and shifted from size to size of pots as they grow, giving the plants plenty of heat and moisture.

CCXXIV. GAGNEBI'NA (meaning unknown). Neck. elem. no. 1296. D.C. legum. mem. xii. no. 3. prod. 2. p. 431.

LIN. SYST. *Decándria, Monogýnia.* Flowers hermaphrodite. Calyx 5-toothed. Petals 5, oblong-linear, distinct. Stamens 10. Style long, filiform, deciduous. Legume complanate, dry, indehiscent, with a marginal wing rising from both sutures, transversely many-celled inside; cells 1-seeded.—Elegant, unarmed, glabrous shrubs, natives of the Mauritius and Madagascar. Leaves bipinnate, with many pairs of linear leaflets, which are equal in size and shape, and having a gland at the base of the petiole, and one between each pair of pinnæ. Spikes of flowers axillary, cylindrical, yellow. Legumes clothed with white villi when young, but glabrous in the adult state.

1 G. TAMARI'SCINA (D. C. prod. 2. p. 432.) leaves with about 20 pairs of pinnæ, each pinna bearing about 30 pairs of leaflets; spikes of flowers crowded at the tops of the branches, disposed in a kind of racemose corymb. ♄. S. Native of the Mauritius and Madagascar. D. C. legum. mem. xii. t. 64. f. B. Mimòsa tamaríscina, Lam. dict. 1. p. 13. Acàcia tamaríscina, Willd. spec. 4. p. 1062.—Pluk. alm. t. 329. f. 3.

Tamarix-like Gagnebina. Clt. 1824. Shrub 6 feet.

2 G. AXILLA'RIS (D. C. prod. 2. p. 432.) leaves with 24 pairs of pinnæ, each pinna bearing about 50 pairs of leaflets; spikes of flowers axillary, lower ones solitary, upper ones rising by twos or threes. ♄. S. Native along with the preceding species. D. C. legum. mem. xii. t. 64. f. A. M. pterocárpa, Lam. dict. 1. p. 13. Vahl. symb. 3. p. 103.

Axillary-spiked Gagnebina. Clt. 1824. Shrub 6 feet.

Cult. See *Mimòsa* for culture and propagation.

CCXXV. I'NGA (the South American name of *I. vèra*, adopted by Marcgraff). Plum. gen. 13. t. 25. Willd. spec. 4. p. 104. Kunth, mim. p. 35. D. C. legum. mem. xii.—Amòsa, Neck. elem. no. 1298.

LIN. SYST. *Polygàmia, Monœ'cia.* Flowers polygamous. Calyx 5-toothed. Petals 5, connected together into a 5-cleft corolla. Stamens numerous, exserted, sometimes joined together a short way at the base, and sometimes a great way up. Legume broad, linear, compressed, 1-celled. Seeds sometimes imbedded in pulp, sometimes in farina, and sometimes, though rarely, enwrapped in a pellicle.—Usually unarmed trees or shrubs, with spikes or heads of red or white flowers. This genus will require to be still further divided into separate genera, when the characters of the species are better known. The legumes being in some thickened at the margins, in others flat, straight, or twisted. The seeds in some are imbedded in pulp, in others enveloped in a dry pellicle at maturity. The stamens in some are monadelphous only at the base, while in others they are connected into a long exserted column, and the pollen in the anthers in some is powdery, but in others it is in a few granular masses, as in *Asclepiàdeæ.*

§ 1. *I'ngæ vèræ* (true species of *I'nga*). *Leaves simply pinnate. Leaflets large, from 2 to 9 pairs, the extreme ones always the largest. The species contained in this division are all natives of South America; they are unarmed trees, bearing spikes of flowers, with a few exceptions, and furnished with glands on the petioles between the pairs of leaflets.*

* *Pterópodæ* (from πτερον, *pteron*, a wing, and πους ποδος, *pous podos*, a foot; in reference to the footstalks of the leaves being winged). *Common petiole evidently winged.*

1 I. SA'PIDA (H. B. et Kunth, nov. gen. amer. 6. p. 286.) leaves with 2 pairs of oblong acuminated leaflets, which are membranous, quite smooth, shining above, and attenuated at the base. ♄. S. Native of the banks of the river Magdalena. Legumes 5-6 inches long, and a little arched, containing pulp which is sweet and sapid. Flowers unknown.

Sapid Inga. Tree 50 feet.

2 I. QUASSIÆFÒLIA (Willd. spec. 4. p. 1013.) leaves with 2 pairs of ovate-oblong acuminated leaflets, which are shining on both surfaces; spikes of flowers ovate, pedunculate; corolla villous. ♄. S. Native of Para, in Brazil. Superior leaflets 3 inches long. Branches glabrous. Legume unknown.

Quassia-leaved Inga. Clt. 1820. Tree 40 feet.

3 I. NI′TIDA (Willd. spec. 4. p. 1013.) leaves with 2 pairs of oblong-lanceolate leaflets, which are shining on both surfaces, and pilose on the veins beneath; spikes of flowers pedunculate, oblong; corolla villous. ♄. S. Native of Para, in Brazil. Branches hairy. Superior leaflets 4-5 inches long. Legume unknown.

Shining-leaved Inga. Tree 30 to 40 feet.

4 I. PILOSIU′SCULA (Desv. journ. bot. 1814. p. 71.) leaves with 2 pairs of oval-oblong, acuminated, shining leaflets, which are rather pilose, as well as the branches; glands large, one between each pair of leaflets; spikes of flowers oblong-capitate, pedunculate; corolla villous. ♄. S. Native of Cayenne. Mimòsa pilosiúscula, Rich. in act. soc. hist. nat. par. 1. p. 113. Mimòsa lùcida, Vahl. ecl. amer. 3. p. 31. t. 24. Petioles cuneately winged beneath the upper pair of pinnæ, and somewhat orbicularly winged beneath the lower pair. Branches terete. Superior leaflets 5-6 inches long. Legume unknown.

Pilose Inga. Tree 40 feet.

5 I. SETI′FERA (D. C. prod. 2. p. 432.) leaves with 2 pairs of oval abruptly-acuminated leaflets, which are rather cuneated at the base, paler beneath, and rather villous on both surfaces; petiole broadly winged, and drawn out at the apex into a long bristle, which is longer than the superior internode of the leaves; spikes of flowers ovate, pedunculate; corolla villous. ♄. S. Native of French Guiana. Superior leaflets 6-8 inches long, and the lower ones 3 inches long, having the nerves clothed with adpressed villi, and the intervals between the nerves rather pilose. Legume unknown.

Bristle-bearing Inga. Clt. 1824. Tree 20 to 30 feet.

6 I. LU′CIDA (H. B. et Kunth, nov. gen. amer. 6. p. 287.) leaves with 2 pairs of nearly elliptic, rather acuminated, coriaceous, quite smooth leaflets, which are shining above, and rounded at the base; spikes of flowers panicled, elliptic-oblong; corolla clothed with silky wool. ♄. S. Native on the banks of the river Magdalena, near Badilles. Seeds black.

Lucid-leaved Inga. Tree 20 to 30 feet.

7 I. UMBELLI′FERA (Steud. nom. p. 431.) leaves with 2 pairs of lanceolate leaflets, which are glabrous, as well as the corollas and branches, with a gland between one of the pairs of leaflets; umbels of flowers axillary, pedunculate. ♄. S. Native of South America. Mimòsa umbellífera, Vahl. ecl. amer. 3. p. 30. Legumes spiral. Flowers white.

Umbelliferous Inga. Tree.

8 I. FU′LGENS (Kunth, mim. p. 36. t. 11. nov. gen. amer. 6. p. 287.) leaves with 2-3 pairs of obovate-elliptic, quite smooth leaflets, which are rounded at both ends, and undulated on the margins; spikes of flowers elliptic-oblong, somewhat panicled; corolla clothed with silky hairs. ♄. S. Native of New Granada, near Honda. Flowers red. Legumes unknown.

Fulgent Inga. Tree.

9 I. MACROPHY′LLA (Humb. et Bonpl. in Willd. spec. 4. p. 1015.) leaves with 2 or 3 pairs of ovate, cordate, rather acuminated, membranous, glabrous leaflets, which are shining above; spikes of flowers pedunculate; corolla villous. ♄. S. Native of South America, on the banks of the Orinoco near St. Fernando de Atabapo. H. B. et Kunth, nov. gen. amer. 6. p. 286. Branches tetragonal. Superior leaflets half a foot long. Legumes unknown.

Long-leafletted Inga. Tree.

10 I. A′LBA (Willd. spec. 4. p. 1013.) leaves with 3-4 pairs of oblong, acuminated, nearly equal leaflets, which are glabrous above and scabrous beneath; spikes of flowers ovate, twin, pedunculate. ♄. S. Native of Cayenne: Mimòsa álba, Swartz. fl. ind. occ. 2. p. 976. Vahl. ecl. 3. p. 31. Petioles a little margined, wingless at the base, but winged at the apex. Corolla green. Filaments white, monadelphous. Legume unknown.

White-stamened Inga. Clt. 1804. Tree 10 to 20 feet.

11 I. FEUI′LLEI (D. C. prod. 2. p. 433.) leaves with 3-4 pairs of oval-oblong, glabrous leaflets, which are acute at both ends; spikes of flowers usually twin, ovate, pedunculate; legumes very long, linear, flat, glabrous. ♄. S. Native of Peru, also cultivated in the gardens about Lima. Pacài, Feuill. obs. 3. p. 2. p. 27. t. 19. but not of Frezier. Flowers white. Legume 1-2 feet long, containing a sweet white pulp which is eaten by the natives of Peru.

Feuille's Inga. Clt. 1824. Tree 20 to 30 feet.

12 I. SINEMARIE′NSIS; leaves with 2 pairs of ovate, shining, glabrous leaflets, which taper to both ends; spikes axillary, solitary, shorter than the leaves, pedunculate. ♄. S. Native of Guiana, and the island of St. Christopher. Mimòsa Sinemariénsis, Aubl. guian. 2. p. 945. Swartz, fl. ind. occ. 2. p. 979. Flowers white.

Sinemari Inga. Tree 20 feet.

13 I. MOCINIA′NA; leaves with 5 pairs of elliptic, acuminated leaflets, which are pubescent above, but clothed with silky down beneath; petioles winged; peduncles, rachis, and young branches clothed with rusty down; peduncles solitary, axillary; corolla clothed with yellowish down. ♄. S. Native of Mexico. Flowers red. (v. s. in herb. Lamb.)

Mocino's Inga. Tree.

14 I. SETÒSA; clothed with bristles in every part, but more so on the petioles, branches, and peduncles; leaves with 6 pairs of sessile, broad, elliptic, acuminated leaflets; petioles broadly winged; stipulas roundish, acuminated; peduncles long, axillary, solitary, bearing spikes of loose flowers at the apex. ♄. S. Native of Peru. (v. s. in herb. R. et P. in herb. Lamb.)

Bristly Inga. Tree.

15 I. PISA′NA; clothed with rusty pubescence, especially on the under side of the leaves, peduncles, and young branches; leaves with 3-4 pairs of oblong, acuminated leaflets; petioles winged; spikes of flowers forming a terminal panicle. ♄. S. Native of Peru. Mimòsa Pisàna, Ruiz et Pav. in herb. Lamb.

Pisan Inga. Tree.

16 I. ODORA′TA; young stems and peduncles pubescent; leaves with 2 pairs of oblique, elliptic, long-acuminated leaflets; spikes twin or tern, axillary. ♄. S. Native of Peru. Mimòsa odoràta, Ruiz et Pav. in herb. Lamb. Petioles only sometimes winged at the very apex.

Sweet-scented Inga. Tree.

17 I. PAVONIA′NA; clothed with rusty down; petioles winged; leaflets alternate, elliptic-oblong, broad, acuminated, and rather cordate at the base, glabrous above, except on the nerves; spikes of flowers axillary, solitary; bracteas linear, length of calyx. ♄. S. Native of Peru. Calyx tubular, ribbed. Corolla villous. (v. s. in herb. Lamb.)

Pavon's Inga. Tree.

18 I. FASTUÒSA (Willd. spec. 4. p. 1014.) leaves with 4-5 pairs of ovate-oblong, acuminated leaflets, which are glabrous above, but clothed with rusty hairs beneath; glands pedicellate; spikes few-flowered; peduncles and corollas villous. ♄. S. Native of Caraccas. Mimòsa fastuòsa, Jacq. fragm. t. 10. Corolla tubular, rufous, 2 inches long. Stamens red, twice the length of the corolla. Legume broad-linear, twisted in a spiral manner, with thickened margins.

Proud Inga. Clt. 1820. Tree 50 feet.

19 I. SAPINDOÌDES (Willd. spec. 4. p. 1012.) leaves with usually 4 pairs of oblong, acuminated leaflets, which are glabrous and shining above, and rather scabrous beneath; spikes of flowers oblong, solitary; corollas glabrous; branchlets hairy. ♄. S. Native of Caraccas. Flowers white. Legumes linear, glabrous, a foot long.

Sapindus-like Inga. Tree 50 feet.

20 I. VELUTÌNA (Willd. spec. 4. p. 1014.) leaves with 4 pairs of ovate, acute leaflets, which are clothed with soft pubescence on both surfaces, but shining above; spikes of flowers solitary; corolla villous; branches and peduncles hairy. ♄. S. Native of Para, in Brazil. Legumes unknown. There is a solitary gland between each of the lower pairs of leaflets, and 3 between the superior pair.

Velvety Inga. Clt. 1820. Tree.

21 I. AFFI'NIS (D. C. prod. 2. p. 433.) leaves with 4 pairs of oval, acuminated leaflets, which are pubescent above and rather shining, but villous beneath and opaque; petioles, branches, peduncles, and flowers clothed with velvety tomentum; spikes of flowers solitary or twin; corolla villous. ♄. S. Native of Brazil. This species is very nearly allied to *I. velutìna*, but the leaflets are not above half the size, with a solitary gland between each pair of leaflets.

Allied Inga. Clt. 1800. Tree.

22 I. INGOÌDES (Willd. spec. 4. p. 1012.) leaves with 4 pairs of oval-oblong, acuminated leaflets, which are clothed with velvety tomentum beneath, with a gland between each pair; racemes terminal, tomentose. ♄. S. Native of Cayenne. Mimòsa ingoìdes, Rich. act. soc. hist. par. 1. p. 113. Allied to the following species.

Inga-like Inga. Tree 20 feet.

23 I. SPU'RIA (Humb. et Bonpl. in Willd. spec. 4. p. 1014.) leaves with 5-6 pairs of oblong, acuminated leaflets, which are shining and glabrous above, but clothed with fine pubescence beneath; spikes of flowers axillary, usually twin; corollas villous; legumes sulcate, pubescent. ♄. S. Native of South America, in humid places near Cumana and Santa Fe de Bogota. Kunth, mim. 39. t. 12. H. B. et Kunth, nov. gen. amer. 6. p. 289. Allied to *I. vèra*, but the leaves are pubescent beneath, and the legume is longer and mucronate. Corolla green.

Spurious Inga. Clt. 1820. Tree 40 to 60 feet.

24 I. VE'RA (Willd. spec. 4. p. 1010.) leaves with 4-5 pairs of obovate-oblong, acuminated, glabrous, membranous leaflets; spikes axillary, few-flowered, usually solitary; corolla clothed with silky wool; legume furrowed, pubescent. ♄. S. Native of Brazil, Mexico, West Indies, and near Maypures, on the Orinoco, &c. Mimòsa I'nga, Lin. spec. 1498.—Sloan. hist. t. 183. f. 1. —Plum. gen. t. 25. Flowers white. Legume sweet and edible.

True Inga. Fl. July, Aug. Clt. 1739. Tree 20 to 30 feet.

25 I. BONPLANDIA'NA (H. B. et Kunth, nov. gen. amer. 6. p. 288.) leaves with 5 pairs of elliptic-oblong, acute, rather cordate, somewhat coriaceous, glabrous leaflets, which are shining above; flowers in spikes; corollas silky; legumes glabrous. ♄. S. Native of South America, in the province of Jaen de Bracamoros, on the banks of the Camaya.

Bonpland's Inga. Tree 40 to 50 feet.

26 I. INSÍGNIS (Kunth, mim. p. 43. t. 13. H. B. et Kunth, nov. gen. amer. 6. p. 290.) leaves with 5 pairs of elliptic, acuminated, glabrous leaflets, which are rounded at the base, the nerves rather hairy, shining above; spikes of flowers oblong, axillary, twin; corollas clothed with silky hairs. ♄. S. Native of South America, between Quito and Puembo. Flowers white. The legume, according to Bonpland, is quadrangular, woody, tomentose, and pulpy inside.

Shewy Inga. Tree 40 to 50 feet.

27 I. ORNIFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 291.) leaves with 5 pairs of oblong-lanceolate, acuminated, coriaceous, pilose leaflets, which are cordate at the base and shining above; spikes of flowers solitary, axillary, and terminal. ♄. S. Native near Quito. Flowers unknown. Legume linear, with thickened margins, rather falcate, densely tomentose.

Ash-leaved Inga. Tree 20 feet.

28 I. ORNA'TA (Kunth, mim. p. 46. t. 14. H. B. et Kunth, nov. gen. amer. 6. p. 292.) leaves with 5 pairs of oblong, acute leaflets, which are rounded at the base, and pubescent above; branches and peduncles clothed with hairy pubescence; spikes of flowers oblong, twin, panicled; corolla clothed with silky hairs. ♄. S. Native in the province of Popayan, on the bank of the river Cauca. Corolla rufous, 10 lines long. Stamens red, 3 inches long. Legumes 3-4 feet long, furrowed, pulpy inside.

Adorned Inga. Tree.

29 I. RHOIFÒLIA (Willd. enum. p. 1046.) leaves with 5 pairs of oblong, acuminated leaflets which are shining and hairy above, but villous beneath; branches clothed with ferruginous tomentum. ♄. S. Native of Brazil. Flowers and fruit unknown.

Red-leaved Inga. Tree.

30 I. BERTERIA'NA (D. C. legum. mem. xii. prod. 2. p. 434.) leaves with 6 pairs of oblong, acuminated leaflets, which are rather puberulous above, but clothed with soft velvety down beneath, with a gland situated between each pair; branches, peduncles, petioles, calyxes, and nerves of leaves clothed with short velvety down; spikes of flowers ovate, axillary, solitary; corolla clothed with silky hairs. ♄. S. Native of St. Martha. Corolla white. Stamens red.

Bertero's Inga. Tree.

31 I. ANGUSTIFÒLIA (Willd. spec. 4. p. 1012.) leaves with 4-9 pairs of lanceolate, acuminated leaflets, which are shining on both surfaces; legumes linear, flat, glabrous. ♄. S. Native of Caraccas. Glands small, between the pairs of leaflets. Flowers unknown.

Narrow-leafletted Inga. Tree.

* * *Apterópodæ* (from *α*, priv. *πτερον*, *pteron*, a wing, and *πους ποδος*, *pous podos*, a foot; in allusion to the footstalks of the leaves being without wings, so conspicuous in the last division). *Common petiole hardly winged or altogether naked.*

32 I.? BOURGÒNI (D. C. prod. 2. p. 434.) leaves with 2-3 pairs of ovate, shining, glabrous leaflets; petioles a little winged at the apex of the articulations, and also each furnished with a gland; spikes of flowers axillary, short, usually 4 together. ♄. S. Native of Guiana, Cayenne, Caraccas, and of Barbados, in humid woods. Mimòsa Bourgòni, Aubl. guian. 2. t. 358. Mimòsa fagifòlia, Lin. spec. 1498. I. marginàta, Willd. spec. 4. p. 1015. The legume, according to Aublet, is dry and divided internally into many cells by transverse dissepiments. The column of stamens exserted beyond the corolla, which is glabrous. *Bourgoni* is the French name of the tree in Guiana.

Bourgoni Inga. Clt. 1752. Tree 30 to 40 feet.

33 I. MARGINA'TA (H. B. et Kunth, nov. gen. amer. 6. p. 285.) leaves with 2 pairs of oblong, much acuminated, membranous, glabrous leaflets, which are opaque above, and shining beneath, and cuneated at the base; petiole rather pilose, furnished with a narrow wing at the apex. ♄. S. Native of South America, in the valleys of Araguem. Perhaps sufficiently distinct from *I. Bourgòni.* Flowers white.

Marginate-petioled Inga. Clt. 1820. Tree 20 to 30 feet.

34 I. THYRSOI'DEA (Desv. journ. bot. 1814. 1. p. 71.) leaves with 3 pairs of ovate, glabrous leaflets, which are veiny beneath; petioles almost naked except at the tops of the articulations, where they are a little winged; branches angular, cinereous; flowers thyrsoid. ♄. S. Native of Guiana. Legume unknown. Flowers not sufficiently known.

Thyrsoid Inga. Tree.

35 I. RUBIGINÒSA (D. C. prod. 2. p. 434.) leaves with 4-5 pairs of oblong-ovate, acuminated leaflets, which are glabrous and shining above, except on the nerves, but clothed with rusty-velvety down beneath, as well as the branches, petioles, peduncles, and calyxes; spikes of flowers oblong, usually twin; corolla clothed with silky hairs. ♄. S. Native of Cayenne.

Mimòsa rubiginòsa, Rich. act. soc. hist. nat. par. 1. p. 113. Pers. ench. no. 18. Corolla rufous, 9 lines long. Legume unknown.

Rusty Inga. Tree.

36 I. THIBAUDIÀNA (D. C. legum. mem. xii. prod. 2. p. 434.) leaves with 4-5 pairs of ovate-oblong, acuminated leaflets, which are glabrous above, except the nerves, but pubescent beneath as well as the petioles, peduncles, and calyxes; spikes of flowers usually twin, oblong, but panicled at the tops of the branches; corollas clothed with silky pubescence. ♄. S. Native of Cayenne. Petioles winged at the apex, but naked at the base. Corolla slender, 7 lines long. Stamens red, exserted. Legume unknown.

Thibaud's Inga. Tree.

37 I. FRAXÍNEA (Willd. spec. 4. p. 1019.) leaves with 5 pairs of oblong, acuminated, shining leaflets; petiole semi-terete, pubescent; spikes of flowers pedunculate, pubescent, and panicled at the tops of the branches; corollas glabrous. ♄. S. Native of Para, in Brazil. Legume unknown.

Ash-like Inga. Tree 20 to 30 feet.

38 I. INÆQUÀLIS (Humb. et Bonpl. in Willd. spec. 4. p. 1019.) leaves with 4 pairs of oblong-lanceolate, membranous leaflets, which are unequal at the base, shining above, and glabrous on both surfaces as well as the petioles, peduncles, and flowers; spikes of flowers oblong, on short peduncles. ♄. S. Native on the banks of the Orinoco.

Unequal-leafletted Inga. Tree.

39 I. HUMBOLDTIÀNA (H. B. et Kunth, nov. gen. amer. 6. p. 285.) leaves with 4 pairs of oblong, acute, membranous, glabrous leaflets, which are acutish at the base and shining above; spikes of flowers nearly globose, terminal, panicled; corolla clothed with silky hairs. ♄. S. Native of New Granada, on the banks of the river Magdalena. Legumes unknown.

Humboldt's Inga. Tree.

40 I. NÓBILIS (Willd. enum. 1047.) leaves with 3-4 pairs of oblong, acute, glabrous leaflets; spikes panicled; peduncles pubescent; corolla silky. ♄. S. Native of Brazil. Legumes unknown.

Noble Inga. Tree.

41 I. JUGLANDIFÒLIA (Willd. spec. 4. p. 1018.) leaves with 3-4 pairs of oblong, acuminated, glabrous leaflets, which are attenuated at the base; petioles glandless, and are as well as the branches clothed with ferruginous pubescence; spikes of flowers 2-3-together, axillary, pedunculate; corolla villous. ♄. S. Native of Caraccas. Legume linear, flat, 7 inches long. This is very distinct, from the absence of the glands on the petiole.

Walnut-leaved Inga. Tree 20 to 30 feet.

42 I. CORÙSCANS (Humb. et Bonpl. in Willd. spec. 4. p. 1017.) leaves with 3 pairs of oblong leaflets, which are attenuated at both ends, coriaceous, glabrous, and shining; petioles, branches, peduncles, and flowers glabrous; spikes of flowers 2-3-together, crowded, axillary. ♄. S. Native of New Granada, on the banks of the river Magdalena, near Viejo. Spikes of flowers 2 inches long. Legume unknown. Kunth, nov. gen. amer. 6. p. 285.

Glittering Inga. Tree.

43 I. STIPULÀRIS (D. C. legum. mem. xii. prod. 2. p. 435.) leaves with 2-3 pairs of oval, acutish leaflets, which are shining above, but glabrous on both surfaces, as well as the branches and flowers; stipulas large, orbicular, permanent, foliaceous; spikes of flowers ovate, axillary, solitary, pedunculate. ♄. S. Native of Cayenne. Calyx tubular, 2-3 lines long. Corolla hardly twice the length of the calyx. Legume unknown.

Stipular Inga. Tree.

44 I. CAPITÀTA (Desv. journ. bot. 1814. vol. 1. p. 71.) leaves with 2 pairs of ovate, acuminated, shining leaflets, which are quite glabrous on both surfaces, as well as petioles, branches, peduncles, and flowers; spikes of flowers ovate-oblong, axillary, 2-3-together, pedunculate. ♄. S. Native of Cayenne. Branches warted, terete. Calyx tubular, 2 lines long. Legume unknown.

Capitate-flowered Inga. Tree.

45 I. LAURÌNA (Willd. spec. 4. p. 1018.) leaves with 2 pairs of obovate-oblong, acuminated, shining leaflets, which are glabrous on both surfaces, as well as the petioles, peduncles, and flowers; spikes of flowers solitary or twin, elongated, almost sessile, axillary. ♄. S. Native of St. Christopher, Martinico, St. Domingo, Brazil, Guadaloupe, and Porto-Rico. Mimòsa laurìna, Swartz, fl. ind. occ. 2. p. 978. Mimòsa fagifòlia, Jacq. amer. 264. t. 164. Calyx 1 line long. Corolla white, 3-times the length of the calyx. The pulp contained in the legumes is purgative.

Laurel-like Inga. Clt. 1818. Tree 30 feet.

46 I. PUNCTÀTA (Willd. spec. 4. p. 1016.) leaves with 2-3 pairs of oblong, acuminated, shining leaflets, which are glabrous as well as the branches; petioles terete, pubescent; spikes of flowers ovate, pedunculate, and panicled at the tops of the branches; corolla clothed with silky villi. ♃. H. Native of Caraccas. Branches beset with white dots. Legume unknown.

Dotted-branched Inga. Clt. 1818. Tree.

47 I. SPLÉNDENS (Willd. spec. 4. p. 1017.) leaves with 2 pairs of oblong, acuminated, shining leaflets, which are glabrous on both surfaces, as well as petioles and branches; spikes of flowers axillary, twin, pedunculate; corolla clothed with silky villi. ♄. S. Native of Para, in Brazil. Branches warted. Legumes unknown. The species is said to be allied to *I. punctàta*, but it is larger in all its parts.

Splendent Inga. Tree.

48 I. SPECTÁBILIS (Willd. spec. 4. p. 1017.) leaves with 2 pairs of ovate, acute, shining leaflets, which are unequal at the base and glabrous on both surfaces, as well as the petioles and branches; spikes terminal; corollas villous. ♄. S. Native of South America, and cultivated in St. Martha. Mimòsa spectábilis, Vahl, act. soc. hafn. 2. p. 219. t. 10. Leaflets thickly beset with feather nerves, the superior ones 6 or 7 inches long and 4 broad, but the lower ones are one-half smaller than the superior ones.

Showy Inga. Tree.

49 I. SERTULÍFERA (D. C. prod. 2. p. 436.) leaves with 2 pairs of ovate, shining leaflets, which are glabrous on both surfaces as well as the calyxes and corollas; flowers pedunculate, umbellate; umbels simple. ♄. S. Native of Cayenne. Mimòsa coriàcea, Pers. ench. 2. p. 262. I'nga coriàcea, Desv. journ. bot. 1814. vol. 1. p. 71. but not of Willd. Branches warted. Leaflets large. Legumes unknown.

Little-garland-bearing Inga. Tree.

50 I. NODÒSA (Willd. spec. 4. p. 1016.) leaves with 2 pairs of ovate-oblong, unequal-sided, glabrous leaflets, furnished with a small gland between the lower pair. ♄. S. Native of Ceylon, Mimòsa nodòsa, Lin. spec. 1496.—Pluk. alm. 211. f. 5.

Knotted Inga. Tree.

51 I. CORIÀCEA; leaves with 3-4 pairs of leaflets, lower ones the smallest; petioles wingless; leaflets lanceolate, acuminated, oblique at the base, undulated on the margins, hairy as well as the petioles and young branches; peduncles short, few-flowered, lateral, terminal, and axillary. ♄. S. Native of Mexico. Mimòsa coriàcea, Sesse et Moc. in herb. Lamb.

Coriaceous-leaved Inga. Tree.

52 I. COCCÍNEA; petioles wingless; leaves with 3 pairs of broad-elliptic, acuminated, smooth leaflets, which are oblique at the base, sometimes with a smaller leaflet on one side at the base; spikes long. ♄. S. Native of Peru. Mimòsa coccínea, Ruiz, et Pav. in herb. Lamb. Flowers scarlet.

Scarlet-flowered Inga. Tree.

53 I. CARNÒSA; petioles wingless; leaves with 3 pairs of broad, elliptic, mucronate, smooth leaflets; peduncles axillary, twin, clothed with rusty down as well as the young branches; legumes lanceolate, flat. ♄. S. Native of Peru. Mimòsa carnòsa, Ruiz et Pav. in herb. Lamb.

Fleshy Inga. Tree.

54 I. RUIZIA'NA; petioles wingless; leaves with 4 pairs of elliptic-oblong, very long, and very broad, smoothish leaflets; panicles axillary, clothed with rusty down; spikes capitate, many-flowered. ♄. S. Native of Peru. (v. s. in herb. Lamb.)

Ruiz's Inga. Tree.

55 I. AGGREGA'TA; petioles wingless; leaves with 3-4 pairs of smooth, membranous, ovate-oblong, acuminated leaflets; spikes aggregate, axillary. ♄. S. Native of Peru. (v. s. in herb. Lamb.)

Aggregate-spiked Inga. Tree.

56 I. STIPULA'CEA; petioles hispid, wingless; leaves with 2 pairs of broad, elliptic, acuminated, sessile leaflets, which are attenuated at the base; tube of stamens much exserted; stipulas large, rounded at the apex, nerved. ♄. S. Native of Peru. Mimòsa stipulàcea, Ruiz et Pav. in herb. Lamb.

Large-*stipuled* Inga. Tree.

57 I. GUAYAQUILE'NSIS; petioles naked; leaves with 2 pairs of elliptic-oblong, glabrous leaflets, which are attenuated at both ends, and acuminated at the apex; spikes sessile, solitary, or twin. ♄. S. Native of Guayaquil. (v. s. in herb. Ruiz et Pav.)

Guayaquil Inga. Tree.

58 I. FAGIFO'LIA; petioles wingless; leaves with 3 pairs of long, oblong-lanceolate, glabrous leaflets, furnished with 1 gland between each pair; panicles terminal and axillary, twin or solitary; peduncles clothed with rusty down. ♄. S. Native of Peru. Mimòsa fagifòlia, Ruiz et Pav. in herb. Lamb. Flowers red.

Beach-leaved Inga. Tree.

59 I. UMBELLA'TA; petiole wingless, bearing only one pair of leaflets at the apex, which are ovate-elliptic, acuminated, and glabrous; peduncles axillary; flowers umbellate, pedicellate. ♄. S. Native of Peru. Mimòsa axillàris, Ruiz et Pav. in herb. Lamb. Flowers apparently white.

Umbellate-flowered Inga. Tree.

60 I. HETEROPHY'LLA (Willd. spec. 4. p. 1020.) leaves with 1-2 pairs of oblong, acuminated leaflets, which are shining on both surfaces; petioles, branches, and flowers glabrous; glands of the petiole somewhat pedicellate; peduncles terete at the base; flowers disposed in umbellate racemes. ♄. S. Native of Para, in Brazil. Mimòsa Pàra, Poir. suppl. 1. p. 44. Branches warted from dots. Leaflets 1½ inch long. Legumes unknown.

Various-leaved Inga. Tree.

61 I. HYMENÆOÌDES (Desv. journ. bot. 1814. 1. p. 70.) leaves with 1-2 pairs of ovate, oblique, obtuse, shining leaflets; petioles glandless; branches, peduncles, and flowers glabrous; heads of flowers axillary, pedunculate; legumes oblong, obtuse, straight, tapering at the base, with thickened margins. ♄. S. Native of Cayenne. Leaflets rather coriaceous, 1½ inch long and 1 inch broad. Legumes 2 inches long.

Hymenæa-like Inga. Clt. 1823. Tree.

62 I. INÍCUIL (Schlecht. et Cham. in Linnæa. 5. p. 592.). This species comes very near *I. corúscans*, with the glands on the petioles usually obsolete, the legume 1 foot long and an inch broad, 6-10-seeded, glabrous, curved, or straight, with the valves thick, and containing eatable pulp. There is another tree found in Mexico, near Colipa, very similar to *I. Inicuil*, but differs in the glands, in the petioles being always present, and in the inflorescence being in few-flowered heads, on short peduncles, which are disposed in crowded fascicles in the axils of the leaves. ♄. S. Native of Mexico, where it is called *Inicuil*. Bracteoles minute, ciliated. Flowers white.

Inicuil Inga. Tree.

§ 2. *Hymenæoìdeæ* (containing plants which have the habit of *Hymenæ'a*). *Leaves with* 1 *pair of pinnæ, and each pinna bearing 2-3 or many leaflets.*

* *Bigéminæ* (from *bis*, twice, and *geminus*, a twin; in reference to the leaves, which are divided twice by twos). *Leaves with one pair of pinnæ, and each pinna bearing only one pair of leaflets.*

63 I. MICROPHY'LLA (Humb. et Bonpl. in Willd. spec. 4. p. 1004.) spines stipular, straight; leaflets dimidiately-elliptic, obtuse, and retuse, glabrous, rather coriaceous; petiole smooth, furnished with a gland in the fork; spikes of flowers globose-elliptic, solitary, axillary; corolla 4-cleft, glabrous. ♄. S. Native of South America, near Cumana. H. B. et Kunth, nov. gen. amer. 6. p. 293. Spines thick. Legumes unknown.

Small-leaved Inga. Clt. 1817. Shrub 6 feet.

64 I. PU'NGENS (Humb. et Bonpl. in Willd. spec. 4. p. 1004.) spines stipular, very short, straight; leaflets dimidiately-oblong, obtuse and retuse, membranous, glabrous; petioles hairy, furnished with a gland in the fork; heads of flowers globose, racemose; corolla 5-cleft, pubescent; legumes torulose, circinnate. ♄. S. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 294. Flowers white.

Pungent Inga. Tree 50 feet.

65 I. DU'LCIS (Willd. spec. 4. p. 1005.) spines stipular, very short, straight; leaflets somewhat dimidiately-oblong, obtuse, and somewhat retuse and mucronate; petioles hairy, shorter than the leaflets, with a gland in the fork, as well as one between the leaflets; heads of flowers globose, racemose. ♄. S. Native of Coromandel and the Philippine islands. Mimòsa dúlcis, Roxb. cor. 1. t. 99. Flowers white, in terminal racemes. Legume twisted, red, and glabrous, containing a fleshy sweet pulp, which is reckoned wholesome.

Sweet Inga. Clt. 1800. Tree 30 feet.

66 I. JAVA'NA (D. C. prod. 2. p. 436.) spines stipular, very short, and straight, or wanting; leaflets somewhat dimidiately-oblong, obtuse, glabrous; petiole smooth, and longer than the leaflets, with a gland in the fork; heads of flowers globose, racemose. ♄. S. Native of Java. Legume flat, incurved, glabrous, coarctate between the seeds.

Java Inga. Tree 20 feet.

67 I. U'NGUIS-CA'TI (Willd. spec. 4. p. 1006.) spines stipular, straight; leaflets roundish-elliptic, rather dimidiate, emarginate, membranous, glabrous; petiole glabrous, furnished with a gland in the fork, and between the leaflets; heads of flowers globose, disposed in terminal racemes; legume twisted. ♄. S. Native of the Caribbee Islands, and near Cumana. Mimòsa únguis-càti, Lin. spec. 499. Jacq. hort. schœnbr. 3. t. 392. Descourt, fl. ant. 1. t. 11. Quámochilt, Hern. mex. 94.—Plum. ed. Burm. t. 4. Flowers whitish. In Jamaica it is called *Black-bean shrub*. The seeds, according to Sloane, are eaten by goats, and sometimes by the negroes; they are frequently brought to England, and strung as beads. The bark is astringent, and is used in lotions and fomentations in America.

Cat's-claw Inga. Clt. 1670. Tree 10 feet.

68 I. GUADALUPE'NSIS (Desv. journ. bot. 1814. 1. p. 70.) plant unarmed; leaflets obovate-rhomboid, obtuse, veiny, quite smooth; petiole glabrous, furnished with a gland in the fork, and one between the leaflets; heads of flowers globose, pedunculate, racemose; legumes twisted, glabrous. ♄. S. Native of Guadaloupe. Mimòsa Guadalupénsis. Pers. ench. 2. p. 262. Perhaps only an unarmed variety of *I. únguis-càti*. Flowers white.

Guadaloupe Inga. Tree.

69 I. MELLI'FERA (Willd. spec. 4. p. 1006.) spines stipular, recurved; leaflets somewhat dimidiately-obovate, with a gland at the base of the petiole; legume ensiform, straight. ♄. S. Native of Arabia Felix. Mimòsa ùnguis-càti, Forsk. desc. 176. M. mellífera, Vahl. symb. 2. p. 103. Flowers white, from which bees collect a great deal of honey.

Honey-bearing Inga. Tree 10 feet.

70 I. LANCEOLA'TA (Humb. et Bonpl. in Willd. spec. 4. p. 1005.) spines stipular, straight; leaflets somewhat dimidiately-lanceolate, obtuse; petiole rather puberulous, furnished with a gland in the fork, and between the leaflets; spikes of flowers cylindrical, axillary, solitary; legumes curved. ♄. S. Native of New Andalusia, near Cumana. Kunth, mim. 49. t. 15. nov. gen. amer. 6. p. 293. Flowers white, as in the rest of the present division of the genus. Legume linear, glabrous. Spikes longer than the leaves.

Lanceolate-leafletted Inga. Tree 50 to 60 feet.

71 I. LIGUSTRI'NA (Willd. spec. 4. p. 1007.) spines stipular, short, straight; leaflets dimidiately-oblong, obtuse at both ends; petiole pubescent, with a gland in the fork, as well as one between the leaflets; spikes of flowers cylindrical, axillary, solitary; legume straight. ♄. S. Native of Caraccas, in sandy places. Mimòsa ligustrìna, Jacq. fragm. t. 32. f. 5. Spikes of flowers white, about equal in length to the leaves.

Privet-like Inga. Tree 15 feet.

72 I.? FŒ'TIDA (Willd. spec. 4. p. 1008.) unarmed; leaves bipinnate, with 1 or 2 pairs of bifoliate pinnæ; leaflets somewhat dimidiately-oblong, acutish, glaucous and rather puberulous beneath; spikes of flowers twin, cylindrical. ♄. S. Native of the West Indies. Mimòsa fœ'tida, Jacq. hort. schœnbr. 3. t. 390. Acàcia fœ'tida, H. B. et Kunth, nov. gen. amer. 6. p. 265. Corolla greenish. Stamens 10, white. Spikes of flowers almost extrafoliaceous. Legume unknown. Seeds naked, ex Bonpl.

Fetid Inga. Clt. 1816. Tree 10 to 20 feet.

73 I. HYMENÆÆFÒLIA (Humb. et Bonpl. in Willd. spec. 4. p. 1008.) spines stipular, very minute, straight; leaflets somewhat dimidiately-oblong, acuminated, obtuse, somewhat coriaceous, glabrous; petioles glabrous, furnished with a gland in the fork, and between the leaflets; spikes of flowers elliptic-oblong, racemose; corolla 5-cleft, pubescent. ♄. S. Native of Cumana, in shady woods near Caripe, and on the banks of the river Magdalena. H. B. et Kunth, nov. gen. amer. 6. p. 296. Flowers large. Legume unknown.

Hymenæa-leaved Inga. Tree 20 feet.

74 I. SPRENGE'LII; spines stipular, twin, straight; leaves with one pair of pinnæ, each pinna bearing 2 obliquely-oblong, obtuse, coriaceous, glabrous leaflets; flowers racemose; legumes glabrous, smoothish. ♄. S. Native of South America. I. Bertèrii, Spreng. syst. 3. p. 127. but not of D. C.

Sprengel's Inga. Tree.

75 I. PUBE'SCENS (Bert. ined. D. C. prod. 2. p. 437.) spines stipular, very small, straight; leaflets oblong-lanceolate, rather oblique at the base, obtuse, pubescent beneath; petiole rather pubescent, with a gland in the fork and between the leaflets; heads of flowers globose, racemose. ♄. S. Native of St. Martha. Corolla greenish, puberulous. Stamens red. Legume unknown. Very like *I. fórfex.*

Pubescent Inga. Tree.

76 I. FO'RFEX (Kunth, mim. p. 52. t. 16. nov. gen. amer. 6. p. 295.) leaflets obliquely-oblong, or lanceolate-oblong, acute, and rather mucronate; petiole glabrous, with a gland in the fork and between the leaflets; heads of flowers globose, racemose. ♄. S. Native of New Granada, near Carthagena. Corolla greenish, puberulous. Stamens red.

Forcep Inga. Tree 20 feet.

77 I. RÒSEA (Steud. nom. p. 431.) spines stipular, straight; leaflets lanceolate, and are, as well as the branches, glabrous; heads few-flowered, disposed in loose axillary racemes; pedicels twin. ♄. S. Native of Cayenne. Mimòsa ròsea, Vahl. ecl. amer. 3. p. 33. t. 25. Flowers red. Legume unknown.

Var. β, *subinérmis* (D. C. prod. 2. p. 437.) leaflets oblong, pubescent beneath; spines very short.

Rose-coloured-flowered Inga. Shrub 6 to 10 feet.

78 I. MACROSTA'CHYA (Steud. nom. p. 431.) spines stipular, straight; leaflets lanceolate-oblong, and are, as well as the branches, glabrous, with a gland at the top of the common petiole, as well as one at the tops of partial ones; spikes of flowers axillary, elongated, solitary; corolla clothed with fine tomentum on the outside. ♄. S. Native of Cayenne. Mimòsa brachystàchys, Vahl. ecl. amer. 3. p. 34. t. 24. Legumes unknown.

Long-spiked Inga. Tree.

79 I. PANICULA'TA (Spreng. in herb. Balb. D. C. prod. 2. p. 437.) unarmed; leaflets elliptic-oblong, obtuse at both ends, rather velvety above, but clothed with velvety tomentum beneath; petioles clothed with soft pubescence, nearly glandless; heads of flowers nearly globose, pedunculate, panicled. ♄. S. Native of South America. Corolla velvety. Stamens red. Legume unknown.

Panicled Inga. Tree.

80 I. TETRAPHY'LLA; leaves with 1 pair of pinnæ, and each pinna bearing 1 pair of leaflets; leaflets oblong, oblique, clothed with white pili beneath; peduncles twin, axillary; heads of flowers globose. ♄. S. Native of Mexico. Mimòsa tetraphýlla, Sesse et Moc. in herb. Lamb.

Four-leafletted Inga. Shrub.

* * *Tergéminæ* (from *ter*, thrice, and *geminus*, a twin; in reference to the divisions of the leaves). *Leaves with 1 pair of pinnæ, each pinna bearing 3 or 5 leaflets.*

81 I. RAMIFLÒRA; smooth; leaves with 1 pair of pinnæ, and each pinna furnished with 3 leaflets, which are elliptic and acuminated; spikes sessile, rising in clusters from the branches. ♄. S. Native of Guayaquil. Mimòsa ramiflòra, Ruiz et Pav. in herb. Lamb. Flowers apparently white.

Branch-flowered Inga. Tree 20 feet.

82 I. TERGE'MINA (Willd. spec. 4. p. 1008.) unarmed; pinnæ trifoliate; leaflets obliquely-oblong, obtuse, glaucous beneath; petioles glandless; fascicles of flowers axillary, solitary, pedunculate; legumes straight, with thickened margins. ♄. S. Native of Martinico. Mimòsa tergémina, Lin. spec. 1499. Jacq. amer. t. 177. f. 81.—Plum. ed. Burm. t. 10. f. 1.—I. Caripénsis, Willd. spec. 4. p. 1009. which is not different, according to Kunth, nov. gen. amer. 6. p. 298. Flowers purplish.

Three-paired-leafletted Inga. Clt. 1820. Tree 20 feet.

83 I. VAHLIA'NA (D. C. prod. 2. p. 438.) unarmed; pinnæ trifoliate; leaflets obliquely-lanceolate, attenuated, bluntish, and are as well as the branches glabrous, with a gland on the top of the common petiole, as well as on the tops of the partial ones; spikes of flowers somewhat opposite, elongated, rising from the leafless branches. ♄. S. Native of St. Martha. Mimòsa ligustrìna, Vahl. ecl. amer. 3. p. 34. t. 27. but not of Jacquin.

Vahl's Inga. Tree.

84 I. EMARGINA'TA (Humb. et Bonpl. in Willd. spec. 4. p. 1009.) unarmed; pinnæ trifoliate; leaflets somewhat dimidiately obovate, obtuse, sometimes somewhat emarginate, and rather cordate at the base; petioles glandless; fascicles of flowers pedunculate, disposed in a somewhat panicled raceme. ♄. S. Native of Mexico, near Acapulco, on the sea-shore. Kunth,

mim. 54. t. 17. nov. gen. amer. 6. p. 296. Flowers of a rose-purple colour. Stamens 14-20. Legume unknown.

Emarginate-leafletted Inga. Fl. Feb. June. Clt. 1825. Sh. 4 to 6 feet.

85 I. CORIA'CEA (Humb. et Bonpl. in Willd. spec. 4. p. 1009. but not of Desv.) unarmed; pinnæ trifoliate; leaflets somewhat dimidiately oblong-lanceolate, acutish, intermediate one the largest; petioles glandless; fascicles of flowers usually twin, axillary, pedunculate. ♄. S. Native of South America. Legume linear, straight, flat, 3 inches long.

Coriaceous-leafletted Inga. Shrub.

86 I. CATARA'CTÆ (H. B. et Kunth, nov. gen. amer. 6. p. 297.) shrub climbing, unarmed; pinnæ bifoliate; leaflets obliquely lanceolate-oblong, acuminated, dimidiately rounded at the base, membranous, glabrous; peduncles axillary, twin; legumes circinnate. ♄. ◡. S. Native on the banks of the Orinoco, near Atures, at the cataracts of Javarivono. Flowers unknown. Legumes linear, compressed, smooth, each containing 4-9 lenticular seeds.

Cataract Inga. Shrub cl.

87 I. LONGIFO'LIA (Humb. et Bonpl. in Willd. spec. 4. p. 1009.) shrub climbing, unarmed; pinnæ trifoliate; leaflets oblong-lanceolate, equal-sided, acuminated, attenuated at the base, membranous, glabrous, with a gland between the terminal leaflets; flowers in spikes; legumes puberulous. ♄. ◡. S. Native of South America, near Cavico, on the banks of the Chamaya. H. B. et Kunth, nov. gen. amer. 6. p. 298.

Long-leafletted Inga. Shrub cl.

88 I. FALCIFÓRMIS (D. C. prod. 2. p. 438.) unarmed; pinnæ trifoliate; leaflets oblong-lanceolate, acuminated, attenuated at the base, narrowest on the inner side, with a gland between the pinnæ and one between the terminal leaflets; legume very flat, linear, falcate, obtuse. ♄. S. Native of St. Martha. Plant quite glabrous. Leaflets 4-6 inches long, and 1 inch broad. Legumes longer than the leaflets, containing about 14 seeds.

Falciform-podded Inga. Tree.

89 I. GLOMERA'TA (D. C. prod. 2. p. 438.) unarmed; pinnæ trifoliate; leaflets dimidiately oblong-lanceolate, attenuated at the base, acuminated at the apex, with a gland between the pinnæ, and one also between the terminal leaflets; flowers disposed in glomerate fascicles, which are axillary, lateral, and sessile. ♄. S. Native of Cayenne. Stamens monadelphous beyond the corolla. Flowers apparently white. Leaves glabrous.

Glomerate-flowered Inga. Tree.

90 I. LATIFÒLIA (Willd. spec. 4. p. 1020.) unarmed; pinnæ trifoliate, but usually bearing 5 leaflets; leaflets dimidiate at the base, ovate-oblong, acuminated, lower ones alternate, upper ones opposite, with a gland between the pinnæ and between the opposite leaflets; flowers disposed in pedunculate, lateral, and axillary fascicles. ♄. S. Native of the Caribbee islands, and the warmer parts of Mexico. Mimòsa latifòlia, Lin. spec. 1499.—Plum. ed. Burm. t. 9. Flowers rose-coloured. Legume unknown.

Broad-leaved Inga. Fl. Mar. April. Clt. 1768. Tree.

91 I. UMBRÒSA (Wall. pl. rar. asiat. 2. p. 23. t. 124.) spines stipular, straight; leaves with 1 pair of pinnæ, each pinna bearing 3 broad leaflets, the lower one the smallest; leaflets oblong, obtuse, oblique at the base, acute; petioles wingless, bearing a small, flat gland at the apex; heads of flowers pedunculate, axillary, solitary, glabrous, globose. ♄. S. Native, of Silhet. Flowers white, fragrant.

Shady Inga. Tree 40 to 60 feet.

* * * *Conjugàto-pinnàtæ* (from *conjugatus* and *pinnatus*; in reference to the disposition of the leaflets). *Leaves with one pair of pinnæ, each pinna bearing from 2 to many pairs of opposite leaflets.*

92 I. CIRCINNA'LIS (Willd. spec. 4. p. 1023.) spines stipular, straight; pinnæ bearing 2-3 pairs of ovate, mucronate leaflets, with a gland in the fork of the petiole; heads of flowers pedunculate, axillary, and disposed in a kind of raceme at the tops of the branches. ♄. S. Native of St. Domingo and of the Bahama Islands. Catesb. car. 2. t. 97. Mimòsa circinnàlis, Lin. spec. 1490. Plum. ed. Burm. t. 5. Leaflets usually ending in a spine-like mucrone. Legume long, cochleate, filled with pulp inside. Seeds flat, red and black mixed.

Circinnate-podded Inga. Clt. 1726. Tree 10 to 15 feet.

93 I. CA'NDIDA (H. B. et Kunth, nov. gen. amer. 6. p. 299.) prickles conically-subulate, straight; pinnæ bearing 2-3 pairs of obliquely obovate leaflets, which are rounded at both ends, rather coriaceous, and somewhat mucronate, glabrous; heads of flowers axillary, solitary, globose; legumes circinnate. ♄. S. Native near Guayaquil. Flowers white.

White-flowered Inga. Shrub 6 to 12 feet.

94 I. EXCE'LSA (Kunth, mim. 57. t. 18. nov. gen. amer. 6. p. 299.) spines stipular, straight; leaves conjugately or doubly pinnate, the outer pinnæ bearing 4 leaflets, and the lower ones only 2 leaflets; leaflets obovate, oblique at the base, with a gland between the pinnæ and one between each pair of leaflets; heads of flowers axillary, pedunculate. ♄. S. Native of New Granada, on the banks of the river Magdalena, near Tomependa. Flowers white. Legume circinnate.

Tall Inga. Tree 60 to 70 feet.

95 I. UMBELLA'TA (Willd. spec. 4. p. 1027.) spines stipular, straight; leaves conjugately or doubly pinnate, each pinna bearing 8-10 pairs of leaflets, with glands between the pairs of leaflets; heads of flowers axillary, umbellate. ♄. S. Native of the East Indies. Mimòsa umbellàta, Vahl. symb. 2. p. 105. Legume spiral, when young pubescent.

Umbellate-flowered Inga. Tree.

96 I. PURPU'REA (Willd. spec. 4. p. 1021.) unarmed; pinnæ bearing from 3-7 pairs of oblong, obtuse leaflets, which are unequal at the base; petioles glandless; heads of flowers pedunculate, axillary. ♄. S. Native of Martinique and of Cumana. Mimòsa purpùrea, Lin. spec. 1500. Andr. bot. rep. 372. Ker. bot. reg. 129.—Plum. ed. Burm. t. 10. f. 2. Flowers purple. Legume linear, obtuse, tapering at the base, straight, with thickened margins. I. obtusifòlia of Willd. spec. 4. p. 1022. is not distinct according to Kunth, nov. gen. amer. 6. p. 301.

Purple Inga. Fl. Mar. April. Clt. 1733. Shrub 3 to 6 ft.

97 I. TAXIFO'LIA (Kunth, mim. p. 64. t. 20. nov. gen. amer. 6. p. 301.) unarmed; pinnæ bearing 13-20 pairs of oblong, obliquely cordate, glabrous leaflets; petioles glandless, pubescent; heads axillary, solitary, few-flowered, on short peduncles. ♄. S. Native on the Andes of Quito. Flowers red. Legumes unknown.

Yew-leaved Inga. Shrub 6 feet.

98 I. COCHLEA'TA (Willd. spec. 4. p. 1020.) unarmed; pinnæ 2, each bearing 3 pairs of elliptic, acuminated, shining leaflets, with an obscure gland between each pair; umbels of flowers pedunculate, solitary, or twin. ♄. S. Native of Para, in Brazil. Legume cochleate, with the outer margin repand.

Cochleate-podded Inga. Shrub 6 to 10 feet.

99 I. XYLOCA'RPA (D. C. prod. 2. p. 439.) unarmed; pinnæ 2, each bearing 3-4 pairs of ovate-elliptic, acutish leaflets, with a gland between the pinnæ and between each pair of leaflets; heads of flowers usually twin, pedunculate, globose; legume woody, falcate, mealy inside. ♄. S. Native of Coromandel. Flowers white. Corolla smooth, 5-toothed. Stamens 10. Mimòsa xylocàrpa, Roxb. cor. 1. p. 68. t. 100. Acàcia xylocàrpa, Willd. spec. 4. p. 1055. Leaflets broad.

Woody-fruited Inga. Clt. 1816. Tree 60 feet.

100 I. CAULIFLO'RA (Willd. spec. 4. p. 1021.) unarmed; pinnæ 2, each bearing 3 pairs of oblong, unequal leaflets, with a gland

between each pair; flowers lateral, in umbels. ♄. S. Native of Para, in Brazil. Allied to *I. latifòlia.*

Stem-flowered Inga. Tree 40 feet.

101 I. BIGE'MINA (Willd. spec. 4. p. 1807.) unarmed; pinnæ 2, each bearing 2-3 pairs of oblong-lanceolate, acuminated leaflets; petiole glabrous, with a gland in the fork and one between each pair of leaflets; racemes panicled, terminal; legume twisted. ♄. S. Native of the East Indies. Mimòsa bigémina, Lin. spec. 1409. Vahl. symb. 2. p. 103.—Rheed. mal. 6. t. 12.

Two-paired-leafletted Inga. Tree 40 feet.

102 I. JIRÍNGA (Jacq. mal. misc. 1. no. 1. p. 14. under *Mimòsa*) unarmed; pinnæ 2, each bearing 3 pairs of quite smooth leaflets; panicles fascicled, axillary; heads few-flowered; legumes large, articulately twisted, black. ♄. S. Native of the East Indies, Pulo-Pinang, Malacca, &c. Mimòsa Djirínga, Roxb. hort. beng. p. 93. Flowers white. *Jiringa* is the Malay name of the tree.

Jiringa Inga. Tree.

103 I. MOLLÍSSIMA (Humb. et Bonpl. in Willd. spec. 4. p. 1007.) unarmed; pinnæ 2, each bearing 4 pairs of obliquely obovate leaflets, which are clothed on both surfaces with very soft silky villi; petioles glandless, and are as well as the branches clothed with pubescence; heads of flowers pedunculate, axillary, solitary. ♄. S. Native of South America. Kunth, mim. p. 61. t. 19. H. B. et Kunth, nov. gen. amer. 6. p. 300. Legume straight, linear, obtuse, beset with hairy tomentum, with thickened margins. Stamens white.

Very soft Inga. Tree 20 feet.

104 I. FASCICULA'TA (Willd. spec, 4. p. 1022.) unarmed; pinnæ 2, each bearing 8-10 pairs of cultrate, 2-nerved leaflets; heads of flowers pedunculate, axillary, solitary. ♄. S. Native of Para, in Brazil. Legume linear, flat, acute, attenuated at the base, with a thickened glabrous margin.

Fascicled-flowered Inga. Tree 20 feet.

105 I. CANE'SCENS (Schlecht. et Cham. in Linnæa. 5. p. 593.) shrubby, unarmed, and clothed on every part with soft canescent hairs; leaves with 1 pair of pinnæ, each pinna bearing 2 pairs of leaflets, lower pair the smallest, all obliquely elliptic, obtuse, and mucronulate; heads of flowers axillary, on long peduncles. ♄. S. Native of Mexico, between Marantial and Puente del Rey. A much-branched shrub. Terminal leaflets 9 lines long. Tube of stamens exserted beyond the corolla.

Canescent Inga. Shrub 6 feet.

106 I. TRIFLÒRA; unarmed; pinnæ 2, each bearing 3-4 pairs of obovate, roundish, nerved, coriaceous, glabrous, shining, box-like leaflets, which are rusty beneath and oblique at the base; panicles of flowers axillary; the heads few-flowered. ♄. S. Native of Guayaquil. Mimòsa triflòra, Ruiz. et Pav. in herb. Lamb.

Three-flowered Inga. Shrub 6 feet.

107 I. ADIANTIFO'LIA (Kunth, mim. p. 66. t. 21. nov. gen. amer. 6. p. 501.) unarmed; upper leaves conjugately pinnate, lower ones bipinnate, each pinna bearing from 11-13 pairs of obliquely-linear, oblong, glabrous leaflets, which are cuneated at the base; heads of flowers axillary, pedunculate, solitary, or twin. ♄. S. Native of South America, on the shady banks of the river Atabapo, in the province of Guiana. I. díscolor, Willd. 4. p. 1023. Corolla greenish. Stamens white. Legumes unknown.

Adiantum-leaved Inga. Tree 20 to 30 feet.

§ 3. *Samàneæ* (*Saman* is the South American name of *A. Sàman*). *Leaves doubly pinnate, that is, bipinnate.*

* *Paucifoliolæ* (from *paucus*, few, and *foliolum*, a leaflet). *Spines none. Leaves with from 2-9 pairs of pinnæ, each pinna bearing from 2-20 pairs of leaflets.*

108 I. FI'LIPES (Vent. choix. t. 38.) leaves with 2 pairs of pinnæ, each pinna bearing from 3-4 pairs of obovate, glabrous leaflets, with a gland between each pair of pinnæ; heads of flowers axillary, on very long peduncles, rather pendulous. ♄. S. Native of St. Domingo. Flowers red. Legume linear, pendulous, acute, torulose at the seeds.

Thread-petioled Inga. Shrub 6 feet.

109 I. NANDINÆFÒLIA (D. C. prod. 2. p. 440.) leaves with 2 or 3 pairs of pinnæ, each bearing 2-3 pairs of oval leaflets, which are attenuated at both ends, with an obscure gland between each pair of pinnæ; heads of flowers usually twin, on long peduncles. ♄. S. Native of Brazil. The leaves are black when dried. Legume linear and incurved.

Nandina-leaved Inga. Shrub.

110 I. MONILIFÓRMIS (D. C. prod. 2. p. 440.) leaves with 2 pairs of pinnæ, each bearing 6-7 pairs of oval, obtuse, glabrous leaflets, with a depressed gland between each pair of pinnæ; petioles and peduncles rather pubescent; umbels of flowers axillary, on long peduncles; flowers on long pedicels; legume moniliform. ♄. S. Native of the island of Timor. Corolla tubular, and is as well as calyx glabrous. Stamens numerous.

Moniliform-podded Inga. Tree or shrub.

111 I. SAPONA'RIA (Willd. spec. 4. p. 1008.) leaves with 2 pairs of distant pinnæ, each bearing 2 pairs of oval, acutish leaflets, with a large, elongated gland at the base of the common petiole; heads of flowers axillary and terminal, disposed in loose, panicled corymbs. ♄. S. Native of the Moluccas, and of Cochin-china, in woods. Mimòsa saponària, Lour. coch. p. 653.—Rumph. amb. 4. t. 66. The bark yields excellent soap, which is used by the inhabitants of Cochin-china.

Soap Inga. Shrub.

112 I. BRACHYSTA'CHYA (D. C. prod. 2. p. 440.) leaves with 3 pairs of pinnæ, each bearing 3-4 pairs of oval, rather obovate, obtuse, glabrous, shining leaflets, with a gland between each of the pairs of pinnæ, and also between the upper pair of the leaflets; petioles, branches, peduncles, and flowers clothed with velvety pubescence; spikes of flowers ovate. ♄. S. Native of Brazil. Peduncles rising 2-3-together from the axils of the leaves. Leaflets reticulately veined beneath.

Short-spiked Inga. Tree or shrub.

113 I. SA'SSA (Willd. spec. 4. p. 1027.) leaves with 3-4 pairs of pinnæ, each bearing 12 pairs of oblong-ovate leaflets; flowers umbellately panicled; staminiferous tube exserted beyond the corolla. ♄. S. Native of Abyssinia. Sássa, Bruce. trav. 5. t. 4 and 5. Flowers of two forms, some with a short staminiferous column, and some with a long one, as in the next species.

Sassa Inga. Tree.

114 I. ZY'GIA (D. C. legum. mem. xii. t. 65. prod. 2. p. 440.) leaves with 3-4 pairs of pinnæ, each bearing 3-4 pairs of somewhat rhomboid-ovate leaflets, with a gland at the base of the common petiole; flowers umbellately panicled; stamens monadelphous, with the tube much exserted beyond the corolla. ♄. S. Native of the West Indies. Staminiferous tube twisted when the flowers are in æstivation. Legumes unknown. From the structure of the stamens the present plant, along with *I. Sássa*, *I. virgultòsa*, and *I. Bourgòni*, will probably form a distinct genus or a section, which may be called *Zýgia*, as in P. Browne, jam. t. 22. f. 3.

Yoke Inga. Tree.

115 I. MERTENSIOIDES (Nees. et Mart. act. bonn. 12. p. 35. t. 5.) leaves with 2-3 pairs of pinnæ, each bearing 12-15 pairs of sessile leaflets; common petiole hairy; spikes of flowers globose, pedunculate, disposed in terminal corymbs at the tops of the branches. ♄. S. Native of Brazil, in fields. Acàcia aspleniòides, Nees. in bot. zeit. 4. p. 203. bras. reis. 2. p. 192.

Corolla 4 rarely 5-cleft. Stamens red. Legume 2-3-seeded. Allied to *I. adiantifòlia.*

Mertensia-like Inga. Shrub 2 to 4 feet.

116 I. como'sa (Willd. spec. 4. p. 1026.) leaves with 3 pairs of pinnæ, each bearing 9-10 pairs of ovate leaflets, which are retuse at the base; flowers disposed in panicled corymbs; petioles, branches, and flowers glabrous. ♄. S. Native of Jamaica, on rocks. Mimòsa comòsa, Swartz, fl. ind. occ. 980. Leaves usually twin. There are holes instead of glands on the partial petioles, which are edged with hairs. Ovary pubescent. Legume glabrous. Flowers white.

Tufted Inga. Clt. 1818. Tree 20 to 30 feet.

117 I. trapezifòlia (D. C. prod. 2. p. 441.) leaves with 2-4 pairs of pinnæ, each bearing 5-9 pairs of rhomboid-ovate leaflets, which are glabrous and shining above, but clothed with pubescence beneath, as well as petioles, branches, peduncles, and flowers; glands between the lower [illegible], and with some along the upper side of the partial petioles beneath the upper pairs of leaflets; heads of flowers pedunculate, solitary, axillary. ♄. S. Native of Cayenne. Mimòsa trapezifòlia, Vahl. ecl. amer. 3. p. 36. t. 28. Legume glabrous, twisted.

Trapezoid-leaved Inga. Tree.

118 I. cyclocárpa (Willd. spec. 4. p. 1026.) leaves with usually 9 pairs of pinnæ, each bearing 20-30 pairs of leaflets, outer ones largest, with a gland in the middle of the petiole; spikes of flowers globose, pedunculate, axillary; legumes cochleate. ♄. S. Native of Caraccas. Mimòsa cyclocárpa, Jacq. fragm. t. 34. f. 1. Flowers white. The pulp in the legume is saponaceous.

Circle-podded Inga. Tree 60 feet.

119 I. cine'rea (Humb. et Bonpl. in Willd. spec. 4. p. 1024. et H. B. et Kunth, nov. gen. amer. 6. p. 304.) leaves with 5 pairs of pinnæ, each bearing 6 pairs of obliquely ovate leaflets, which are glabrous above and pubescent beneath, with a gland between each pair of pinnæ and one between each pair of leaflets; heads of flowers pedunculate, globose; stamens 20-22. ♄. S. Native of Caraccas. Branchlets pubescent. Mimòsa pubígera, Poir. suppl. 1. p. 47. Stamens red. This species, with the following, will perhaps form a distinct genus.

Grey Inga. Tree 30 to 40 feet.

120 I. saluta'ris (H. B. et Kunth, nov. gen. amer. 6. p. 304.) leaves with 4 pairs of pinnæ, each bearing 6-7 pairs of somewhat rhomboid-ovate leaflets, which are glabrous above but clothed with soft pubescence beneath, with a gland between each pair of pinnæ, and also between each pair of leaflets; heads of flowers globose; stamens about 40; legumes rather torulose. ♄. S. Native of New Granada, between Turbaco and Carthagena. Stamens red.

Salutary Inga. Tree 20 to 30 feet.

121 I. Sa'man (Willd. spec. 4. p. 1024.) leaves with 4-6 pairs of pinnæ, outer pairs of pinnæ bearing 6 pairs of leaflets, inner pair bearing 2 or 3 pairs; leaflets ovate-oblong, obtuse, glabrous above but pubescent beneath, as also the petioles and branchlets, with a gland between each pair of pinnæ, as well as one between each pair of leaflets; heads of flowers pedunculate, axillary, lower ones solitary, the upper ones rising 3-6-together. ♄. S. Native of Caraccas and Jamaica. Mimòsa Sàman, Jacq. fragm. t. 9. Legume linear, 7-8 inches long, flat on both sides, and channelled on both sutures. Branchlets striated, when young they are clothed with velvety tomentum, as well as the leaves.

Saman Inga. Tree 60 feet.

122 I. pedicella'ris (D. C. prod. 2. p. 441.) leaves with 6-7 pairs of pinnæ, each bearing about 20 pairs of oblong-linear, obtuse leaflets, which are glabrous above and pubescent beneath, as well as the peduncles, petioles, branches, and flowers, with a thick gland between the upper pair of pinnæ, and a small one between the upper pair of leaflets; heads of flowers usually twin, axillary; flowers pedicellate. ♄. S. Native of Cayenne. Legume oblong, straight, 2½ inches long and an inch broad, chinky on the inside after the seeds have fallen.

Pedicellate-flowered Inga. Tree 20 to 40 feet.

123 I. pteroca'rpa (D. C. prod. 2. p. 441.) leaves with 8-9 pairs of pinnæ, each bearing about 12 pairs of oval, very blunt, glabrous leaflets; petioles velvety, glandless; legumes compressed, winged, nearly lanceolate, glabrous. ♄. S. Native of the island of Timor. Flowers unknown.

Winged-fruited Inga. Tree.

124 I. hirsu'ta; densely clothed in every part with white hairs; leaves with 3-4 pairs of pinnæ, each pinna bearing many pairs of small leaflets, which are densely clothed with white hairs beneath, but glabrous above; heads of flowers solitary, axillary, on long peduncles; flowers silky. ♄. S. Native of New Spain. Mimòsa hirsùta, Ruiz et Pav. in herb. Lamb. Stamens red, much exserted.

Hairy Inga. Tree.

* * *Spinòsæ* (*spinòsus*, full of spines). *Spines stipular. Leaves bipinnate, with from 4-7 pairs of pinnæ, each pinna bearing from 10-20 pairs of leaflets.*

125 I. leptophy'lla (Lag. gen. et spec. 16. no. 203.) spines stipular, recurved; leaves with 4-7 pairs of pinnæ, each pinna bearing 10-18 pairs of leaflets; heads of flowers globose, pedunculate; legumes lanceolate, nearly falcate. ♄. S. Native of South America. Mimòsa leptophy̆lla, Cav. Flowers all hermaphrodite. Perhaps a species of *Acàcia.*

Slender-leaved Inga. Shrub 4 to 6 feet.

126 I. Ma'rthæ (Spreng. in herb. Balb. syst. 3. p. 132.) spines lateral, straight, solitary; leaves with 6-8 pairs of pinnæ, each pinna bearing from 15-25 pairs of linear leaflets; petioles pubescent, bearing a gland at the base, and one between each of the 2 ultimate pairs of pinnæ; heads of flowers axillary and lateral, on short peduncles, somewhat umbellately globose. ♄. S. Native of St. Martha. Young branches rising from scaly stipulaceous buds. Stipulas oblong. Spines usually absent. Corolla glabrous, 5-cleft. Stamens numerous. Legume rather falcate, compressed, 4 inches long, bearing gum on the inside.

St. Martha Inga. Tree.

127 I.? Corcondia'na (D. C. prod. 2. p. 441.) spines lateral, solitary, straight; leaves with 2 pairs of pinnæ, each pinna bearing 5-6 pairs of oblong, glabrous, obtuse leaflets, ultimate ones obovate, with a small gland between each pair of pinnæ; heads of flowers axillary, pedunculate, somewhat umbellately-globose. ♄. S. Native of Coromandel. Mimòsa Corcondiàna, Roxb. hort. beng. p. 40. Branchlets grey, glabrous. Petioles pubescent. Flowers glabrous, 5-cleft. Stamens numerous, much exserted. Legumes unknown.

Corcondian Inga. Tree.

128 I. alternifòlia; smooth; leaves bipinnate, with many pairs of pinnæ, each pinna bearing many alternate, glaucous, coriaceous leaflets; spines stipular, straight; peduncles solitary, axillary; heads of flowers globular; legumes smooth, twisted in the form of a shell. ♄. S. Native of Mexico. Mimòsa circinnàtus, Sesse et Moc. in herb. Lamb.

Alternate-leafletted Inga. Shrub 2 to 3 feet.

* * * *Multifoliolàtæ* (from *multus*, many, and *foliolum*, a leaflet; in reference to the leaves bearing many pairs of pinnæ, as well as leaflets). *Unarmed trees. Leaves bipinnate, with from 10-30 pairs of pinnæ, each pinna bearing above 20 pairs of leaflets.*

129 I. pe'ndula (Willd. spec. 4. p. 1025.) leaves with about 20 pairs of pinnæ, each pinna bearing numerous pairs of linear ciliated leaflets; petiole pubescent, bearing a gland above its

base; spikes of flowers globose, on long compressed peduncles, pendulous. ♄. S. Native of Para, in Brazil. Legume unknown. Perhaps a species of *Párkia*.

Pendulous-spiked Inga. Tree 30 feet.

130 I. FILI'CINA (Willd. spec. 4. p. 1025.) leaves with 10 pairs of pinnæ, each pinna bearing numerous pairs of linear, obtuse, mucronulate, shining leaflets; petioles and peduncles clothed with rusty pubescence; spikes of flowers oblong, on long peduncles, drooping. ♄. S. Native of Para, in Brazil. Perhaps a species of *Párkia*.

Fern-like-leaved Inga. Tree.

131 I. FÆCULI'FERA (Hamilt. prod. fl. ind. occ. p. 61.) unarmed; leaves with usually 7 pairs of pinnæ, each pinna bearing 45-50 pairs of narrow, linear, acute leaflets, which are cordate and auricled at the base; rachis and petioles pubescent; heads of flowers oblong, on long peduncles; legume pedicellate, twin. ♄. S. Native of St. Domingo, where it is called *Pois doux*. Legume 8-10 inches long, marginated, filled with sweet yellow edible pulp inside.

Fæcula-bearing Inga. Tree 20 to 30 feet.

§ 4. *Annesléya* (in honour of George Annesley, Lord Mountnorris). *Leaves bipinnate, with 6-50 pairs of pinnæ, each pinna bearing many pairs of linear leaflets. Anthers 2-celled; the pollen in 4 globular masses. This division will certainly form a distinct genus.*

132 I. GLANDULÒSA (Steud. nom. p. 431.) leaves with 17 pairs of pinnæ, each pinna bearing 8 pairs of linear acute leaflets, which are glabrous, as well as the corollas, with a sessile gland seated between each pair of leaflets; spikes of flowers axillary, solitary, erect, longer than the leaves. ♄. S. Native of Cayenne. Mimòsa glandulòsa, Vahl. ecl. amer. 3. p. 38. but not of Smith nor Michx. Corolla 5-cleft. Stamens numerous, monadelphous. Legumes unknown.

Glandular Inga. Shrub 6 to 10 feet.

133 I. PENNA'TULA (Schlecht. et Cham. in Linneæ. 5. p. 593.) clothed with white mealy tomentum; branches flexuous, angular, striated, pubescent; leaves with 40-50 pairs of pinnæ, each pinna bearing many pairs of small, oblong, obtuse, ciliated and densely imbricated leaflets, with a large gland beneath the lower pair of pinnæ on the petiole; prickles stipular, connate, straight, spreading, conically-subulate; heads of flowers axillary, on short peduncles; legume in an immature state fleshy; seeds immersed in pulp. ♄. S. Native of Mexico, near Hacienda de la Laguna, and also near Jalapa.

Feathered-leaved Inga. Shrub.

134 I. ANÓMALA (Kunth, mim. 70. t. 22. nov. gen. amer. 6. p. 303.) leaves with 15-17 pairs of rather unequal pinnæ, each pinna bearing many pairs of linear leaflets, which are obtuse at both ends and glabrous, but adpressedly ciliated on the margins; petioles glandless, and are, as well as the branches, peduncles, and flowers puberulous; heads usually twin, few-flowered, disposed in a terminal raceme. ♄. S. Native of Mexico, near Pascuaro, and on mount Jorullo. Mimòsa grandiflòra, Lher. sert. ang. t. 30. Acàcia grandiflòra, Willd. spec. 4. p. 1074. Coll. hort. rip. 2. t. 9. Legume linear, acute, glabrous, attenuated at the base, having the margins thickened. Flowers of a pleasing red colour, sessile on the apex of the peduncle. Anthers 2-celled; the pollen in 4 globular masses.

Var. β, *pedicellàta* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 442.) flowers distinctly pedicellate at the apex of the peduncles; pedicels longer than the calyx. ♄. S. Native of Mexico. Hern. mex. p. 104. f. 1-2.

Anomalous Inga. Fl. May, Aug. Clt. 1729. Sh. 6 to 10 feet.

135 I. HOUSTÒNI (D. C. prod. 2. p. 442.) leaves with 5-7 pairs of pinnæ, the upper ones longer than the rest, each pinna bearing many pairs of linear leaflets, which are somewhat obliquely-truncate at both extremities, and pubescent beneath; petioles glandless, and are, as well as the peduncles and flowers, clothed with rufous tomentum; heads usually twin, few-flowered, disposed in a terminal raceme. ♄. S. Native of Mexico, about Vera Cruz. Gledítschia inérmis, Lin. spec. 1509. Mimòsa Houstòni, Lher. sert. t. 30. Acàcia Houstòni, Willd. spec. 4. p. 1062. Ker. bot. reg. 98. Mill. fig. t. 5. Mimòsa hirsùta, Vahl. Flowers white. Anthers like those of *I. anómala*. Legume linear, flat, very hairy.

Houston's Inga. Fl. May, Aug. Clt. 1729. Sh. 6 to 10 ft.

136 I.? TIMORIA'NA (D. C. prod. 2. p. 442.) leaves with usually about 30 pairs of pinnæ, each pinna bearing numerous pairs of linear leaflets, which are obliquely truncate at both ends, and pubescent beneath; petioles glandless, and are, as well as branchlets, velvety. ♄. S. Native of the island of Timor. Leaflets about 50 pairs. Flowers unknown. The legume is described [illegible] being on a long pedicel within the calyx, oblong, compressed, flat, [illegible], and glabrous, but as it was only on the same sheet of paper with the specimen, and separated from it, it is doubtful whether it belonged to the plant or not.

Timor Inga. Tree 60 feet.

Cult. *I'nga* is a fine genus of trees and shrubs, bearing delicate compound leaves, and beautiful flowers; for which some of the species are much admired. They are all increased by young cuttings, which should be taken off at a joint, and placed in a pot of sand, placing a bell-glass over them, then the pot to be plunged in heat.

CCXXVI. PA'RKIA (in memory of Mungo Park, the celebrated African traveller). R. Brown, in Denham et Clapp. trav. append. p. 29.—I'nga species of D. C.—Mimòsa species of Willd.

LIN. SYST. *Monadélphia, Decándria.* Calyx tubular, bilabiate, the mouth imbricate in æstivation. Petals 5, nearly equal, the upper one a little broader than the rest, connivently imbricated in æstivation. Stamens 10, hypogynous, monadelphous. Legume many-seeded, 2-valved, separated into 1-seeded divisions, filled with farinaceous pulp.—African and East Indian unarmed trees, with bipinnate leaves with many pairs of pinnæ, and each of the pinna bearing many pairs of leaflets, with minute stipulas, axillary pedunculate spikes of vermilion flowers, which are seated on a club-shaped or orbicular receptacle, the lower ones usually male.

1 P. AFRICA'NA (R. Brown, l. c.) leaves with usually 20 pairs of pinnæ, each pinna bearing about 30 pairs of obtuse pubescent leaflets, with a gland at the base of the petiole, and with a small umbilicate gland between 2 or 3 of the upper pairs of leaflets; heads of flowers biglobular. ♄. S. Native of Africa, in various places, particularly on the western coast, in the kingdoms of Benin and Waree; and also of North Africa, in Soudan, where it is called *Douro*. I'nga biglobòsa, Beauv. fl. d'ow. 2. p. 53. t. 90. D. C. prod. 2. p. 442. Mimòsa biglobòsa, Jacq. amer. t. 176. f. 87. Mimòsa taxifòlia, Pers. ench. 2. p. 266. In Soudan the seeds are roasted as we roast coffee, then bruised, and allowed to ferment in water; when they begin to become putrid they are well washed and pounded, the powder made into cakes, somewhat in the manner of our chocolate; they form an excellent sauce for all kinds of food. The farinaceous matter surrounding the seeds is made into a pleasant drink, and they also make it into a kind of sweetmeat.

African Nitta-tree. Fl. Feb. Clt. 1822. Tree 30 to 40 ft.

2 P. UNIGLOBO'SA (G. Don, in Loud. hort. brit. p. 277.) leaves bipinnate, pubescent, with many pairs of pinnæ, each pinna bearing many pairs of leaflets; heads of flowers globular, on very long peduncles. ♄. S. Native of Sierra Leone, where it is

called *Locust-tree.* Heads of flowers pendulous. Flowers of a vermilion colour. The pulp within the pods is sweet and farinaceous, and is eaten by the natives of Africa. This is probably the *Nitta* mentioned by Mr. Mungo Park.

One-globed-flowered Nitta-tree. Fl. Feb. Clt. 1822. Tr. 30 ft.

3 P. ROXBU'RGHII; leaves with usually 20-24 pairs of pinnæ, each pinna bearing 50-65 pairs of linear, obtuse, rather falciform leaflets, with a gland between 2 or 3 of the upper pairs of pinnæ; rachis pubescent; heads of flowers club-shaped. ♄. S. Native of Silhet, in the East Indies. I'nga biglobòsa, Roxb. Flowers vermilion.

Roxburgh's Nitta Tree. Tree 30 to 40 feet.

Cult. See *I'nga* for culture and propagation, p. 396.

CCXXVII. SCHRA'NKIA (in honour of Francis Von Paula Schrank, a celebrated German botanist, author of numerous botanical works). Willd. spec. 4. p. [illegible] D. C. prod. 2. p. 443.

LIN. SYST. *Polygàmia Monœ'cia.* Flowers polygamous. Petals 5, joined into a [illegible]cleft corolla. Stamens 8-10, free. Legume muricately echinated, tetragonal, and as if it were 4-valved in consequence [illegible] the valves being divisible into 2 parts longitudinally. Seeds numerous, oblong.—Herbs, with tuberous roots, and angular stems. Petioles and legumes beset with hooked prickles. Leaves bipinnate, sensible to the touch, as those of the sensitive plants. Flowers rose-coloured, collected into globose heads.

1 S. ACULEA'TA (Willd. spec. 4. p. 1041.) stem tetragonal; leaves with 2-3 pairs of pinnæ, each pinna bearing numerous pairs of leaflets; legumes acute, a little longer than the peduncles; heads of flowers solitary. ♃. S. Native of Mexico, about Vera Cruz. Mimòsa quadriválvis, Lin. spec. 1508. Mill. fig. pl. 182. f. 1. Banks, rel. Houst. t. 25. Flowers red. Roots creeping.

Prickly Schrankia. Fl. July, Aug. Clt. 1733. Pl. 1 to 2 ft.

2 S. LEPTOCA'RPA (D. C. legum. mem. xii. prod. 2. p. 443.) [illegible] tetragonal; leaves with 2-3 pairs of pinnæ, each pinna bearing many pairs of leaflets; legumes ending in a long acumen, [illegible] times the length of the peduncles; heads of flowers solitary or twin. ♃. S. Native of St. Domingo. Prickles of the stem and petioles hooked, but those on the legume are subulate and straight. Flowers red.

Slender-fruited Schrankia. Pl. 1 to 2 feet.

3 S. HAMA'TA (Humb. et Bonpl. in Willd. spec. 4. p. 1042.) stem pentagonal; leaves with 4 pairs of pinnæ, each pinna bearing many pairs of leaflets, which are unequal at the base; legumes ending in a beak-like acumen; heads of flowers on very short peduncles. ♃. S. Native of South America, on the banks of the river Magdalena near Mompox. H. B. et Kunth, nov. gen. amer. 6. p. 260. Flowers red.

Hooked-prickled Schrankia. Pl. 1 to 2 feet.

4 S. DISTA'CHYA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 443.) stems pentagonal; leaves with 6 pairs of pinnæ, each pinna bearing many pairs of leaflets; legumes acute at both ends, 3 times the length of the peduncles; heads of flowers twin. ♃. S. Native of New Spain. Flowers red.

Two-spiked Schrankia. Pl. 1 to 2 feet.

5 S. UNCINA'TA (Willd. spec. 2. p. 443.) stem pentagonal; leaves with 6 pairs of pinnæ, each pinna bearing many pairs of leaflets; legumes ending in a beak-like acumen at the apex, twice the length of the peduncles; heads of flowers solitary or twin. ♃. F. Native of North America, from Virginia to Florida. Mimòsa horrídula, Michx. fl. bor. amer. 2. p. 154. Vent. choix. t. 28. Mimòsa I'nstia, Walt. car. p. 252. Flowers red.

Uncinate-prickled Schrankia. Fl. July, Aug. Clt. 1789. Pl. 1 to 2 feet.

Cult. All the species of this genus are worth cultivating on account of their leaves, which fall at the slightest touch, as those of the sensitive plants. They grow best in a mixture of loam, peat, and sand, and may be propagated by young cuttings planted in sand, with a bell-glass placed over them in heat, or they may be increased by separating the tubers of the roots.

CCXXVIII. DARLINGTO'NIA (in honour of Dr. Darlington, an American botanist). D. C. in ann. sc. nat. jan. 1825. 4. p. 97. legum. mem. xii. no. 6. prod. 2. p. 443.

LIN. SYST. *Pentândria, Monogýnia.* Flowers hermaphrodite. Petals 5, distinct. Stamens 5. Legume 2-valved, dry, continuous, lanceolate, few-seeded.—Smooth, unarmed, perennial herbs, natives of North America, with bipinnate leaves, having numerous pairs of pinnæ and leaflets. Heads of flowers axillary, solitary, pedunculate. Flowers white. Legumes crowded, short, 4-8 lines long.

1 D. BRACHY'LOBA (D. C. legum. mem. xii. t. 66.) plant herbaceous, unarmed, glabrous; leaves with 6-8 pairs of pinnæ, each pinna bearing 16-24 pairs of linear leaflets, with a gland seated between the lower pair of pinnæ; heads of flowers solitary, axillary, pedunculate; legumes straightish, lanceolate. ♃. F. Native of meadows in the region of Illinois and Kentucky. Acàcia brachýloba, Willd. spec. 4. p. 1071. Mimòsa Illinoénsis, Michx. fl. bor. amer. 2. p. 254. Legume glabrous, 6-7 lines long, and 2½ broad. Flowers white.

Short-podded Darlingtonia. Fl. Jul. Oct. Clt. 1803. Pl. 1½ ft.

2 D. GLANDULÒSA (D. C. l. c.) plant herbaceous, glabrous, unarmed; leaves with 12-14 pairs of pinnæ, each pinna bearing 20-30 pairs of linear leaflets, with a gland situated on the petiole between each of the pairs of pinnæ; heads of flowers solitary, pedunculate, axillary; legumes falcate. ♃. F. Native of the plains along the banks of the rivers Tenessee and Mississippi. Mimòsa glandulòsa, Michx. fl. bor. amer. 2. p. 254. Vent. choix. t. 27. but not of Smith. Acàcia glandulòsa, Willd. spec. 4. p. 1071. Mimòsa contortuplicàta, Zucc. obs. cent. 1. no. 100. Flowers white.

Glandular Darlingtonia. Fl. Sept. Oct. Clt. 1806. Pl. 1½ ft.

3 D. INTERME'DIA (Torrey in ann. lyc. 2. p. 191.) unarmed, herbaceous, and glabrous; leaves with 8-9 pairs of pinnæ, each pinna bearing many pairs of oblong-linear leaflets, with a gland seated on the petiole between the lower pair of pinnæ; heads of flowers solitary, axillary, pedunculate; legumes falcate. ♃. F. Native of North America, on the Canadian river. Flowers white.

Intermediate Darlingtonia. Pl. 1 foot.

Cult. Peat and sand, mixed with some vegetable mould is the best soil for the species of *Darlingtònia.* They should be grown in pots, and placed among the Alpine plants, and they may be increased by dividing at the root, or by young cuttings planted in sand, with a bell-glass placed over them.

CCXXIX. DESMA'NTHUS (from δεσμη, *desme,* a bundle, and ανθος, *anthus,* a flower; in reference to the flowers, which are collected into bundles or spikes). Willd. spec. 4. p. 1044. Kunth, mim. p. 115. D. C. prod. 2. p. 443.

LIN. SYST. *Polygàmia, Monœ'cia.* Flowers polygamous. Calyx 5-toothed. Petals 5, distinct, oblong-spatulate or joined, but usually wanting in the neuter flowers. Stamens 10, rarely 5, with the filaments in the lower flowers of the spike sterile, membranous, and dilated or filiform. Legume dry, continuous, 2-valved. —Herbs or shrubs, with bipinnate leaves, and linear leaflets. Spikes of flowers axillary, pedunculate, ovate or cylindrical. Flowers white, but with the fertile filaments usually yellow. Perhaps it would have been better to have divided the present genus into three separate genera instead of sections.

SECT. I. NEPTU'NIA (so called on account of the species contained in this section being inhabitants of lakes and ponds). Lour. coch. p. 654. D. C. legum. mem. xii. prod. 2. p. 444. Legume oblong, 4-6-seeded, broadest at the base. Sterile filaments all petaloid.—Prostrate, usually rooting, aquatic herbs, furnished with bipinnate leaves, which are sensible to the touch, as those of the sensitive plants, and axillary solitary peduncles. Leaves with 2-3 pairs of pinnæ, each pinna bearing 10-12 pairs of leaflets.

1 D. LACU'STRIS (Willd. spec. 4. p. 1044.) stems creeping, terete; leaves with 3 pairs of pinnæ, each pinna bearing many pairs of leaflets; peduncles bracteate; spikes of flowers ovate. ♃. W. S. Native of South America, near Mompox, floating in stagnant water, as well as in the river Magdalena. Mimòsa lacústris, Humb. et Bonpl. pl. equin. 1. t. 16. Mimòsa aquática, Pers. ench. no. 58. Sterile stamens white tipped with yellow.

Lake Desmanthus. Fl. July. Clt. 1818. Pl. fl.

2 D. NA'TANS (Willd. l. c.) stems terete, creeping, inflated in parts; leaves with 2-3 pairs of pinnæ, each pinna bearing many pairs of leaflets; spikes of flowers ovate; peduncles naked, or only furnished with one bractea. ⊙. W. S. Native of the East Indies and Cochin-china, floating in stagnant water. Mimòsa nàtans, Roxb. cor. 2. t. 119. Andr. bot. rep. 629. Neptùnia oleràcea, Lour. coch. p. 804. Mimòsa prostràta, Lam. dict. 1. p. 10.—Pluk. alm. t. 307. f. 4.—Rheed. mal. t. 20. Sterile stamens yellow.

Floating Desmanthus. Fl. July, Sept. Clt. 1800. Pl. fl.

3 D. STOLÓNIFER (D. C. prod. 2. p. 444.) stems terete, creeping; leaves with 2-3 pairs of pinnæ, each pinna bearing many pairs of leaflets; spikes of flowers nearly globose; peduncles long, naked, or furnished with one bractea in the middle. ♃. W. H. Native of Senegal, floating in stagnant water. The plant throws out large branched roots. Stamens long, petaloid. Mimòsa stolonífera, Perr. in litt. Mimòsa aquática, Bacle in litt.

Stolon-bearing Desmanthus. Pl. fl.

4 D. POLYPHY'LLUS (D. C. prod. 2. p. 444.) stem erect? angular; leaves with 4 pairs of pinnæ, each pinna bearing many pairs of leaflets; peduncles furnished with 2 bracteas each; spikes of flowers ovate. ♃. W. S. Native country unknown. Leaflets 30-40 pairs. Legume oval-oblong, tapering into a stipe at the base, 5-seeded.

Many-leafletted Desmanthus. Pl. fl.

5 D. TRÍQUETRUS (Willd. spec. 4. p. 1045.) stems prostrate, compressed, triquetrous at the base; leaves with 2-3 pairs of pinnæ, each pinna bearing 12 pairs of leaflets; spikes of flowers globose; peduncles furnished with 2 deciduous bracteas. ♃. W. S. Native of the East Indies. Mimòsa tríquetra, Vahl. symb. 3. p. 101. Mimòsa nàtans, Lin. fil. suppl. 439.

Triquetrous-stemmed Desmanthus. Fl. July. Clt. 1820. Pl. fl.

6 D. PLE'NUS (Willd. spec. l. c.) stems prostrate, compressed; leaves with 2-4 pairs of pinnæ, each pinna bearing 12 pairs of leaflets; peduncles bracteate. ⊙. W. S. Native of Mexico, about Vera Cruz, in water. Mimòsa plèna, Lin. spec. 1502. Mill. fig. t. 182. f. 2. Banks, rel. Houst. t. 23. Bracteas 2 on each peduncle, broad, ovate-lanceolate, acuminated. Flowers white and yellow.

Full Desmanthus. Fl. July, Sept. Clt. 1733. Pl. fl.

SECT. II. DESMA'NTHEA (an alteration from the generic name). D. C. legum. mem. xii. prod. 2. p. 444. Legumes linear, 10-15-seeded. Sterile stamens almost filiform. Neuter flowers usually apetalous.—Shrubs or subshrubs, with leaves which are not sensible to the touch as those of the last section. Leaves bipinnate, with from 2-5 pairs of pinnæ, each pinna bearing from 12-15 pairs of leaflets.

7 D. DEPRE'SSUS (Humb. et Bonpl. in Willd. spec. 4. p. 1510.) stems suffruticose, prostrate; leaves with 2 pairs of pinnæ; petiole bearing one gland at the apex; spikes capitate, few-flowered; flowers decandrous; legume narrow, linear. ♄. S. Native of Peru, near Moche, and of Guadaloupe. Kunth, mim. p. 115. t. 35. nov. gen. amer. 6. p. 262. Mimòsa depréssa, Poir. suppl. 1. p. 58. Flowers white.

Depressed Desmanthus. Shrub prostrate.

8 D. DIFFU'SUS (Willd. l. c.) stems suffruticose, prostrate; leaves with 4-5 pairs of pinnæ; spikes capitate, few-flowered; flowers pentandrous; legumes narrow, linear. ♄. S. Native of New Andalusia, in shady places near Cumana. H. B. et Kunth, nov. gen. amer. 6. p. 262. Mimòsa Pernambucàna, Lin. spec. 1503.—Pluk. phyt. t. 307. f. 3. Very nearly allied to the following species. Flowers white.

Diffuse Desmanthus. Fl. July, Aug. Clt. 1731. Sh. pros.

9 D. LEPTOPHY'LLUS (H. B. et Kunth, nov. gen. amer. 6. p. 264.) stems [illegible] leaves with 6-7 pairs of pinnæ, each pinna bearing 16-20 pairs of [illegible] acute, ciliated leaflets, with a gland seated on the petiole between the lower pair of pinnæ; heads few-flowered; flowers decandrous; legumes linear, elongated. ♄. S. Native of Cumana, near [illegible]lones. Flowers white.

Slender-leaved Desmanthus. Shrub 1½ foot.

10 D. VIRGA'TUS (Willd. spec. 4. p. 1047. exclusive of the synonymes of Pluk. and Rheed.) stems suffruticose, erect, angular; leaves with 3-4 pairs of pinnæ, with a gland situated between the lower pair; peduncles naked; spikes few-flowered, capitate; flowers decandrous; legume narrow, linear, [illegible] 30-seeded. ♄. S. Native of the East Indies. Mimòsa [illegible] Lin. spec. 1502. Jacq. hort. vind. t. 80. Sims, bot. mag. [illegible] Flowers white. Anthers yellow.

Twiggy Desmanthus. Fl. June, Aug. Clt. 1774. [illegible] 1 to 2 feet.

11 D. STRI'CTUS (Bertol. vir. bon. 1824. p. 49.) ste[illegible]ticose, erect, angular; leaves with 2-3 pairs of pinn[illegible] gland seated on the petiole beneath the lower pair; [illegible] naked; spikes capitate, few-flowered; flowers decand[illegible] gume narrow, linear, 15-20-seeded. ♄. S. Nativ[illegible] West Indies. Mimòsa angustisiliqua, Lam. dict. 1. [illegible] Flowers white. Very like D. virgàtus according to Be[illegible] hort. crem. 1816. p. 49. of which it is perhaps only a varie[illegible]

Straight-stemmed Desmanthus. Fl. June, Aug. Clt. 1[illegible] Shrub 1 to 2 feet.

12 D. PUNCTA'TUS (Willd. l. c.) stem suffruticose, erect; leave[illegible] with 4-5 pairs of pinnæ, with a gland situated on the petiole beneath the lower pair; spikes of flowers ovate; peduncles furnished with deciduous bracteas at the base; flowers decandrous; legume linear-oblong, rather oblique at the base, hardly 5 times longer than broad. ♄. S. Native of Jamaica, St. Domingo, and Guadaloupe. Mimòsa punctàta, Lin. spec. 1502.—Comm. hort. 1. t. 31. Flowers white. The legume has the form of those species contained in the section *Neptùnia*, but it contains from 12-15 seeds as in those of the present section.

Dotted Desmanthus. Fl. June, July. Clt. 1686. Shrub 2 to 3 feet.

13 D. TENE'LLUS (D. C. prod. 2. p. 445.) stems rather diffuse; leaves with 3-4 pairs of pinnæ, having a gland situated on the petiole beneath the lower pair; peduncles naked, shorter than the petioles; legume linear, 10-12-seeded, hardly 5 times longer than the breadth. ♄. S. Native of the East Indies. Legume 3-9 lines long, and 2 lines broad.

Weak Desmanthus. Shrub 1 foot.

SECT. III. DICHRO'STACHYS (from δις, *dis*, two, χρωμα, *chroma*, colour, and σταχυς, *stachys*, a spike; in reference to the two colours of the spikes of flowers, from the white and yellow stamens).

D. C. legum. mem. xii. prod. 2. p. 445. Legume linear, twisted or somewhat falcate? Sterile filaments linear, and elongated; anthers of the fertile ones bearing a pedicellate gland at the apex of each. Petals 5, distinct or joined?—Shrubs, having the branches usually spinescent, with bipinnate pubescent leaves, bearing from 5-10 pairs of pinnæ, and each pinna bearing many pairs of leaflets, furnished with glands between the pairs of pinnæ, especially between the lower ones. Flowers disposed in oblong-cylindrical 2-coloured spikes, in consequence of the sterile stamens being white or variously coloured, and the fertile ones yellow.

14 D. dive'rgens (Willd. spec. 4. p. 1048.) leaves with 8 pairs of pinnæ, each pinna bearing 10-15 pairs of ciliated leaflets; spikes of flowers twin, pendulous, cylindrically obovate; legumes twisted. ♄. S. Native of Abyssinia. Bruce, trav. 5. t. 61.

Diverging Desmanthus. Fl. June, July. Clt. 1816. Shrub 3 to 6 feet.

15 D. lepto'stachys (D. C. legum. mem. xii. prod. 2. p. 445.) leaves with 8 pairs of pinnæ, each pinna bearing 20-30 pairs of ciliated leaflets, furnished with a stipitate gland between each pair of pinnæ; petioles and peduncles hairy; spikes of flowers usually twin, cylindrical, shorter than the leaves. ♄. S. Native of Senegal and Sierra Leone. Sieb. pl. exsic. seneg. 47. Very nearly allied to the preceding species, but differs from the plant figured by Bruce, in the leaflets being more numerous, and in the spikes of flowers being more slender, and not pendulous, and, lastly, in the sterile filaments being filiform.

Slender-spiked Desmanthus. Fl. July. Clt. 1825. Shrub [illegible] to 5 feet.

16 D. calli'stachys (D. C. prod. 2. p. 445.) leaves with 5 pairs of pinnæ, each pinna bearing about 20 pairs of leaflets; petioles and peduncles hairy; glands on the petiole sessile; spikes solitary, cylindrical, erect. ♄. S. Native country unknown. Spikes of flowers rose-coloured at the bottom, but yellow at the top. Sterile filaments linear. Anthers furnished with a black gland each. The specimens of this plant were collected in the gardens of Teneriffe.

Beautiful-spiked Desmanthus. Fl. June, July. Clt. 1824. Shrub 2 to 4 feet.

17 D. tricho'stachys (D. C. legum. mem. xii. t. 67.) leaves with 10 pairs of pinnæ, each pinna bearing 20 pairs of ciliated leaflets; petioles and peduncles puberulous; glands on the petioles pedicellate; spikes cylindrical, erect, interrupted at the base, rather longer than the leaves. ♄. S. Native of Senegal. Mimòsa bícolor, Bacle in litt. 1820. Mimòsa vària, Perr. in litt. 1825. Branches unarmed according to the specimen. Spikes 2 inches long. Sterile filaments very long, and hair-formed.

Hair-spiked Desmanthus. Shrub 3 to 4 feet.

18 D. cine'reus (Willd. spec. 4. p. 1048.) leaves with 8-10 pairs of pinnæ, each pinna bearing about 12-15 pairs of ciliated leaflets; petioles pubescent; spikes of flowers solitary, nodding, rather shorter than the leaves; corolla gamopetalous, 5-toothed; legume linear, falcate, somewhat transversely loculate inside. ♄. S. Native of the East Indies. Mimòsa cinèrea, Lin. spec. 1505. Roxb. cor. 2. t. 174.—Burm. zeyl. t. 2. Spikes rose-coloured at the bottom and yellow at the apex. Branches white, when young pubescent.

Cinereous Desmanthus. Fl. June, July. Clt. 1739. Shrub 6 to 7 feet.

19 D. nu'tans (D. C. prod. 2. p. 446.) branches spiny, when young clothed with hairy tomentum; leaves with 10 pairs of pinnæ, each pinna bearing 20-25 pairs of ciliated leaflets; petioles villous; spikes pedunculate, rather shorter than the leaves, nodding; flowers decandrous; the filaments in the lower ones castrate and petaloid. ♄. S. Native of Senegal. Mimòsa nùtans, Pers. ench. 2. p. 115. This is perhaps the same as *D. leptóstachys*, but differs in the spines being straight, spreading, simple, hairy, but at length becoming glabrous.

Nodding-spiked Desmanthus. Shrub 3 to 4 feet.

Cult. A mixture of peat, loam, and sand suits the species of this genus, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them. The kinds belonging to section 1. *Neptùnia*, being aquatics with sensitive leaves, should be grown in tubs or large pans, with 4 or 5 inches of mould in the bottom, and filled up with water. The tubs or pans should be placed in a warm situation in a stove, or in a hot-bed in summer, where the plants will thrive and produce seeds.

CCXXX. ADENANTHE'RA (from αδην, *aden*, a gland, and ανθηρα, *anthera*, an anther; in reference to the anthers, which are terminated by a deciduous, pedicellate gland each). Lin. gen. no. 526. Lam. ill. t. 334. D. C. prod. 2. p. 446.

Lin. syst. *Decándria, Monogýnia.* Flowers hermaphrodite. Calyx 5-toothed. Petals 5, lanceolate, sessile. Stamens 10. Anthers terminated by a pedicellate, deciduous gland each. Legume compressed, linear, membranous, transversely many-celled inside, somewhat swollen above the seeds, destitute of pulp.---Trees or shrubs, with bipinnate leaves and racemose spikes of flowers. This genus is related to *Cássia*, according to Bronn. diss. p. 130. but differs in the petals being valvate in æstivation.

1 A. Pavoni'na (Lin. spec. 553.) leaflets oval, obtuse, glabrous on both surfaces; legumes rather falcate. ♄. S. Native of the East Indies. Jacq. coll. 4. p. 212. t. 23. - Rumph. amb. 3. t. 109. Flowers white and yellow mixed. Legume falcate, 10-12-seeded. Seeds highly polished, of a vivid scarlet colour, with a circular streak in the middle on each side. This is one of the largest trees in the East Indies, and its timber is much valued on account of its solidity. The natives use the powder of the leaves in their ceremonies. The seeds, besides being eaten by the common people, are of great use to jewellers and goldsmiths, on account of their equality, for weights, each of them weighing 4 grains; they also make a cement by beating them up with borax.

Peacock Adenanthera. Fl. May, Aug. Clt. 1759. Tr. 100 ft.

2 A. falca'ta (Lin. spec. 550.) leaflets oval, acutish, tomentose beneath; legume straight. ♄. S. Native of the Moluccas. Rumph. amb. 3. t. 111. Petals 4, yellowish. Seeds blackish.

Falcate Adenanthera. Clt. 1812. Tree 60 feet.

† *Species not sufficiently known.*

3 A.? Bonplandia'na (H. B. et Kunth, nov. gen. amer. 6. p. 311.) leaflets oblong, puberulous beneath; spikes of flowers twin, nearly terminal. ♄. S. Native of Caraccas, in shady humid woods, near Higuerote and Guriepe. Legume unknown. Perhaps a species of *Prosòpis*. Corolla green.

Bonpland's Adenanthera. Tree 25 feet.

4 A.? circinna'lis (D. C. prod. 2. p. 446.) leaflets ovate, acute, tomentose beneath? legumes circinnately incurved. ♄. S. Native of the Moluccas. Clypeària rùbra, Rumph. amb. 3. t. 112.

Circinnate-podded Adenanthera. Tree 30 feet.

Cult. See *Inga* for culture and propagation, p. 396.

CCXXXI. PROSO'PIS (from προσωπον, *prosopon*, a mask; a name given by Dioscorides to *A'rctium láppa*). Lin. mant. 68. Kunth, mim. 106. D. C. prod. 2. p. 446.

Lin. syst. *Polygàmia, Monœ'cia.* Flowers polygamous. Calyx 5-toothed. Petals 5, free. Stamens 10, with the filaments hardly joined at the base. Legume continuous, filled with pulp inside, linear, rather compressed, swollen above the seeds, and at length separable into 1-seeded divisions.—Unarmed or prickly trees or shrubs, with bipinnate leaves, having from 1-4 pairs of pinnæ, each pinna bearing many pairs of oblong-linear leaflets, and pedunculate elongated axillary spikes of flowers. Flowers rather distant on the spikes, greenish, whitish, or yellow. The pulp in the pods of all the species is eaten by the natives in the various countries of their growth. The pericarp almost entirely consists of tannin.

Sect. I. Adeno'pis (from ἀδὴν ἀδένος, *aden adenos*, a gland; in reference to the anthers, which are terminated by a deciduous gland each, as in the genus *Adenanthèra*). D. C. prod. 2. p. 446. Anthers tipped by a deciduous gland each. Indian trees, furnished with a few scattered prickles.

1 P. spici'gera (Lin. mant. 68.) prickles scattered; leaves with 1-2 pairs of pinnæ, each pinna bearing 7-10 pairs of oblong-linear, obtuse leaflets. ♄. S. Native of the coast of Coromandel. Roxb. cor. 1. t. 63.—Burm. ind. t. 25. f. 3. Flowers yellow. Legume linear, terete, attenuated at both ends, pendulous, filled with mealy pulp, which the natives of the coast of Coromandel eat; it has a sweetish agreeable taste, and may be compared to that of the Spanish *Algaroba*, or locust-tree, *Ceratònia síliqua*.

Var. β, adenanthèra (D. C. prod. 2. p. 446.) prickles scattered, compressed at the base; leaves with 1-2 pairs of pinnæ, each pinna bearing 10-11 pairs of linear, acute leaflets. ♄. S. Native of the coast of Coromandel. Adenanthèra aculeàta, Roxb. hort. beng. 90. Both this and the species are called *Tshamie* by the Telingas, and *Vanni-marum* by the Tamuls.

Spike-bearing Algaroba. Clt. 1812. Tree 40 to 50 feet.

Sect. II. Algaro'ba (*Algaroba* is the name in South America for several of the species). D. C. prod. 2. p. 446. Anthers without glands.—American trees, which are either destitute of spines, or when present they are axillary.

2 P. hórrida (Kunth, mim. p. 106. t. 33. nov. gen. amer. 6. p. 306.) spines stipular, twin, very long; leaves with 2-3 pairs of pinnæ, each pinna bearing 10-12 pairs of oblong leaflets, which are pubescent on both surfaces; rachis of leaves bearing 2 or 3 glands. ♄. S. Native at the bottom of the Andes, on the eastern side, and in the sand on the sea-shore along the Pacific ocean, where it is called *Algaroba* by the natives, who eat the pulp contained in the pods. Flowers white. Legume torulose, 17-24-seeded.

Horrid Algaroba. Tree 20 feet.

3 P. glandulo'sa (Torrey, in ann. lyc. 2. p. 192. t. 2.) spines thick, cylindrically conical; leaves with 1 pair of pinnæ, each pinna bearing 6-7 distant pairs of linear, rather falcate, obtuse, glabrous, rather coriaceous leaflets, with glands between the pair of pinnæ, as well as between the pairs of leaflets; legumes straight, torulose, pulpy inside; spikes of flowers cylindrical. ♄. F. Native of North America, on the Canadian river.

Glandular Algaroba. Tree.

4 P. ine'rmis (H. B. et Kunth, nov. gen. amer. 6. p. 307.) unarmed; leaves with 3 pairs of pinnæ, each pinna bearing 6-13 pairs of linear oblong leaflets, which are finely pubescent beneath; rachis of leaves bearing 2-3 small, cup-shaped glands. ♄. S. Native of Peru. Flowers greenish white.

Unarmed Algaroba. Tree 60 feet.

5 P. du'lcis (Kunth, mim. p. 110. t. 34. nov. gen. amer. 6. p. 307.) spines stipular, or almost wanting or deciduous; leaves with 1-2 pairs of pinnæ, each pinna bearing 18-25 pairs of glabrous leaflets, but which are a little ciliated at the apex; rachis of leaves bearing 1-2 small, convex glands. ♄. S. Native of New Spain. Acàcia lævigàta, Willd. spec. 4. p. 1059. and A. edùlis, Willd. enum. p. 1056.? Corolla green. Filaments white. Legume torulose, containing 13-15 seeds. The pulp contained in the pods is very sweet, and is eaten by the inhabitants of the countries where the trees grow.

Sweet-podded Algaroba. Clt. 1818. Tree 40 to 50 feet.

6 P. microphy'lla (H. B. et Kunth, nov. gen. amer. 6. p. 308.) spines stipular, subulate; leaves with 2-4 pairs of pinnæ, each pinna bearing from 11-18 pairs of minute, oblong, pubescent, canescent leaflets; rachis of leaves bearing 2 glands. ♄. S. Native of Mexico, between Valladolid and Tolucco. This is perhaps a species of *I'nga*, according to Kunth.

Small-leafletted Algaroba. Tree 20 feet.

7 P. du'bia (H. B. et Kunth, nov. gen. amer. 6. p. 309.) unarmed; leaves with 12 pairs of pinnæ, each pinna bearing 11-21 pairs of linear-oblong, acute, glabrous leaflets; rachis of leaves biglandular. ♄. S. Native of New Granada, near Turbaco. Le[illegible] [illegible]what spirally convolute.

Doubtful Algaroba. Shrub [illegible].

8 P. pa'llida (Kunth, mim. p. [illegible] nov. gen. amer. 6. p. 30[illegible]) spinose or unarmed; leaves with [illegible] pairs of pinnæ, each pinna bearing 11-12 pairs of linear, obtuse, pubescent leaflets; rachis of leaves bearing 2-3 concave glands; spikes of flowers solitary, filiform, exceeding the leaves. ♄. S. Native of South America, on hills about Bracamora, near Passo de [illegible]atara.

Pale Algaroba. Tree.

9 P. siliqua'strum (D. C. prod. 2. p. 447.) spines stipular, twin, straight; leaves with 2-3 pairs of pinnæ, each pinna bearing numerous pairs of linear, obtuse leaflets; legumes compressed, falcate. ♄. S. Native of Chili, where it is called *Algar[illegible]a de Chile*, and where the inhabitants eat the pulp contained in the pods. Acàcia siliquástrum, Lag. nov. gen. et spec. 16. no. 205. Flowers white?

Silique-podded or Chili Algaroba. Tree 30 to 40 feet.

10 P. flexuòsa (D. C. prod. 2. p. 447.) spines stipular; leaves with only 1 pair of pinnæ, each pinna bearing usually about 8 pairs of glabrous, linear, obtuse leaflets, which are narrowest at the base; legume rather terete, torulose. ♄. G. Native of Chili. Acàcia flexuòsa, Lag. nov. gen. et spec. 16. no. 205. Very like the preceding species.

Flexuous Algaroba. Tree.

11 P. Cumane'nsis (Kunth, mim. 106. nov. gen. amer. 6. p. 310.) unarmed; leaves with 1 pair of pinnæ, each pinna bearing many pairs of linear leaflets, which are obtuse at both ends, and glabrous as well as the petioles, with a sessile, oblong, obtuse gland, seated on the petiole between the pair of pinnæ; spikes filiform; flowers opposite. ♄. S. Native of Cumana. Acàcia Cumanénsis, Willd. spec. 4. p. 1058. Legumes unknown. Leaflets 11 pairs on each pinna, ex Willd., but in Bonpland's specimen there are 22 pairs on each of the pinna.

Cumana Algaroba. Clt. 1822. Tree 20 feet.

12 P. bracteola'ta (D. C. prod. 2. p. 447.) spines stipular, straight; leaves with 2 pairs of pinnæ, each pinna bearing from 16-18 pairs of linear leaflets, which are obtuse at both ends, and are as well as petioles glabrous, with a sessile gland on the petiole between the pairs of pinnæ; spikes filiform, bearing subulate erect bracteoles beneath the flowers. ♄. S. Native of St. Martha. Habit as well as flowers like that of the preceding species, from which it is hardly distinct.

Bracteolate-flowered Algaroba. Tree.

13 P. Dominge'nsis (D. C. prod. 2. p. 447.) spines stipular, straight, small; leaves with 1 pair of pinnæ, each pinna bearing from 16-18 pairs of linear leaflets, which are obtuse at both ends and glabrous as well as the petioles, with a sessile gland between the pair of pinnæ; spikes filiform; legumes compressed, constricted between the seeds. ♄. S. Native of St. Domingo, where it is called *Bohahunda*, and therefore perhaps

the note in Coll. hort. rip. p. 2. no. 3. is referrible to this species.

St. Domingo Algaroba. Clt. 1818. Tree.

14 P. juliflòra (D. C. prod. 2. p. 447.) spines stipular, straight, small; leaves with 1-2 pairs of pinnæ, each pinna bearing from 18-20 pairs of linear leaflets, which are acutish at both ends, and are glabrous as well as petioles, with a sessile gland seated on the petiole between the pairs of pinnæ; spikes cylindrical, sessile; legume much compressed. ♄. S. Native of the south of Jamaica, in dry places. Mimòsa juliflòra, Swartz, prod. p. 85. Mimòsa piliflòra, Swartz, fl. ind. occ. 2. p. 986. Spikes of flowers almost like the aments of *Sàlix frágilis.* Flowers yellowish. Legume filled with a fleshy substance between the seeds, which is eatable. Leaflets 6-8 lines long. Acàcia falcàta, Desf. cat. hort. par. ed. 2. p. 207. is probably not distinct from this tree.

July-flower Algaroba. Clt. 1800. Tree.

† *Species insufficiently known.*

15 P. torqua'ta (D. C. prod. 2. p. 448.) spines twin, stipular; leaves with 1-2 pairs of pinnæ, each pinna bearing many pairs of linear leaflets; with a gland between the pairs of pinnæ on the petiole; spikes of flowers cylindrical, on short peduncles; legume torquate and constricted between the seeds, and filled with mealy pulp inside. ♄. S. Native of South America. Acàcia torquàta, Lag. nov. gen. et spec. 16. no. 206. Stamens 10, free.

Collared-podded Algaroba. Tree.

16 P. affi'nis (Spreng. syst. 2. p. 326.) spines straight; leaves with only one pair of pinnæ, each pinna bearing many pairs of remotish, quite glabrous leaflets; petioles without glands; branches tubercled; spikes filiform, twin. ♄. S. Native of Monte Video.

Allied Algaroba. Tree.

Cult. See *I'nga* for culture and propagation, p. 396.

CCXXXII. LAGONY'CHIUM (from λαγως, *lagos*, a hare, and ονυχιον, *onychion*, a little nail; in reference to the spines on the shrub). Bieb. suppl. 288. D. C. prod. 2. p. 418.

Lin. syst. *Decándria, Monogýnia.* Flowers hermaphrodite, many of which are abortive. Calyx 5-toothed. Petals 5, free. Stamens 10, hypogynous, free. Anthers without glands. Style twisted at the apex. Legume stipitate, indehiscent, ovate-cylindrical, somewhat didymous, rather incurved, never torulose, filled with pulp inside.—A small shrub, with scattered, prickles, bipinnate leaves, bearing 3-5 pairs of pinnæ, and each pinna bearing 10 pairs of leaflets, which are pubescent beneath. This is a doubtful genus, which is perhaps not distinct from *Acàcia.*

1 L. Stephania'num (Bieb. l. c.). ♄. H. Native of the arid plains between the Caucasus and the Caspian sea, and of Persia, between Mossul and Bagdad. Acàcia Stephaniàna, Bieb. fl. taur. 2. p. 449. Mimòsa micrántha, Vahl. in herb. Michx.—Buxb. cent. 3. t. 48. bad.—Breyn. cent. 1. t. 56. f. 4.

Stephan's Lagonychium. Fl. Jul. Aug. Clt. 1816. Sh. 1 to 2 ft.

Cult. This shrub should be planted in a warm situation in the open border, and sheltered by a mat in severe weather in winter. It may be increased by seeds or layers, and very young cuttings will root if taken off at a joint, and planted in sand, with a hand-glass placed over them.

CCXXXIII. ACA'CIA (from *ac*, a point, in Celtic, or from ακαζω, *akazo*, to sharpen; many of the species are furnished with spines). Neck. elem. no. 1297. Willd. spec. 4. p. 1049. Kunth, mim. p. 74. D. C. prod. 2. p. 448.

Lin. syst. *Polygàmia, Monœ'cia.* Flowers polygamous (f. 53. c. f. 54. b.). Calyx 4-5-toothed (f. 54. a.). Petals 4-5, sometimes free (f. 53. a.), and sometimes joined together into a 4-5-cleft corolla. Stamens variable in number from 10 to 200 in each flower. Legume continuous, dry, 2-valved.—Shrubs or trees, very variable in habit and leaves. Spines stipular, scattered, or wanting. Flowers yellow, white, rarely red, disposed in globular heads or spikes, decandrous, or polyandrous, eleutherandrous or monadelphous. This is a very polymorphous genus, which may hereafter be divided into several genera, when the characters of the species are better known. The barks of many of the species abound to such a degree in tanning principle as to have become an object of commercial importance.

Sect. I. Phyllodíneæ (from φυλλον, *phyllon*, a leaf; leaves simple). Leaves of two forms, those in seedling plants are bipinnate, but in the adult plants the leaflets are abortive, and there only remains the dilated petiole, which is called a phyllodium. Acàciæ aphýllæ, Wendl. diss. 1820. Flowers in all yellow. The species are mostly natives of New Holland.

§ 1. *Capitàtæ* (from *capitatus*, headed; disposition of flowers). *Flowers collected into globular heads; heads solitary on the peduncles.*

* *Stipulas spinose.*

1 A. ala'ta (R. Br. in hort. kew. ed. 2. vol. 5. p. 464.) stipulas spinose, permanent; stem bifariously winged; phyllodia decurrent, 1-nerved, ending in a spine at the apex, and with the upper margin furnished with a glandular tooth; heads of flowers solitary or twin. ♄. G. Native of New Holland, on the western coast. Ker. bot. reg. 396. Wendl. diss. no. 1. t. 1. Coll. hort. rip. 1. t. 17. Reich. mag. gart. t. 88. Flowers yellow.

Winged-stemmed Acacia. Fl. April, July. Clt. 1803. Sh. 6 to 10 feet.

2 A. dolabrifórmis (Wendl. l. c. no. 38.) stipulas deciduous or wanting; branches rather angular; phyllodia linear, somewhat falcate, rather decurrent at the base, obliquely and emarginately truncate at the apex, with the lower lobe ending in a pungent mucrone. ♄. G. Native of New Holland. Flowers yellow.

Dolabriform-leaved Acacia. Fl. April, July. Clt. 1818. Shrub 4 to 6 feet.

3 A. deci'piens (R. Br. l. c. p. 465.) stipulas spinescent, deciduous; phyllodia triangular and somewhat trapezoid, with the nerve approximating the lower side, and drawn out into a spine at the apex, the superior margin furnished with one acute gland-bearing tooth; heads many-flowered, usually solitary. ♄. G. Native of New Holland, on the south-west coast. Adiántum truncàtum, Burm. fl. ind. t. 66. f. 4. Mimòsa decípiens, Kœn. ann. bot. 1. p. 366. t. 8. Sims, bot. mag. 1745. A. dolabrifórmis, Coll. hort. ripul. p. 1. but not of Wendl. Peduncles longer than the phyllodia. Branches glabrous. Flowers yellow.

Var. β, trapezoìdea (D. C. prod. 2. p. 449.) stipulas deciduous; phyllodia irregularly trapezoid, with the nerve approximating the lower margin, and drawn out into a spine at the apex, but the upper margin is furnished with 2 obtuse, gland-bearing teeth; young heads of flowers axillary, sessile, and usually solitary. ♄. S. Native of New Holland, on the eastern coast. Branches angular, glabrous. Perhaps a proper species.

Deceiving Acacia. Fl. Mar. Ju. Clt. 1818. Sh. 3 to 6 ft.

4 A. deltoi'dea (Cunningh. mss.) stipulas acicular, spinescent, twin; phyllodia dolabriform, smooth, ending in a spine-like mucrone, many-nerved, convex on the upper side, and nearly straight on the lower; branches slightly angular, pubescent; heads of flowers solitary, on peduncles, which are longer than the phyllodia. ♄. S. Native of New Holland, within the tropic.

Deltoid-leaved Acacia. Clt. 1824. Shrub 3 to 6 feet.

5 A. biflòra (R. Br. hort. kew. 5. p. 463.) stipulas spines

permanent; phyllodia triangular, with 1 nerve, which approximates the lower side, and is drawn out into a spine at the apex, the superior margin furnished with 1 gland-bearing tooth; heads solitary, on short peduncles, 2-flowered. ♄. G. Native of New Holland, on the western coast. Wendl. diss. no. 3. t. 2. Branches pubescent. Corolla 4-cleft.

Two-flowered Acacia. Fl. Mar. Jul. Clt. 1803. Sh. 2 to 4 ft.

6 A. HASTULA'TA (Smith, in Rees' cycl. suppl.) stipulas spinescent, permanent; phyllodia glabrous, rhomboid, ending in a spinose acumen, with 1 nerve in the centre, and the superior margin furnished with 1 gland-bearing, obtuse tooth; branchlets hispid; heads solitary, 3-4-flowered. ♄. G. Native of New Holland, at King George's Sound. Stipulas bristle-formed, erect.

Hastulate-leaved Acacia. Fl. April, June. Clt. 1824. Sh. 3 to 6 feet.

7 A. NERVÒSA (D. C. legum. mem. xii. prod. 2. p. 449.) stipulas spinescent, permanent; phyllodia oval-oblong, acuminated at both ends, ending in a spine, with 1 nerve in the middle, and with nerve-formed, entire margins; heads pedunculate, usually twin, 5-8-flowered. ♄. G. Native of New Holland.

Nerved-leaved Acacia. Fl. April, Ju. Clt. 1824. Sh. 3 to 6 ft.

8 A. ORNITHO'PHORA (Sweet, fl. austr. 24.) stipulas spinescent, permanent, a little shorter than the phyllodia; phyllodia obliquely oblong-lanceolate, 1-nerved, rather pilose, ending in a hooked beak at the apex, and furnished on the upper margin with a gland-bearing tooth; branches hairy; heads of flowers pedunculate, solitary, or twin, numerous. ♄. G. Native of New Holland. The outline of the leaves gives the form of the body and head of a bird.

Bird-bearing Acacia. Fl. Apr. Ju. Clt. 1824. Sh. 4 to 8 ft.

9 A. PARADÒXA (D. C. cat. hort. monsp. p. 74.) stipulas spinescent, permanent; phyllodia obliquely oblong-lanceolate, quite entire, undulated, 1-nerved; branches clammy, glabrous; heads of flowers solitary. ♄. G. Native of New Holland, on the eastern coast. A. undulàta, Willd. enum. suppl. p. 68. Wendl. diss. no. 4. t. 3.

Paradoxical Acacia. Fl. Apr. June. Shrub 3 to 6 feet.

10 A. ARMA'TA (R. Br. in hort. kew. 5. p. 463.) stipulas spinescent, permanent; phyllodia obliquely ovate-oblong, quite entire, 1-nerved; branches hairy; heads of flowers solitary; legumes velvety. ♄. G. Native of New Holland, on the southern coast. Sims, bot. mag. 1653. Bonpl. nav. t. 55.

Armed Acacia. Fl. Apr. June. Clt. 1803. Sh. 6 to 10 ft.

11 A. GENISTIFÒLIA (Link. enum. 2. p. 448.) stipulas spinescent, very minute; phyllodia linear, ending in a subulate pungent point, approximate; branches glabrous, angular; heads of flowers solitary. ♄. G. Native of New Holland.

Genista-leaved Acacia. Fl. Mar. Aug. Clt. 1825. Sh. 3 to 6 ft.

12 A. JUNIPE'RINA (Willd. spec. 4. p. 1049.) stipulas setaceous, spinescent, permanent; phyllodia linear-subulate, ending in a pungent mucrone; branches terete, pubescent; heads of flowers solitary. ♄. G. Native of New Holland, on the eastern coast. Lodd. bot. cab. 398. Mimòsa junipérina, Vent. malm. t. 64. Mimòsa ulicifòlia, Wendl. coll. 2. t. 6. A. verticillàta, Sieb. pl. exsic. nov. holl. no. 419. Calyx 5-parted. Petals 5.

Juniper-like Acacia. Fl. Mar. Ju. Clt. 1790. Sh. 4 to 8 ft.

13 A. ASPARAGOÌDES (Cunning. in Field's new south wales, p. 343.) stipulas permanent; phyllodia linear, sulcate, stiff, mucronate, alternate, and crowded, somewhat dilated near the base, where it bears a glandular tooth; heads of flowers axillary, solitary; branches glabrous, diffuse. ♄. G. Native of New South Wales, on the Blue Mountains. Intermediate between *A. aciculàris* and *A. junipérina.*

Asparagus-like Acacia. Fl. March, June. Clt. 1818. Sh. diffuse.

14 A. BRO'WNII (Steud. nom. phan. 1. p. 2.) stipulas setosely-spinescent, small, deciduous; phyllodia linear-subulate, ending in a pungent mucrone, distant, spreading; branches terete, glabrous; heads of flowers solitary, unarmed; peduncles a little shorter than the phyllodia. ♄. G. Native of New Holland, in King's Island. A. aciculàris, R. Br. in hort. kew. 5. p. 450. but not of Willd. A. junipérina, Sieb. pl. exsic. nov. holl. no. 463. The phyllodia are much more distant from each other than those of *A. junipérina.*

Brown's Acacia. Fl. Mar. Aug. Clt. 1796. Sh. 4 to 8 ft.

15 A. ECHINA'TA (D. C. prod. 2. p. 449.) stipulas setaceous, spinescent, permanent; phyllodia linear-subulate, ending in a pungent mucrone; branches terete, hairy-pubescent; heads of flowers solitary; bracteas ending in a spine-like bristle, each longer than the corolla. ♄. G. Native of New Holland. A. junipérina, Sieb. pl. exsic. nov. holl. no. 447. Very like *A. junipérina,* but differing from it in the young heads of the flowers being echinated from the spine-like exserted bracteas.

Echinate-headed Acacia. Fl. Mar. July. Clt. 1824. Sh. 3 to 6 feet.

16 A. PUGIONIFÓRMIS (Wendl. diss. no. 2. t. 9. exclusive of the synonyme of R. Brown,) stipulas very acute, small, and almost permanent; phyllodia linear-terete, smooth, obtuse, obliquely mucronate; branches terete, glabrous; heads of flowers solitary; peduncles 3-times shorter than the phyllodia. ♄. G. Native of New Holland, on the eastern coast.

Dagger-formed-leaved Acacia. Fl. March, July. Clt. 1818. Shrub 4 to 6 feet.

* * *Stipulas not spinescent, but are either very small or wanting, and usually deciduous.*

17 A. DIFFU'SA (Ker. bot. reg. 634.) stipulas small, caducous; phyllodia linear, 1-nerved, ending in an oblique acumen, with the spinula continuous along the lower margin; branches diffusely procumbent, glabrous, angular; heads of flowers usually twin. ♄. G. Native of New South Wales, on the Blue Mountains, Sims, bot. mag. 2417. A. prostràta, Lodd. bot. cab. 631. A. daviesioides, Cunningh. mss.

Diffuse Acacia. Fl. Apr. June. Clt. 1818. Shrub diffuse.

18 A. SULCA'TA (R. Br. in hort. kew. 5. p. 460.) stipulas small, concave, deciduous; phyllodia linear-terete, sulcate, mucronate; branches nearly terete, glabrous; heads of flowers usually twin. ♄. G. Native of New Holland, on the western coast. Wendl. diss. no. 27. t. 10. Calyx 5-parted. Petals 5, ex Wendl. Bracteas concave, permanent. Legume flexuous.

Furrowed-leaved Acacia. Fl. May, Aug. Clt. 1803. Sh. 2 to 6 feet.

19 A. SALIGNA (Wendl. diss. no. 16.) stipulas almost wanting; phyllodia linear, attenuated at both ends, quite entire, almost nerveless; branches angular, glabrous; heads of flowers solitary, on short peduncles; legumes contracted between the seeds, loment-formed. ♄. G. Native of New Holland, at Cape Van Diemen and about Port Jackson. Mimòsa saligna, Labill. nov. holl. 2. p. 86. t. 235. There is a variety with broader phyllodia, and another with very narrow ones.

Willowy Acacia. Fl. Mar. Ju. Clt. 1818. Sh. 6 to 10 ft.

20 A. EMARGINA'TA (Wendl. diss. no. 17.) stipulas wanting; phyllodia linear-spatulate, attenuated at the base, emarginate at the apex, and mucronate; heads of flowers twin; peduncles longer than the heads. ♄. G. Native of New Holland. Perhaps a variety of the following species, the calyx being sinuately 5-toothed in both.

Emarginate-leaved Acacia. Fl. Mar. July. Clt. 1824. Sh. 6 to 10 feet.

21 A. STRÍCTA (Willd. spec. 4. p. 1052.) stipulas wanting;

phyllodia linear, attenuated at the base, but rounded and mucronate at the apex, 1-nerved in the middle; heads of flowers twin; peduncles shorter than the heads. ♄. G. Native of New Holland, on the eastern coast. Mimòsa stricta, Andr. bot. rep. t. 53. Sims, bot. mag. 1121. Mimòsa suaveòlens, Desf.

Straight Acàcia. Fl. Feb. May. Clt. 1790. Sh. 3 to 6 ft.

22 A. lepròsa (Sieb. pl. exsic. nov. holl. no. 2455.) stipulas almost wanting; phyllodia linear-lanceolate, leprously dotted, 1-nerved, attenuated at the base, and terminating in a callous, incurved mucrone; branches angularly-furrowed; heads of flowers 2-3-together, axillary; peduncles clothed with hoary pubescence, shorter than the heads. ♄. G. Native of New Holland. Very like *A. dodoneæfòlia*.

Leprous Acacia. Fl. Mar. June. Clt. 1817. Sh. 4 to 8 ft.

23 A. dodoneæfòlia (Willd. enum. suppl. p. 68.) stipulas wanting; phyllodia linear-lanceolate, rather falcate, attenuated at the base, 1-nerved in the middle, and terminated by an incurved callous mucrone; branches angular, and are as well as the phyllodia clammy; heads of flowers twin; peduncles longer than the heads. ♄. G. Native of New Holland, on the eastern coast. Mimòsa dodoneæfòlia, Pers. ench. 2. p. 261. A. viscòsa, Wendl. diss. no. 19. t. 7. Calyx 5-toothed.

Dodonæa-leaved Acacia. Fl. Mar. Ju. Clt. 1816. Sh. 4 to 8 ft.

24 A. multine'rvia (D. C. legum. mem. xii. prod. 2. p. 450.) stipulas wanting; phyllodia linear-lanceolate, attenuated at the base, many-nerved, furnished with a gland-like tooth on the upper margin; heads of flowers solitary or twin, on short peduncles. ♄. G. Native of New Holland, on the eastern coast. Young branches angular, adult ones terete.

Many-nerved-leaved Acacia. Fl. Mar. June. Clt. 1824. Shrub 5 to 6 feet.

25 A. eglandulòsa (D. C. legum. mem. xii. prod. 2. p. 450.) stipulas wanting; phyllodia linear-lanceolate, attenuated at the base, entire on both sides, and glandless, many-nerved at the base; heads of flowers solitary; peduncles rather longer than the heads. ♄. G. Native of New Holland.

Glandless-leaved Acacia. Fl. Mar. June. Clt. 1824. Sh. 4 to 6 feet.

26 A. lani'gera (Cunning. in Field's new south wales, p. 345.) shrub villous; phyllodia lanceolate, acute, stiff, nerved, falcate, ending in a pungent mucrone; heads of flowers twin, axillary; upper part of branches and legume very woolly. ♄. G. Native of New Holland, frequent on rocky barren ranges in the interior of the country. Hook. bot. mag. 2922.

Wool-bearing Acacia. Fl. Mar. May. Clt. 1824. Sh. 6 to 8 ft.

27 A. rìgens (Cunningh. mss. in Loud. hort. brit. p. 406.) stipulas almost wanting or deciduous; phyllodia filiform, compressed, ending in an oblique, callous mucrone at the apex, 3-nerved at the base, and furnished with a gland-bearing tooth on the upper margin at the base; branches straight, angular, pubescent; heads axillary, solitary; peduncles clothed with rufous scales, much shorter than the phyllodia. ♄. G. Native of New Holland. Phyllodia 3-4 inches long.

Stiff Acacia. Fl. Mar. June. Clt. 1824. Shrub 4 to 6 feet.

28 A. linea'ta (Cunningh. mss.) stipulas wanting or deciduous; phyllodia linear, ending in an oblique, callous mucrone at the apex, glandless, 1-nerved, the nerve parallel with the superior margin, and contiguous to it; phyllodia as well as the branches hairy; heads of flowers usually twin; peduncles filiform, longer than the phyllodia. ♄. G. Native of New Holland. Phyllodia ½ an inch long.

Lined-leaved Acacia. Fl. Mar. May. Clt. 1824. Sh. 4 to 6 ft.

29 A. hispi'dula (Willd. spec. 4. p. 1054.) stipulas small, deciduous; phyllodia oblong, 1-nerved, with both the nerve and margins denticulately hispid; heads of flowers solitary. ♄. G. Native of New Holland, on the eastern coast. Lodd. bot. cab. 836. Mimòsa hispídula, Smith, new holl. t. 16. Calyx 4-toothed. Petals 4. Legume oval-oblong, 2-seeded.

Hispid Acacia. Fl. April, May. Clt. 1794. Sh. 2 to 4 ft.

30 A. cochlea'ris (Wendl. diss. no. 7.) stipulas almost wanting; phyllodia linear-lanceolate, many-nerved at the base, rather pilose, quite entire, mucronate; heads solitary. ♄. G. Native of New Holland, in Van Leuwin's Land. Mimòsa cochleàris, Lab. nov. holl. 2. p. 85. t. 234. Calyx 5-parted. Legume linear-oblong, straightish, 4-8-seeded, somewhat contracted between the seeds.

Spoon-leaved Acacia. Fl. April, Ju. Clt. 1818. Sh. 4 to 6 ft.

31 A. coria'cea (D. C. legum. mem. xii. prod. 2. p. 451.) stipulas wanting; phyllodia very long and linear, quite entire, nerveless, thick, and coriaceous, when young they are clothed with adpressed, velvety down, but in the adult state they are glabrous; heads of flowers solitary; branches terete. ♄. G. Native of New Holland, on the eastern coast. Legume linear, curved into a circle, when young clothed with cinereous down. The down on the leaves is at first yellowish, but at length becomes cinereous.

Coriaceous-leaved Acacia. Fl. May, June. Clt. 1824. Sh. 4 to 6 feet.

32 A. a'nceps (D. C. legum. mem. xii. prod. 2. p. 451.) stipulas wanting; phyllodia obovate-oblong, tapering to the base, obtuse at the apex, quite entire, and with 1 nerve in the middle; heads of flowers solitary; branches angularly 2-edged. ♄. G. Native of New Holland, on the east coast.

Two-edged-branched Acacia. Fl. April, June. Clt. 1820. Shrub 4 to 6 feet.

33 A. Ma'ngium (Willd. spec. 4. p. 1053.) stipulas almost wanting; phyllodia ovate, acute, attenuated at the base; longitudinal nerve parallel to the lower margin of the leaf, and sending out oblique nerves on the upper side; heads of flowers usually solitary; branches triquetrously-angular. ♄. S. Native of the Moluccas, where it is called *Mangi Gocnong*. Mángium montànum, Rumph. amb. 3. p. 123. t. 81.

Mangium Acacia. Clt. 1820. Tree 10 to 20 feet.

34 A. laurifòlia (Willd. spec. 4. p. 1053.) stipulas almost wanting; phyllodia obliquely ovate-oblong, 7-8-nerved, emarginate at the apex, and oblique at the base; heads of flowers globose, usually solitary; branches hardly angular; legumes falcate. ♄. G. Native of the Friendly Islands and the Hebrides, as well as of New Caledonia. Labill. nov. cal. p. 68. t. 68. Mimòsa simplicifòlia, Lin. suppl. 436. Mimòsa Mángium, Forst. prod. no. 395. Legume moniliform.

Laurel-leaved Acacia. Clt. 1775. Tree 20 to 25 feet.

35 A. trinerva'ta (Sieb. l. c. no. 445.) stipulas almost wanting; phyllodia linear, mucronate, smoothish, with 3 nerves running the whole length without any gland on the side, twice the length of the peduncles; heads of flowers sometimes solitary, sometimes disposed in short racemes on long pedicels. ♄. G. Native of New Holland. Phyllodia nearly like those of the preceding species, but 1½ inch long, and ending in a long oblique mucrone. Branches and phyllodia rather pilose at the top. This is an ambiguous species, apparently joining the present division of the genus to the following.

Three-nerved Acacia. Fl. Apr. Ju. Clt. 1820. Sh. 4 to 6 ft.

36 A. elonga'ta (Sieb. pl. exsic. nov. holl. no. 443.) stipulas almost wanting; phyllodia linear-falcate, 3-nerved, ending in a callous mucrone, bearing 1 gland on the upper margin at the base; branches angular, glabrous, as well as the phyllodia; heads of flowers solitary, twin, or tern; peduncles canescent, much shorter than the phyllodia. ♄. G. Native of New South Wales. A. hebecéphala, Cunningh. mss. in Lodd. hort. brit. p. 406. Branches angular, drooping. Phyllodia 3 inches long and 1 line broad. Corolla 5-cleft.

Elongated-leaved Acacia. Fl. March, May. Clt. 1817. Sh. 6 to 10 feet.

37 A. vernici'flua (Cunning. in Field's new south wales, p. 344.) phyllodia linear-lanceolate, 2-nerved, falcate, attenuated at the base; heads of flowers globose, axillary, twin; young branches viscid. ♄. G. Native of New Holland, on rocky hills near Cox's River, &c.

Varnish-flowing Acacia. Fl. March, May. Clt. 1817. Sh. 4 to 6 feet.

38 A. calamifòlia (Sweet, in Colv. cat. ed. 2. and bot. reg. 839.) stipulas almost wanting; phyllodia filiform, compressed, spreading, ending in an incurved mucrone at the apex, glabrous as well as the branches; peduncles solitary, much shorter than the phyllodia. ♄. G. Native of New Holland, in the interior of the country. A. uncinàta, Lodd. bot. cab. t. 909. Sieb. pl. exsic. no. 522. The legume is said to be articulated, arched, and compressed.

Reed-leaved Acacia. Fl. May, June. Clt. 1823. Sh. 3 to 4 ft.

39 A. quadrilatera'lis (D. C. prod. 2. p. 451.) stipulas almost wanting; phyllodia filiform, tetragonal, straight, ending in a straight mucrone, without any gland on the side, glabrous as well as the branches, and with a slight nerve on both the lower and upper side; heads of flowers sometimes solitary and sometimes racemose. ♄. G. Native of New Holland. A. calamifòlia, Sieb. pl. exsic. nov. holl. no. 442. A. àrida, Cunningh. mss. This appears to be an intermediate species between the first division of the genus *Capitàtæ*, and the second division *Capitàto-racemòsæ*. Very like *A. calamifòlia.*

Four-sided-leaved Acacia. Fl. April, June. Clt. 1820. Sh. 3 to 4 feet.

40 A. Cunningha'mi; leaves linear, falcate, mucronate, 2-3-nerved, scattered, twice the length of the peduncles; heads of flowers axillary, solitary; legume very narrow, elongated. ♄. G. Native of New Holland, at Spring-wood. A. taxifòlia; Cunning. in Field's new south wales, p. 344. Lodd. bot. cab. 1225. but not of Willd.

Cunningham's Acacia. Fl. Apr. Ju. Clt. 1823. Sh. 10 to 12 ft.

41 A. undulæfòlia (Cunning. mss. Loud. hort. brit. p. 407.) stipulas almost wanting; phyllodia obliquely ovate, undulated, and marginated, 1-nerved, glabrous, ending in a hooked or twisted point, bearing an obsolete gland on the upper margin at the base; branches terete, hairy; heads of flowers axillary, solitary; peduncles beset with adpressed pili, longer than the phyllodia. ♄. G. Native of New South Wales. Lodd. bot. cab. 1544. Phyllodia an inch long. The heads of flowers being so numerous, appear like a raceme at the tops of the branches.

Waved-leaved Acacia. Fl. Apr. Ju. Clt. 1824. Sh. 3 to 4 ft.

42 A. cy'clops (Cunning. mss. Loud. hort. brit. 407.) stipulas almost wanting; phyllodia oblong-lanceolate, obtuse, ending in an oblique callous mucrone, but attenuated at the base, 3-7-nerved, having one gland in front on the upper margin; heads of flowers solitary, axillary, few; peduncles shorter than the phyllodia. ♄. G. Native of New Holland, on the south-west coast.

Circle-eye-seeded Acacia. Fl. April, June. Clt. 1824. Sh. 4 to 6 feet.

43 A. brunioìdes (Cunning. mss.) phyllodia disposed in something like whorles, they are crowded and very short, compressed, subulate, and mucronate; branches rather hairy; heads of flowers solitary; peduncles twice the length of the phyllodia. ♄. G. Native of New South Wales. Phyllodia 2 lines long.

Brunia-like Acacia. Shrub 2 to 4 feet.

44 A. graveolens (Cunning. mss. Loud. hort. brit. 407. Lodd. bot. cab. 1460.) stipulas almost wanting; phyllodia lanceolate, tapering at both ends, shining, 2-nerved, furnished with a gland on the upper margin at the base, and are, as well as the young branches, clammy; heads of flowers usually twin, axillary; peduncles much shorter than the phyllodia; branches erect. ♄. G. Native of New South Wales. Heads of flowers somewhat secund.

Strong-scented Acacia. Fl. April, June. Clt. 1820. Shrub 6 to 10 feet.

45 A. runcifórmis (Cunningh. mss.) young branches slightly pubescent; phyllodia rather clammy, linear-lanceolate, somewhat falcate, ending in a stiff hooked mucrone, having one longitudinal nerve, which is parallel to the superior margin, and contiguous to it; heads of flowers axillary, usually twin, on short peduncles. ♄. G. Native of New South Wales. Phyllodia half an inch long, bearing one gland on the upper margin at the base. Very like A. ornithóphora of Sweet.

Hedge-bill-formed-leaved Acacia. Shrub 5 to 6 feet.

§ 2. *Capitàto-racemòsæ. Flowers collected into globose heads, the heads disposed in racemes along the axillary peduncles. Stipulas of all nearly obsolete, or when present they are unarmed.*

46 A. falca'ta (Willd. spec. 4. p. 1053.) phyllodia oblong, falcate, tapering much at the base, acute, 1-nerved, and feather-veined, glandless; the longitudinal nerve parallel to the upper margin, and contiguous to it; heads of flowers racemose, rarely solitary. ♄. G. Native of New Holland, on the eastern coast. Wendl. diss. no. 11. t. 14. A. oblíqua, Desv. journ. bot. 1814. p. 67. Mimòsa falcàta, Pers. ench. 2. p. 261. Calyx 5-parted. There are two varieties of this species; one with very acute leaves, and the heads of flowers in racemes, and another with bluntish leaves, and the heads of flowers usually solitary.

Falcate-leaved Acacia. Fl. May, June. Clt. 1790. Shrub 4 to 8 feet.

47 A. falcifórmis (D. C. prod. 2. p. 452.) phyllodia oblong, falcate, much attenuated at the base, but bluntish at the apex, with a longitudinal nerve in the middle, as well as being finely feather-nerved, bearing one gland in front on the upper margin. ♄. G. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 616. Phyllodia 5-6 inches long, and 8-9 lines broad. Heads of flowers racemose. Legume stipitate, flat, rather glaucous, 2 inches long, and 8-10 lines broad.

Falciform-leaved Acacia. Fl. April, June. Clt. 1818. Shrub 4 to 8 feet.

48 A. spiro'lobus (Labill. cal. p. 69. t. 69.) unarmed; phyllodia lanceolate, falcate, obtuse, 3-nerved, tapering to both ends; heads of flowers twin, in racemes; legumes cochleately-orbicular. ♄. G. Native of New Caledonia. Racemes shorter than the phyllodia.

Spire-podded Acacia. Shrub 8 feet.

49 A. pennine'rvis (Sieb. pl. exsic. nov. holl. no. 458.) phyllodia oblong, acuminated at both ends, straight, with one longitudinal nerve in the middle, having feathered veins running from it, and furnished with one gland in front at the base. ♄. G. Native of New Holland. A. imprèssa, Cunningh. mss. Lindl. bot. reg. 1115. Lodd. bot. cab. 1319. Hook. bot. mag. 2754. Phyllodia 2-3 inches long, and 5-6 lines broad, pale. The feathered veins rise from the base of the phyllodia, both in this and the preceding species, growing obliquely from the gland. Heads of flowers about the size of a pea, racemose.

Feather-nerved-leaved Acacia. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

50 A. pe'ndula (Cunningh. mss. Loud. hort. brit. 490.) aspect greyish; phyllodia linear-lanceolate, rather arcuate, attenuated at both ends, ending in a somewhat hooked mucrone, having one gland in front at the base, and 2-3 longitudinal nerves; heads of flowers racemose; branches slender, pendulous. ♄. G.

Native of New South Wales. Phyllodia 3 inches long, and 3 lines broad. Habit of *Sàlix Babylónica* or *Weeping-willow*.

Drooping-branched Acacia. Fl. April. Clt. 1824. Shrub 6 to 10 feet.

51 A. MELANÓXYLON (R. Br. in hort. kew. 5. p. 462.) phyllodia lanceolate-oblong, rather falcate, obtuse, quite entire, many nerved; heads of flowers very few, disposed in a kind of raceme. ♄. G. Native of New Holland, on the south coast, and of Van Diemen's Land. Sims, bot. mag. 1659. Wendl. diss. no. 14. t. 6. A. arcuàta, Sieb. pl. exsic. nov. holl. no. 459. Legume linear, arched, length of phyllodia. Umbilical funicle coloured, plicate, girding the seed.

Black-wooded Acacia. Fl. April, June. Clt. 1808. Shrub 6 to 10 feet.

52 A. HETEROPHY'LLA (Willd. spec. 4. p. 1054.) phyllodia linear, attenuated at both ends, rather falcate, many nerved; there are also sometimes bipinnate leaves at the tops of the branches; heads of flowers disposed in a kind of raceme. ♄. S. Native of the island of Bourbon. Mimòsa heterophylla, Lam. dict. 1. p. 14. exclusive of var. β. Heads 2 or 3 in each raceme.

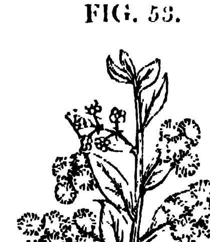
Variable-leaved Acacia. Clt. 1824. Tree.

53 A. AMŒNA (Wendl. diss. no. 8. t. 4.) phyllodia oblong, tapering much at the base, 1-nerved, bearing 1-3 glands in front on the upper margin; heads of flowers racemose; flowers 5-cleft. ♄. G. Native of New Holland. Very like the following species, but differs in the racemes being one-half shorter than the phyllodia. Petals 5, distinct. Ovary tomentose. The plant under this name in Sieb. pl. exsic. nov. holl. no. 452. differs from Wendland's in the phyllodia being scarcely margined, and only furnished with one gland in front on the upper margin, although perhaps the same.

Pleasing Acacia. Fl. April, June. Clt. 1820. Shrub 4 to 6 ft.

54 A. MYRTIFÒLIA (Willd. spec. 4. p. 1054.) phyllodia oblong-lanceolate, tapering much at the base, 1-nerved, and furnished with one gland in front on the upper margin; heads few-flowered, racemose; flowers 4-cleft. ♄. G. Native of New Holland, on the eastern coast. Sweet, austr. t. 49. Mimòsa myrtifòlia, Smith, new holl. t. 15. Curt. bot. mag. 302. Calyx sinuately 4-toothed. Petals connected at the base. Ovary glabrous. Perhaps not sufficiently distinct from A. lunàta of Lodd. bot. cab. 324.

FIG. 53.



Myrtle-leaved Acacia. Fl. Feb. May. Clt. 1789. Shrub 3 to 6 ft.

55 A. OLEIFÒLIA (Cunningh. mss. Loud. hort. brit. 407.) stipulas small, caducous; phyllodia ovate-oblong, oblique, marginated, falcate at the apex, mucronate, and are, as well as the branches, pubescent; heads solitary, axillary, length of the phyllodia. ♄. G. Native of New South Wales. A. uncinàta, Lindl. bot. reg. 1332.

Olive-leaved Acacia. Fl. June, July. Clt. 1824. Sh. 4 to 6 ft.

56 A. PODALYRIÆFÒLIA (Cunningh. mss. Loud. hort. brit. p. 407.) plant clothed with hoary powder; phyllodia elliptic, obtuse, rather undulated, 1-nerved, ending in an oblique mucrone; heads of flowers racemose, axillary, elongated. ♄. G. Native of New South Wales. Phyllodia 1 inch long, and ½ inch broad. Peduncles forming panicles at the tops of the branches.

Podalyria-leaved Acacia. Fl. March, May. Clt. 1824. Sh. 4 to 6 feet.

57 A. SCAPULIFÓRMIS (Cunningh. mss.) aspect white; phyllodia roundly triangular or obliquely obovate, mucronate at the apex, with an angle on the upper margin above the middle, wherein one gland is seated, having only one nerve, which is curved; heads of flowers disposed in axillary and terminal racemes, crowded. ♄. G. Native of New South Wales. A. papulifórmis, Loud. hort. brit. 407. Phyllodia ½ inch long, and 4 lines broad.

Scapula-formed-leaved Acacia. Shrub 4 to 6 feet.

58 A. VESTÌTA (Ker. bot. reg. t. 698.) phyllodia obliquely elliptic-lanceolate, 1-nerved, ending in an awn-like mucrone, and are, as well as the branches, hispid; heads of flowers loosely racemose along the peduncles, upper ones solitary. ♄. G. Native of New Holland, in the interior of the country. A. conspícua, Cunningh. mss. Racemes longer than the phyllodia. Petals 5.

Clothed Acacia. Fl. April, July. Clt. 1820. Sh. 4 to 6 feet.

59 A. MARGINA'TA (R. Br. in hort. kew. 5. p. 462.) phyllodia lanceolate, elongated, 1-nerved, bearing one gland on the upper margin in front; heads few-flowered, racemose; flowers 4-cleft. ♄. G. Native of New Holland, on the western coast. This species has much the appearance of *A. myrtifòlia*, but the ovary is tomentose. Wendl. diss. 1. t. 5. A.

Marginated-leaved Acacia. Fl. April, June. Clt. 1803. Sh. 3 to 6 feet.

60 A. FURFURA'CEA; glaucescent; leaves elliptic or ovate, glabrous, oblique, ending in an innocuous mucrone, bearing a gland on the upper margin; racemes erect, axillary; legumes covered with white furfuraceous powder. ♄. G. Native of New Holland, on hills on Gugee-gong river, 50 miles from Bathurst. A. dealbàta, Cunningh. in Field's new south wales, p. 345. but not of Link. A slender shrub.

Scurfy Acacia. Fl. April, June. Clt. 1824. Sh. 2 to 4 feet.

61 A. UMBRO'SA (Cunningh. mss. Loud. hort. brit. p. 407.) phyllodia obliquely ovate-lanceolate, tapering at both ends, smooth, 3-nerved, with the nerves to one side, acute at the apex, and ending in a hooked mucrone, and bearing a gland on the upper margin not far from the base; heads of flowers racemose; racemes shorter than the phyllodia. ♄. G. Native of New South Wales. Phyllodia 4 inches long, and 1 inch broad.

Shady Acacia. Fl. March, May. Clt. 1824. Sh. 4 to 6 feet.

62 A. ASTRÍNGENS (Cunningh. mss.) phyllodia glaucescent, broad, obliquely ovate-oblong, obtuse, somewhat arcuate, and marginated, feather-nerved, smooth, furnished with one gland on the upper margin at the base; heads of flowers racemose. ♄. G. Native of New South Wales. Phyllodia 3-4 inches long, and 1 inch broad.

Astringent Acacia. Shrub 6 to 10 feet.

63 A. PYRIFO'LIA (D. C. legum. mem. xii. prod. 2. p. 452.) stipulas hard, permanent; phyllodia broad, oval, ending in a pungent mucrone, furnished with a middle nerve, as well as with feathered and reticulated veins, quite entire, and are, as well as the branches, glaucescent; heads numerous, racemose; flowers 5-cleft. ♄. G. Native of New Holland, on the eastern coast.

Pear-leaved Acacia. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

64 A. BINERVA'TA (D. C. prod. 2. p. 452.) phyllodia oblong, acuminated at both ends, and furnished with a gland on the upper margin at the base, and with 2 nerves, which run the whole length of the phyllodia; heads of flowers racemose; racemes shorter than the phyllodia. ♄. G. Native of New Holland. Sieb. pl. exsic. nov. holl. 504.

Two-nerved-leaved Acacia. Fl. April, June. Clt. 1824. Sh. 4 to 8 feet.

65 A. BIVENÒSA (D. C. legum. mem. xii. prod. 2. p. 452.) phyllodia oblong, obtuse, rather attenuated at the base, quite entire, glaucous, smoothish, furnished with 2 fine nerves at the

base; heads of flowers disposed in loose racemes; racemes rather longer than the phyllodia; flowers 5-cleft. ♄. G. Native of New Holland, on the eastern coast. Heads of flowers on long pedicels.

Two-veined-leaved Acacia. Fl. April, June. Clt. 1824. Sh. 2 to 3 feet.

66 A. cultrifórmis (Cunningh. mss.) branches smooth, angular; phyllodia cultriform, ending in an acute hooked mucrone, which leans to one side, and furnished with a gland on the middle of the upper margin, 1-nerved, the nerve nearly parallel with the lower margin; heads crowded, disposed in racemes, which are either axillary or terminal. ♄. G. Native of New South Wales. Phyllodia 8-10 lines long, and 4 lines broad.

Cultriform-leaved Acacia. Shrub 4 to 6 feet.

67 A. próminens (Cunningh. mss. Loud. hort. brit. 407.) phyllodia divaricate, retrorsely falcate, linear-lanceolate, acute, 1-nerved, ending in a hooked mucrone, with a rather prominent gland on the upper margin at the base; heads of flowers in terminal and axillary racemes. ♄. G. Native of New South Wales. Phyllodia 1½ inch long, and 1½ line broad.

Prominent Acacia. Fl. Feb. June. Clt. 1824. Sh. 4 to 6 feet.

68 A. fimbria'ta (Cunningh. mss.) phyllodia straight, linear, obtuse, mucronulate, 1-nerved in the middle, and furnished with one gland on the upper margin at the base; branches angular, the angles fringed, as well as the phyllodia; heads of flowers racemose, axillary. ♄. G. Native of New South Wales. Phyllodia 1½ inch long, and 2 lines broad.

Fringed Acacia. Shrub 4 to 6 feet.

69 A. luna'ta (Sieb. pl. exsic. nov. holl. no. 461.) phyllodia obliquely oblong, rather falcate, narrowed at the base, terminating in an oblique callous mucrone, convex beneath the middle on the margin, and furnished with a minute gland in the convex part, and are glabrous, as well as the branches; heads of flowers disposed in racemes, which are longer than the phyllodia. ♄. G. Native of New Holland. Phyllodia an inch long, and 3 lines broad, almost veinless, with a lateral nerve running along the straight side. ♄. G. Native of New Holland. Lindl. bot. reg. 1352. Lodd. bot. cab. 384. Sweet, fl. austr. t. 42.

Lunate-leaved Acacia. Fl. April, May. Clt. 1810. Shrub 2 to 4 feet.

70 A. brevifòlia (Lodd. bot. cab. 1235.) phyllodia elliptic, ending in a spine-like mucrone, 1-nerved, and feather-nerved, glaucous, glabrous, with a gland on one side; branches angular, smooth; heads of flowers racemose, longer than the phyllodia. ♄. G. Native of New South Wales.

Short-leaved Acacia. Fl. April, June. Clt. 1820. Shrub 3 to 4 feet.

71 A. obtusa'ta (Sieb. pl. exsic. nov. holl. no. 441.) phyllodia oblong-cuneated, obtuse, attenuated at the base, 1-nerved, entire, and glandless, coriaceous, and are, as well as the branches, glabrous; heads of flowers disposed in racemes, which are shorter than the phyllodia; flowers 5-cleft. ♄. G. Native of New Holland. Phyllodia 20 lines long, and 3-4 lines broad.

Blunted-leaved Acacia. Fl. Ap. Ju. Clt. 1824. Sh. 4 to 6 ft.

72 A. buxifòlia (Cunningh. in Field's new south wales, p. 344.) glabrous; phyllodia ovate, acute, bearing a gland on the upper margin; heads of flowers axillary, twice the length of the phyllodia. ♄. G. Native of New Holland, in pine ranges at Macquarie river. A. confèrta, Cunningh. mss.

Box-leaved Acacia. Fl. Feb. Ju. Clt. 1824. Sh. 4 to 6 feet.

73 A. crassiu'scula (Wendl. diss. no. 20. t. 8.) phyllodia linear, 1-nerved, thickish, quite entire, attenuated at the base, rounded at the apex, and ending in an inflexed mucrone; heads of flowers usually 3 in a raceme; flowers 5-cleft. ♄. G. Native of New Holland, on the east coast. Sieb. pl. exsic. nov. holl. no. 464.

Thickish-leaved Acacia. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

74 A. suave'olens (Willd. spec. 4. p. 1050.) phyllodia linear, tapering a little at the base, acute, mucronulate, 1-nerved, quite entire; heads of flowers racemose; calyx 5-parted; ovary glabrous. ♄. G. Native of New Holland, on the east coast. Mimòsa suaveòlens, Smith in Lin. soc. trans. 1. p. 253. Labill. nov. holl. 2. t. 236. Lodd. bot. cab. 730. Legume oblong, glaucous from grey powder, 15 lines long, and 5 lines broad.

Var. β, platycárpa (D. C. prod. 2. p. 453.) legumes nearly twice the length of the breadth, especially 15 lines long, and 9 lines broad. Mimòsa ambígua, Salisb. prod. 325.

Sweet-scented Acacia. Fl. Feb. June. Clt. 1790. Sh. 4 to 8 ft.

75 A. angustifo'lia (Wendl. diss. no. 22.) phyllodia linear, tapering a little to the base, acute, mucronate, 1-nerved, quite entire; heads of flowers racemose; calyx 4-toothed; ovary tomentose. ♄. G. Native of New Holland, about Port Jackson. Lodd. bot. cab. 768. Mimòsa angustifòlia, Jacq. schœnbr. 3. t. [illegible]. A. odoràta, Desv. Very like the preceding species, but differs in the fructification.

Narrow-leaved Acacia. Fl. April, May. [illegible] 1816. Shrub 3 to 6 feet.

76 A. adu'nca (Cunningh. mss.) phyllodia straight, elongated, linear, attenuated at the base, but rounded at the apex, ending in a callous mucrone, which forms a right angle with the phyllodia, 1-nerved, and bearing a gland on the upper margin between the middle and the base; heads of flowers crowded, disposed in terminal and axillary racemes. ♄. G. Native of New South Wales.

Hooked Acacia. Shrub 3 to 6 feet.

77 A. linifo'lia (Willd. spec. 4. p. 1051.) phyllodia narrow, linear, mucronate. 1-nerved, quite entire; heads of flowers racemose; racemes length of the phyllodia; calyx sinuately 5-toothed; ovary glabrous. ♄. G. Native of New Holland, on the east coast. Mimòsa linifòlia, Vent. cels. t. 2. Andr. bot. rep. 394. Mimòsa lineàris, Wendl. hort. herrench. t. 18. Sims, bot. mag. t. 2168. Bonpl. nav. t. 19.

Flax-leaved Acacia. Fl. May, June. Clt. 1790. Sh. 3 to 4 ft.

78 A. abietìna (Willd. spec. 4. p. 1051.) phyllodia narrow, linear, mucronate, 1-nerved, quite entire; heads of flowers racemose; racemes longer than the phyllodia. ♄. G. Native of New Holland. Perhaps this is merely a variety of the preceding species.

Fir-like Acacia. Fl. April, June. Clt. 1823. Sh. 3 to 6 ft.

79 A. subula'ta (Bonpl. nav. t. 45.) phyllodia very long and linear, subulate and mucronate at the apex; heads of flowers racemose; racemes one-half shorter than the phyllodia; calyx 5-cleft; ovary tomentose. ♄. G. Native of New Holland. Wendl. diss. no. 25.

Subulate-leaved Acacia. Fl. April, June. Clt. 1824. Shrub 3 to 6 feet.

80 A. ru'bida (Cunningh. in Field's new south wales, p. 344.) phyllodia ovate-lanceolate, ending in an oblique innocuous mucrone at the apex, bearing a gland on the upper margin; racemes small, pedunculate, axillary, and terminal; the rib and margins of the leaves coloured with red. ♄. G. Native of New Holland, frequent on the edge of rills on the blue mountains.

Reddish Acacia. Fl. April, June. Clt. 1823. Sh. 4 to 6 feet.

§ 3. *Spicàtæ* (from *spicatus*, spiked; disposition of flowers). *Flowers disposed in cylindrical spikes. Stipulas usually wanting, or when present they are small and unarmed.*

81 A.? taxifo'lia (Willd. spec. 4. p. 1050.) phyllodia in whorles of threes, lanceolate; spikes axillary, solitary, rather ovate; flowers 4-cleft, tetrandrous. ♄. G. Native of Cochin-

china, on the mountains. Mimòsa stellàta, Lour. coch. p. 651. Mimòsa ternàta, Pers. ench. 2. p. 261.

Yew-leaved Acacia. Clt. 1825. Shrub 8 feet.

82 A. OXYCE'DRUS (Sieb. pl. exsic. nov. holl. no. 457.) stipulas spinose; phyllodia scattered or somewhat verticillate, lanceolate-linear, ending in a pungent point, 3-nerved, glabrous, with nerve-formed glandless margins; spikes axillary, solitary, elongated; flowers 4-cleft. ♄. G. Native of New South Wales. Sweet, fl. austr. 6. Hook. bot. mag. 2928. A. pugionifórmis, Cunning. mss. A. taxifòlia, Lodd. bot. cab. 1225. Branches and rachis of spikes clothed with velvety villi.

Sharp-cedar Acacia. Fl. Ap. Ju. Clt. 1823. Sh. 6 to 10 ft.

83 A. VERTICILLA'TA (Willd. spec. 4. p. 1049.) phyllodia linear, ending in a pungent mucrone, disposed somewhat verticillately; spikes axillary, solitary, oblong; flowers 5-cleft; young legumes pubescent. ♄. G. Native of New Holland, on the south coast, and of Van Diemen's Land. Phyllodia probably tern, the middle one the proper phyllodium, and the lateral ones are probably dilated stipulas, assuming the form of phyllodia.

Var. α, *glàbra* (D. C. prod. 2. p. 453.) branches and peduncles glabrous; phyllodia linear, subulate; legumes very narrow.

Var. β; *ang[illegible]a* (D. C. l. c.) branches and peduncles velvety; phyllodia linear-subulate; legumes very narrow. Mimòsa verticillàta, L'Her. sert. angl. 30. Curt. bot. mag. 110. Vent. malm. t. 63.

Var. γ, *latifòlia* (D. C. l. c. p. 454.) branches and peduncles velvety; phyllodia oblong-obovate or oblong-lanceolate; legumes roundish. Mimòsa ulicifòlia, Salisb. prod. 324. Mimòsa verticillàta, Wendl. coll. 1. t. 30.

Whorled-leaved Acacia. Fl. March, May. Clt. 1780. Shrub 6 to 10 feet.

84 A. RUSCIFO'LIA (Cunningh. mss.) phyllodia lanceolate, ending in a pungent mucrone, somewhat verticillately disposed; spikes axillary, solitary, cylindrical; branches stiff, deflexedly-divaricate. ♄. G. Native of New Holland. Nearly allied to *A. verticillàta*, but differs in the more rigid dwarf habit.

Butcher's-broom-leaved Acacia. Fl. March, May. Clt. 1824. Shrub 2 to 3 feet.

85 A. LINEA'RIS (Sims, bot. mag. t. 2156.) phyllodia narrow-linear, very long, 1-nerved, and quite entire; spikes axillary, numerous, usually branched; calyx sinuately 4-toothed. ♄. S. Native of New Holland. Legume narrow-linear, attenuated at both ends, when young pubescent. Petals 4, distinct.

Var. β, *longíssima* (Wendl. diss. no. 31. t. 11.) phyllodia longer, and more spreading, but not erect. ♄. G. Native of New Holland. Ker. bot. reg. 680. A. lineàris, Lodd. bot. cab. 595. is a plant intermediate between the species and the variety.

Linear-leaved Acacia. Fl. May, June. Clt. 1819. Shrub 3 to 6 feet.

86 A. MUCRONA'TA (Willd. enum. suppl. 68.) phyllodia linear-spatulate, 1-3-nerved, rounded and mucronate at the apex; spikes axillary, solitary or twin, simple; calyx sinuately 4-toothed. ♄. G. Native of New Holland. Wendl. diss. no. 32. t. 12. Sims, bot. mag. 2747. Petals 4, joined at the base. Ovary clothed with white tomentum.

Mucronate-leaved Acacia. Fl. May, June. Clt. 1818. Sh. 3 to 6 feet.

87 A. FLORIBU'NDA (Willd. spec. 4. p. 1051.) phyllodia linear-lanceolate, attenuated at both ends, quite entire, with 3-5 fine nerves; spikes axillary, solitary, simple; calyx sinuately 4-toothed. ♄. G. Native of New Holland, on the east coast. Mimòsa floribúnda, Vent. choix. t. 13. A. longifòlia, Sieb. pl. exsic. nov. holl. no. 440. Petals 4, joined at the base, reflexed at the apex. Ovary rather silky.

Bundle-flowered Acacia. Fl. May, June. Clt. 1796. Shrub 6 to 10 feet.

88 A. HOMOMA'LLA (Wendl. diss. no. 34. t. 13.) phyllodia linear-lanceolate, attenuated at both ends, falcate, 3-nerved, white on both surfaces, but pubescent at the base; spikes twin, but solitary on the peduncles, axillary; calyx 5-toothed. ♄. G. Native of New Holland. Petals 5, joined at the base.

Equal-woolled Acacia. Fl. Ap. Ju. Clt. 1822. Sh. 6 to 8 ft.

89 A. HOLOSERI'CEA (Cunningh. mss.) aspect silky-white: phyllodia oblong-lanceolate, obliquely-cuneated at the base, ending in a soft mucrone at the apex, 3-nerved, and furnished with one gland on the upper margin, spikes axillary, usually twin. ♄. S. Native of New Holland within the tropic. A. heteromálla, Sweet. A. leucophýlla, Sweet. Phyllodia 6 inches long, and 1 inch broad.

Whole-silky Acacia. Fl. May, July. Clt. 1818. Tr. 10 to 20 ft.

90 A. LONGIFÒLIA (Willd. spec. 4. p. 1052.) phyllodia lanceolate, attenuated at both ends, 2-3-nerved at the base, and quite entire, the rest many nerved; spikes axillary, twin, on short peduncles; calyx 4-cleft. ♄. G. Native of New Holland, on the east coast. Mimòsa longifòlia, Andr. bot. rep. 107. Vent. malm. 62. M. macrostàchya, Poir. suppl. 1. p. 61. A. floribúnda, Sieb. pl. exsic. nov. holl. no. 438 and 439. There are varieties of this species with acute and obtuse, narrower (Sims, bot. mag. 1827.) and broader (Sims, bot. mag. 2166.) phyllodia. Petals 4, joined at the base.

Long-leaved Acacia. Fl. March, May. Clt. 1792. Tree 10 to 20 feet.

91 A. DORATO'XYLON (Cunningh. in Field's new south wales, p. 345.) leaves lanceolate-linear, falcate, striated, attenuated at the base; spikes cylindrical, axillary, twin, nearly sessile. ♄. G. Native of New Holland, on pine ridges on the Macquarie river. This is the spearwood of certain tribes in the interior of the country.

Spear-wood Acacia. Fl. March, May. Clt. 1823. Tree 20 ft.

92 A. INTERTE'XTA (Sieb. pl. exsic. nov. holl. no. 453.) phyllodia long-lanceolate, bluntish, straight, attenuated at the base, bearing on the upper margin at the base an inconspicuous gland, 2-nerved, reticulated with anastomosing veins, and are, as well as the branches, glabrous; spikes twin; flowers 4-cleft. ♄. G. Native of New Holland. A. obtusifòlia, Cunningh. in Field's new south wales, p. 345. A. thegonocárpa, Cunningh. mss. in Loud. hort. brit. p. 407. no. 2470. Phyllodia 6 inches long, and half an inch broad. Spikes an inch long.

Interwoven-nerved Acacia. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

93 A. GLAUCE'SCENS (Willd. hort. berol. t. 101.) phyllodia oblong, rather falcate, quite entire, many-nerved, 2 or 3 of the nerves very evident; spikes axillary, solitary, pedunculate; calyx 5-toothed. ♄. G. Native of New Holland. Petals 5, joined at the base, and spreading at the apex.

Glaucescent Acacia. Fl. Feb. Ju. Clt. 1790. Sh. 3 to 6 ft.

94 A. CINERA'SCENS (Sieb. pl. exsic. nov. holl. no. 448.) phyllodia oblong, somewhat falcate, acuminated at both ends, quite entire, many-nerved, 2 or 3 of the nerves very evident; spikes axillary, solitary, pedunculate; flowers 4-cleft. ♄. G. Native of New Holland. Branches angular, and are, as well as rachis of the spikes, clothed with short, velvety, white down. Very nearly allied to *A. Sophòræ*.

Greyish Acacia. Fl. March, May. Clt. 1824. Sh. 4 to 6 ft.

95 A. SOPHO'RÆ (R. Br. in hort. kew. 5. p. 462.) phyllodia obovate-oblong or lanceolate, quite entire, many-nerved, sometimes there are bipinnate leaves at the tops of the branches, young ones and branchlets rather velvety; spikes axillary, usually twin; calyx 4-cleft. ♄. G. Native of New Holland, on the south coast, and at Cape Van Diemen. Mimòsa sophòræ, Labill. nov. holl. 2. t. 237. Legume torose. Umbilical funicle plicate. Petals 4, distinct.

Sophora-podded Acacia. Fl. April, Ju. Clt. 1805. Tr. 20 ft.

Sect. II. Conjuga'to-pinna'tæ. Leaves with one pair of pinnæ, each pinna bearing few or many pairs of leaflets. This is an artificial section, composed of a heterogeneous mass of species, the most part of which are not well known.

96 A. amenta'cea (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 455.) glabrous; spines stipular, straight; pinnæ bearing 2 pairs of oblong leaflets; petiole very short; spikes oblong-cylindrical, axillary, sessile. ♄. S. Native of New Spain. Spikes dense, resembling the aments of a salix. Legumes unknown. Flowers yellow.

Amentaceous Acacia. Tree.

97 A. laxiflo'ra (D. C. prod. 2. p. 455.) unarmed, glabrous; pinnæ bearing 3 pairs of petiolulate oval leaflets; petiole elongated; panicles axillary, loosely branched; heads 1-3-flowered. ♄. S. Native of the island of Timor. Flowers polyandrous. Leaflets 2-3 inches long, and 1½ inch broad. A very distinct species.

Loose-flowered Acacia. Tree.

98 A. coronillæfòlia (Desf. cat. hort. par. ed. 2. p. 207.) glabrous; spines stipular, straight; pinnæ bearing 5-9 pairs of linear, obtuse, rather glaucous leaflets; petiole very short, or hardly any, bearing a sessile gland between the pair of pinnæ. ♄. G. Native of the north of Africa, near Mogodor. Mimòsa Giráffæ, Brouss. in hort. monsp. Mimòsa coronillæfòlia, Pers. ench. no. 44. Heads of flowers ovate, pedunculate. It differs from the following species in the petioles being very short.

Coronilla-leaved Acacia. Clt. 1817. Tree.

99 A. gummífera (Willd. spec. 4. p. 1056.) glabrous; spines stipular, straight; pinnæ bearing 6 pairs of linear obtuse leaflets; petiole bearing a sessile gland between the pair of pinnæ; spikes oblong, axillary; legumes somewhat moniliform, clothed with white tomentum. ♄. G. Native of the north of Africa, near Mogodor. Sássa gummífera, Gmel. syst. Very like *A. Arábica*. Gum-arabic is obtained from this species as well as from many others.

Gum-bearing Acacia. Clt. 1823. Tree.

100 A. strombulífera (Willd. spec. 4. p. 1055.) glabrous; spines stipular, or nearly wanting; pinnæ bearing 4-6 pairs of alternate or opposite, linear, obtuse leaflets, without any gland between the pinnæ; legume terete, spirally twisted. ♄. S. Native of Peru, in woods, where it is vulgarly called *retortuna* from the shape of the pods. Mimòsa strombulífera, Lam. dict. 1. p. 15. Flowers unknown. Legume indehiscent, which character indicates a separate genus.

Strombus-bearing Acacia. Shrub 6 to 8 feet.

101 A. Magdale'næ (Bert. in herb. Balb. D. C. prod. 2. p. 455.) unarmed; stipulas lanceolate, striated, erect; pinnæ bearing 25 pairs of linear, obtuse, smoothish leaflets; petiole pubescent, glandless, much shorter than the pinnæ. ♄. S. Native of St. Martha. Flowers unknown. Legume 2 inches long, thickish, straight, and glabrous, with the valves thick and furrowed on the outside.

Magdalena Acacia. Tree.

102 A. pilòsa (Bert. in herb. Balb. ex D. C. prod. 2. p. 455.) spines nearly axillary, spreading, straight; stipulas lanceolate, striated, erect; pinnæ with 13 pairs of linear obtuse leaflets; petiole very short, glandless, and is, as well as the branches, pilose. ♄. S. Native of Jamaica. Flowers and legumes unknown. This is a very singular species from having stipular spines, and the stipulas existing at the same time.

Pilose Acacia. Clt. 1800. Tree.

103 A. reticula'ta (Willd. enum. 1051.) spines stipular, straight, length of the leaflets; leaves with one or more pairs of pinnæ, each pinna bearing 6-9 pairs of oblong-linear, obtuse, distant leaflets; petiole furnished with a gland at the apex, and terminated by a spine-like mucrone: spikes globose, pedunculate; legumes oval, compressed. ♄. G. Native of the Cape of Good Hope? Mimòsa reticulàta, Lin. mant. 129.—Pluk. alm. t. 123. f. 2. Flowers white.

Reticulated Acacia. Clt. 1816. Tree 10 to 12 feet.

104 A. pulche'lla (R. Br. in hort. kew. 5. p. 264.) smoothish; spines stipular, straight, slender; pinnæ bearing 5-7 pairs of oblong-obovate, obtuse leaflets; petiole short, bearing a pedicellate gland between the pair of pinnæ; heads of flowers solitary. ♄. G. Native of New Holland. Lodd. bot. cab. 212. Flowers yellow. Perhaps the same as *A. pulchélla* of Link, enum. 2. p. 444. but the spines are said to be scattered in it.

Neat Acacia. Fl. April, July. Clt. 1803. Sh. 3 to 5 ft.

105 A. hispidi'ssima (D. C. prod. 2. p. 455.) stem and branches very hispid; spines stipular, straight, slender; pinnæ bearing 5-7 pairs of [illegible] obtuse leaflets; petiole short, bearing a pedicellate gland between [illegible] pair of pinnæ; heads of flowers solitary. ♄. G. Native of New Holland, on the east coast. Very like the preceding species, but it differs from it in the stems, branches, and petioles being beset with long, white stiff hairs. Peduncles glabrous.

Very hispid Acacia. Fl. April, Jul. Clt. 1800. Sh. 3 to 6 ft.

106 A. hæmastòma (Bert. ined. D. C. legum. mem. xii. t. 68. prod. 2. p. 456.) stem glabrous; spines stipular, spreading, straight; pinnæ bearing 4-6 pairs of obovate-elliptic, obtuse, rather pilose leaflets; petiole short, glandless; heads of flowers solitary or twin, somewhat racemose. ♄. S. Native of St. Domingo. Mimòsa spartioìdes, Vahl. ined. in herb. Juss. Peduncles, corolla, and legumes hairy. Stamens purple, 15, or only 13 or 14 from abortion. Legume linear, bluntish, attenuated at the base, straightish. Leaflets 2 lines long. Very like *I'nga purpùrea*, of which it is probably a congener, but differs in there being no pulp in the pods.

Bloody-mouthed Acacia. Shrub 3 to 6 feet.

107 A. deti'nens (Burch, trav. 1. p. 310. cat. no. 1628.) spines stipular, recurved, very short; leaflets obovate; petioles pubescent; flowers capitate; legume oval, flat, membranous, few-seeded. ♄. G. Native of the Cape of Good Hope, where it forms impenetrable masses.

Detaining Acacia. Fl. April, Jul. Clt. 1824. Sh. 3 to 6 ft.

108 A. viridira'mis (Burch. trav. 1. p. 300. cat. no. 1586.) spines stipular, very short, recurved; pinnæ bearing 6-8 pairs of small, oval, approximate leaflets. ♄. G. Native of the Cape of Good Hope, in a place called Carel Krieger's Grave. Branches green, flexuous. Buds white from wool.

Green-branched Acacia. Clt. 1816. Shrub 4 to 5 feet.

109 A. cinera'ria (Willd. spec. 4. p. 1057.) prickles scattered, hooked; pinnæ bearing 8-9 pairs of oblong-linear, equal leaflets. ♄. S. Native of the East Indies. Mimòsa cinerària, Lin. spec. 1500.—Pluk. alm. t. 2. f. 1.

Greyish Acacia. Tree.

110 A. eria'ntha (Desv. journ. bot. 1814. 1. p. 68.) spinose; pinnæ bearing usually about 6 pairs of nearly elliptic, pubescent leaflets; flowers capitate; calyxes quite glabrous, but the corolla is clothed on the outside with silky pili. ♄. S. Native of the East Indies.

Woolly-flowered Acacia. Tree.

111 A. cassioìdes (Willd. enum. 1051.) spines stipular, setaceous; pinnæ bearing 4-6 pairs of lanceolate leaflets, which are acute at both ends, the outer ones the largest. ♄. S. Native country, flowers, and fruit unknown.

Cassia-like Acacia. Clt. 1820. Tree 20 feet.

112 A. di'ptera (Willd. enum. 1051.) spines stipular, very short, subulate; pinnæ bearing 20-24 pairs of linear, obtuse, glabrous leaflets. ♄. S. Native of South America. Flowers

and legumes unknown. Perhaps a species of *Prosòpis*, according to H. B. et Kunth, nov. gen. amer. 6. p. 281.

Two-winged Acacia. Clt. 1818. Tree.

113 A.? SALINA'RUM (D. C. prod. 2. p. 456.) spines solitary, straight, rising from the sides of the buds; pinnæ bearing 19-20 pairs of linear, obtuse leaflets, which are glabrous as well as branches and corollas, with a gland at the top of the petiole, and one between each pair of leaflets; spikes solitary, pedunculate. ♄. S. Native of Jamaica, in salt marshes. Mimòsa salinàrum, Vahl. ecl. amer. 3. p. 35. Stamens 10. Ovary hairy.

Salt-marsh Acacia. Tree.

114 A. STRIGO'SA (Spreng. syst. 3. p. 137.) leaves with 1 pair of pinnæ, each pinna bearing 2 pairs of oblique leaflets, which are pilose beneath; heads of flowers globose; legume strigose. ♄. S. Native of Peru. Mimòsa strigòsa, Pers. ench. 2. p. 263.

Strigose Acacia. Shrub.

115 A. SELLO'I (Spreng. syst. 3. p. 137.) leaves almost sessile, with 1 pair of pinnæ, each pinna bearing about [illegible] pairs of linear, shining leaflets; heads of flowers pedunculate, usually solitary; legumes straight, lanceolate, with thickened margins. ♄. S. Native of Brazil.

Sello's Acacia. Tree.

116 A. FLA'CCIDA (Spreng. syst. 3. p. 137.) branches and petioles elongated and filiform, flaccid, glabrous; stipulas linear; leaves with 1 pair of pinnæ, each pinna bearing 6 pairs of obliquely oblong, nerved, pubescent leaflets; heads of flowers pedunculate. ♄. S. Native of Brazil.

Flaccid-branched Acacia. Shrub.

117 A. INCA'NA (Spreng. syst. 3. p. 137.) branches clothed with flocky down; leaves with 1 pair of pinnæ, each pinna bearing about 20 pairs of oblong, obtuse, nerveless leaflets, which are hoary and lepidoted beneath; heads of flowers twin, pedunculate. ♄. S. Native of Brazil.

Hoary Acacia. Shrub.

118 A. SETÒSA (Spreng. syst. 3. p. 137.) branches hairy; leaves with 1 pair of pinnæ, each pinna bearing many pairs of linear leaflets, which are ciliated with strigæ on the margins. ♄. S. Native of Brazil.

Setose Acacia. Shrub.

SECT. III. SPICIFLORÆ (from *spica*, a spike, and *flos*, a flower; in reference to the disposition of the flower in spikes). Leaves bipinnate, with few or many pairs of pinnæ, each pinna bearing many pairs of leaflets. Flowers disposed in spikes.

* *Unarmed trees or shrubs.*

119 A. CAUDA'TA (D. C. prod. 2. p. 456.) unarmed; leaves with 2-3 pairs of pinnæ, each pinna bearing 7-8 pairs of linear-oblong, very blunt, somewhat emarginate, quite glabrous leaflets, which are oblique at the base, the outer ones largest; petioles glandless; spikes twin, disposed in a terminal raceme. ♄. S. Native of Cayenne. Mimòsa caudàta, Vahl. ecl. amer. 3. p. 35. Petals 5. Stamens 10. Legume unknown.

Tailed Acacia. Tree.

120 A. CYCLOSPE'RMA (D. C. prod. 2. p. 456.) unarmed; leaves with 3 pairs of pinnæ, each pinna bearing 3-4 pairs of ovate-oblong, rather coriaceous leaflets, which are cuneated at the base, and are glabrous as well as the petioles, with a depressed gland between each of the pairs of pinnæ, and also between each of the pairs of leaflets; spikes supra-axillary, solitary; seeds flat, orbicular. ♄. G. Native of New Caledonia. Flowers 5-cleft. Legume 4-5 inches long, compressed.

Circle-seeded Acacia. Tree.

121 A. GRANULO'SA (Labill. cal. p. 67. t. 66.) unarmed; leaves with 5 pairs of pinnæ, each pinna bearing 12 pairs of alternate, obliquely ovate-oblong, obtuse leaflets; spikes axillary, solitary; stamens monadelphous; branches granular. ♄. G. Native of New Caledonia. Legumes moniliform, 6-7-seeded.

Granular-branched Acacia. Shrub 4 to 6 feet.

122 A. FU'LGENS (Labill. cal. p. 68. t. 67.) unarmed; leaves with 2-3 pairs of pinnæ, each pinna bearing 3 pairs of broad, elliptic, obtuse leaflets, which are attenuated at both ends; spikes of flowers length of leaves. ♄. G. Native of New Caledonia.

Shining Acacia. Shrub 12 feet.

123 A. DISTA'CHYA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 456.) unarmed; leaves with 4 pairs of pinnæ, each pinna bearing 3-4 pairs of oval, obtuse leaflets, which are rather villous as well as the petioles; spikes axillary, twin. ♄. S. Native of New Spain. Partial petioles jointed at the base. Corolla 5-parted. Stamens 9? monadelphous at the base. Legume unknown.

Two-spiked Acacia. Tree.

124 A. THIBAUDIA'NA (D. C. prod. 2. p. 456.) unarmed; leaves with 4 pairs of pinnæ, each pinna bearing 7-9 pairs of ovate, somewhat rhomboid leaflets, which are rather oblique at the base, and villous beneath, as well as the petioles, which bear a sessile gland each; legumes compressed, contracted between the seeds. ♄. S. Native of South America, but in what place is unknown. Sophòra oblíqua, Pers. ench. 1. p. 452.

Thibaud's Acacia. Tree.

125 A. ROHRIA'NA (D. C. prod. 2. p. 457.) unarmed; leaves with 4 pairs of pinnæ, each pinna bearing about 10-11 pairs of somewhat trapeziform, obtuse, glabrous leaflets, which are beset with yellow villi on the ribs, with a gland between each of the pairs of leaflets; spikes solitary, pedunculate, axillary, length of leaves. ♄. S. Native of South America. Mimòsa nígricans, Vahl. ecl. amer. 3. p. 37. t. 29. but not of Labill. Plant becoming black on drying.

Rhor's Acacia. Tree.

126 A. NUDIFLO'RA (Willd. spec. 4. p. 1058.) unarmed; leaves with 4-6 pairs of pinnæ, each pinna bearing 12-15 pairs of elliptic, obtuse leaflets, with a depressed gland between each of the pairs of pinnæ; spikes of flowers axillary and lateral, filiform. ♄. S. Native of Porto Rico. Leaves downy beneath as well as the petioles, when young. Legume linear, flat, glabrous.

Naked-flowered Acacia. Tree 20 feet.

127 A. MURICA'TA (Willd. spec. 4. p. 1058.) unarmed; leaves with 5 pairs of pinnæ, each pinna bearing 12-15 pairs of ovate, retuse, rather emarginate leaflets, with a depressed gland between each of the pairs of pinnæ; spikes cylindrical, subulate, aggregate at the tops of the branches; branches warted. ♄. S. Native of the West Indies. Mimòsa muricàta, Lin. spec. 1501. —Plum. ed. Burm. t. 11. Flowers white.

Muricate-branched Acacia. Tree.

128 A. ROSTRA'TA (Humb. et Bonpl. in Willd. spec. 4. p. 1060.) unarmed; leaves with 6 pairs of pinnæ, each pinna bearing numerous pairs of linear, glabrous leaflets; petioles pilose, bearing an urceolar gland at the base; spikes axillary. ♄. S. Native of South America. Mimòsa ignàvi, H. B. et Kunth, nov. gen. amer. 6. p. 259. Flowers unknown. Legume linear, beaked at the apex.

Beaked-podded Acacia. Tree.

129 A. CALLO'SA (Spreng. syst. 3. p. 138.) branches beset with callous warts: petioles pubescent, bearing a gland at the base; leaves with 7 pairs of pinnæ, each pinna bearing many pairs of linear, shining leaflets; spikes disposed in panicles. ♄. S. Native of Brazil.

Callous-warted Acacia. Tree or shrub.

130 A. ARENO'SA (Willd. l. c.) unarmed; leaves with 6 pairs of pinnæ; each pinna bearing 16 pairs of linear, acute, ciliated leaflets; petioles pubescent, bearing a gland between each of

the pairs of pinnæ; spikes twin, filiform. ♄. S. Native of Caraccas, on the sandy banks of rivers.

Sand Acacia. Clt. 1818. Tree 10 to 12 feet.

131 A. lophanthoìdes (D. C. prod. 2. p. 457.) unarmed; leaves with 8-9 pairs of pinnæ, each pinna bearing 12 pairs of oval-oblong, obtuse leaflets; petioles glandless, and are as well as the branchlets pubescent; racemes usually twin, short, axillary; calyxes glabrous. ♄. S. Native of Jamaica. Flowers and habit of the following species. Legumes unknown.

Lophantha-like Acacia. Clt. 1820. Tree.

132 A. lopha'ntha (Willd. spec. 4. p. 1070.) unarmed; leaves with 8-10 pairs of pinnæ, each pinna bearing 25-30 pairs of linear, bluntish leaflets; petioles and calyxes clothed with velvety down, with a gland at the base of the common petiole, and one between each of the two extreme pairs of leaflets; racemes ovate-oblong, axillary, twin. ♄. G. Native of New Holland. Sims, bot. mag. 2108. Mimòsa distàchya, Vent. cels. t. 20. but not of Cav. Mimòsa élegans, Andr. bot. rep. t. 563. A. lophántha, Lodd. bot. cab. 716. This and the preceding species would almost constitute a proper section from the flowers. Perhaps *A. insignis* of Hoffmans. verz. 1824. p. 159. is not distinct from the present species. Flowers yellow.

Crest-flowered Acacia. Fl. May, Jul. Clt. 1803. Sh. 6 to 10 ft.

133 A. Guiane'nsis (Willd. spec. 4. p. 1061.) unarmed; leaves with 10 pairs of pinnæ, each pinna bearing 10 pairs of elliptic, obtuse, glabrous leaflets; petiole rather velvety, furnished with a convex gland at the base; spikes filiform, solitary, axillary. ♄. S. Native of Guiana and Cayenne. Legume lanceolate, flat. Mimòsa Guianénsis, Aubl. guian. 2. t. 357. Flowers small, glabrous, white.

Guiana Acacia. Clt. 1803. Tree 40 feet.

134 A. psilosta'chya (D. C. prod. 2. p. 457.) unarmed; leaves with 7-10 pairs of pinnæ, each pinna bearing 15-20 pairs of oblong-linear, obtuse, glabrous leaflets, which are truncate at the base, with an adpressed gland at the base of the petiole, and one between the extreme pair of pinnæ; spikes filiform, slender, solitary, axillary. ♄. S. Native of French Guiana. Flowers small, as in the preceding, but pubescent.

Smooth-spiked Acacia. Tree.

135 A. Acapulce'nsis (Kunth, mim. 78. t. 24. nov. gen. amer. 6. p. 267.) unarmed; leaves with 8-9 pairs of pinnæ, each pinna bearing 35-45 pairs of oblong-linear, glabrous leaflets, with a gland between 2 or 3 of the extreme pairs of pinnæ, and one at the base of the petiole; spikes cylindrical, axillary, solitary, twin, or tern. ♄. S. Native of Mexico, about Acapulco, in the sand by the sea-side. Flowers white. Stamens numerous, monadelphous. Legumes unknown.

Acapulco Acacia. Clt. 1825. Tree.

136 A. elephanthorhi'za (Burch. cat. geogr. no. 2410.) unarmed; leaves with 10-12 pairs of pinnæ, each pinna bearing 25 pairs of linear, glabrous leaflets; petioles glandless; branches and flowers glabrous; spikes axillary, cylindrical, solitary. ♄. G. Native of the Cape of Good Hope. Petals 15. Stamens 10. Perhaps a species of *Prosòpis*.

Elephant-root Acacia. Clt. 1818. Shrub.

137 A. scleróxyla (Tussac. fl. antil. t. 21.) unarmed; leaves with 10-15 pairs of pinnæ, each pinna bearing an indefinite number of leaflets, with an urceolar gland below the lower pair of pinnæ; spikes filiform, solitary; branches warted. ♄. S. Native of the French West India Islands, where it is called *Tendre à caillou batard*, with many other species.

Hard-wooded Acacia. Tree 60 feet.

138 A. pulche'rrima (Willd. spec. 4. p. 1061.) unarmed; leaves with 13 pairs of pinnæ; each pinna bearing numerous pairs of oblong-linear, obtuse leaflets, which are pubescent beneath as well as the petioles, and with a convex gland at the base of the petiole; spikes of flowers axillary, twin, filiform. ♄. S. Native of Para, in Brazil. Flowers pilose, 5-cleft.

Fairest Acacia. Clt. 1823. Tree 50 feet.

139 A. dumeto'rum (D. C. prod. 2. p. 458.) stem furnished with a few prickles; branches sulcate, pubescent; leaves bipinnate, each pinna bearing many pairs of minute, linear-elliptic leaflets, which are glandularly dotted beneath; spikes axillary, twin, slender; corolla profoundly 5-cleft; stamens free; ovary villous. ♄. S. Native of Brazil, in the province of Minas Novas. Mimòsa dumetòrum, St. Hil. pl. rem. bras. 1. p. 1. Legume unknown.

Bush Acacia. Shrub 1 to 2 feet.

140 A. adstríngens (Mart. reis. bras. ex Schlecht. Linnæa. 5. p. 41.) unarmed; leaves with 4-5 pairs of pinnæ, each pinna bearing 4-5 pairs of broad-ovate, glaucescent leaflets, which are unequal at the base, obtuse, and glabrous, with a gland between the superior pair of pinnæ; petioles and young branches clothed with chestnut-coloured tomentum; spikes cylindrical, axillary, with the rachis and calyxes tomentose. ♄. S. Native of Brazil. Legume oblong, compressed.

Astringent Acacia. Shrub 2 to 3 feet.

141 A. macro'loba (Willd. spec. 4. p. 1060.) unarmed; leaves with 16 pairs of pinnæ, each pinna bearing many pairs of linear, falcate, acuminated leaflets, which are angular at the base; petioles with 2 hairy lines on the upper side; spikes filiform, solitary, axillary. ♄. S. Native of Para, in Brazil.

Long-podded Acacia. Tree 40 to 50 feet.

142 A. Sprenge'lii; branches glandless; petioles hairy; leaves with 6 pairs of pinnæ, each pinna bearing 15 pairs of oblong, obtuse, pubescent leaflets; spikes short, twin. ♄. Native of Jamaica. A. Berteriàna, Spreng. syst. 3. p. 138. but not of Spreng. in herb. Balb. D. C.

Sprengel's Acacia. Tree.

143 A. aspidioìdes (Meyer. prim. esseq. 165.) unarmed; leaves with 15-18 pairs of pinnæ, each pinna bearing many pairs of linear, glabrous leaflets, and bearing on the under side at the base a transverse gland each; petioles glandless, pubescent; spikes cylindrical, disposed in terminal racemes. ♄. S. Native of Guiana, in the island of Arowabisch, in humid places. Petals 5, white, hardly connected at the base. Stamens 10. Legume curved.

Aspidium-like Acacia. Tree 30 to 40 feet.

144 A. dealba'ta (Link. enum. 2. p. 445.) unarmed; leaves with 15 pairs of pinnæ, each bearing many pairs of minute, equal, pubescent leaflets, with a perforated gland seated between one of the pairs of pinnæ; racemes lateral. ♄. S. Native country and legumes unknown.

Whitened Acacia. Tree.

145 A. Wallichia'na (D. C. prod. 2. p. 458.) unarmed; branches and leaves pubescent; leaves with 10-12 pairs of pinnæ, each pinna bearing about 50 pairs of approximate, linear leaflets; petiole bearing a gland beneath the pinnæ, and one between each of the pairs of pinnæ; spikes cylindrical, elongated; legumes flat, lanceolate; quite glabrous, 6-10-seeded. ♄. S. Native of the East Indies. Stamens 20-25.

Wallich's Acacia. Clt. 1820. Tree 30 feet.

* * *Prickly or spiny trees or shrubs.*

146 A. ferrugínea (D. C. prod. 2. p. 458.) spines stipular, straightish, conical, broadest at the base; leaves with 3-4 pairs of pinnæ, each pinna bearing 10-12 pairs of linear, bluntish, glabrous, glaucous leaflets; petiole furnished with a large, depressed gland; spikes of flowers cylindrical, slender, disposed in a panicle; legumes oval, hard, compressed, 1-2-seeded, indehiscent. ♄. S. Native of Coromandel. Mimòsa ferrugínea, Roxb. hort. beng. p. 41. Stamens 20-25. Allied to *A. Súndra* and *A. Cátechu.*

Rusty Acacia. Clt. 1818. Tree 12 to 20 feet.

147 A. Su'ndra (D. C. prod. 2. p. 458.) spines stipular, hooked, decurrent at the base; leaves with about 20 pairs of pinnæ, and each pinna bearing about the same number of leaflets, which are linear, obtuse, and glabrous, with a gland at the base of the petiole, and one between each of the 3 outer pairs of pinnæ; spikes axillary, usually solitary, cylindrical; legumes flat, compressed, 2-3-seeded, acuminated at both ends. ♄. S. Native of the coast of Coromandel, in woods and on the mountains. Mimòsa Súndra, Roxb. cor. 3. t. 225. Acàcia Chúndra, Willd. spec. 4. p. 1078. Flowers yellow. Stamens 20-25. Allied to *A. Cátechu.* Wood hard, chocolate-coloured. The tree is called *Sundra* by the Telingas.

Sundra Acacia. Clt. 1789. Tree 12 to 15 feet.

148 A. Ca'techu (Willd. spec. 4. p. 1079.) prickles stipular, when young straightish, but at length becoming hooked; leaves with 10 pairs of pinnæ, each pinna bearing [illegible] pairs of linear pubescent leaflets, with 1 depressed gland at the base of the petiole, and 2 or 3 between the extreme pairs of pinnæ; spikes cylindrical, solitary, twin, or tern, axillary. ♄. S. Native of the East Indies. Mimòsa Cátechu, Lin. fil. suppl. 439. Roxb. cor. 2. t. 175. Flowers yellow, 5-cleft, with about 20 stamens. Legume lanceolate, flat, 3-6-seeded. This is a small tree, about a foot in diameter, covered with brown bark. The drug known by the name *Catechu* (from *cate*, a tree, and *chu*, juice) is the product of this tree. In Bengal the extract of *catechu*, which was formerly termed, with peculiar impropriety, *Japan earth*, is principally prepared from the external coloured part of the wood, decoction, evaporation, and exsiccation in summer. But *Catechu* is also prepared in India from other species of *Acàcia*, and even from the wood, bark, and fruits of other genera, as the *Naúclea Gámbir.* In Mysore it is chiefly prepared from the nuts of *Arèca Cátechu.* *Catechu* has the appearance of a dried extract of various forms, rounded masses, or cut into squares or lozenges. It is perfectly opaque, and has always an earthy fracture. The Bombay *catechu* is of an uniform texture, and of a red-brown hue, its specific gravity being generally about 1-39. The extract from Bengal is more friable and less consistent. Its colour is like that of chocolate externally, but when broken its fracture presents streaks of chocolate and of red brown. Its specific gravity is 1-28. Their tastes are precisely similar, being astringent, but leaving in the mouth a sensation of sweetness. They do not deliquesce by exposure to the air, and are not fusible. Sir H. Davy states that *catechu* contains one-half of tannin, 35 per cent. of extractive, 6 to 8 of mucilage, and 5 to 7 of impurities. Chemists have not succeeded in presenting the astringent principle in a state of purity. In medicine *catechu* is one of the most convenient and powerful astringents we possess, and may be exhibited in every case where astringents are indicated. It is particularly serviceable in diarrhœa, in hoarseness from relaxation of the fauces, ulcers, and aphthæ in the mouth, and in excoriations, with lymphatic exudation.

Catechu Acacia. Clt. 1790. Tree 20 to 40 feet.

149 A. subtilifòlia (H. B. et Kunth, nov. gen. amer. 6. p. 268.) spines stipular, nearly erect; leaves with 5-10 pairs of pinnæ, each pinna bearing about 30-45 pairs of linear leaflets, which are puberulous beneath; petioles bearing 1 gland in the middle and one at the top of the rachis; spikes cylindrical, solitary; legumes oblong, unarmed. ♄. S. Native of New Granada, on the banks of the river Chota. Stamens 10, free.

Subtile-leaved Acacia. Tree.

150 A. fascicula'ta (Kunth, mim. 75. t. 23. nov. gen. amer. 6. p. 267.) prickles scattered, or twin, straight; leaves with 15 pairs of pinnæ, each pinna bearing 9-14 pairs of obliquely oblong leaflets; petioles glandless, rather prickly, and are as well as the branchlets pubescent; spikes cylindrical, fasciculately panicled. ♄. S. Native of Mexico, near Guanaxuato. Flowers white, 5-cleft, octandrous or decandrous. Legume unknown.

Fascicled-spiked Acacia. Tree.

151 A. viridiflòra (Kunth, mim. 81. t. 25. nov. gen. amer. 6. p. 269.) prickles recurved; leaves with 6-15 pairs of pinnæ, each pinna bearing 15-35 pairs of linear-oblong leaflets, which are puberulous beneath as well as the petioles, which are furnished with 1 gland at the base, and 2 or 3 along the rachis; spikes cylindrical, solitary. ♄. S. Native of South America, in the province of Bracamora, near St. Felipe. Flowers greenish-white, 5-cleft. Stamens 10, free. Legume unknown.

Green-flowered Acacia. Clt. 1823. Shrub 4 to 6 feet.

152 A. Ca'ffra (Willd. spec. 4. p. 1078.) prickles stipular, twin, incurved; leaves with 5-10 pairs of pinnæ, each pinna bearing 20-30 pairs of lanceolate-linear, obtuse, glabrous leaflets, with a depressed gland at the base of the petiole; spikes cylindrical, axillary. ♄. G. Native of the Cape of Good Hope. Mimòsa Cáffra, Thunb. prod. 92. fl. cap. 433. Legumes linear-lanceolate.

Caffrarian Acacia. Clt. 1800. Tree 12 to 20 feet.

153 A. polyaca'ntha (Willd. spec. 4. p. 1079.) prickles stipular, dilated; leaves with 10 pairs of pinnæ, each pinna bearing 30-40 pairs of linear, obtuse, ciliated leaflets, with a gland both at the base and apex of the common petiole, which is prickly beneath; spikes cylindrical, twin, axillary. ♄. S. Native of the East Indies. Mimòsa spinosissima, Poir. suppl. 1. p. 78.

Many-spined Acacia. Tree.

154 A. stella'ta (Willd. spec. 4. p. 1078.) prickles stipular, recurved; leaves with 10 pairs of pinnæ, each pinna bearing 13 pairs of oblong leaflets, which are obtuse at both ends; petioles bearing 2 or 3 recurved prickles at the origin of each pinna; racemes of flowers compound. ♄. G. Native of Arabia Felix, on Mount Kurma. Mimòsa stellàta, Forsk. descript. 177. Vahl. symb. 1. p. 81. Petals 5. Stamens 10. Legume compressed, lanceolate, membranous.

Starry Acacia. Tree.

155 A. velutìna (D. C. prod. 2. p. 459.) prickles petiolar, scattered, hooked; leaves with 11 pairs of pinnæ, each pinna bearing 25-35 pairs of oblong, linear leaflets, which are pubescent as well as the petioles, peduncles, and flowers; petiole furnished with a gland at the base, and one between each of the two extreme pairs of pinnæ. ♄. S. Native of Brazil. Corolla 5-furrowed, pubescent. Stamens numerous. Legume unknown.

Velvety Acacia. Tree.

156 A. ataxaca'ntha (D. C. prod. 2. p. 459.) prickles hooked, scattered in a loose manner along the branches and petioles; leaves with 6-8 pairs of pinnæ, each pinna bearing 20-30 pairs of linear, ciliated leaflets, with an oblong gland on the petiole, both between the lower and upper pair of pinnæ; stipulas lanceolate, dilated on the outside at the base; spikes twin, axillary, cylindrical. ♄. S. Native on the banks of the rivers Senegal and Gambia. Stamens 20-25. Legumes unknown.

Unorderly-spined Acacia. Shrub 6 to 8 feet.

157 A. macrosta'chya (Reichb. in Sieb. pl. exsic. seneg. no. 44.) prickles hooked, scattered without any order along the branches; stipulas foliaceous, large, rather reniform, acute; leaves with 20 pairs of pinnæ, each pinna bearing 20-30 pairs of linear, villous, and ciliated leaflets; spikes of flowers elongated, and are as well as the petioles and branches velvety. ♄. S. Native of Senegal and Gambia, where we have seen it and the preceding species growing in plenty about Bathurst, near the mouth of the river. Spikes of flowers clothed with hoary tomentum, 3 inches long. Flowers glabrous, 5-cleft.

Long-spiked Acacia. Shrub 8 to 10 feet.

158 A. Se'negal (Willd. spec. 4. p. 1077. exclusive of figure cited,) prickles stipular, straight, short; leaves with 5-8 pairs of pinnæ, each pinna bearing 15-18 pairs of oblong-linear obtuse leaflets, which are glabrous, as well as the petioles and branches, with a sessile gland between each of the pairs of pinnæ on the petiole; spikes axillary, solitary, slender. ♄. S. Native of Arabia, and the interior of Africa. Mimòsa Sénegal, Lin. spec. 1506. Flowers small, glabrous, distant. Branches white. Prickles sometimes wanting. Axillary branches abortive, and becoming spines. The spines at the base of the leaves are said to be three by Linnæus. Gum-senegal is the produce of this tree; it is usually sold in the shops as gum-arabic; its medicinal uses are the same, and it is procured in the same way from the trees. It was not until the beginning of the 17th century that the Dutch made gum-senegal known in Europe. After the French got possession of that river they directed their attention to it as an important object of commerce, and ascertained by experiments made in the latter half of the 17th century that gum-senegal was superior to the best gum-arabic. M. Adanson examined all the gum trees of West Africa with great care. They amount to 40 in number, but the three great forests which supply the Senegal market consist chiefly of two kinds, one which produces a white gum called vereck, and another called nebueb, which yields a red gum.

Senegal Acacia. Clt. 1823. Tree 20 feet.

159 A. a'lbida (Delil. fl. ægypt. 143. t. 52. f. 3.) prickles stipular, straight; leaves with 3-4 pairs of pinnæ, each pinna bearing 9-10 pairs of oblong-linear, obtuse, rather mucronate, glaucous leaflets, which are glabrous, as well as the branches, with a sessile gland between each of the pairs of pinnæ; spikes cylindrical, exceeding the leaves. ♄. G. Native of Upper Egypt, near Syene. [illegible] unknown.

97 A. psilosta'chya (D. C. prod. 2. p. 457.) unarmed; leaves with 7-10 [illegible] of [illegible]-leaved Acacia. Tree 20 feet.

160 A. monaca'ntha (Willd. enum. 1056.) prickles stipular, infra-axillary, solitary, recurved; leaves with usually 8 pairs of pinnæ, each pinna bearing 17-20 pairs of oblong leaflets; spikes cylindrical, panicled, axillary. ♄. S. Native of Brazil.

One-spiked Acacia. Clt. 1818. Tree.

161 A. Da'lea (Desv. journ. bot. 1814. vol. 1. p. 69.) spines straight, elongated, solitary, pubescent, stipular; leaves bipinnate, pubescent; spikes 3-together, axillary, on short peduncles. ♄. S. Native of the East Indies. Flowers rose-coloured.

Dalea-like Acacia. Tree.

162 A. Spi'ni (Balb. in Spin. cat. supp. 1823. p. 8. Col. hort. ripul. append. t. 5.) prickles stipular, infra-axillary, solitary, hooked; leaves with 3-4 pairs of pinnæ, each pinna bearing 3-5 pairs of elliptic leaflets, the lower ones the smallest; spikes cylindrical, solitary or twin, axillary. ♄. S. Native country unknown. Flowers greenish yellow. Legumes coarctate between the seeds, prickly on the sutures.

Spini's Acacia. Shrub 5 to 8 feet.

163 A. corni'gera (Willd. spec. 4. p. 1080.) prickles or spines stipular, connate at the base, compressed, large; leaves with 6 pairs of pinnæ, each pinna bearing about 20 pairs of glabrous leaflets; gland petiolar; spikes axillary, cylindrical. ♄. S. Mimòsa cornígera, Lin. spec. ed. 1. p. 520. Flowers pale yellow. The two large connate spines resemble the horns of an ox.

Var. α, *Americàna* (D. C. prod. 460.) spines brown. ♄. S. Native of Mexico, Cuba, and in the woods of Carthagena.—Pluk. phyt. t. 122. f. 1.—Comm. hort. 1. t. 107. Jacq. amer. 266. The legume is filled with pulp according to Jacquin, and it is therefore probably a species of *I'nga* or *Prosòpis*.

Var. β, *I'ndica* (D. C. l. c.) spines yellow. ♄. S. Native of the East Indies.—Seba, thes. 1. t. 70. f. 13.

Horn-bearing Acacia or Cuckold-tree. Clt. 1692. Tree 10 to 14 feet.

164 A. tenuiflo'ra (Willd. spec. 4. p. 1088.) prickles scattered, incurved; leaves with 5 pairs of pinnæ, each pinna bearing many pairs of ciliated leaflets; petioles pubescent, rather prickly; spikes filiform, length of the leaves. ♄. S. Native of Caraccas. Legumes membranous, sub-lanceolate, 3-5-seeded.

Fine-flowered Acacia. Tree.

165 A. mode'sta (Wall. pl. rar. asiat. 2. p. 27. t. 130.) arboreous; branches flexuous; spines axillary, subulate; leaves with 2-3 pairs of pinnæ, each pinna bearing 4 pairs of oblong, obtuse, glabrous, glaucous leaflets; petioles pilose, bearing 1 gland in the middle; spikes axillary and terminal, usually solitary, cylindrical, nodding, on short peduncles; flowers hermaphrodite; filaments distinct, twice the length of the corolla; legume stipitate, linear-oblong, flat, glabrous, rather membranous, 6-seeded, acute at both ends. ♄. S. Native of Hindostan. Flowers white, fragrant. Spines twin, stipular.

Modest Aca[illegible] April. Shrub 8 to 12 feet.

166 A. latro'num (Willd. spec. 4. p. 1077.) spines stipular, twin, connate; leaves with 4 pairs of pinnæ, each pinna bearing many pairs of small leaflets; spikes usually twin, elongated, axillary; legume semi-lunate. ♄. S. Native of the East Indies. Mimòsa latrònum, Lin. fil. suppl. 438. Spines milk-coloured, straight. Flowers white. This species of *Acàcia* form impenetrable thickets from their interwoven branches and terrible spines in the mountainous parts of India, and are the secure retreat of the smaller animals and rogues. Lin. suppl.

Rogue's Acacia. Clt. 1820. Shrub 4 to 6 feet.

167 A. A'zak (Willd. l. c.) spines stipular, 3-together? straight; leaves with 3 pairs of pinnæ, each pinna bearing 5 pairs of leaflets, with a gland on the petiole between the lower pair of pinnæ. ♄. G. Native of Arabia Felix. Mimosa A'zak, Forsk. descr. 176. Vahl. symb. 2. p. 104. Flowers and fruit unknown. *Azak* is the Arabian name of the tree.

Azak Acacia. Shrub.

168 A.? cadu'ca (Humb. et Bonpl. in Willd. spec. 4. p. 1089.) prickles scattered, rather hooked; leaves with 4-6 pairs of pinnæ, each pinna bearing 5-10 pairs of oblique, oval, obtuse leaflets, which are pubescent beneath, without any gland on the petioles; spikes ovate, pedunculate, axillary, solitary or twin; stamens 8-10; legumes ciliated, with prickles. ♄. S. Native of Peru, near Gualtaquillo on the banks of the river Cachiyacu. Kunth, nov. gen. amer. 6. p. 266. Legume hardly known.

Caducous Acacia. Tree.

169 A. prosopoi'des (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 460.) prickles few, scattered, hooked at the apex; leaves with 2-3 pairs of pinnæ, and each pinna bearing 2-3 pairs of oval, oblong, obtuse, glabrous leaflets; spikes usually twin. ♄. S. Native of New Spain. Corolla 5-cleft, reddish. Stamens 10. Legume unknown.

Prosopis-like Acacia. Tree.

170 A. adiantoi'des (Spreng. syst. 3. p. 146.) prickles short, few, straight; petioles tomentose; leaves with 4 pairs of pinnæ, each pinna bearing usually 8 pairs of alternate, dimidiately-oblong, obtuse, shining leaflets; spikes axillary, sessile. ♄. S. Native of Brazil, Sello.

Adiantum-like Acacia. Tree.

171 A. hosti'lis (Mart. reis. bras. ex Schlecht. Linnæa. 5. p. 43.) shrubby, branches elongated, spreading; prickles scattered, straight; leaves bipinnate, clothed with clammy pubescence, with 4-6 pairs of pinnæ, each pinna bearing 20 pairs of linear leaflets; stipular prickles and those between the stipulas straight; spikes solitary; legumes membranous, linear-oblong, 2-3-seeded, pubescent. ♄. S. Native of Brazil.

Hostile Acacia. Shrub.

Sect. IV. Globiflo'ræ (from *globus*, a globe, and *flos*, a flower; in reference to the flowers being collected into globose heads on the tops of the peduncles). Leaves bipinnate, with few or many pairs of pinnæ, each pinna bearing few or many pairs of leaflets. Flowers collected into globose heads at the tops of the peduncles.

* *Prickles all stipular and straight. Legumes unarmed. Stamens 20 or more.*

§ 1. *Aculeàtæ* (from *aculeatus*, prickly; plants furnished with stipular prickles).

172 A. ni'tida (Willd. spec. 4. p. 1086.) spines twin; leaves with 2 pairs of pinnæ, each pinna bearing 5 pairs of oblong leaflets, which are narrowest at the base, and shining above, with a gland between each of the pairs of pinnæ; petioles pubescent; heads of flowers pedunculate, twin. ♄. S. Native of the East Indies. Mimòsa nítida, Vahl. symb. 2. p. 803. Flowers polyandrous. Legume unknown.

Shining-leaved Acacia. Tree.

173 A. Seya'l (Delil. fl. ægypt. 142. t. 52. f. 2.) spines twin, straight, about the length of the leaves; leaves with 2 pairs of pinnæ, each pinna bearing 8-12 pairs of oblong-linear glabrous leaflets; legumes compressed, linear, falcate, acute, glabrous. ♄. G. Native of Egypt, where it is called *Sejal*. Mimòsa Sejàl, Forsk. descr. p. 177. In a specimen received by De Candolle from Sieber the branches are brown, the prickles stipular, shorter than the leaves, and sometimes wanting; the heads of flowers are globose and yellow, and the legume is striated with nerves. It is perhaps the same as the plant of Delile.

Sejal Acacia. Shrub.

174 A. ho'rrida (Willd. spec. 4. p. 1082.) spines twin, about equal in length to the leaves, and are glabrous, as well as the leaves and branches; leaves with 2-3 pairs of pinnæ, each pinna bearing 9-12 pairs of oblong obtuse leaflets, with the rib biglandular; heads of flowers pedunculate, axillary, usually aggregate. ♄. G. Native of the south of Africa and of Arabia. Mimòsa hórrida, Lin. spec. 1505. Mimòsa leucacántha, Jacq. schœnbr. t. 393. Mimòsa ebúrnea, Lam. dict. 1. p. 18. A. Capénsis, Burch. trav. 189. with a figure. Mimòsa Orfóta, Forsk. descr. 177. Mimòsa Capénsis, Burm. fl. cap. prod. 27.—Pluk. phyt. 121. f. 4. with white spikes. Young branches almost unarmed. Flowers yellow, polyandrous. Legume unknown. There is a variety of this species bearing 1-3 glands on the petiole, either beneath or between the pairs of pinnæ. Spines in pairs, white, purple at the top.

Horrid Acacia. Clt. 1823. Shrub.

175 A. ebu'rnea (Willd. spec. 4. p. 1081.) spines twin, connate, and are, as well as the branches and leaves, glabrous; leaves with 4-8 pairs of pinnæ, each pinna bearing 6-12 pairs of oblong small leaflets, with a gland situated on the petiole between the lower pair of pinnæ; heads of flowers pedunculate, crowded, axillary. ♄. S. Native of the East Indies, in woods. Roxb. cor. 2. t. 199. Flowers yellow, polyandrous. Legume linear, a little twisted, 8-10-seeded. Spines white, 1-2 inches long.

Ivory-thorned Acacia. Clt. 1792. Shrub 5 to 6 feet.

176 A. tortuo'sa (Willd. spec. 4. p. 1083.) spines twin, connate, and are, as well as the branches and petioles, pubescent; leaves with 2-6 pairs of pinnæ, each pinna bearing 12-16 pairs of leaflets, with a gland between the lower pair of pinnæ, and sometimes between the extreme pair; heads of flowers solitary, axillary; legumes compressed, thickish, pubescent, rather corniculate. ♄. S. Native of Jamaica, in sandy fields, and of the island of St. Thomas. Mimòsa tortuòsa, Lin. spec. 1505. Swartz, obs. 391. but not of Burm. Spines ½ inch long, white, downy at the base. Legumes with fleshy juicy valves. Heads of flowers yellow.

Twisted Acacia. Clt. 1824. Shrub 4 to 6 feet.

177 A. Burmannia'na (D. C. prod. 2. p. 461.) spines twin, glabrous; branches angular, smoothish; petioles pubescent; leaves with 6 pairs of pinnæ, each pinna bearing 15-20 pairs of leaflets; gland small, petiolar; heads of flowers solitary, on long axillary peduncles. ♄. S. Native of the East Indies. Mimòsa tortuòsa, Burm. fl. ind. p. 224. Heads of flowers larger than those of *M. tortuòsa*. Legume unknown.

Var. β; peduncles 3-together, axillary. ♄. S. Native of the East Indies. Mimòsa cæ'sia, Burm. fl. ind. 224. but not of Lin. A. Ceylánica sarmentosa flore luteo globoso, Burm. zeyl. p. 3.

Burmann's Acacia. Clt. 1818. Shrub 4 to 6 feet.

178 A. ve'ra (Willd. spec. 4. p. 1085.) spines twin; branches and leaves glabrous; leaves with 2 pairs of pinnæ, each pinna bearing 8-10 pairs of oblong-linear leaflets, with glands on the petioles, one between each pair of pinnæ; heads of flowers usually twin, pedunculate, axillary; legume (ex Willd.) moniliform. ♄. S. Native of Africa, from Senegal to Egypt. Mimòsa Nilótica, Lin. spec. 1506. but not of hort. cliff. Woodv. med. bot. 187. t. 67.—Lob. icon. 2. p. 95. f. 1.—Hern. mex. 866. f. 1. Gommier rouge, Adans. Branches and spines red. Flowers yellow. This is the tree which yields the gum-arabic of the shops, and succus acàciæ. According to Hasselquist the Arabs call it *chasad*. The gum is gathered in vast quantities from the trees growing in Arabia Petræa, near the north bay of the Red Sea at the foot of mount Sinai; this gum is called by dealers Thur or Thor, which is the name of the harbour in the north bay of the Red Sea, thereby distinguishing it from gum-arabic. The gum-thur is also more pellucid and white, whereas gum-arabic is of a brown or dirty yellow colour, and generally opaque.

Gum-arabic is a concrete juice, which exudes from various species of *Acàcia*, but especially from *A. vèra*, *A. Arábica*, and *A. Sénegal*, natives of the sandy deserts of Africa, Arabia, and other parts of Asia. It either exudes spontaneously or from incisions made in the bark, and afterwards hardens in the air. The barks of all the species are highly astringent, and some are used in India for tanning. There are two kinds of gum found in the shops in this country, and often sold promiscuously, but distinguished in commerce by the names of gum-arabic and East India gum. Gum-arabic consists of roundish transparent tears, colourless, or of a yellowish colour, without smell or taste, and almost perfectly soluble in water. The pieces which are most transparent and have least colour are reckoned the best. They are sometimes selected from the gum-arabic and sold for about double the price, under the name of picked gum. The East India gum is darker coloured than gum-arabic, and is not so readily soluble in water. Gum-thur, the produce of *Acàcia Arábica*, is almost colourless, and resembles the picked gum, and gum-senegal resembles the East India gum.

About the middle of November, that is, after the rainy season, which begins early in July, a gummy juice exudes spontaneously from the trunk and principal branches. In about 15 days it thickens in the furrow down which it runs, either into a vermicular shape, or more commonly assuming the form of round or oval tears, about the size of a pigeon's egg, of different colours, as they belong to the white or red gum tree. About the middle of December the Moors encamp on the borders of the forest, and the harvest lasts 5 weeks. The gum is packed in very large sacks of tanned leather, and brought on camels and bullocks to certain ports, where it is sold to the French and English merchants. Mr. Jackson, in his account of the empire of Morocco, informs us, that from Mogodor they export two sorts of gum, one is common gum-arabic, the other finer, called gum-soudan, brought from Tumbuctoo by the caravans. He also says that the gum called Morocco or Barbary-gum, is produced from a thorny tree called *Attaleh*. It yields most gum during the parching heat of July and August, and the hotter the weather, and the more sickly the tree appears, the more gum it yields.

The gum is highly nutritious. During the whole time of the gum harvest, of the journey, and of the fair, the Moors of the desert live almost entirely upon it, and experience has proved that six ounces are sufficient for the support of an adult during twenty-four hours. The characters generally given of gum as a vegetable principle belong only to fine gum-arabic, which is transparent and colourless, easily reduced to powder, without smell, and of a slightly sweetish taste. The solution of gum in water constitutes mucilage; it is thick and adhesive, and soon dries when exposed to the air. Gum is also soluble in weak acids, but is totally insoluble in alcohol. Gum is very little disposed to spontaneous decomposition. By oxygenizement with nitric acid it forms successively mucic, malic, and oxalic acid; with oxymuriat acid it forms citric acid. By exposure to heat it does not melt, but softens, swells, and becomes charred.

In medicine gum-arabic possesses the powers of a mucilaginous demulcent in a high degree. It is useful in all cases where there seems to be a natural deficiency of mucus in the intestinal canal; dissolved in milk, barley-water, or almond emulsions, it removes tenesmus. It is useful in an irritable state of the respiratory passages in catarrh, hoarseness, and cough; for this purpose it may be either administered in substance as a troche, or in a strong solution, and may be combined with a little opium. It is also useful in salivation after mercury, or in small pox. Externally it is applied in powder to bleeding vessels of a small size as a styptic, operating by gluing them up. It is also used in solution as an injection in gonorrhœa.

True Acacia or Gum-Arabic-tree, or Egyptian-thorn. Clt. 1596. Tree 20 feet.

179 A. **Ara'bica** (Willd. spec. 4. p. 1085.) spines twin; branches and petioles pubescent; leaves with 4-6 pairs of pinnæ, each pinna bearing 10-20 pairs of oblong linear leaflets, with a gland on the petiole beneath the lower pair of pinnæ, and usually with one between the upper pair; heads of flowers pedunculate, axillary, usually 3-together; legume moniliform. ♄. S. Native of the East Indies, Senegal, Egypt, and Arabia. Mimòsa Arábica, Lam. dict. 1. p. 19. Roxb. cor. 2. t. 149. A. Nilótica, Delil. ill. fl. ægypt. p. 31. Legume at length smooth. Flowers yellow, polyandrous. This is the tree from which the white transparent gum-arabic, called gum-thur, is obtained; the brown or common gum-arabic being the produce of the preceding species. The wood is strong, tough, and durable, and makes excellent knees and crooked timber in ship building. The bark is astringent and is used for tanning leather, and to dye various shades of brown. A decoction of the bark is used as a substitute for soap. According to Dr. Roxburgh, a large portion of East India gum is also obtained from this species. Perhaps the Arabian plant is distinct from the East Indian one.

Arabian Acacia or Gum-thur-tree. Clt. 1820. Tr. 30 to 40 ft.

180 A. **hebe'clada** (D. C. monsp. p. 73.) spines twin; branches, petioles, and peduncles pubescent, and rather hispid; leaves with 3-5 pairs of pinnæ, each pinna bearing 10 pairs of oblong-linear, glabrous leaflets; gland petiolar; heads of flowers pedunculate, 2-3-together, axillary. ♄. G. Native of the south of Africa. A. stolonífera, Burch. cat. no. 2267. The heads of flowers are very like those of *A. Farnesiàna,* but without scent.

Young-branched Acacia. Clt. 1816. Shrub 3 to 6 feet.

181 A. **Mauroce'nia** (D. C. cat. hort. monsp. p. 74.) spines twin; branches, petioles, and peduncles pubescent; leaves with 3-8 pairs of pinnæ, each pinna bearing 10-20 pairs of oblong, linear, glabrous leaflets, with a gland on the petiole beneath the lower pair of pinnæ; heads of flowers solitary or 2-4-together, axillary, pedunculate. ♄. G. Native of Morocco. Mimòsa Maurocènia, Desf. cat. 181. Heads of flowers white.

Moor's Acacia. Shrub 4 to 6 feet.

182 A. **Farnesia'na** (Willd. spec. 4. p. 1083.) spines twin; tops of branches, petioles, and peduncles rather pubescent; leaves with 5-8 pairs of pinnæ, each pinna bearing from 15-20 pairs of linear glabrous leaflets, with a gland on the petiole between the lower pair of pinnæ, and usually between the extreme pair; heads of flowers axillary, usually twin, on unequal peduncles; legume terete, rather attenuated at both ends. ♄. G. Native of St. Domingo, but now cultivated in the south of Europe and the north of Africa. Ald. farn. p. 2. 4. and 7. with a figure. Mimòsa Farnesiàna, Lin. spec. 1506. Duham. ed. nov. 2. p. 28. Mimòsa scorpioìdes, Forsk. Heads of flowers yellow, sweet-scented, sessile when in a young state, but at length becoming pedunculate. This species of *Acàcia* has been dispersed through most parts of Europe, has been made familiar to the Italian gardens since it was introduced to the Farnese garden in 1616, and is cultivated in great plenty in Spain and Portugal. In Italy it is called *gazia.*

Var. β, pedunculàta (Willd. spec. 4. p. 1084.) branches and petioles hardly pubescent; peduncles a little longer than those of the species, scarcely glabrous at the apex. ♄. S. Native of Java and Timor. Perhaps this is hardly different from A. Giráffæ of Sieb. pl. exsic. seneg. no. 45. which only differs from Willdenow's specimen in the situation of the glands.

Var. γ, curvispìna (D. C. prod. 2. p. 462.) spines somewhat incurved; leaves with 2 pairs of pinnæ; leaflets ovate. . Farnesiàna, Coll. hort. rip. p. 2. Perhaps a distinct species.

Farnesian Acacia. Fl. July, Aug. Clt. 1656. Shrub 6 to 10 feet.

183 A. **parvifo'lia** (Willd. spec. 4. p. 1086.) spines stipular; branches glabrous; petioles pubescent; leaves with 5-9 pairs of pinnæ, each pinna bearing 10-20 pairs of small linear leaflets, with a gland situated on the petiole beneath the lower pair of pinnæ; heads of flowers axillary, solitary, pedunculate. ♄. S. Native of the West Indies, in sandy places by the sea side. Mimòsa parvifòlia, Swartz, fl. ind. occ. 2. p. 984. Mimòsa Antillàrum, Poir. suppl. 1. p. 80. Mimòsa Mangénsis, Jacq. amer. 267. ? The spines, according to Jacquin, are stipular and distinct, but according to Swartz they are solitary under the branchlets. Heads of flowers white and green, void of scent.

Small-leaved Acacia. Tree 20 feet.

184 A. **a'lba** (Willd. ex Steud. nom. phan. 1. p. 1.) spines stipular; leaves with 7-10 pairs of pinnæ, each pinna bearing 16-20 pairs of leaflets; heads of flowers globose, disposed in a panicle; legumes compressed, linear, tomentose. ♄. S. Native of the East Indies. Mimòsa álba, Roxb. ex Rottl. et Willd. nov. act. nat. cur. berol. 1813. vol. 1. p. 208. Heads of flowers white.

White Acacia. Tree 20 feet.

185 A. **a'lbicans** (Kunth, mim. 87. t. 27. nov. gen. amer. 6. p. 272.) spines twin; brânchlets and petioles pubescent; leaves with 8-9 pairs of pinnæ, each pinna bearing 19-32 pairs of oblong, linear glabrous leaflets, with glands on the petiole, one between the superior and another beneath the inferior pair of pinnæ; heads 2-5, aggregate, rising in racemes from the axils of the leaves. ♄. S. Native of Mexico, on the sea shore near Campeachy. Flowers white, polyandrous. Legume unknown.

Whitish Acacia. Shrub.

186 A. **leucophlœ'a** (Roxb. cor. 2. t. 150.) spines twin; branches, leaves, and peduncles glabrous; leaves with 8-12 pairs of pinnæ, each pinna bearing 20-30 pairs of linear-oblong leaflets, with a gland on the petiole between the lower and higher pairs of pinnæ; heads of flowers racemose; the racemes disposed in a terminal panicle. ♄. S. Native of Coromandel, on dry mountains. Flowers pale yellowish, polyandrous. Legume linear, compressed, rather falcate. The specimen in Willdenow's

herbarium, under the name of *A. leucophlœ'a*, has the branches and petioles puberulous, and the leaflets rather ciliated. The bark is very astringent, and the natives distil an ardent spirit from it, mixed with palm wine and a little coarse sugar.

White-juiced Acacia. Tree.

187 A. COCHLIACA'NTHA (Humb. et Bonpl. in Willd. spec. 4. p. 1081.) spines twin, compressed, concave; branches glabrous; petioles and peduncles pubescent; leaves with 9-10 pairs of pinnæ, each pinna bearing 19-24 pairs of linear, very minute, ciliated leaflets; rachis of leaves bearing 4 glands; heads of flowers axillary, twin, pedunculate. ♄. S. Native of Quito, near Guayaquil, Kunth, mim. 93. t. 29. nov. gen. amer. 6. p. 274. Flowers white, polyandrous. Legume unknown.

Twisted-spined Acacia. Shrub 6 to 10 feet.

188 A. HÆMATÓXYLON (Willd. enum. 2. p. 1056.) spines twin, slender, and are, as well as the branches, glabrous; branchlets, leaves, peduncles, and flowers clothed with hoary velvety down; leaves with 8-16 pairs of pinnæ, each pinna bearing 18-24 pairs of very minute, obtuse, crowded leaflets, with a gland below or between the lower pair of pinnæ; heads of flowers axillary, 2-3 together, pedunculate. ♄. G. Native of the Cape of Good Hope. A. atomiphýlla, Burch. trav. 1. p. 341. cat. no. 1685 and 2449. Leaflets so much crowded as to appear joined together. Legume, according to Burchell, tomentose, linear, and indehiscent.

Red-wooded Acacia. Clt. 1816. Shrub 2 to 3 feet.

189 A. TOMENTO'SA (Willd. spec. 4. p. 1087.) spines twin; branches, petioles, peduncles, and under side of leaves tomentose; leaves with 10 pairs of pinnæ, each pinna bearing 20 pairs of linear obtuse leaflets, with a gland on the petiole below the pinnæ, and one between each of the extreme pairs of leaflets; heads of flowers axillary, aggregate, pedunculate. ♄. S. Native of the East Indies. Mimòsa Klèinii, Poir. suppl. 1. p. 82. Perhaps the same as *Mimòsa cavàly-toòma*, Roxb. which is the same as *Mimòsa tomentòsa*, Rottl. nov. act. nat. cur. 1813. p. 208. of which it is said that the peduncles are bracteate, and that the legumes are involute and compressed.

Tomentose Acacia. Clt. 1816. Tree 15 to 20 feet.

190 A. I'NDICA (Desv. journ. bot. 1814. 1. p. 69.) spines twin; leaves with 12-15 pairs of pinnæ, each pinna bearing 15-18 pairs of oblong-linear obtuse leaflets, which are pilose, as well as the petioles, when examined by a lens; heads of flowers axillary. ♄. S. Native of the East Indies. Mimòsa I'ndica, Poir. suppl. p. 80. Pers. ench. 2. p. 266. Habit of *A. Farnesiàna*. Branches terete, brown.

Indian Acacia. Clt. 1800. Tree 20 feet.

191 A. PUNCTA'TA (Humb. et Bonpl. in Willd. spec. 4. p. 1084.) spines twin; leaves with 8-12 pairs of pinnæ, each pinna bearing about 25-30 pairs of linear, obtuse, ciliated leaflets, with an urceolar gland at the base of the petiole; heads of flowers axillary, usually twin; peduncles tomentose. ♄. S Native of South America. Mimòsa atomària, Poir. suppl. 1. p. 81. Like A. Farnesiàna. Legume unknown.

Dotted Acacia. Tree.

192 A. MACRACA'NTHA (Humb. et Bonpl. in Willd. spec. 4. p. 108.) spines twin, lanceolate, compressed; branchlets and petioles pubescent; leaves with 14-18 pairs of pinnæ, each pinna bearing 30 pairs of oblong-linear ciliated leaflets, with a gland between the ultimate pair of pinnæ, and 2 or 3 between the pairs of leaflets; heads of flowers axillary, 2-8 together, pedunculate. ♄. S. Native of Quito, near Guayaquil. Kunth, mim. 90. t. 28. nov. gen. amer. 6. p. 273. Flowers yellow. Spines very long. Petiole furnished with a gland at the base.

Long-spined Acacia. Tree large.

193 A. MACRACANTHOÌDES (Bert. in herb. Balb. D. C. prod. 2. p. 463.) spines twin, terete; branches, petioles, and peduncles pubescent; leaves with 12-14 pairs of pinnæ, each pinna bearing about 25 pairs of oblong-linear glabrous leaflets, with a gland on the petiole beneath the lower pair, and one between the extreme pair of pinnæ; heads of flowers twin, axillary, pedunculate. ♄. S. Native of Jamaica. Very like the preceding species.

Macracantha-like Acacia. Clt. 1820. Tree.

194 A. SIEBERIA'NA (D. C. prod. 2. p. 463.) spines twin, terete, rather connate at the base, and are, as well as the branches, glabrous; leaves with 15-20 pairs of pinnæ, each pinna bearing 25-30 pairs of elliptic-oblong, obtuse, rather ciliated leaflets; heads of flowers globose, twin; peduncles twice the length of the heads, and are, as well as the petioles, puberulous. ♄. S. Native of Senegal. A. flexuòsa affìnis, Sieb. pl. exsic. seneg. no. 43. but it differs from *A. flexuòsa* in the spines being white, not brown, as in that species, and in the peduncles being twice the length, and fewer.

Sieber's Acacia. Tree.

195 A. FLEXUO'SA (Humb. et Bonpl. in Willd. spec. 4. p. 1082.) spines twin, connate; leaves with 16 pairs of pinnæ, each pinna bearing 25 pairs of linear, obtuse, ciliated leaflets, with a depressed gland above the base of the petiole, and one between the extreme pair of leaflets; heads pedunculate, 3-6-together, axillary, about the length of their own peduncles. ♄. S. Native of South America, near Cumana. H. B. et Kunth, nov. gen. amer. 6. p. 271. Spines brown, shining. Legume unknown.

Var. β, ambígua (D. C. prod. 2. p. 463.) spines shorter than the peduncles. ♄. S. Native of Guadaloupe. Spines 3 lines long. Peduncles 5-6-lines long. Legumes glabrous, straight. thickish. Perhaps a proper species.

Flexuous Acacia. Clt. 1824. Shrub.

196 A. OBTU'SA (Humb. et Bonpl. in Willd. spec. 4. p. 1087.) spines twin; leaves with 16-20 pairs of pinnæ, each pinna bearing many pairs of glabrous, ciliated, linear leaflets, with a gland at the base of the petiole, and one on the petiole between each of the 2 extreme pairs of pinnæ; legume linear, arched, obtuse, glabrous. ♄. S. Native of Caraccas, ex Kunth, on the banks of the Orinoco, ex Willd. H. B. et Kunth, nov. gen. amer. 6. p. 272.

Obtuse-leafletted Acacia. Tree.

197 A. SUBINE'RMIS (Bert. in herb. Balb. D. C. prod. 2. p. 463.) spines twin, subulate, short, sometimes wanting; branches, petioles, and peduncles pubescent; leaves with 30-40 pairs of pinnæ, each pinna bearing 30-40 pairs of linear-oblong, glabrous leaflets, with 2 glands beneath the lower pair of pinnæ, and 2 or 4 between the ultimate pairs of pinnæ; heads of flowers pedunculate, 2-3-together, axillary. ♄. S. Native of Jamaica. Flowers yellow. Legume linear, flat, glabrous, 6-7-seeded.

Almost-unarmed Acacia. Tree.

* * *Prickles stipular, twin, usually also petiolar, and along the ribs of the legume. Stamens* 10.

198 A. ACANTHOCA'RPA (Willd. enum. 1057.) stipular; prickles twin, hooked; petioles glandless, prickly; leaves with 6-8 pairs of pinnæ, each pinna bearing 6-15 pairs of oblong, pubescent leaflets; heads of flowers axillary, twin, pedunculate; legumes flat, compressed, falcate, prickly on the rib on both sides. ♄. S. Native of New Spain. Mimòsa aculeaticárpa, Ort. dec. 134. A. aculeaticárpa, Lag. nov. gen. et spec. 16. Flowers dirty white, or rather flesh-coloured. Leaves irritable or sensible to the touch.

Var. β, uncinélla (D. C. prod. 2. p. 463.) petioles unarmed, bearing 1 gland at the base. Mimòsa uncinélla, Poir. suppl. 1. p. 80.

Spiny-fruited Acacia. Clt. 1822. Shrub 6 to 8 feet.

199 A. REVOLU'TA (Kunth, mim. 84. t. 26. nov. gen. amer. 6. p. 270.) stipular spines twin, straight; petioles unarmed; leaves with 2-3 pairs of pinnæ, each pinna bearing 8-12 pairs of oblong, ciliately-scabrous leaflets; heads axillary, 2-3-together, pedunculate; legumes flat, compressed, falcate, prickly on the exterior or convex suture. ♄. S. Native of Peru, at Caxamarca. Flowers white, but the petals are green.

Revolute-podded Acacia. Shrub 6 feet.

200 A. CAVE'NIA (Hook. in Beech, voy. append. bot. p. 21.) spines stipular, about half an inch long, twin, straight; petioles furnished with 1 obscure gland; leaves with usually about 5 pairs of pinnæ, each pinna bearing 9-10 pairs of linear-oblong leaflets, which are clothed with scabrous pubescence; peduncles axillary, aggregate; heads of flowers globose; flowers polyandrous. ♄. G. Native of Chili. Mimòsa Cavènia, Mol. chil. At Valparaiso the flowers are called *Flor d'Aroma*, and the tree *Espino* by the inhabitants. It is used for various purposes, especially as yielding the best charcoal.

Cavenia Acacia. Tree 20 feet.

201 A. DOMINGE'NSIS (Bert. ined. ex D.C. prod. 2. p. 464.) stipular spines hooked, sometimes wanting; petioles prickly, glandless; leaves with 4 pairs of pinnæ, each pinna bearing 7 pairs of elliptic-oblong, glabrous leaflets; heads of flowers 2-3-together, axillary, ultimate ones disposed in a branched panicle; legumes unarmed. ♄. S. Native of St. Domingo. Flowers white. Legume flat, compressed, quite glabrous, falcate, irregularly coarctate on one side.

St. Domingo Acacia. Tree.

202 A. ACANTHO'LOBA (Humb. et Bonpl. in Willd. spec. 4. p. 1089.) prickles scattered, hooked; petioles unarmed, pubescent; leaves with 3-4 pairs of pinnæ, each pinna bearing about 10-12 pairs of leaflets, which are pubescent beneath; heads of flowers almost sessile, racemose; legumes flat, membranous, prickly on both margins. ♄. S. Native of South America. H. B. et Kunth, nov. gen. amer. 6. p. 279. Flowers pale rose-coloured. Perhaps belonging to the following division.

Spiny-podded Acacia. Clt. 1823. Shrub 6 feet.

* * * *Rameal prickles scattered without order. Stems erect.*

203 A.? PSORA'LEA (D. C. prod. 2. p. 464.) rameal prickles scattered; petioles unarmed, but are beset with brown warts as well as the peduncles; leaves with 2-5 pairs of pinnæ, each pinna bearing about 7-8 pairs of oblong-linear, obtuse, glabrous leaflets; heads of flowers axillary, solitary, pedunculate. ♄. S. Native of Madagascar. Legumes unknown.

Scurfy-branched Acacia. Shrub.

204 A.? CONCI'NNA (D. C. prod. 2. p. 464.) rameal prickles scattered; branches clothed with velvety villi; petioles prickly, bearing 1 gland above the base; leaves with 5-6 pairs of pinnæ, each pinna bearing many pairs of linear-cultrate, ciliated leaflets; stipulas cordate, upper ones in the form of bracteas; heads of flowers disposed in a terminal panicle. ♄. S. Native of the East Indies. Mimòsa saponària, Roxb. in herb. Lamb. Mimòsa concínna, Willd. spec. 4. p. 1039. Legume unknown.

Neat Acacia. Clt. 1823. Tree.

205 A. TAMARINDIFO'LIA (Willd. spec. 4. p. 1092.) rameal prickles straight, scattered; leaves with 4-6 pairs of pinnæ, each pinna bearing 10-15 pairs of oblong, obtuse, quite glabrous leaflets; petioles rather prickly, and furnished with a gland at the base; stipulas cordate, upper ones in the form of bracteas; heads of flowers pedunculate, disposed in a panicle. ♄. S. Native of the West India islands and South America. Mimòsa tamarindifòlia, Lin. spec. 1509. Jacq. schœnbr. 3. t. 396.—Plum. ed. Burm. t. 7. Flowers white. Legume broad-linear, flat, straight.

Tamarind-leaved Acacia. Clt. 1774. Tree 40 feet.

206 A. GUADALUPE'NSIS (D. C. prod. 2. p. 464.) rameal and petiolar prickles very few, scattered, and recurved; leaves with 7-9 pairs of pinnæ, each pinna bearing 15-20 pairs of oblong-linear, glabrous leaflets; petioles glandless; heads of flowers pedunculate, disposed in a terminal panicle. ♄. S. Native of Guadaloupe. Flowers yellow, polyandrous. Legumes flat, glabrous, on short stipes, 3-4 inches long, and 9 lines broad.

Guadaloupe Acacia. Tree or shrub.

207 A. I'NTSIA (Willd. spec. 4. p. 1091.) rameal as well as petiolar prickles scattered and recurved; leaves with 6 pairs of pinnæ, each pinna bearing about 12 pairs of incurved leaflets, with a gland between the lower pairs of leaflets; prickles shorter than the stipulas; heads of flowers pedunculate. ♄. S. Native of the East Indies.—Rheed. mal. 6. t. 4.—Pluk. phyt. 122. f. 2. Mimòsa I'ntsia, Lin. spec. 1508. *I'ntsi* is the Malabar name of the tree.

Intsia Acacia. Clt. 1778. Tree 20 feet.

208 A. INTSIOI'DES (D. C. prod. 2. p. 464.) rameal as well as petiolar prickles scattered and recurved; leaves with 8-10 pairs of pinnæ, each pinna bearing about 25 pairs of linear-oblong, somewhat incurved leaflets, with a gland at the base of the petiole; heads of flowers pedunculate, aggregate, somewhat panicled, with the branches between the flowers unarmed. ♄. S. Native country unknown. Leaves and branches glabrous. Heads of flowers about the size of those of *A. Farnesiàna*. It has very much the appearance of the preceding species and to the figure of Rheede, and it differs at first sight from the following in heads of flowers being larger.

Intsia-like Acacia. Tree.

209 A. PENNA'TA (Willd. spec. 4. p. 1090.) rameal as well as petiolar prickles scattered and recurved; leaves with 8-16 pairs of pinnæ, each pinna bearing 20-30 pairs of linear-oblong leaflets, with a depressed gland at the base of the petiole; heads of flowers on short peduncles, aggregate, disposed in a terminal prickly panicle. ♄. S. Native of Ceylon (Burm. zeyl. t. 1.), and Madagascar (Commerson). Mimòsa pennàta, Lin. spec. 1507. The whole plant is glabrous. Heads of flowers yellow, smaller than those of *A. Farnesiàna*. Legume unknown. Perhaps different from *A. pterophýlla* of Hoffmans. verz. 1824. p. 207. which has glands between the exterior pairs of pinnæ. In Cochin-china the bark is converted into a sort of tow, which is used to fill up cracks in houses as well as in boats.

Feather-leaved Acacia. Clt. 1773. Shrub.

210 A. WESTIA'NA (D. C. prod. 2. p. 464.) rameal as well as petiolar and peduncular prickles recurved; leaves with 8 pairs of pinnæ, each pinna bearing 15-27 pairs of linear acute leaflets, with a gland at the base of the petiole, and one between the outer pair of leaflets; heads of flowers disposed in a terminal panicle; pedicels from 2-5, rising from the same dot or centre. ♄. S. Native of the island of Santa Cruz. Mimòsa paniculàta, West. beschr. 312. ex Vahl. ecl. amer. 13. p. 39. It differs from *A. paniculàta* of Willd. It is perhaps the same as *Mimòsa tenuifòlia*, Lin. spec. 771. but the description is not sufficient to decide this point.

West's Acacia. Tree.

211 A. CÆ'SIA (Willd. spec. 4. p. 1090.) rameal as well as petiolar prickles scattered and recurved; leaves with 5-7 pairs of pinnæ, each pinna bearing 12-16 pairs of oval-lanceolate leaflets, with an oblong gland above the base of the petiole; heads of flowers pedunculate, disposed in a terminal panicle; branches of panicle prickly. ♄. S. Native of the East Indies. Pluk. t. 330. bad. Mimòsa cæ'sia, Lin. spec. 1507. but not of Burm. Legume unknown.

Grey Acacia. Clt. 1773. Tree.

212 A. CENTROPHY'LLA (D. C. prod. 2. p. 465.) prickles of the branches, petioles, and panicles numerous, scattered, and re-

curved; petioles glandless, bearing subulate prickles between the pairs of pinnæ; leaves with 6-9 pairs of pinnæ, which are callous and bistipellate at the base, each pinna bearing 8-12 pairs of oblong-linear, mucronate, glabrous leaflets, which are obtuse at both ends; heads of flowers pedunculate, disposed in a terminal raceme. ♄. S. Cultivated in the gardens of Jamaica, where it was observed by Bertero. Flowers white, decandrous. A very distinct species, but the legume is unknown.

Spur-leaved Acacia. Clt. 1818. Tree 20 feet?

213 A. COURRANTIA'NA (D. C. prod. 2. p. 465.) prickles on the branches, petioles, and panicles, few and recurved; petioles glandless; leaves with 8-10 pairs of pinnæ, each pinna bearing 15-20 pairs of linear-oblong leaflets; heads of flowers pedunculate, disposed in terminal and axillary racemes. ♄. S. Native country unknown, but is cultivated in the gardens of Teneriffe. The whole plant is of a greyish or greenish glaucous colour, and is related to *A. cæ'sia.*

Courrant's Acacia. Clt. 1818. Tree.

214 A. RIPA'RIA (H. B. et Kunth, nov. gen. amer. 6. p. 276.) prickles scattered, hooked; leaves with 10-11 pairs of pinnæ, each pinna bearing 30-50 pairs of linear, ciliated leaflets, with a gland above the base of the common petiole, and one between each of the 2 ultimate pairs of leaflets; heads axillary, solitary; legumes linear, flat, rather hooked at the apex. ♄. S. Native at the confluence of the Amazon and Chamaya. Flowers unknown.

River-side Acacia. Tree very tall.

215 A. STRIA'TA (Humb. et Bonpl. in Willd. spec. 4. p. 1089.) rameal prickles scattered, erect; branches striated, and are as well as petioles pubescent; leaves with 9 pairs of pinnæ, each pinna bearing 13-16 pairs of leaflets, which are rather pilose beneath; heads of flowers pedunculate, disposed in a terminal panicle; legume compressed, rather falcate, obtuse, beset with a few short hairs. ♄. S. Native of South America. Heads of flowers small.

Striated-branched Acacia. Shrub.

216 A. MEGALADE'NA (Desv. journ. bot. 1814. 1. p. 69.) rameal as well as petiolar prickles scattered and minute; leaves with many pairs of pinnæ, each pinna bearing many pairs of leaflets, which are linear and glabrous, with a peltate gland above the base of the petiole; heads of flowers pedunculate, disposed in racemes; legumes compressed, rather falcate, quite glabrous. ♄. S. Native of the East Indies.

Large-glanded Acacia. Tree.

217 A. ARROPHU'LA (D. Don, prod. fl. nep. 247.) rameal as well as petiolar prickles recurved; petiole furnished in the middle with a large depressed broad gland; leaves with many pairs of pinnæ, each pinna bearing many pairs of linear, unequal-sided, obtuse leaflets, which are ciliated as well as the rachis; panicle terminal; heads of flowers globose, solitary, or 5, pedunculate. ♄. S. Native of Sirinagur, where it is called *Arroophul* by the natives.

Arroophul Acacia. Clt. 1818. Tree 20 feet.

**** *Prickles scattered. Stem climbing.*

218 A. SCA'NDENS (Willd. enum. 1057.) prickly; stem climbing, sulcate, tomentose; leaves with many pairs of pinnæ, each pinna bearing many pairs of leaflets, with a gland between each of the 10 or 12 ultimate pairs of pinnæ; heads of flowers panicled, axillary, and terminal. ♄. ◡. S. Native of Brazil. The rest unknown.

Scandent Acacia. Clt. 1780. Shrub cl.

219 A.? GUILANDÌNÆ (D. C. prod. 2. p. 465.) rameal as well as petiolar prickles small, and recurved; stem sub-scandent; branches and leaves glabrous; leaves with 4 pairs of pinnæ, each pinna bearing 2 pairs of leaflets, with a gland under the ultimate pair of leaflets; heads of flowers pedunculate, disposed in a loose terminal panicle. ♄. ◡. S. Native of Cayenne. Heads of flowers small, yellow. Legume unknown.

Guilandina-like Acacia. Clt. 1820. Shrub cl.

220 A. SARMENTO'SA (Desv. journ. bot. 1814. 1. p. 70.) quite glabrous; rameal and petiolar prickles scattered and hooked; leaves bipinnate, with 7 pairs of pinnæ, each pinna bearing many pairs of obtuse, linear, somewhat imbricate leaflets, with a minute gland above the base of the petiole. ♄. S. Native country, flowers, and fruit unknown. Mimòsa sarmentòsa, Desf. cat. hort. par. 180. Pers. ench. 2. p. 265.

Sarmentose Acacia. Clt. 1820. Shrub cl.

§ 2. *Unarmed trees or shrubs.*

* *Trichòdeæ* (from θριξ τριχος, *thrix trichos,* hair; in reference to the hairy anthers). *Anthers hairy. Stigma pencil-formed. Perhaps a proper genus.*

221 A. TRICHO'DES (Willd. spec. 4. p. 1063.) unarmed, glabrous; leaves with 2-3 pairs of pinnæ, each pinna bearing 3-5 pairs of ovate, acute leaflets, with an oblong, erect gland between the lower pair of pinnæ; heads of flowers twin, pedunculate, axillary. ♄. S. Native of Caraccas, ex Jacq., and about Lima, ex Dombey. Mimòsa trichòdes, Jacq. schœnbr. t. 394. Branches dotted. Legume flat, compressed, linear, rather obtuse at both ends, and somewhat mucronate at the apex, glabrous. Seeds flat, compressed. Flowers white.

Hairy-anthered Acacia. Clt. 1818. Shrub 6 to 10 feet.

222 A. PSEUDOTRICHO'DES (D. C. prod. 2. p. 466.) unarmed, glabrous; leaves with 2 pairs of pinnæ, each pinna bearing 2-4 pairs of leaflets; petioles glandless; heads of flowers 3-5, axillary, pedunculate. ♄. S. Native of St. Domingo. Legume like that of the preceding species, linear, flat, glabrous, somewhat stipitate at the base. Branches glabrous.

False Trichodes Acacia. Shrub.

* * *Anthers glabrous. Stigma simple. Julibrissinæ.*

223 A. FORMO'SA (Kunth, mim. p. 102. t. 32. nov. gen. et spec. 6. p. 278.) unarmed, glabrous; leaves with 2 pairs of pinnæ, each pinna bearing 5-6 pairs of obovate-elliptic leaflets; petioles glandless; stipulas large, oblong, obtuse; heads of flowers axillary, 2-5 on a common peduncle. ♄. S. Native of Mexico, near Guanaxuato. Flowers white, polyandrous. Legume unknown.

Beautiful Acacia. Clt. 1825. Shrub 6 to 12 feet.

224 A. NI'GRICANS (R. Br. in Ait. hort. kew. 4. p. 465.) unarmed, glabrous; leaves with 2 pairs of pinnæ, bearing 5-7 pairs of obovate-oblong, obtuse leaflets on each of the superior pinnæ, and 2 or 3 pairs on each of the lower pinnæ, with 1 or 2 glands on the petiole; stipulas subulate-setaceous; heads of flowers solitary. ♄. G. Native of New Holland, on the south-west coast. Mimòsa nígricans, Labill. nov. holl. 2. t. 238. A. nígricans, Sims, bot. mag. 2188. The whole plant becomes black on drying. Legume linear, flat, straight, 6-7-seeded. Flowers yellow, polyandrous.

Blackish Acacia. Fl. May, Jul. Clt. 1803. Sh. 6 to 10 feet.

225 A. STRIGO'SA (Link. enum. 2. p. 444.) unarmed, pilose; leaves with 2 pairs of pinnæ, each pinna bearing 2-3 pairs of leaflets; stipulas somewhat setaceous, caducous; heads of flowers solitary. ♄. G. Native of New Holland, on the south-west coast. A. ciliàta, R. Br. in hort. kew. 5. p. 465. but not of Willd. Flowers yellow.

Strigose Acacia. Fl. Mar. Ju. Clt. 1803. Sh. 6 to 10 ft.

226 A. UNGULA'TA (Desv. journ. bot. 1814. 1. p. 68.) unarmed; branches and branchlets pubescent; leaves with usually 3 pairs of pinnæ, each pinna bearing several pairs of linear, nearly glabrous leaflets; heads of flowers on long peduncles;

legumes mucronate, cartilaginous, thickened, ending in an incurved point. ♄. S. Native of the West Indies. The rest unknown.

Claw-podded Acacia. Shrub or tree.

227 A. VA'GA (Willd. spec. 4. p. 1066.) unarmed; leaves with 3 pairs of pinnæ; leaflets smoothish, with 3 pairs on each of the terminal pinnæ, and either 1 or 2 pairs on the lower pinnæ; heads of flowers pedunculate, 2 or 3-together, axillary. ♄. S. Native of Brazil. Mimòsa vàga, Lin. spec. 1503. exclusive of the country, and the synonyme of Breynius, which is evidently referrible to a species of *I'nga*.—Pis. bras. p. 80. f. 2. Marcg. bras. p. 111. f. 1.

Wandering Acacia. Clt. 1818. Tree.

228 A. MULTIFLO'RA (H. B. et Kunth, nov. gen. amer. 6. p. 277.) unarmed; leaves with 3 pairs of pinnæ, each pinna bearing 6-9 pairs of oblong, acute, glabrous leaflets; petioles glandless; racemes axillary, 2-5-together; heads in fascicles; stamens 15. ♄. S. Native of the eastern declivities of the Andes, near St. Felipe. Legume unknown.

Many-flowered Acacia. Tree 20 feet.

229 A. LE'BBEK (Willd. spec. 4. p. 1066.) unarmed, smoothish; leaves with 2-4 pairs of pinnæ, each pinna bearing about 6-8 pairs of oval, somewhat dimidiate leaflets, which are obtuse at both ends; petioles glandless; heads of flowers pedunculate, aggregate; flowers pedicellate. ♄. S. Native of Upper Egypt, but now cultivated in both the East and West Indies. Mimòsa Lébbek, Lin. spec. 1503. A. Hábbas, Link. enum. 2. p. 444.? but not of Delile. Cássia planisíliqua, Burm. ind. 96. but probably exclusive of the leaves. Legume broad-linear, flat, rather long, attenuated at both ends, 7-8-seeded.—Pluk. mant. 2. t. 331. f. 1. The Arabs call the tree *Læbach*. It is cultivated in gardens for the sake of the beauty and scent of the flowers.

Lebbek Acacia. Fl. Mar. June. Clt. 1823. Tree 20 feet.

230 A. PRO'CERA (Willd. spec. 4. p. 1063.) unarmed, smoothish; leaves with 4 pairs of pinnæ, each pinna bearing 5-8 pairs of ovate, acutish leaflets, with a depressed gland at the base of the petiole; heads of flowers pedunculate, disposed in a terminal panicle. ♄. S. Native of the East Indies. Mimòsa prócera, Roxb. cor. 2. t. 21. Flowers pale yellow, polyandrous. Stamens monadelphous. Legume flat, glabrous, attenuated at both ends, 6-7 inches long.

Tall Acacia. Clt. 1816. Tree 60 feet.

231 A. ODORATI'SSIMA (Willd. spec. l. c.) unarmed, smoothish; leaves with 3-4 pairs of pinnæ, each pinna bearing 10-12 pairs of oval-oblong leaflets, lower ones very minute, with a depressed gland at the base of the petiole, and one beneath the extreme pair of pinnæ; heads pedunculate, aggregate, forming a terminal panicle. ♄. S. Native of the coast of Coromandel. Mimòsa odoratíssima, Roxb. cor. 2. t. 120. Flowers pale yellow, very sweet-scented. Legume nearly like that of the preceding species.

Very-sweet-scented-flowered Acacia. Clt. 1790. Tr. 30 to 40 ft.

232 A. LEBBEKIOÌDES (D. C. prod. 2. p. 467.) unarmed, smoothish; leaves with 3-8 pairs of pinnæ, each pinna bearing 10-20 pairs of oval-oblong, glabrous leaflets; petioles puberulous, glandless; legumes flat, glabrous, 7-9-seeded. ♄. S. Native of the Island of Timor. Very nearly allied to *A. Lébbek*, but differs in the leaflets being narrower, more numerous, as well as in other respects.

Lebbek-like Acacia. Tree 30 feet.

233 A. LA'XA (Willd. spec. 4. p. 1069.) unarmed, glabrous; leaves with 4 pairs of pinnæ, each pinna bearing 12-24 pairs of linear-oblong leaflets, which are glaucous beneath; petioles beset with rusty villi; heads of flowers axillary, on long peduncles. ♄. S. Native of Caraccas. Branches terete, divaricate. Filaments purple. Legume compressed, narrowed at the base, 4 inches long.

Loose Acacia. Tree 15 to 20 feet.

234 A. SPECIO'SA (Willd. l. c.) unarmed, glabrous; leaves with 4-5 pairs of pinnæ, each pinna bearing 7-11 pairs of oval-oblong, obtuse, somewhat dimidiate leaflets, with a gland at the base of the petiole; heads 2-3-together, axillary, on long peduncles. ♄. S. Native of the East Indies. Mimòsa speciòsa, Jacq, coll. 1. p. 47. icon. rar. 1. t. 198. Flowers white, polyandrous.

Showy Acacia. Fl. Aug. Sept. Clt. 1742. Sh. 6 to 10 ft.

235 A. JUPU'NBA (Willd. l. c.) unarmed; leaves with 4-5 pairs of pinnæ, each pinna bearing 6-8 pairs of ovate, obtuse leaflets, which are clothed with hoary pubescence beneath; spikes of flowers somewhat capitate, axillary. ♄. S. Native of Para, in Brazil, where it is called *Jupunba*.

Jupunba Acacia. Tree.

236 A. BI'CEPS (Willd. spec. 4. p. 1075.) unarmed; leaves with 4-5 pairs of pinnæ, each pinna bearing about 16 pairs of distant, lanceolate, ciliated leaflets, with a gland on the petiole beneath the lower pair of pinnæ; heads of flowers axillary, twin, pedunculate. ♄. S. Native of Para, in Brazil. Very like *A. glaúca*, of which it is only a variety, according to Steudel.

Two-headed Acacia. Tree.

237 A. GLAU'CA (Willd. l. c.) unarmed, glabrous; leaves with 4-6 pairs of pinnæ, each pinna bearing about 12-15 pairs of linear, distant, acute leaflets, which are glaucous beneath; petiole downy, sometimes glandular beneath the lower pair of pinnæ; heads of flowers axillary, pedunculate, usually twin; legume nearly sessile. ♄. S. Native of South America. Mimòsa glaúca, Lin. spec. 504. Mill. fig. 4. t. 4.—Cat. car. 2. t. 42. Trew. ehret. t. 46. Flowers white, 5-parted, decandrous. Legume linear, flat, glabrous, acute at both ends, 4 inches long and 2 lines broad.

Glaucous Acacia. Fl. June, Jul. Clt. 1690. Sh. 5 to 10 ft.

238 A. LEUCOCE'PHALA (Link. enum. 2. p. 444.) unarmed, smoothish; leaves with 4-5 pairs of pinnæ, each pinna bearing 12-15 pairs of oblong-linear, acute leaflets; petioles downy, sometimes bearing a gland or glands beneath the lower pair of pinnæ; heads of flowers pedunculate, axillary, usually twin; legume standing on a stipe, which is about equal in length to the peduncle, when young it is clothed with velvety down. ♄. S. Native of South America. Mimòsa leucocéphala, Lam. dict. 1. p. 12. Flowers white. Very nearly allied to *A. glaúca*, and is often confused with it in gardens, but differs in the legume being broader, shorter, and standing on a long stipe.

White-headed Acacia. Fl. Ju. Aug. Clt. 1823. Sh. 5 to 10 ft.

239 A. LOMATOCA'RPA (D. C. prod. 2. p. 467.) unarmed, glabrous; leaves with 5 pairs of pinnæ, each pinna bearing 15 pairs of oblong rather falcate leaflets, with a gland between each pair of leaflets; legume flat, girded by a thickened margin. ♄. S. Native of Pondicherry. Mimòsa marginàta, Lam. dict. 1. p. 12. —Wàga, Rheed. mal. 6. t. 5. where the flowers drawn in the figure are loosely panicled, 4-parted, and polyandrous. Perhaps the same.

Fringe-podded Acacia. Clt. 1824. Tree 30 feet.

240 A. LATISI'LIQUA (Willd. spec. 4. p. 1067.) unarmed, glabrous; leaves with 5 pairs of pinnæ, each pinna bearing 10 pairs of elliptic obtuse leaflets; stipulas in the form of bracteas, obliquely cordate; heads of flowers pedunculate, aggregate, forming a terminal panicle. ♄. S. Native of South America. Mimòsa latisíliqua, Lin. spec. 1504.—Plum. ed. Burm. t. 6. Flowers white. Legume oblong, flat, acute at both ends, and standing on a long stipe.

Var. β, paucifoliola (D. C. prod. 2. p. 467.) leaves with 3-4 pairs of pinnæ, each pinna bearing 4-6 pairs of leaflets. ♄. S.

Native of St. Domingo. Flowers not seen, and therefore its affinity with the present species is rather doubtful.

Broad-podded Acacia. Fl. March, June. Clt. 1777. Shrub 6 to 10 feet.

241 A. PORTORICE'NSIS (Willd. l. c.) unarmed; leaves with 5 pairs of pinnæ, each pinna bearing 20 pairs of linear, obtuse, smoothish leaflets; petioles glandless, and are, as well as the branches, pubescent; heads of flowers 2-3-together, axillary; calyx with ciliated margins. ♄. S. Native of Porto-Rico. Mimòsa Portoricénsis, Jacq. icon. rar. t. 633. coll. 4. p. 143. A. álba, Hortul. Stamens with long white filaments.

Porto-Rico Acacia. Fl. June, Aug. Clt. 1824. Shrub 6 to 10 feet.

242 A. CARACCASSA'NA (Willd. l. c.) unarmed, smoothish; leaves with 4-5 pairs of pinnæ, each pinna bearing about 20 pairs of linear bluntish leaflets; petioles glandless, and are, as well as the branches, rather pubescent; heads of flowers pedunculate, 2-3-together, axillary, and somewhat terminal; calyxes with glandular margins. ♄. S. Native of Caraccas. Mimòsa Caraccassàna, Jacq. icon. rar. t. 632. coll. 4. p. 142. Stamens with purple filaments.

Caraccas Acacia. Clt. 1817. Shrub 6 to 12 feet.

243 A. LYCOPODIOI'DES (Desv. journ. bot. 1814. 1. p. 69.) unarmed; branches tetragonal; leaves with 3 pairs of pinnæ, each pinna bearing many pairs of minute rather pubescent leaflets; flowers in capitate spikes, on long peduncles; stipulas distinct, lanceolate, striated. ♄. S. Native country unknown. Mimòsa lycopodioìdes, Pers. ench. 2. p. 263. Poir. suppl. 1. p. 68.

Club-moss-like Acacia. Shrub.

244 A. LAMBERTIA'NA (D. Don, in bot. reg. t. 721.) unarmed; branches terete, and are, as well as the leaves, villous; leaves with 2-3 pairs of pinnæ, each pinna bearing 9-12 pairs of oval-oblong leaflets, which are obtuse at both ends; petiole glandless; heads of flowers 3-5-together, disposed in a raceme. ♄. S. Native of Mexico. Stamens 20-25, with purple exserted filaments, like those of *I'nga purpùrea*. Legume unknown.

Lambert's Acacia. Fl. May, Ju. Clt. 1818. Sh. 6 to 10 feet.

245 A. QUADRANGULA'RIS (Link. enum. 2. p. 445.) unarmed; branches tetragonal; leaves with 5 pairs of pinnæ, each pinna bearing many pairs of linear, acute, ciliated leaflets, the lower and outer ones the shortest; petioles pubescent, glandless; heads of flowers usually tern, pedunculate, axillary. ♄. S. Native country, as well as the legumes, unknown. Stipulas lanceolate, and are, as well as the peduncles, striated longitudinally. Filaments long, white.

Quadrangular-branched Acacia. Fl. June, July. Clt. 1825. Shrub 6 to 10 feet.

246 A. TETRAGO'NA (Willd. spec. 4. p. 1069.) unarmed, glabrous; branches tetragonal; leaves with 5-6 pairs of pinnæ, each pinna bearing 16-29 pairs of linear acute leaflets, the outer ones the largest; heads of flowers pedunculate, usually tern, axillary; legume linear, obtuse, with thickened margins. ♄. S. Native of Caraccas, in sand on the banks of rivers. Flowers white.

Tetragonal-branched Acacia. Clt. 1820. Shrub 6 to 8 feet.

247 A. DI'SCOLOR (Willd. spec. 4. p. 1068.) unarmed; leaves with 5 pairs of pinnæ, each pinna bearing 9-12 pairs of oblong, glabrous, acute leaflets, which are pale beneath; petioles glandular at the base, and are, as well as the branches, pubescent; heads of flowers pedicellate, disposed along the axillary peduncles in long racemes. ♄. G. Native of New Holland. Mimòsa díscolor, Andr. bot. rep. 235. Mimòsa botrycéphala, Vent. cels. t. 1. A. discolor, Sims, bot. mag. 1750. Branches nearly terete. Flowers yellow. Legume flat, broad-linear, obtuse, 2½ inches long, and 8-10 lines broad.

Discoloured-leaved Acacia. Fl. March, June. Clt. 1788. Shrub 6 to 10 feet.

248 A. ANGULA'TA (Desv. journ. bot. 1814. 2. p. 68.) unarmed, quite smooth; branches tetragonal; leaves with 5-7 pairs of pinnæ, each pinna bearing about 30 pairs of very narrow linear leaflets, with one perforated gland beneath the pinnæ, and one between each pair of pinnæ; heads of flowers pedicellate, disposed in long racemes along the axillary peduncles. ♄. G. Native of New Holland. A. súlcipes, Sieb. pl. exsic. nov. holl. no. 460. Heads of flowers small, yellow. Leaflets usually alternate. Legumes unknown.

Angular-branched Acacia. Fl. June, July. Clt. 1820. Tree 10 to 15 feet.

249 A. PUBE'SCENS (R. Br. in hort. kew. 5. p. 467.) unarmed; branches terete, hairy; leaves with 3-10 pairs of pinnæ, each pinna bearing 6-18 pairs of linear glabrous leaflets; petiole glandless; heads of flowers globose, pedicellate, disposed in racemes along the axillary peduncles. ♄. G. Native of New Holland, on the east coast. Mimòsa pubéscens, Vent. malm. t. 21. Sims, bot. mag. 1263. Sieb. pl. exsic. nov. holl. no. 466. Heads of flowers small, yellow. Legume unknown.

Pubescent Acacia. Fl. March, June. Clt. 1790. Shrub 6 to 10 feet.

250 A. FILI'CINA (Willd. spec. 4. p. 1072.) unarmed; branches terete, and are, as well as the petioles, glandless, and pilose; leaves with usually 6 pairs of pinnæ, each pinna bearing 50-70 pairs of linear, acute, ciliated leaflets; heads of flowers pedicellate, disposed in long racemes along the panicled peduncles. ♄. S. Native of Mexico. Mimòsa filicoìdes, Cav. icon. 1. t. 78. Mimòsa pteríeina, Poir. suppl. 1. p. 74. Flowers polyandrous. Legume linear, flat, pilose, with thickened margins.

Fern-like Acacia. Clt. 1825. Shrub 3 to 6 feet.

251 A. VILLO'SA (Willd. spec. 4. p. 1067.) unarmed; leaves with 5-6 pairs of pinnæ, each pinna bearing about 12 pairs of ovate leaflets, which are, as well as the branches, villous; petioles glandless; heads pedicellate, disposed in a terminal panicle. ♄. S. Native of Jamaica, on the mountains on the south side. Mimòsa villòsa, Swartz, fl. ind. occ. 2. p. 982. Flowers white. Legume short, flat, hairy.

Villous Acacia. Clt. 1806. Shrub 6 to 8 feet.

252 A. FRONDO'SA (Willd. spec. 4. p. 1076.) unarmed; leaves with 6 pairs of pinnæ, each pinna bearing 14 pairs of distant lanceolate leaflets, which are pubescent beneath, as well as the branches and petioles, with a gland between the inferior pair of pinnæ; heads of flowers axillary, pedunculate, solitary. ♄. S. Native of the East Indies. Legume linear, flat, with the margin rather repand on the outside.

Leafy Acacia. Clt. 1816. Tree.

253 A. OUYRARE'MA (D. C. prod. 2. p. 469.) unarmed; leaves with 6 pairs of pinnæ, each pinna bearing 30 pairs of oblong, obtuse, glabrous, 2-nerved leaflets, which are obliquely truncate at the base; petioles acutely trigonal or tetragonal, a little winged, bearing an oblong depressed gland at the base. ♄. S. Native of Guiana. Mimòsa Ouyrarèma, Aubl. guian. 946. exclusive of the synonyme. The Guiana name of the tree is *Ouyrarema*.

Ouyrarema Acacia. Tree.

254 A. STIPULA'CEA (D. C. prod. 2. p. 469.) unarmed; leaves with 5-7 pairs of pinnæ, each pinna bearing 20-30 pairs of oblong leaflets, which are pubescent beneath, as well as the petioles, peduncles, and branches; stipulas ovate, cordate, acute, large, permanent; heads of flowers pedunculate, somewhat corymbose. ♄. S. Native of Bengal. Mimòsa stipulàta, Roxb. hort. beng. p. 40. Legume linear, flat, glabrous, straight, 6 inches long, and 9 lines broad. Gland ovate, striated in the middle of the naked part of the petiole.

Large-*stipuled* Acacia. Clt. 1800. Tree 40 feet.

255 A. BIMUCRONA'TA (D. C. prod. 2. p. 469.) unarmed; branches, petioles, and pedicels pubescent; leaves with 6-8 pairs of pinnæ, each pinna bearing 28 pairs of oblong-linear glabrous leaflets, with 2 retrograde mucrones on the lower part of each pinna, and with an obsoletely villous gland between each pair of pinnæ; heads of flowers forming a loose terminal panicle. ♄. S. Native of Brazil. Legume unknown.

Two-pointed-leaved Acacia. Tree.

256 A. DIVARICA'TA (Willd. spec. 4. p. 1070.) unarmed, glabrous; leaves with 6-9 pairs of pinnæ, each pinna bearing 40 pairs of linear obtuse leaflets, with a convex sessile gland beneath the lower pair of pinnæ; stipulas semi-ovate, falcate; heads of flowers pedunculate, 1-3-together, axillary. ♄. S. Native of the East Indies. Flowers white, polyandrous. Mimòsa divaricàta, Jacq. schœnbr. t. 395. Legume unknown.

Divaricate Acacia. Clt. 1820. Tree.

257 A. FLA'VA (Spreng. in herb. Balb. D. C. prod. 2. p. 469.) unarmed, glabrous; leaves with 7-9 pairs of pinnæ, each pinna bearing 18-25 pairs of linear, mucronate, glabrous leaflets; petiole pubescent, with a gland at the base; legume flat, compressed, glabrous, obtuse, ending in a short mucrone, 8-10-seeded. ♄. S. Native of St. Martha. Flowers yellow.

Yellow Acacia. Tree.

258 A. UMBELLULI'FERA (Kunth, mim. p. 100. t. 31. nov. gen. amer. 6. p. 275.) unarmed; leaves with 7-10 pairs of pinnæ, each pinna bearing 17-37 pairs of linear ciliated leaflets; peduncles axillary, bearing numerous umbellules of flowers; flowers pedicellate. ♄. S. Native near the city of Mexico. Flowers white, polyandrous. Legume unknown.

Umbellule-bearing Acacia. Tree.

259 A. ARBO'REA (Willd. spec. 4. p. 1064.) unarmed; branches and petioles clothed with rusty velvety down; leaves with 7-12 pairs of pinnæ, each pinna bearing 16-18 pairs of oblong, dimidiate, glabrous leaflets, with a depressed gland on the petiole between each pair of pinnæ; heads of flowers 2-3-together, axillary, pedunculate. ♄. S. Native of Jamaica and Porto-Rico. Mimòsa arbòrea, Lin. spec. 1503. Swartz, obs. 390. Mimòsa filicifòlia, Lam. dict. 1. p. 12.—Pluk. phyt. 251. f. 2.—Sloan, hist. 2. t. 182. f. 1 and 2. Flowers of a pale flesh colour. The legume, according to Swartz, is nearly terete, arched, and twisted.

Tree Acacia. Clt. 1768. Tree 40 feet.

260 A. AMA'RA (Willd. spec. 4. p. 1074.) unarmed; branches, petioles, and peduncles clothed with velvety hairs; leaves with 8-10 pairs of pinnæ, each pinna bearing 20-25 pairs of linear, bluntish, glabrous leaflets; heads of flowers axillary, from 2-6-together, pedunculate. ♄. S. Native of the East Indies. Mimòsa amàra, Roxb. cor. 2. t. 122. Flowers yellow, polyandrous. The legume, according to Roxburgh, is linear, flat, acute, and 8-seeded. The bark is bitter and astringent.

Bitter Acacia. Clt. 1816. Tree 30 feet.

261 A. NE'MU (Willd. spec. 4. p. 1065.) unarmed; leaves with usually 9 pairs of pinnæ, each pinna bearing many pairs of acute dimidiate leaflets, with a gland at the base of the petiole; heads of flowers pedunculate, forming a terminal panicle; legumes linear, pubescent. ♄. G. Native of Japan. Mimòsa arbòrea, Thunb. fl. jap. 229. Banks, icon. Kœmpf. t. 19. Mimòsa speciòsa, Thunb. in Lin. soc. trans. 2. p. 336. The tree is called *Nemu* in Japan.

Nemu Acacia. Tree.

262 A. JULIBRI'SSIN (Willd. spec. 4. p. 1065.) unarmed, glabrous; leaves with 8-12 pairs of pinnæ, each pinna bearing about 30 pairs of dimidiate-oblong, acute, rather ciliated leaflets, with a depressed orbicular gland at the base of the petiole; heads of flowers pedunculate, forming a terminal somewhat corymbose panicle; legumes flat, membranous, glabrous. ♄. H. Native of the Levant. Mimòsa arbòrea, Forsk. descr. 177. Lam. dict. 1. p. 13. Mimòsa Julibríssin, Scop. del. 1. t. 8. Flowers white. Stamens flesh-coloured at the apex. The specific name is of Persian origin, where the tree is called *Gul-ebrouschim* according to Fischer, or *Ghul-ibrichim* according to Mangles, from its silky flowers. In Turkey it is called *Irbzim*. It is an elegant, hardy, deciduous tree.

Julibrissin Acacia or Silk-tree. Fl. Aug. Clt. 1745. Tree 30 to 40 feet.

263 A. POLYPHY'LLA (D. C. cat. hort. monsp. p. 74.) unarmed, glabrous; leaves with 11-12 pairs of pinnæ, each pinna bearing 30 pairs of dimidiately-oblong ciliated leaflets, which are somewhat puberulous beneath, with a small orbicular gland in the middle of the petiole, and one between each of the 2 or 3 uppermost pairs of pinnæ; heads of flowers pedunculate, forming an ample terminal panicle; legumes flat, membranous, glabrous. ♄. S. Native of St. Martha. Acàcia ripària, Bertero, but not of Kunth. Leaves like those of *A. Julibríssin*, but the heads of flowers are much smaller, and the stamens are about 40 in each flower, hardly 3 lines in length, while those of *A. Julibríssin* are nearly an inch long.

Many-leafletted Acacia. Clt. 1824. Tree 20 feet.

264 A. BERTERIA'NA (Balbis, herb. ex D. C. prod. 2. p. 470.) unarmed, glabrous; leaves with 9-10 pairs of pinnæ, each pinna bearing about 40 pairs of oblong-linear glabrous leaflets, which are shining above, and pale beneath, with a sessile gland at the base of the petiole, and one between the extreme pair of pinnæ; heads of flowers pedunculate, disposed in a panicle; legumes flat, membranous, glabrous. ♄. S. Native of St. Domingo. Stamens 15, 3 times the length of the corolla.

Bertero's Acacia. Tree.

265 A. DECU'RRENS (Willd. spec. 4. p. 1072.) unarmed, glabrous; leaves with 9-11 pairs of pinnæ, each pinna bearing 30-40 pairs of narrow, linear, distant leaflets, with a gland on the rachis between each pair of pinnæ; petioles and branches with acute angles; heads pedicellate, disposed in racemes along the axillary peduncles. ♄. G. Native of New Holland, about Port Jackson. Mimòsa decúrrens, Vent. malm. t. 61. Sieb. pl. exsic. nov. holl. no. 436. Flowers yellow, polyandrous.

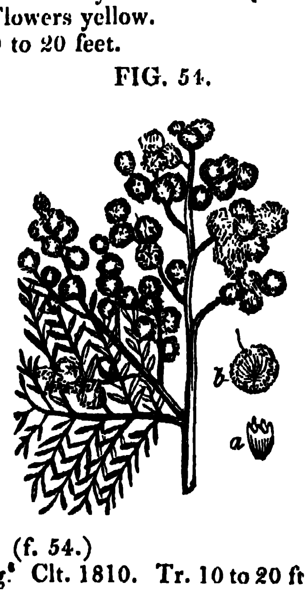
Decurrent Acacia. Fl. May, Jul. Clt. 1790. Tree 10 to 20 ft.

266 A. ADENO'PHORA (Spreng. syst. 3. p. 140.) branches and petioles glandular and glabrous; leaves with 8 pairs of pinnæ, each pinna bearing many pairs of linear, bluntish, glabrous leaflets; heads of flowers disposed in axillary racemes. ♄. G. Native of New Holland, Sieber. Flowers yellow.

Gland-bearing Acacia. Tree 10 to 20 feet.

267 A. MOLLÍSSIMA (Willd. enum. 1053.) unarmed; branches and petioles angular, pubescent; leaves with from 8-18 pairs of pinnæ, each pinna bearing 30-40 pairs of linear, much crowded, pubescent leaflets, with glands on the rachis, one between each pair of pinnæ; heads of flowers pedicellate, disposed in racemes along the axillary peduncles. ♄. S. Native of Van Diemen's Land. A. decúrrens β, móllis, Ker. bot. reg. 371. A. móllis, Sweet, fl. austr. t. 12. Leaves glaucous, when young clothed with yellowish velvety down. Legume linear, glabrous, obtuse, flat; seeds 8-9 in each legume, rather tumid, cuneated and narrowed at the base. (f. 54.)

FIG. 54.



Very-soft Acacia. Fl. July, Aug. Clt. 1810. Tr. 10 to 20 ft.

268 A. DEALBA'TA (Link. enum. 2. p. 445. Sieb. pl. exsic.

nov. holl. no. 446.) unarmed; branches rather angular, and are, as well as the petioles, clothed with short velvety down; leaves with 15 pairs of pinnæ, each pinna bearing 30-35 pairs of linear, much crowded, pubescent leaflets, with glands on the rachis, one between almost every pair of pinnæ; heads of flowers pedicellate, disposed in racemes along the axillary peduncles. ♄. G. Native of New Holland. Flowers yellow. The glands between the pairs of pinnæ perforated.

Whitened Acacia. Fl. Ju. Aug. Clt. 1820. Tree 10 to 20 ft.

269 A. MÓLLIS (Wall. pl. rar. asiat. 2. p. 76. t. 177.) arboreous, erect, unarmed; leaves with 4-8 pairs of pinnæ, each pinna bearing numerous pairs of villous, half-ovate, acute leaflets, with a concave gland above the base of the petiole, and one between each of the ultimate pairs of pinnæ; heads of flowers in fascicles, on long peduncles, disposed in corymbs at the tops of the branches; filaments very long, monadelphous at the base. ♄. G. Native of Nipaul, where it is grown in gardens at Katmandu, under the name of *Lakkay*. Corolla yellow. Filaments red. Tree villous in every part.

Soft Acacia. Tree 40 to 50 feet.

270 A. IRRORA'TA (Sieb. ex Spreng. syst. 3. p. 141.) branches brown, as well as petioles, which are glandless; leaves with 15-20 pairs of pinnæ, each pinna bearing numerous pairs of linear, bluntish, pruinose leaflets; heads of flowers disposed in terminal panicles. ♄. G. Native of New Holland.

Bedewed Acacia. Shrub.

271 A. CONTÓRTA (D. C. prod. 2. p. 470.) unarmed; branches nearly terete, and are, as well as the leaves, glabrous; leaves with 12-16 pairs of pinnæ, each pinna bearing 30-35 pairs of linear approximate leaflets, with an urceolate gland on the petiole beneath the lower pair of pinnæ; legume very long, spirally twisted, flat, glabrous. ♄. S. Native of Brazil. Flowers unknown. Peduncles axillary, solitary, an inch long. Legume a foot long.

Twisted-podded Acacia. Clt. 1825. Tree.

272 A. PENICILLÍFERA (Lag. nov. gen. et spec. 16. no. 208.) unarmed; petioles clothed with adpressed pubescence, glandless, and emarginate; leaves with about 12 pairs of pinnæ, each pinna bearing 20-30 pairs of linear, obtuse, rather ciliated leaflets; heads of flowers pedunculate. ♄. S. Native of New Spain. A weak twiggy shrub, with the habit of *A. filicina*. Legume unknown.

Pencil-bearing Acacia. Shrub 2 to 3 feet.

273 A. ESCULE'NTA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 470.) unarmed, glabrous; leaves with 17 pairs of pinnæ, each pinna bearing 32 pairs of linear obtuse leaflets; heads pedunculate, twin, disposed in a terminal panicle; legumes linear, flat, glabrous, tapering much to the base. ♄. S. Native of Mexico, where it is called *Guaxe*. Legume eatable. Flowers white, decandrous.

Esculent-podded Acacia. Clt. 1825. Tree.

274 A. PEREGRÌNA (Willd. spec. 4. p. 1073.) unarmed, nearly glabrous; leaves with 15-20 pairs of pinnæ, each pinna bearing 25-30 pairs of oblong-linear ciliated leaflets, bearing one gland in the middle of the petiole, and 1 or 2 at the top of the pinnæ; heads of flowers 2-4-together, pedunculate; anthers bearing a pedicellate gland at the apex. ♄. S. Native of New Granada, at the river Chota. Kunth, mim. p. 96. t. 30. nov. gen. amer. 6. p. 274. Mimòsa peregrìna, Lin. spec. 1504. Flowers white, decandrous.

Foreign Acacia. Tree 40 feet.

275 A. BE'LLA (Spreng. syst. 3. p. 141.) branches and petioles hairy; petioles glandless; leaves with 15 pairs of pinnæ, each pinna bearing many pairs of minute, imbricated, linear, strigose leaflets; heads of flowers disposed in racemes. ♄. S. Native of Brazil.

Pretty Acacia. Tree.

276 A. ANGUSTIFÒLIA (D. C. prod. 2. p. 470.) unarmed, nearly glabrous; leaves with 15-20 pairs of pinnæ, each pinna bearing 30-40 pairs of linear, acute, ciliated leaflets, with a gland at the base of the petiole, and one between the extreme pair of pinnæ; heads of flowers 2-4-together, pedunculate; anthers glandless. ♄. S. Native of the West India Islands. Mimòsa angustifòlia, Lam. dict. 1. p. 12. but not of Wendl. Legume flat, glabrous, with the margins rather sinuated, tapering into a stipe at the base, 6 inches long, and 8-9 lines broad.

Narrow-leafletted Acacia. Tree.

277 A. GRA'TA (Willd. enum. 1056.) unarmed; leaves with 20 pairs of pinnæ, each pinna bearing many pairs of linear leaflets, with scabrous margins; petiole glandular above the base; legumes repand. ♄. S. Native of Brazil. The rest unknown.

Grateful Acacia. Tree.

278 A. MICROPHY'LLA (Willd. enum. p. 1056.) unarmed; leaves with 25 pairs of pinnæ, each pinna bearing 50-60 pairs of linear, acute, ciliated leaflets, with a large gland at the base of the petiole; branches and petioles pubescent; heads of flowers axillary, pedunculate, twin. ♄. S. Native of the Caraccas, on stony hills. Mimòsa parvifòlia, Poir. suppl. 1. p. 74. Legume linear, 9 inches long.

Small-leafletted Acacia. Tree.

279 A. PANICULA'TA (Willd. spec. 4. p. 1074.) unarmed; leaves with 20-25 pairs of pinnæ, each pinna bearing 10 pairs of linear ciliated leaflets, with a gland on the petiole beneath the lower pair of pinnæ; petioles and branches pubescent; heads of flowers pedunculate, disposed in axillary panicles. ♄. S. Native of Para, in Brazil. Legume unknown. The specimen of this species sent by Willdenow to Desfontains is furnished with hooked scattered spines; it is, therefore, perhaps a different plant, or it should be placed in a different division of the genus.

Panicled-flowered Acacia. Tree.

280 A. BRASILIE'NSIS (Spreng. syst. 3. p. 142.) branches terete, hairy, as well as the petioles, which are glandless; leaves with many pairs of pinnæ, each pinna bearing many pairs of linear, minute, strigose, imbricated leaflets; heads of flowers disposed in spikes. ♄. S. Native of Brazil, Sello.

Brazil Acacia. Tree.

281 A. MULTIFLÒRA (Spreng. syst. 3. p. 142.) branches angular, glabrous; petioles glandless; leaves with many pairs of pinnæ, each pinna bearing many pairs of smooth, lanceolate, falcate leaflets; heads of flowers disposed in panicles. ♄. S. Native of Brazil, Sello.

Many-flowered Acacia. Tree.

282 A.? PECTINA'TA (H. B. et Kunth, nov. gen. amer. 6. p. 282. but not of Hoffmansegg,) unarmed; leaves with 15-16 pairs of pinnæ, each pinna bearing 50-60 pairs of linear, obtuse, mucronate leaflets, which are glabrous above, but clothed with rusty pubescence beneath, as well as the petioles; petioles glandless. ♄. S. Native of South America, at the river Cassiquiare. Leaflets on each pinna usually about 60 pairs. I'nga pectinàta, Willd. spec. 4. p. 1126. Flowers and fruit unknown.

Pectinate-leaved Acacia. Tree.

283 A. Nìopo (Humb. rel. hist. 2. p. 620. H. B. et Kunth, nov. gen. amer. 6. p. 282.) unarmed; leaves with 20-25 pairs of pinnæ, each pinna bearing 50-70 pairs of linear, rather falcate, acute, membranous, glabrous, ciliated, obsoletely 1-nerved leaflets, with a gland on the petiole above the base, and one between the extreme pair of pinnæ; legumes linear, beaked. ♄. S. Native of South America, near Maypures and Atures, &c. on the Orinoco. I'nga Nìopa, Willd. spec. 4. p. 1027. *Niopo* is the South American name of the tree.

Niopo Acacia. Tree.

284 A. CHRYSA'NTHA (D. C. prod. 2. p. 471.) unarmed; leaves and branches glabrous; leaves with 20-28 pairs of pinnæ, each pinna bearing 8 pairs of linear-oblong, obtuse leaflets; petioles glandless; peduncles 3-4-together, axillary; heads of flowers oblong. ♄. S. Native of Cayenne. Mimòsa chrysántha, Vahl. ecl. amer. 3. p. 38. Stamens innumerable, golden yellow. Legume unknown.

Golden-flowered Acacia. Tree.

285 A. ASPLENIOÌDES (Neuw. reis. bras. 2. with a figure, ex flora, 1821. p. 303.) unarmed; leaves with 2-3 pairs of pinnæ, each pinna bearing 12-15 pairs of leaflets; petioles hairy; spikes terminal, corymbose, globose, pedunculate. ♄. S. Native of Brazil. Stamens long, purple.

Spleenwort-like Acacia. Tree or shrub.

286 A. INUNDA'TA (Mart. reis. bras. ex Schleicht. Linnæa. 5. p. 43.) arboreous, glabrous; petiole bearing one gland in the middle, and one at the apex; leaves with 3 pairs of pinnæ, each pinna bearing 12-13 pairs of oblong-lanceolate, oblique, unequal-sided, nerved leaflets, which are shining above, but glaucous beneath; heads of flowers pedicellate, disposed in racemes along the axillary peduncles, shorter than the leaves; petioles and peduncles pubescent. ♄. S. Native of Brazil.

Inundated Acacia. Tree.

† *Species of Acàcia not sufficiently known.*

* *Leaves with only one pair of pinnæ, each pinna bearing few or many pairs of leaflets.*

287 A. RUTÆFÒLIA (Link. enum. 2. p. 444.) leaves with one pair of pinnæ; leaflets unequal; flowers yellowish. ♄. S. Native country unknown.

Rue-leaved Acacia. Clt. 1810. Shrub.

288 A. OLIGOPHY'LLA (Hoffmans. verz. 1824. p. 201.) unarmed; leaves with one pair of pinnæ, each pinna bearing 3-4 pairs of ovate-oblong, apiculated leaflets; stipulas filiform. ♄. S. Native country unknown, as well as the flowers and fruit.

Few-leafletted Acacia. Clt. 1817. Tree.

* * *Unarmed trees and shrubs, with bipinnate leaves.*

289 A. HOFFMANSE'GGII (D. C. prod. 2. p. 471.) unarmed; leaves with 4 pairs of pinnæ, each pinna bearing many pairs of linear, equal-sided, bluntly acute leaflets, which are unequal at the base; petioles pubescent, with a gland below the lower pair of pinnæ, and one between the upper pair of pinnæ. ♄. S. Native of Brazil, about Rio Janeiro. H. pectinàta, Hoffmans. verz. 1824. p. 201. but not of others. Said to be allied to *A. rostràta*, but the flowers and fruit are unknown.

Hoffmansegg's Acacia. Tree.

290 A. VENU'STA (Willd. enum. p. 1052.) unarmed; leaves with 3-5 pairs of pinnæ, each pinna bearing from 15-20 pairs of falcate, acutish, quite glabrous leaflets. ♄. S. Native of South America. Flowers and fruit unknown.

Beautiful Acacia. Tree.

291 A.? JAVA'NICA (D. C. prod. 2. p. 471.) unarmed; leaves with 4 pairs of pinnæ, each pinna bearing 70 pairs of oval, lucid, obtuse leaflets. ♄. S. Native of Java. Gledítschia Javánica, Lam. dict. 2. p. 466. Lower leaves bearing fewer leaflets than the upper ones.

Java Acacia. Tree.

292 A. GUACHAPE'LE (H. B. et Kunth, nov. gen. amer. 6. p. 281.) unarmed; leaves with 4-5 pairs of pinnæ, each pinna bearing 5-6 pairs of obovate or subelliptic-oblong membranous leaflets, which are pubescent on both surfaces, with a gland on the middle of the petiole, and between each of the 2 superior pairs of pinnæ; flowers capitate; stamens monadelphous; legumes linear, ending in a long beak. ♄. S. Native of Quito, in woods near Guayaquil. *Guachapele* is the vernacular name of the tree.

Guachapele Acacia. Tree 50 to 60 feet.

293 A. HADIE'NSIS (D. C. prod. 2. p. 472.) unarmed; leaves with 3 pairs of pinnæ, lower pair furnished with one scale, upper pair furnished with a double scale, each pinna bearing about 14 pairs of oval-linear leaflets, middle ones the longest. ♄. G. Native of Arabia, about Hadie. Mimòsa Sejàl, Forsk. descrip. p. 197. but not of Delile.

Hadie Acacia. Tree.

294 A. PRISMA'TICA (Hoffmansegg, verz. 1824. p. 159.) unarmed; leaves with 7-8 pairs of pinnæ, each pinna bearing 14-17 pairs of oblong two-coloured leaflets; branches angled; petioles glabrous; young leaves clammy. ♄. S. Native country unknown. Said to be allied to *A. díscolor*, but the flowers and fruit are unknown.

Prismatic Acacia. Tree.

295 A. COCHLIOCA'RPA (Gomez, mem. acad. das. sci. lisb. 3. p. 104. under *Mimòsa*,) leaves with 3 pairs of pinnæ, each pinna bearing about 3 pairs of leaflets; legumes compressed and spiral. ♄. S. Native of Brazil. Abaremotèmo, Pis. bras. Its root is known by the name of *Cortex Brasiliénsis*, and is a very powerful astringent. The plant is known in Brazil by the name of *Barbatimao*.

Twisted-fruited Acacia. Tree.

*** *Prickles stipular, twin, but without any petiolar ones.*

296 A. PLATY'LOBA (Bert. ined. in herb. Balb. ex D. C. prod. 2. p. 472.) glabrous; prickles stipular, hooked; leaves with 3 pairs of pinnæ, each pinna bearing 2-3 pairs of obovate obtuse leaflets; petioles glandless; legumes flat, rather stipitate. ♄. S. Native of St. Domingo. I'nga Magdalènæ, Spreng. in herb. Balb. Legume 6 inches long, and 1½ inch broad, 2-valved, dry inside. Seeds flat, shining. Flowers unknown. A very doubtful species, allied to *A. Lèbbek* and *A. latisíliqua*, but differs in being prickly. Perhaps it ought to be inserted between the sections *Globiflòræ* and *Spiciflòræ*.

Broad-podded Acacia. Tree.

297 A.? LEPTOPHY'LLA (D. C. cat. hort. monsp. p. 74.) prickles stipular, straight, setaceous, distinct, short; leaves with 4-5 pairs of pinnæ, each pinna bearing 12 pairs of oblong distant leaflets, which are pubescent beneath, as well as the petioles and branches, with a gland on the petiole between the lower pair of pinnæ. ♄. S. Native of South America. Flowers and fruit unknown.

Slender-leaved Acacia. Clt. 1824. Tree.

298 A.? VIRE'SCENS (D. C. l. c.) glabrous; prickles stipular, setaceous, straight, distinct; leaves with 2 pairs of pinnæ, each pinna bearing 12-20 pairs of oblong-linear leaflets, with an obsolete gland on the petiole between the lower pair of pinnæ. ♄. S. Native of South America. Flowers and fruit unknown.

Greenish-flowered Acacia. Clt. 1820. Tree.

299 A. LENTISCIFÒLIA (Desf. cat. hort. par. ed. 2. p. 208.) glabrous; spines subulate, stipular, straight; leaves with usually 4 pairs of pinnæ, each pinna bearing about 10 pairs of ovate, mucronate, rather coriaceous, shining leaflets, with a sessile gland between each of the pairs of pinnæ. ♄. S. Native of Mexico. Mimòsa lentiscifòlia, Pers. ench. 2. p. 263. Poir. suppl. 1. p. 84. Flowers and fruit unknown.

Lentiscus-leaved Acacia. Tree.

300 A. PA'TULA (Humb. et Bonpl. in Willd. enum. 1055.) spines stipular, connate, twin, compressed at the base and dilated; leaves with 5 pairs of pinnæ, each pinna bearing 15-20 pairs of linear leaflets, which are glabrous on both surfaces; petioles rather pilose and glandless. ♄. S. Native of South America. Flowers and fruit unknown.

Spreading Acacia. Clt. 1818. Tree.

301 A. PERUVIA'NA (Humb. et Bonpl. in Willd. enum. p.

1055.) spines stipular, setaceous, twin; leaves with 2 pairs of pinnæ, each pinna bearing 11-15 pairs of obtuse, glabrous leaflets. ♄. S. Native of Peru. Allied to *A. diptera*, according to habit.

Peruvian Acacia. Clt. 1820. Tree.

302 A.? GUAYAQUILE'NSIS (Desf. hort. par. ed. 2. p. 208.) spines stipular, opposite; leaves with 2 pairs of pinnæ, each pinna bearing 3-5 pairs of ovate, obtuse, glaucescent leaflets, lower ones the smallest. ♄. S. Native of Peru, near Guayaquil. Flowers and fruit unknown.

Guayaquil Acacia. Tree.

303 A. BRACHYACA'NTHA (Humb. et Bonpl. in Willd. enum. 1055.) spines stipular, twin, hooked; leaves with usually 10 pairs of pinnæ, each pinna bearing about 10-12 pairs of ciliated leaflets. ♄. S. Native of South America. Flowers and fruit unknown.

Short-spined Acacia. Clt. 1824. Tree.

304 A.? CILIA'TA (Humb. et Bonpl. in Willd. enum. 1055. but not of Ait.) spines stipular, twin, straight, subulate; leaves with 3-4 pairs of pinnæ, each pinna bearing 13 pairs of ciliated leaflets. ♄. S. Native of South America. Flowers and fruit unknown.

Ciliated-leafletted Acacia. Clt. 1822. Tree.

305 A.? ACICULA'RIS (Humb. et Bonpl. in Willd. enum. 1056. but not of Ait.) spines stipular, subulate, twin, straight; leaves with 4 pairs of pinnæ, each pinna bearing 15 pairs of distant, ciliated leaflets. ♄. S. Native of South America. Flowers and fruit unknown.

Acicular-spined Acacia. Tree.

306 A. GIRA'FFÆ (Willd. enum. 1054.) spines stipular, twin, connate, about equal in length to the leaves; leaves with 3-6 pairs of pinnæ, each pinna bearing 10-20 pairs of leaflets, with 1 gland between each pair of pinnæ on the petiole. ♄. G. Native of the Cape of Good Hope, in the interior of the country. Flowers and fruit unknown. It is on this tree that the Cape giraffe or camel-leopard feeds.

Giraffe's Acacia. Tree 40 to 70 feet.

307 A.? MICRACA'NTHA (Desv. journ. bot. 1814. 1. p. 69.) prickles stipular, very slender; leaves pubescent, bipinnate; leaflets linear, rather falcate, very thin; flowers disposed in spike-like racemes, on short peduncles. ♄. S. Native of Cayenne. Mimòsa semi-spinòsa, Lin. ex Desv.

Small-spined Acacia. Tree.

* * * * *Spines or prickles all scattered in an irregular manner, or some of them are stipular, and those on the branches and petioles are scattered.*

308 A.? RHODACA'NTHA (Desf. cat. hort. par. ed. 2. p. 208.) glabrous; stipular prickles twin, petiolar ones scattered; leaves with about 7 pairs of pinnæ, lower pair the smallest, each pinna bearing from 8-20 pairs of oblong-linear, somewhat ciliated leaflets, with a depressed gland at the base of the petiole. ♄. S. Native country, flowers, and fruit unknown. Mimòsa rhodacántha, Pers. ench. 2. p. 266.

Red-spined Acacia. Tree.

309 A. HETEROCA'NTHA (Burch. cat. no. 1710. ex trav. 1. p. 389.) some of the spines are twin, short, recurved, and brown, others are straight, longer, and white; leaves pubescent as well as the branches, with 4-6 pairs of pinnæ, each pinna bearing 10-14 pairs of approximate, oblong leaflets. ♄. G. Native of the Cape of Good Hope, near the river Gariep or Orange River. Legume linear.

Variable-spined Acacia. Clt. 1816. Tree.

310 A. BANCROFTIA'NA (Bert. in herb. Balb. Coll. hort. ripul. p. 1.) glabrous; rameal prickles scattered, petiolar ones twin at the origin of the pinnæ; leaves with 2-5 pairs of pinnæ, each pinna bearing about 2-5 pairs of obovate, obtuse leaflets; petioles glandless. ♄. S. Native of Jamaica. This species approaches in habit to *A. platýloba*. Flowers unknown. Fruit ovate-oblong, glabrous, rather fleshy, few-seeded, sessile.

Bancroft's Acacia. Tree 20 feet.

311 A.? POLYCE'PHALA (D. C. prod. 2. p. 473.) rameal as well as petiolar prickles scattered and a little hooked; leaves with 6-9 pairs of pinnæ, each pinna bearing 20 pairs of linear, acute leaflets, which are puberulous beneath and on the margins; petioles furnished with a large depressed gland at the base, and one between the extreme pair of pinnæ; petioles, branches, and peduncles clothed with velvety hairs; heads of flowers numerous, pedunculate, in fascicles, which are disposed in terminal racemes. ♄. S. Native of the Mauritius. Heads of flowers globose, reddish brown before the flowers expand. Stamens numerous, white. Legume unknown. The species is very like *A. concínna*, but differs in the absence of stipulas.

Many-headed Acacia. Tree.

312 A. SPHÆROCE'PHALA (Schlecht. et Cham. in Linnæa. 5. p. 394.) leaves unknown; racemes axillary, usually tern; heads on short peduncles, ovate-roundish; flowers polyandrous; legume inflated, acinaciform, tapering to both ends, 12-18-seeded; seeds egg-shaped, compressed; spines red, white, or black. ♄. S. Native of Mexico, near Actopan and Vera Cruz. Prosòpis species, Schiede. in litt.

Round-headed Acacia. Tree.

313 A. SPADI'GERA (Schlecht. et Cham. l. c.) leaves unknown; racemes usually twin, leafy; spikes referrible to the spadix of an aroideous plant, cylindrically clavate; spines twin, stipular; peduncles very thick; flowers dense, polyandrous, propped by scales as in the preceding species. ♄. S. Native of Mexico, near La Laguna Verde.

Spadix-bearing Acacia. Tree.

† *Species, the names of which are only known from Roxburgh's Hortus Bengalensis, under Mimòsa.*

1 *A. Kalkòra*, Roxb. 2 *A. fruticòsa*, Roxb. 3 *A. Smithiàna*, Roxb. 4 *A. semicordàta*, Roxb. 5 *A. dumòsa*, Roxb. 6 *A. pedunculàta*, Roxb.

Cult. The greenhouse or New Holland species of *Acàcia* are the most ornamental of greenhouse plants in the winter season and early in spring, bearing flowers from Christmas to April. They are hardy and easily managed. The best soil for them is an equal quantity of sand, loam, and peat. Cuttings taken off by a joint from young wood, and planted in a pot of sand, with a bell-glass placed over them, root freely. Some of the kinds that do not strike readily by cuttings may be increased by taking off pieces of the roots, planting them in the same kind of soil as recommended for the plants, leaving only their points above the surface, and then plunging them in a little bottom heat. The greater part of the species might be propagated by this means. The stove species are furnished with very elegant foliage, but seldom flower in this country. Their culture and propagation are the same as for the greenhouse species, with the exception that they require more heat. The *Acàcia Julibríssin*, *A. acanthocárpa*, *A. decúrrens*, and *A. mollíssima* are the only species that can be considered sufficiently hardy to stand our climate in the open air, and these are liable to be injured in severe winters, unless protected by mats. The best situation for them is against a south wall, where they will make a very fine appearance. They may be propagated either by slips of the root or by young cuttings, planted in sand, with a bell-glass placed over them. The surest way to raise all the kinds is by seeds, when they can be procured.

CCXXXIV. ERYTHROPHLE'UM (from ερυθρος, *erythros*, red; in reference to the red juice which flows from the tree when cut). Afzelius, mss. R. Br. Congo, and in Denh. and Clapp. trav. append. p. 30.

LIN. SYST. *Decándria, Monogýnia.* Flowers hermaphrodite, regular. Calyx 5-cleft. Petals 5. Stamens perigynous. Legume compressed, 2-valved, many-seeded.—A lofty tree with a spreading top and bipinnate leaves. Leaflets opposite, oval, oblique, from roundish to lanceolate, repand, acuminated, and entire. Racemes of flowers terminal and lateral.

1 E. GUINEE'NSE (G. Don, in Edinb. phil. journn. 1824.). ♄. S. Native of Sierra Leone and other parts of Guinea. The red juice in which the tree abounds is used as an ordeal by the natives of many parts of western Africa, as well as of the interior, to detect the innocence or guilt of those who are accused of any crime. The red juice is taken in large draughts, and those who are not sufficiently strong to withstand this ordeal are pronounced guilty, and those who are are considered innocent.

Guinea Gregre-tree or Ordeal-tree. Fl. Feb. Clt. 1823. Tree 100 feet.

Cult. See *Acàcia* for culture and propagation, p. 424.

SUBORDER IV. CÆSALPÍNEÆ (plant agreeing with *Cæsalpínia* in some important characters). R. Br. gen. rem. p. 19. congo. p. 10. D. C. legum. mem. xiii.—Lomentaceàrum and Papilionaceàrum, Lin. gen.—Rectembrièæ, Cassièæ, and Cérceæ, Bronn. mem. Flowers more or less irregular, sometimes papilionaceous, but usually regular (f. 55. *c.* f. 56. *b.*). Petals irregularly imbricate in æstivation, never valvate, sometimes wanting, but never joined together, always free (f. 55. *c.* f. 56. *b.*). Stamens more or less unequal (f. 56. *c.* f. 57. *d.*) always perigynous, and usually free, rarely as in Tribe *Geoffrèæ* having the filaments concrete. Embryo straight (f. 21. *g. h. l. m.*) with the plumule usually large and conspicuous.

Tribe IX.

GEOFFRÈ'Æ (plants agreeing with *Geoffròya* in particular characters). D. C. legum. mem. xiii. prod. 2. p. 473. Petals perigynous, unequal, disposed in a papilionaceous or sub-papilionaceous manner (f. 55. *c.*), imbricate in æstivation. Stamens monadelphous or diadelphous. Cotyledons fleshy or oily (f. 21. *l.*). This is an artificial tribe, which ought perhaps to have been brought in among the *Papilionàceæ*, from the perigynous papilionaceous flowers and connected stamens, but it agrees with the sub-order *Cæsalpíneæ* in the embryo being straight, as in the rest of that suborder. The genera belonging to this tribe are also very dissimilar in habit, and ought perhaps to have formed 4 or 5 distinct tribes.

CCXXXV. ARA'CHIS (*Aracos*, a name under which Pliny speaks of a plant with neither leaves nor branches, which comes from *a* priv. and *ῥακις*, *rakis*, a branch; the present plant, however, has nothing to do with the plant of Pliny). Lin. gen. no. 876. Lam. ill. 615. D. C. prod. 2. p. 474.

LIN. SYST. *Diadélphia, Decándria.* Calyx a long pedicel-like tube, with a bilabiate limb. Corolla resupinate. Stamens and petals inserted in the throat of the calyx, 9 of the stamens are joined together, and the free one sterile. Ovary stipitate, inclosed in the tube of the calyx; the stipe short at first but afterwards becoming elongated. Style filiform. Legume ovate-oblong, obtuse at both ends, gibbous, torulose, coriaceous, indehiscent, 2-4-seeded, and reticulated with veins. Seeds thick, oily inside. Embryo straight, with a short obtuse radicle, and semi-elliptic cotyledons.—An American herb, with elongated stipulas which are adnate to the petioles, abruptly pinnate leaves bearing 2 pairs of leaflets, without any tendril. Flowers yellow, 5-7 together in the axils of the leaves, lower ones subterraneous and fertile, those above ground flowering but sterile.

1 A. HYPOGÆ'A (Lin. spec. 1040.) ⊙. S. Native of South America, from whence it has been transported to Africa, Asia, and the south of Europe, where it is extensively cultivated for its seeds. Trew. ehret. t. 3. f. 3. Niss. act. par. 1723. t. 19. Rumph. amb. 5. t. 136. D. C. legum. mem. ii. t. 20. f. 105. A. Asiática, Lour. cochin. p. 430. Branches diffusedly procumbent. All the European settlements in America abound with ground-nuts, but it is generally supposed that it was brought by the slaves from Africa. In South Carolina it is cultivated in great quantities, where the inhabitants roast the nuts, as they are commonly called, and make use of them as chocolate. In the eastern countries they are a substitute for almonds. They abound in a thin limpid oil proper for lamps, and it is much used for this purpose in Cochin-china; it supplies the place also of their oil of olives for the use of the table, but is inferior to it in flavour. About Paris it is raised on hot-beds, and transplanted into the open garden, where it ripens its seeds, which are used as other legumes. The pods are sold in most fruiterers' shops in London.

Var. β, *glàbra* (D. C. prod. 2. p. 474.) ⊙. S. A. Africàna, Lour. coch. p. 430. Leaves glabrous, not as in the species rather pilose.

Underground or Earth-nut. Fl. May, July. Clt. 1712. Pl. 1 foot or procumbent.

Cult. The seeds of the *Underground-nut* require to be sown on a hot-bed, and when the plants have grown a sufficient size they should be planted singly into separate pots, and set in the stove among other tender annuals. After the plant has done flowering, and the pods begin to lengthen, the pedicels force them into the earth, where they ripen their seeds.

CCXXXVI. VOANDZE'IA (*Voandzou* is the name of the plant in Madagascar). Pet. Th. gen. mad. no. 777. D. C. prod. 2. p. 474.—Cryptólobus, Spreng. ex Bronn.

LIN. SYST. *Polygàmia, Monœ'cia.* Flowers polygamous, outer ones male, sterile and bibracteolate, with a campanulate calyx, and papilionaceous corolla, with horizontal wings. Stamens diadelphous. Style incurved, hairy. Female flowers usually solitary and fertile, borne on reflexed peduncles, with a campanulate calyx, but the corolla and stamens are wanting. Ovary 2-seeded. Style short, ending in a hooked stigma. Legumes subterraneous, roundish, fleshy, usually 1-seeded from abortion. —A tufted creeping herb, with trifoliate leaves on long petioles; the leaflets oblong, the terminal one stalked. Seeds esculent. The peduncles bend down, and penetrate the earth after the flowers have decayed and pods begin to form. This genus is allied to *Aràchis*, or more probably to *Amphicarpæ'a*, but the structure of the seeds is not sufficiently known to decide this point.

1 A. SUBTERRA'NEA (Pet. Th. l. c.) ⊙. S. Native of Madagascar, many parts of the continent of Africa within the tropics, Brazil, and Surinam. D. C. legum. mem. ii. t. 20. f. 106. Voándzou, Flac. mad. 118. Glýcine subterrànea, Lin. dec. 37. t. 17. Aràchis Africàna, Burm. ind. p. 22. Flowers yellow. In Surinam and various parts of Africa the seeds are very good, and are boiled in an unripe state like peas. They are also very good when ripe. The Surinam name of the plant is *Gobbe.*

Underground-podded Voandzou. Fl. June, Aug. Clt. 1823. Pl. ½ foot.

Cult. See *Aràchis* for culture and propagation.

CCXXXVII. PERA'LTEA (in honour of Joseph Peralt, of New Spain, who communicated dried specimens and seeds of plants to Humboldt). H. B. et Kunth, nov. gen. amer. 6. p. 469. D. C. legum. mem. xiii. D. C. prod. 2. p. 474.

LIN. SYST. *Diadélphia, Decándria.* Calyx furnished with 2 opposite bracteoles, which are longer than it, with a short tube, the 3 lower segments deep, elongated, and linear-lanceolate, the 2 superior ones joined into a lip, which is bidentate at the apex. Stamens diadelphous. Style filiform, simple at the apex. Legume oblong, compressed, flat, 4-8-seeded, apiculated by the style, sessile, winged on the seminiferous suture, and somewhat sheathed at the base by the lengthened torus. Embryo straight, with rather fleshy cotyledons.—Mexican subshrubs, clothed with silky villi. Leaves impari-pinnate, with many pairs of leaflets, the terminal one not remote from the rest. Pedicels twin, axillary, 1-flowered. Flowers large, purple. This genus is perhaps not distinct from *Brongniártia*, and probably both are referrible to tribe *Phaseòleæ*.

1 P. lupinoìdes (H. B. et Kunth, nov. gen. amer. 6. p. 471. t. 589.) leaflets clothed with silky wool, oval-oblong, obtuse at both ends, mucronate at the apex; ovary sessile; legume furnished with a narrow wing on the seminiferous suture. ♄. S. Native of New Spain, between Chilpancingo and Zumpango. Pedicels 5-10 lines long. Flowers violaceous.

Lupine-like Peraltea. Shrub 1 to 2 feet.

2 P. oxyphy′lla (D. C. legum. mem. xiii.) leaflets clothed with silky wool, 12-13 pairs, with the terminal one ovate-lanceolate, and very much acuminated; ovary nearly sessile. ♄. S. Native of New Spain. Peduncles an inch long. Corollas glabrous, and are, as well as the bracteas, very villous, 8-10 lines long. The immature pod is emarginate on the back. Stamens connected farther up than those of *P. lupinoìdes*.

Sharp-leaved Peraltea. Shrub 1 to 2 feet.

Cult. The species of *Peráltea* are very elegant when in flower; they thrive best in a mixture of loam, peat, and sand, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them in heat.

CCXXXVIII. BRONGNIA′RTIA (in honour of Adolph Brongniart, a distinguished botanist, one of the editors of Annales des Sciences Naturelles). H. B. et Kunth, nov. gen. amer. 6. p. 465. D. C. prod. 2. p. 475.

Lin. syst. *Diadélphia, Decándria*. The characters of the genus are the same as *Peráltea*, but differs in the legume being seated on a more distinct stipe, and in the seminiferous suture being without any wing. Perhaps it ought to be joined to *Peráltea*.

1 B. móllis (H. B. et Kunth, nov. gen. amer. 6. p. 465. t. 587.) leaves with 4-5 pairs of ovate-elliptic acute leaflets, which are puberulous above, but clothed with soft villous pubescence beneath, as well as on the margins. ♄. S. Native of New Spain, on the mountains between Zumpango and Tasco. Legume on a long pedicel. Flowers large, purple.

Soft Brongniartia. Shrub 1 to 2 feet.

2 B. podalyrioìdes (H. B. et Kunth, nov. gen. amer. 6. p. 465. t. 588.) leaves with 2-5 pairs of leaflets; leaflets elliptic-oblong, rounded, and mucronate at the apex, clothed with adpressed villi on both surfaces, but silky when young; branches and petioles glabrous. ♄. S. Native of New Spain, in warm places between Tasco and Cuernavaca. Legume on a short pedicel. Flowers large, purple.

Podalyria-like Brongniartia. Shrub 1 foot.

Cult. Elegant plants when in flower. For their culture and propagation see *Peráltea*.

CCXXXIX. ANDI′RA (the Brazilian name of some of the species). Lam. dict. 1. p. 171. Kunth, nov. gen. amer. 6. p. 385. D. C. prod. 2. p. 475.—Vouacapoùa, Aubl. guian. suppl. p. 10. t. 373.

Lin. syst. *Diadélphia, Decándria*. Calyx turbinately-campanulate, 5-toothed; teeth nearly equal, acute, and erect. Corolla papilionaceous, with a roundish emarginate vexillum, which is longer than the keel. Stamens diadelphous, 9 joined, and 1 free. Ovary 3-ovulate. Legume stipitate, rather orbicular, hard, 1-celled, 1-seeded, when mature it is divisible into 2 valves according to Swartz.—Unarmed trees, with impari-pinnate leaves, opposite petiolulate stipellate leaflets, and terminal panicles of purple flowers. This genus is nearly allied to *Geoffròya*, from which it is probably not distinct.

1 A. racemòsa (Lam. dict. 1. p. 17.) leaflets 13, ovate-oblong, acuminated, glabrous on both surfaces; flowers in panicled racemes; fruit obovate-globose, bluntly mucronate. ♄. S. Native of Cayenne and Brazil. Pison, bras. p. 81. f. 2. Geoffræ'a racemòsa, Poir. dict. 8. p. 182. Lam. ill. t. 604. f. 1. Vouacapoùa Americàna, Aubl. guian. suppl. p. 10. t. 373. Geoffræ'a Pisònis, Raeusch.

Racemose-flowered Andira. Clt. 1818. Tree 20 to 60 feet.

2 A. exce′lsa (H. B. et Kunth, nov. gen. amer. 6. p. 385.) leaflets 13, oblong, ending in a short acumen, obtuse at the base, glabrous; panicle simple; calyx urceolate, clothed with fine tomentum. ♄. S. Native of Mexico. Petiolules exstipulate, hairy. Flowers rose-coloured.

Tall Andira. Tree 40 feet.

3 A. ripa′ria (H. B. et Kunth, nov. gen. amer. 6. p. 385.) leaflets 13, oblong, acuminated, rounded at the base, quite glabrous, and shining above; panicle simple; calyx turbinately-campanulate, clothed with rusty down. ♄. S. Native of New Granada, on the banks of the river Magdalena near the mouth of the Rio Opon. Petiolules stipellate, glabrous. Flowers red.

River-side Andira. Tree 20 to 30 feet.

4 A. ine′rmis (H. B. et Kunth, nov. gen. amer. 6. p. 385 in a note,) leaflets 13-15, ovate-lanceolate, acute, glabrous on both surfaces; flowers panicled on short pedicels; calyx urceolate, clothed with rusty pubescence. ♄. S. Native of Jamaica, Trinidad, Martinico, Porto-Rico, St. Domingo, and Guiana, in woods and on river banks. Geoffræ'a inérmis, Swartz, fl. ind. occid. 1255. Wright in phil. trans. 1777. p. 512. t. 70. The bark of this tree is of a grey colour externally, but black and furrowed on the inside. The powder looks like jalap. It has a mucilaginous and sweetish taste, and a disagreeable smell. Its medical effects are great. When properly exhibited it operates as a powerful anthelmintic. It is given in the form of powder, decoction, syrup, and extract, but should always be given in small doses. The decoction is preferred, and is made by slowly boiling an ounce of the dried bark in a quart of water until it assumes the colour of Madeira wine. This sweetened is the syrup; evaporated it forms the extract. It commonly produces some sickness and purging, and sometimes violent effects, as vomiting, delirium, and fever, but these are usually the effects of an over dose, and are relieved by warm water, castor oil, or vegetable acid. The tree is called *Cabbage-tree*.

Unarmed Andira. Clt. 1773. Tree 20 to 30 feet.

5 A. retu′sa (H. B. et Kunth, nov. gen. amer. l. c. in a note,) leaflets 11-13, oval, retuse, and somewhat emarginate, glabrous on both surfaces. ♄. S. Native of Cayenne. Geoffræ'a retùsa, Lam. ill. 602. f. 2. dict. 8. p. 182.

Var. β, Surinaménsis (D. C. prod. 2. p. 476.) leaflets oblong. ♄. S. Native of Surinam. Geoffræ'a Surinaménsis, Bondt. monogr. p. 13. with a figure.

Retuse-leafletted Andira. Tree 20 to 30 feet.

† *A doubtful species.*

6 A.? Horsfie′ldii (Lesch. ann. mus. 16. p. 481. t. 12.) leaflets 3-5, oval, acute, glabrous; flowers disposed in loose racemes; calyx gibbous above at the base; legume olive-formed. ♄. S. Native of Java, on the mountains. Seeds bitter.

Flowers white. This plant ought to be removed from the present genus.

Horsfield's Andira. Shrub.

Cult. See *Geoffròya* for culture and propagation.

CCXL. GEOFFRO'YA (in honour of M. E. F. Geoffroy; he was author of a Materia Medica, and died in 1731.) Jacq. amer. 207. Lin. gen. no. 878. D. C. prod. 2. p. 476.—Acouròa, Aubl. guian. 3. p. 10. and 753.—Drakenstèinia, Neck. elem. no. 1344.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, half-5-cleft, somewhat bilabiate. Corolla papilionaceous, with the wings and keel about equal in length, but shorter than the vexillum. Stamens diadelphous, 9 joined, and one free. Ovary biovulate. Legume drupaceous, egg-shaped, 1-celled, 1-seeded, marked with a furrow on both sides, 2-valved inside. Seeds thick. Cotyledons fleshy. Embryo straight.—American thorny or unarmed trees, with impari-pinnate leaves, axillary racemes or panicles of flowers, and edible seeds. This genus is closely allied to *Amygdalàceæ*.

1 G. SPINÒSA (Jacq. amer. 207. t. 180. f. 62.) spines on the trunk and branches few, and subulate; leaflets 13-15, oblong, obtuse, glabrous. ♄. S. Native of Carthagena, in woods by the sea side, and perhaps of Brazil, if the Umàri of Marcgraff, brasil. p. 121. f. 1. be the same. Flowers of a dirty fulvous colour, diffusing widely a most fetid odour. The drupe is very like an almond, with a tomentose rind of a greenish yellow colour. The pulp is soft, sweet, and yellowish, has a nauseous smell, and stains the hand with rust colour not easily washed out. The nut or stone is white, adheres closely to the pulp, and contains a white kernel that has a farinaceous astringent taste. This plant having papilionaceous flowers, and a drupe for a fruit indicates the close relationship of *Leguminòsæ* with *Amygdalàceæ*, the following order.

Spinose Geoffroya. Clt. 1818. Tree 12 to 20 feet.

2 G. SPINULÒSA (Mart. reis. ex Schlecht. Linnæa. 5. p. 45.) trunk unarmed; branches covered with spongy bark; leaflets 7, ovate, obtuse, pubescent, and reticulated beneath; petioles winged, the wing spinulose at the base of the leaflets; racemes forming a spreading panicle. ♄. S. Native of Brazil.

Spinulose-leaved Geoffroya. Tree.

3 G. SUPE'RBA (Humb. et Bonpl. pl. equin. 2. p. 69. t. 100.) unarmed; leaflets 13-17, oblong, obtuse, somewhat emarginate; branches and calyxes pubescent. ♄. S. Native on the banks of the river Amazon near Tomependa, where it is called *Almendron* or *Almond*. Flowers yellow. Leaves nearly like those of the tamarind-tree (ex Kunth), shining and puberulous above, but glaucous and paler beneath (ex Bonpland), glabrous above, and pubescent beneath (ex D. C.). The fruit is much like that of the last species.

Superb Geoffroya. Tree 24 feet.

4 G. BREDEMEYE'RI (H. B. et Kunth, nov. gen. amer. 6. p. 379.) unarmed; leaflets 17-25, oblong, shining above, but with a few scattered hairs, pubescent beneath; adult branches glabrous; calyx clothed with canescent tomentum. ♄. S. Native of Caraccas, on dry hills and in valleys near New Valencia, and at Cumana. Robínia striàta, Willd. spec. 3. p. 1132. Flowers yellow. Drupe similar to the two preceding species.

Bredemeyer's Geoffroya. Shrub 6 to 8 feet.

5 G. PUBE'SCENS (Rich. in act. soc. hist. nat. par. p. 121.) unarmed; leaflets 11-13, elliptic-obovate, obtuse, and somewhat emarginate, clothed with white pubescence beneath, as well as the calyx. ♄. S. Native of Cayenne. Flowers pedunculate, purple. Leaflets 2 inches long, and about an inch broad.

Pubescent Geoffroya. Tree.

6 G. VERMI'FUGA (Mart. reis. ex Schlecht. Linnæa. 5. p. 44.) trunk unarmed; branches covered with spongy bark; leaves with 9-11 roundly elliptic leaflets, which are glabrous above; petioles wingless, furrowed, covered with rusty tomentum, as well as the primary veins of the leaves on the under surface; racemes panicled, pyramidal, clothed with fulvous tomentum, as well as the calyxes. ♄. S. Native of Brazil.

Vermifuge Geoffroya. Tree.

7 G. VIOLA'CEA (Pers. ench. 2. p. 278.) unarmed; leaflets 7, alternate, ovate-oblong, acuminated, and somewhat emarginate, glabrous on both surfaces. ♄. S. Native of Guiana, on the banks of rivers. Acouròa violàcea, Aubl. guian. 753. t. 301. Flowers violaceous.

Violaceous-flowered Geoffroya. Tree 50 feet.

8 G.? TOMENTÒSA (Poir. dict. 8. p. 181.) leaflets 11, oval, oblong, obtuse or emarginate, glabrous above, and tomentose beneath, as well as the calyxes, peduncles, and branches. ♄. S. Native of Senegal. Petals nearly equal, velvety on the outside. Stamens 8? monadelphous, very villous. Legume unknown. This is a very doubtful species of the present genus.

Tomentose Geoffroya. Tree.

Cult. The species of *Geoffròya* grow freely in sandy loam, or a mixture of loam and peat, and cuttings will strike root if planted in sand, with a hand-glass placed over them in heat.

CCXLI. BRO'WNEA (in honour of Patrick Browne, M.D., author of a history of Jamaica). Jacq. amer. 194. fragm. p. 24. exclusive of Palòvea. Lin. gen. no. 833. Lam. ill. 575. D. C. prod. 2. p. 476.

Lin. syst. *Monadélphia, Deca-Polyándria.* Bracteoles 2, constituting a bifid sheath to the calyx (f. *55. a.*). Calyx coloured, 5-cleft (f. *55. b.*), with the tube permanent, and the lobes long, usually cohering to each other in various ways. Petals 5 (f. *55. c.*), unguiculate (f. *55. e.*). Stamens 10-15, monadelphous, with the tube or sheath cleft longitudinally. Ovary furnished with a stipe, which is adnate to the calyx. Style filiform. Legume 1-celled, many-seeded, acinaciform, compressed. Seeds ovate, covered with fungous fibres.—Small American trees, with abruptly-pinnate leaves, when young they are flaccid, and with the leaflets revolute at the edges. Leaf-bud long and stipulaceous. Flowers elegant, of a rose scarlet colour, rising in fascicled heads from the axillary buds.

1 B. RÒSA (Pers. ench. 2. p. 237.) leaves with 2-3 pairs of oval-oblong acuminated leaflets; stamens twice the length of the corolla; branches and petioles glabrous: flowers in dense heads; leaflets of the involucrum roundish, imbricated, and when in a young state are rather velvety. ♄. S. Native of South America, about Porto-bello, also of Guadaloupe, where it is cultivated. Hermèsias, Lœfl. itin. 278. B. ròsa de monte, Ber. act. angl. 1771. p. 171. t. 8, 9. Lam. ill. 575. f. 3. B. speciòsa, of Reichb. in Sieb. fl. trin. exsic. no. 68. does not differ from the present plant unless in the stamens being less elongated. Flowers scarlet.

Rose Brownea. Fl. June, Aug. Clt. 1820. Shrub 8 feet.

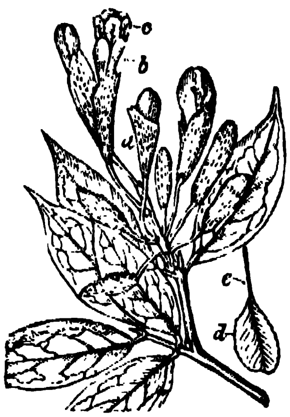
2 B. COCCÍNEA (Jacq. amer. 194. t. 121.) leaves with 2-3 pairs of oval-oblong, acuminated leaflets; flowers in fascicles; branches and petioles glabrous. ♄. S. Native of Venezuela, in hilly and woody places. Lam. ill. t. 575. f. 1. Calyx ferruginous. Corolla scarlet. Stamens 10.

Scarlet-flowered Brownea. Fl. July, Aug. Clt. 1793. Sh. 6 to 10 feet.

3 B. LATIFÒLIA (Jacq. fragm. p. 25. t. 17.) leaves with 1-3 pairs of ovate or obovate cuspidate leaflets; flowers in dense fascicles; involucrum tomentose; calyx compressed, with the two inferior lobes joined together into an emarginate lip. ♄. S. Native of Caraccas and Trinidad. Flowers red. Stamens 11.

Broad-leaved Brownea. Clt. 1824. Shrub 6 to 8 feet.

FIG. 55.



4 B. **racemòsa** (Jacq. fragm. p. 25. t. 16.) leaves with 4 pairs of unequal-sided, oblong or oblong-obovate, cuspidately-acuminated leaflets, which are glanduliferous at the base; flowers in racemes; involucrum and calyx clothed with fine tomentum; calyx apparently of 3 lobes, one free, and the 4 others joined by pairs. ♄. S. Native of Caraccas, at Guriepe, and of Trinidad. H. B. et Kunth, nov. gen. amer. 6. p. 312. Flowers rose-coloured. Stamens 11-12.

Racemose-flowered Brownea. Shrub 4 feet.

5 B. **capite'lla** (Jacq. fragm. p. 26. t. 18 and 19.) leaves with from 2-7 pairs of oblong cuspidate leaflets; flowers disposed in dense heads; ovary villous. ♄. S. Native of Caraccas, where it is called *Rosa-Macho*. Flowers scarlet.

Headed-flowered Brownea. Shrub 6 to 10 feet.

6 B. **leuca'ntha** (Jacq. fragm. p. 26. t. 20 and 21.) leaves with 6-8 pairs of oblong-lanceolate cuspidate leaflets, outer ones the largest, lower ones small, ovate, cordate; flowers disposed in heads. ♄. S. Native of Caraccas. Flowers white.

White-flowered Brownea. Shrub 8 feet.

7 B. **gra'ndiceps** (Jacq. coll. 3. p. 287. t. 22. f. a. i. fragm. t. 22 and 23.) leaves with usually 12 pairs of oblong-lanceolate glandless leaflets, ending in a long cuspidate acumen; branches and petioles pubescent; flowers in dense capitate spikes. ♄. S. Native of mountain woods at Caraccas, and in woods near Cumana, also of Trinidad. H. B. et Kunth, nov. gen. amer. 6. p. 313. Lam. ill. 575. f. 2. Corolla red. Stamens 11.

Large-headed Brownea. Clt. 1829. Tree 60 feet.

Cult. All the species of *Brównea* are very splendid when in bloom, and are therefore worthy a place in every collection of stove plants. A mixture of loam, peat, and sand is a soil well adapted for them, and care should be taken not to over water the plants in winter, as too great a supply of water at that season is almost sure to destroy them. Cuttings should be taken off from ripened wood, and planted in a pot of sand, and placed under a hand-glass in a moist heat, where they will strike root freely.

CCXLII. DI'PTERIX (from δὶς, *dis*, double, and πτερυξ, *pteryx*, a wing; in reference to the 2 upper lobes of the calyx, which appear like 2 wings). Schreb. gen. no. 1161. D. C. prod. 2. p. 477.—Baryósma, Pers. ench. 2. p. 278.

Lin. syst. *Monadélphia, Octo-Decándria.* Calyx turbinately tubular, 3-5-lobed, 2 superior lobes largest and wing-formed, and nearly opposite, the lower ones smaller. Petals 5, disposed into a papilionaceous corolla. Stamens 8-10, monadelphous, with the sheath or tube cleft longitudinally above. Style ascending. Legume ovate, rather compressed, thick, 2-valved, 1-celled, 1-seeded. Seed ovate-oblong, pendulous in the cell, exalbuminous. Embryo straight, with thick cotyledons.—Trees, with abruptly-pinnate coriaceous leaves, and panicles of flowers.

Sect. I. Coumarou'na (*Coumarou* is the name of the tree in Guiana). Aubl. guian. 2. p. 740. t. 296. Cumarùna, Lam. ill. t. 601.—Baryósma, Gærtn. fruct. 2. t. 93.—Heínzia, Scop. Stamens 8. Lower segment of calyx undivided; perhaps it is simple, or perhaps composed of 3 joined sepals.

1 D. **odora'ta** (Willd. spec. 3. p. 910.) leaves alternate, composed of 5-6 alternate leaflets; petiole marginated. ♄. S. Native of Guiana, in woods. Coumaroùna odoràta, Aubl. l. c. Baryósma Tónga, Gærtn. l. c. Flowers purple dashed with violet, disposed in racemose panicles. The seeds of this tree are the Tongo or Tonquin-beans, well known as giving a grateful scent to snuff. The Creoles put them into chests in order to drive away insects, as well as for their fragrance.

Sweet-scented Tonquin-bean. Clt. 1793. Tree 60 feet.

Sect. II. Tara'lea (*Tarala* is the name of the tree in Guiana). Aubl. guian. 2. p. 745. t. 298. D. C. prod. 2. p. 478.—Boldùcia, Neck. elem. no. 1342. Stamens 10; lower segments of the calyx 3 or only one, which is trifid.

2 D. **oppositifòlia** (Willd. spec. 3. p. 910.) leaves opposite, bearing 6-8 nearly opposite leaflets; petiole wingless. ♄. S. Native of Guiana, in woods. Taràlea oppositifòlia, Aubl. l. c. Baryósma oppositifòlia, Pers. ench. 2. p. 278. Flowers in axillary and terminal panicles, when blown their fragrance is very diffusive. Petals violaceous.

Opposite-leaved Tonquin-bean. Tree 60 feet.

Cult. These trees grow best in a loamy soil, and ripened cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them, in a moist heat.

Tribe X.

CASSIE'Æ (plants agreeing with *Cássia* in important characters). D. C. legum. mem. xiii. prod. 2. p. 478.—Cássiæ and Cérceæ, Bronn. diss. Lobes of calyx imbricate before expansion (f. 57. *a.*). Petals perigynous, nearly equal (f. 56. *b.* f. 57. *b.*), rarely somewhat papilionaceous, always imbricate in æstivation. Stamens distinct (f. 56. *c.* f. 57. *c.*), never with the filaments concrete. Legume usually dry, and 2-valved (f. 56. *c.* f. 58. *g.*). Cotyledons foliaceous, rarely fleshy. Leaves sometimes bipinnate, sometimes tripinnate, sometimes simply pinnate, but rarely simple. The habit variable. This tribe will need still to be further divided when the characters of the genera are better known. Some of the genera have the sepals joined at the base, or in a long tube, which is staminiferous at the apex.

CCXLIII. MORI'NGA (*Muringo* is the Malabar name of the first species). Burm. zeyl. 161. Lam. ill. t. 337. Gært. fruct. 2. p. 314. t. 147. Alandìna, Neck. elem. no. 1293.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5 nearly equal, oblong, deciduous sepals, which are a little concrete at the base. Petals 5, nearly equal, oblong, the upper one ascending. Stamens 10, unequal, separate, sometimes 5 of which are sterile. Style filiform, acute. Legume silique-formed, 3-valved. Seeds trigonal, exalbuminous, fixed to the centre of the fruit. Embryo straight, with thick oily cotyledons, which are inclosed within the spermaderm through germination. Plumule none.—Unarmed trees, with impari-bipinnate or tripinnate leaves. Racemes panicled. Legume constantly composed of 3 carpels, which are closely joined together, but which separate at maturity, leaving only the seminiferous sutures. Perhaps a proper tribe.

1 M. **pterygospe'rma** (Gærtn. fruct. 2. p. 314. t. 147.) legumes triquetrous; seeds trigonal, with the angles expanded into wings; leaves sub-bipinnate. ♄. S. Native of the East Indies and South America, where it has probably been introduced. Guilandìna Moringa, Lin. spec. 540. Hyperanthèra Moringa, Vahl. symb. 1. p. 30. Moringa oleífera, Lam. l. c. Anòma Moringa, Lour. coch. p. 279. Moringa Zeylánica, Pers. ench. 1. p. 460.—Rheed. mal. 6. t. 11.—Rumph. amb. t. 74. and t. 75. Flowers pale yellow, the upper petal whitish. The root of this tree when young is scraped, and used by the inhabitants of the places of its natural growth as horse-radish is in Europe, having much the same sharp taste, as have also the seeds.

Horse-radish-tree or *Winged-seeded* Moringa. Clt. 1759. Tree 20 to 30 feet.

2 M. POLYGÒNA (D. C. prod. 2. p. 478.) legumes many-angled; seeds trigonal, with the angles expanded into wings. ♄. S. Native of Bengal and other places in the East Indies. Anòma Morínga, Lour. 879. Hyperanthèra decándra, Willd. 2. p. 535. Burm. zeyl. t. 75? Flowers pale yellow. Perhaps only a variety of the preceding species.

Many-angled-fruited Moringa. Tree 15 to 20 feet.

3 M. A'PTERA (Gærtn. fruct. 2. p. 315.) legumes triquetrous; seeds trigonal, wingless. ♄. S. Native of the East Indies. Bálanus myrépsica, Black. herb. t. 386. Ben album officinale. Seeds snow white. Oil of ben is the produce of the seeds of this tree. It is a fixed, inodorous insipid oil, and is prepared in the Levant, in Egypt, Syria, and in Italy by expression. It is used very largely in perfumery, as a basis into which the art of the perfumer is able to infuse the fine fragrant scent of various delicate flowers, which do not of themselves retain a sufficient basis in which to fix their scent. Thus the great proportion of the oily essences of the shops is only perfumed oil of ben.

Wingless-seeded Moringa or Oil of ben-tree. Tree 15 to 20 ft.

4 M.? ARA'BICA (Pers. ench. 1. p. 460.) legume cylindrical, with 6 keels, articulately thickened; common petiole bearing glands between the pinnæ. ♄. S. Native of Arabia, near Beit-el-faklh. Hyperanthèra semidecándra, Forsk. descript. 67. Vahl. symb. 1. p. 30. Gymnócladus Arábica, Lam. dict. 1. p. 733. Hyperanthèra peregrìna, Spreng. syst. 2. p. 337.

Arabian Moringa. Tree 30 to 40 feet.

Cult. The species of *Moringa* thrive well in light loamy soil, and cuttings strike root readily in sand, under a hand-glass, in heat.

CCXLIV. GLEDI'TSCHIA (in honour of Gottlieb Gleditsch, of Leipsic, once a professor at Berlin, and defender of Linnæus against Siegesbeck; author of Methodus Fungorum, 1753; Systema Plantarum a Staminum situ, 1764, and many other smaller works). Lin. gen. 1159. Lam. ill. 857. D.C. prod. 2. p. 479.

LIN. SYST. *Polygàmia, Diœ'cia.* Flowers unisexual from abortion, or hermaphrodite. Calyx of 3-4-5 equal sepals, which are connected together at the base into a cupula. Petals equal in number to the sepals, rising from the tube of the calyx, sometimes fewer or abortive, or 2 of them are connected together into a carina. Stamens equal in number to the sepals, or fewer from abortion. Style short. Stigma pubescent above. Legume continuous, divided internally in many cells by dissepiments, furnished with more or less pulp, which surrounds the seeds, rarely 1-celled, 1-seeded, or dry. Seeds compressed.—Trees with the supra-axillary branches usually converted into branched spines. Leaves abruptly pinnate and bipinnate on the same tree. Flowers greenish, disposed in spikes.

1 G. TRIACA'NTHOS (Lin. spec. 1509.) spines robust, compressed at the base, but cylindrically conical at the apex, simple, or trifid; leaflets linear-oblong, lucid; legumes compressed, flat, a little twisted, many-seeded, 10 times or more longer than broad. ♄. H. Native of Virginia and Carolina, and other parts of North America. Duham. arb. 1. t. 105. ed. nov. 4. t. 25. Michx. fil. arb. 2. p. 164. t. 10. Hort. ang. t. 21. Wats. dend. brit. t. 138.—Pluk. mant. t. 352. f. 2. Spines supra-axillary. This tree is known in North America by the name of *Honey-locust*, and it is called by gardeners the *Three-thorned Acacia.*

Var. β, *inérmis* (D. C. prod. 2. p. 479.) stem unarmed; branches furnished with a few spines. ♄. S. D. C. legum. mem. ii. t. 22. f. 109. G. læ'vis, Hortul. Catesb. carol. 1. t. 43.—Pluk. alm. t. 123. f. 3.

Three-thorned Acacia or Honey-locust. Fl. June, July. Clt. 1700. Tree 30 to 50 feet.

2 G. BRACHYCA'RPA (Pursh, fl. amer. sept. 1. p. 221.) spines thick, short, and ternate; leaflets oblong, obtuse; legumes oblong, short. ♄. H. Native of Virginia and the Alleghany mountains. G. triacánthos β, Michx. fl. bor. amer. 2. p. 257. Compare Michx. fil. arb. 3. p. 171. Spines sometimes solitary.

Short-fruited Gleditschia. Fl. June, July. Tr. 30 to 50 feet.

3 G. MONOSPE'RMA (Walt. car. 254.) spines slender, few, usually trifid; leaflets ovate-oblong, acute; legumes flat, compressed, roundish, 1-seeded. ♄. H. Native of Carolina, Florida, and Illinois, in humid woods. Michx. fil. arb. 3. p. 169. t. 10. G. Carolinénsis, Lam. dict. 2. p. 461. G. triacántha, Gærtn. fruct. 2. p. 149. Mill. fig. t. 5.

One-seeded Gleditschia. Fl. June, July. Clt. 1723. Tree 30 to 40 feet.

4 G. SINE'NSIS (Lam. dict. 2. p. 465.) spines robust, conical, rameal ones simple or branched, cauline ones in fascicles, branched; leaflets ovate-elliptic, obtuse; legumes compressed, elongated. ♄. H. Native of China. D. C. legum. mem. i. t. 1. G. hórrida, Willd. spec. 4. p. 1098. Spines axillary. A tree beset with strong branched thorns.

China Gleditschia. Fl. June, Jul. Clt. 1774. Tr. 30 to 50 ft.

5 G. MACRACA'NTHA (Desf. arb. 2. p. 246.) spines strong; branched, conical, numerous; leaflets lanceolate, rather rigid; legumes elongated, thickened, pulpy inside. ♄. H. Native country unknown. Trunk very spiny; spines of the branches axillary. Leaflets nearly 2 inches long, crenately toothed. The pulp in the fruit is more austere than in any other species.

Long-spined Gleditschia. Fl. Ju. Jul. Clt. ? Tr. 40 to 50 ft.

6 G. FE'ROX (Desf. arb. 2. p. 247.) spines robust, much compressed, trifid; leaflets lanceolate, acute. ♄. H. Native country unknown. G. orientàlis, Bosc. Spines of the branches supra-axillary, large, compressed almost their whole length, furnished with short, lateral, opposite branchlets. The trunk of the tree is thickly beset with strong, branching thorns.

Fierce Gleditschia. Fl. Ju. Jul. Clt. ? Tree 30 to 50 feet.

7 G. CA'SPICA (Desf. arb. 2. p. 247.) spines slender, trifid, compressed; leaflets elliptic-lanceolate, obtuse. ♄. S. Native of Persia, at the Caspian sea, and at Lenkeran. Flowers and fruit unknown. Spines of the branches supra-axillary, decurrent along the bark at the base on all sides. Leaves usually bipinnate. Flowers and fruit unknown.

Caspian Gleditschia. Clt. 1822. Tree 30 to 40 feet.

8 G. I'NDICA (Pers. ench. 2. p. 623.) spines slender, conically-subulate, simple, or branched; leaflets elliptic-oblong, acutish. ♄. G. Native of Bengal. Spines axillary.

Indian Gleditschia. Clt. 1812. Tree.

† *The following names occur in the gardens, but they are in all probability synonymes of some of those above.*

1 *G. micracántha*, Lodd. cat. 2 *G. latisiliqua*, Lodd. cat.

Cult. The trees are remarkable in producing large strong branching thorns on the main stems. They will grow in any kind of soil, and are generally raised from seeds, which are usually procured from the native countries of the trees. The seeds may be sown one inch deep in a bed prepared for the purpose, and if the spring prove dry they will not vegetate until the second year. The first year from seed the plants should be sheltered from frost.

CCXLV. GYMNO'CLADUS (from γυμνος, *gymnos*, naked, and κλαδος, *klados*, a branch; appearance of branches). Lam. dict. 1. p. 733. ill. t. 823. D. C. prod. 2. p. 479.

LIN. SYST. *Diœ'cia, Decándria.* Flowers dioecious from abortion. Calyx tubular, 5-cleft. Petals 5, equal, oblong, exserted from the tube. Stamens 10, inclosed. Legume oblong, thick, filled with pulp inside.—An unarmed tree, with obtuse branches, bipinnate leaves, with 4-7 pairs of pinnæ, the lower pinna bearing 1 leaflet, the rest bearing 6-8 pairs of leaflets. Flowers white, disposed in racemes.

1 G. Canade'nsis (Lam. l. c. Michx. fl. bor. amer. 2. p. 241. t. 51.). ♄. H. Native of Canada, in woods, State of New York, Tenessee, Ohio, and Kentucky. Reich. mag. t. 40. Guilandìna dioíca, Lin. spec. 546. Hyperanthèra dioíca, Vahl. symb. 1. p. 31. Duham. arb. 1. t. 103. Bark of branches of a bluish ash-colour. Petals white.

Canadian Gymnocladus. Clt. 1748. Tree 30 to 40 feet.

Cult. A fine deciduous tree, with large, bipinnate leaves. It will grow in any common soil, and is increased by slips from the roots, which should be planted in spring, with their ends upwards.

CCXLVI. ANO'MA (*ανομος*, *anomos*, without law, irregular; the corolla as well as the legume are irregular). Lour. coch. p. 279. Juss. in ann. mus. 9. p. 327. D. C. prod. 2. p. 480.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5, nearly equal sepals, which are concrete at the base. Petals 5, oblong, nearly equal. Stamens 10, ascending, the 5 alternate ones sterile. Legume oblong, thick, 1-celled, 2-valved, many-seeded.—A small tree, with opposite, bipinnate leaves, according to Loureiro, but perhaps they are alternate and tripinnate, somewhat ovate, tomentose leaflets, and panicles of white flowers.

1 A. Cochinchine'nsis (Lour. l. c.). ♄. G. Native of Cochin-china, in woods. Hyperanthèra Cochinchinénsis, Willd. spec. 2. p. 537. Hypelàte Cochinchinénsis, Smith, in Rees' cycl. vol. 19.

Cochin-china Anoma. Tree.

Cult. See *Cæsalpínia* for culture and propagation, p. 432.

CCXLVII. GUILANDI'NA (in honour of Melchior Guilandinus, or Wieland, of Prussia, a great traveller, he succeeded Anquillara at Padua in 1561, and Tallopius in 1564; he died in 1589. His publications are, De Stirpibus, 1558, and De Papyro, in 1572). Lin. gen. no. 517. Juss. gen. 350. Gærtn. fruct. 2. t. 148. Lam. ill. t. 336. D. C. prod. 2. p. 480.—Bónduc, Plum. gen. 25. Guilandina species of Lin.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5 nearly equal sepals, joined together into a short tube at the base. Petals 5, sessile, nearly equal. Stamens 10, with the filaments villous at the base. Style short. Legume ovate, compressed, rather ventricose, echinated with prickles on the outside, 2-valved, 1-2-seeded. Seeds bony, shining, nearly globose, exalbuminous.—Trees and shrubs, furnished with hooked prickles both on the stems and petioles. Leaves abruptly bipinnate. Flowers yellow, disposed in racemose spikes. Bracteas elongated.

1 G. Bo'nduc (Lin. spec. 545.) leaves pubescent, velvety; leaflets ovate; prickles solitary; seeds yellow. ♄. S. Native of the East Indies, Africa, Arabia, and South America, on the sea-shore. Rumph. amb. 5. t. 48. G. Bónduc, var. *α*, màjus, D. C. prod. 2. p. 480. Flowers yellow. Seeds large, yellowish. Leaves with 7 pairs of pinnæ each, bearing as many pairs of leaflets. *Bondoq*, a necklace in Arabic; use of seeds.

Bonduc or Nicker-tree. Clt. 1640. Shrub 6 to 10 feet.

2 G. Bonduce'lla (Lin. spec. 545.) leaves pubescent; leaflets ovate-oblong; prickles twin; seeds grey. ♄. S. Native of the East Indies, Africa, and South America. Schrank, hort. mon. t. 68. Glycyrhìza aculeàta, Forsk. desc. 135.—Rumph. amb. t. 49. f. 1. This plant differs from the last in having much smaller leaves set closer together, and below each pair of leaflets are two short, stiff, crooked spines, which are opposite, not solitary, as in the last species. The seeds of this plant are usually used by boys instead of marbles, they being about the same size and shape. In Egypt the seeds of both this and the preceding are used by wömen, strung in necklaces, and hung about their children by way of amulet, to guard them from sorcery. They are often thrown on shore on the coast of Scotland and Ireland, and are called by the inhabitants of the former Molucca beans. The bark and seeds are bitter and tonic.

Small Bonduc or Nicker-tree. Clt. 1700. Sh. 6 to 8 feet.

3 G. cilia'ta (Berg. herb. Wicks. obs. fl. St. Barth. p. 411) branches clothed with rusty tomentum; leaves pubescent, with 3-6 pairs of pinnæ; leaflets nearly orbicular, oblique at the base, emarginate at the apex, pilose beneath at the base on the middle nerve. ♄. S. Native of the island of St. Bartholomew. Flowers in terminal, spicate racemes. Peduncles and pedicels clothed with rusty tomentum.

Ciliated Nicker-tree. Shrub.

4 G. microphy'lla (D. C. cat. hort. monsp. 114.) leaves smooth, with 3-4 pairs of opposite pinnæ, each pinna bearing 6-8 pairs of oval obtuse leaflets. ♄. S. Native country, flowers, and fruit unknown. Perhaps this species is referrible to the figure in Rumph. amb. 5. t. 49. f. 2.

Small-leaved Nicker-tree. Shrub.

5 G. gla'bra (Mill. dict. no. 3.) leaves glabrous, with 4 pairs of alternate pinnæ, pinna bearing oval, acute, opposite leaflets. ♄. S. Native about Campeachy.

Glabrous Nicker-tree. Tree.

6 G.? ge'mina (Lour. coch. 265.) leaves glabrous, simply pinnate; legumes 2 from the same flower. ♄. S. Native of Cochin-china, in woods. Leaves abruptly pinnate. Flowers yellow, disposed in terminal, branched racemes.

Twin-fruited Nicker-tree. Shrub 6 to 10 feet.

Cult. See *Cæsalpínia*, p. 432. for culture and propagation. The species require a considerable degree of heat to make them thrive.

CCXLVIII. COULTE'RIA (in honour of Thomas Coulter, M. D. author of a monograph on the natural order *Dipsàceæ*). H. B. et Kunth, nov. gen. amer. 6. p. 328. D. C. prod. 2. p. 480.—Adenocàlyx, Bertero, ined.—Tàra, Mol. chil. ed. 2. gall. p. 283. Schult. syst. 978.

Lin. syst. *Decándria, Monogýnia.* Calyx turbinate at the base, 5-cleft, the 4 upper lobes nearly equal, the lower one is larger and pectinately toothed, with glands. Petals 5, the upper one the largest. Stamens 10, with the filaments free and somewhat bearded at the base, and with a nectariferous gland on the upper side of the ovary. Style short. Stigma glandularly ciliated. Legume compressed, flat, spongy, hardly dehiscent but usually divided transversely into cells inside, 4-6-seeded. Embryo straight.—Shrubs or trees, native of South America, with spines in the axils of the leaves. Leaves abruptly bipinnate. Flowers yellow, disposed in racemes. Pedicels articulated, under the flower.

1 C. móllis (H. B. et Kunth, nov. gen. amer. 6. p. 328. in a note,) leaves, calyxes, and fruit clothed with velvety pubescence; leaflets oval-oblong, retuse; petioles unarmed; legumes stipitate, obtuse. ♄. S. Native of St. Martha. Adenocàlyx remòtus, Bert. ined. Cæsalpínia móllis, Spreng. syst. append. 169.

Soft Coulteria. Shrub 6 to 7 feet.

2 C. hórrida (H. B. et Kunth, nov. gen. amer. 6. p. 330. t. 568.) leaflets glabrous, oblong; petioles prickly; calyxes hairy; legumes glabrous, sessile, obliquely oblong. ♄. S. Native of the province of Popayan, near Carthagena.

Horrid Coulteria. Clt. 1824. Shrub 6 to 8 feet.

3 C. tinctòria (H. B. et Kunth, nov. gen. amer. 6. p. 330.) t. 569.) leaflets glabrous, oval, emarginate; petioles armed, sometimes somewhat puberulous; calyxes smoothish; legumes gla-

brous, curved, obtuse. ♄. S. Native of the province of Popayan, near Carthagena. Cæsalpínia pectinàta, Cav. præl. D. C. cat. hort. monsp. 84. Turp. dict. sc. nat. icon. Cæsalpínia tinctòria, Domb. ined. Cæsalpínia Tárra, Ruiz, et Pav. fl. per. 4. t. 376. Flowers orange-coloured. Legume 5-6-seeded. Leaves with 3 pairs of pinnæ, each pinna bearing 6 pairs of leaflets. The wood is used in dyeing.

Dyers' Tara. Clt. 1822. Shrub 6 to 10 feet.

4 C. Mexica'na (D. C. prod. 2. p. 481.) leaves, calyxes, and legumes glabrous; leaflets obovate, emarginate; legumes rather torose at the seeds, acuminated at both ends. ♄. S. Native of New Spain. Cæsalpínia vesicària, Sesse et Moc. fl. mex. icon. ined. Flowers yellow, but with the superior petal reddish. Stamens approximate. Leaves with 4 pairs of pinnæ.

Mexican Tara. Shrub.

5 C. Chile'nsis (D. C. prod. 2. p. 481.) flowers pentandrous. ♄. G. Native of Chili. Tàra tinctòria, Mol. chil. l. c. ex Schult. syst. 5. p. 407. The leaves are said to be opposite.

Chili Tara. Shrub.

Cult. See *Cæsalpinia* for culture and propagation, p. 432.

CCXLIX. CÆSALPI'NIA (in honour of Andreas Cæsalpinus, chief physician to Pope Clement VIII., the father of systematic arrangement in plants; in his work entitled De Planti Libri sedecem, Florence 4to. 1583. He died in 1602, at Rome). Plum. gen. 28. t. 9. Lin. gen. no. 516. Lam. ill. t. 335. Gærtn. fruct. 2. p. 144. D. C. legum. mem. xiii. prod. 2. p. 481.

Lin. syst. *Decándria, Monogýnia.* Calyx cup-shaped at the base, 5-lobed; lobes unequal, the lower one largest and a little arched. Petals 5, unequal, unguiculate, the upper one shorter than the rest. Stamens 10, with the filaments villous at the base and ascending; anthers all fertile. Style filiform. Legume unarmed, compressed, 2-valved. Seeds oval-oblong, compressed. Embryo with an elongated plumule.—Prickly or unarmed trees or shrubs, with abruptly bipinnate leaves, and simple or branched racemes of yellow flowers, with the pedicels bractless at the base.

Sect. I. Nuga'ria (*Nuga* is the Molucca name of the first species). D. C. legum. mem. xiii. Legume 1-2-seeded. Seeds very thick, transversely oblong. Calyx glabrous. Perhaps a proper genus, allied to *Moringa* or *Guilandina.*

1 C. Nu'ga (Ait. hort. kew. 3. p. 32.) primary petiole prickly beneath; leaves with 3-4 pairs of pinnæ, each pinna bearing 2-3 pairs of ovate, acute leaflets; flowers in racemose panicles. ♄. S. Native of the Moluccas. Rumph. amb. 5. t. 50. Guilandìna Nùga, Lin. spec. 546. Legume flat, short, ending in an incurved mucrone. Guilandìna Nùgæ of Burm. ind. 99. is very different from this plant in the simply pinnate leaves. Roots diuretic.

Nuga Brasiletto. Clt. 1801. Tree.

2 C. panicula'ta (Desf. cat. ed. 2. p. 210.) petioles and branches prickly; leaves with 2-4 pairs of pinnæ; leaflets oval; flowers panicled; pedicels longer than the flowers. ♄. S. Native of Malabar, in humid places. Guilandìna paniculàta, Lam. dict. 1. p. 435. Legume oval, acute at both ends.—Rheed. mal. 6. t. 19.

Panicled-flowered Brasiletto. Clt. 1817. Tree.

3 C.? axilla'ris (D. C. prod. 2. p. 481.) petioles and branches prickly; leaves simply pinnate; leaflets ovate, acute; flowers axillary, usually solitary. ♄. S. Native of Malabar, in woods. Guilandìna axillàris, Lam. dict. 1. p. 435.—Rheed. mal. 6. t. 20. Legume like those of the first species.

Axillary-flowered Cæsalpinia. Tree.

Sect. II. Brasile'ttia (*Brasiletto* is the name of *C. Brasiliénsis* in the Antilles). D. C. legum. mem. xiii. Legume oblong, acuminated at both ends, indehiscent, samaroid, 1-seeded. Seeds flat, transversely oblong. Calyx clothed with rufous down. Perhaps a proper genus.

4 C. sca'ndens (Roth, nov. spec. 209.) petioles and branches prickly; leaves with 3 pairs of pinnæ, each pinna bearing 4 pairs of ovate, acuminated leaflets, which are tomentose beneath; flowers disposed in loose panicles. ♄. S. Native of the East Indies. Legume roundish, oval, glabrous, 2 inches long and 1½ inch broad. Flowers and seeds unknown.

Climbing Brasiletto. Clt. 1800. Shrub cl.

5 C. Brasilie'nsis (Lin. spec. 544. exclusive of Catesby's synonyme) unarmed; leaves with 7-9 pairs of pinnæ, each pinna bearing about 15 or 16 pairs of oval-oblong, obtuse, glabrous leaflets; rachis and calyxes pubescent; racemes rather panicled; pedicels rather shorter than the corollas, flowers and stamens. ♄. S. Native of Jamaica, St. Domingo, and perhaps of Brazil, according to the name. This is the tree which affords the Brasiletto or Brazil-wood of commerce, much used in dyeing. It is an excellent timber wood, but seldom exceeds 8 or 10 inches in diameter. It is elastic, tough, and durable, and bearing a fine polish; it is of a beautiful orange and red colour, full of resin, and yields a fine tincture by infusion.

Common *Brasiletto.* Clt. 1739. Tree 20 feet.

6 C. fe'rrea (Martius, mss. in herb. Lamb.) unarmed, pubescent in every part; leaves with 3 pairs of pinnæ, each pinna bearing 4-6 pairs of elliptic, oblique leaflets; racemes panicled; legume oblong-ovate, mucronate, pedicellate. ♄. S. Native of Brazil, in the province of Bahia, where it is called *Pao-ferro* or *Iron-tree.*

Iron Brasiletto. Tree.

Sect. III. Sappa'nia (*Sappan* is the Malabar name of the tree). D. C. legum. mem. xiii. prod. 2. p. 482. Campècia, Adans. fam. 2. p. 318. Legume compressed, many-seeded, 1-celled, with dry valves. Seeds oblong. Upper petal short.

7 C. Sa'ppan (Lin. spec. 544.) leaves with 10-12 pairs of pinnæ, each pinna bearing 10-12 pairs of unequal-sided, obliquely oval-oblong leaflets, which are emarginate at the apex; flowers panicled; calyxes glabrous. ♄. S. Native of the East Indies. Roxb. cor. 1. t. 16.—Rheed. mal. 6. t. 2. Legume compressed, woody, glabrous, obliquely truncate at the apex. Flowers yellow. Ovary pubescent, ending in the short style. The uses of the wood of this tree in dyeing are numerous throughout Asia; it is an ingredient in the red dye on the coast of Coromandel, commonly called the chay dye. Where a cheap red is required for cotton cloth, the wood is employed by the Telinga dyers, but they cannot make it stand. The process of the Telinga dyers is as follows:—The cotton cloth is well washed, to remove any remains of the quick-lime, &c. used in bleaching; an infusion of half a pound of the powdered caducay in a pint and a half of cold water strained is employed to prepare the cloth, which is done by wetting it twice in the same infusion, drying it between and after. The following day it is twice wetted in a strong solution of alum, and as often dried in the sun. Next day a decoction of the Sappan-wood is prepared as follows: take 1 pound of Sappan-wood in powder, water 12 quarts, boil it till a third is consumed, divide the remaining 8 quarts into 3 parts, one of 4 and the other two of 2 quarts each; into the 4 quarts put the cloth, wet it well, wring it gently, and half dry it, it is again wetted in one of the small portions, and when half dry wetted for the third and last time in the other remaining portion of the decoction; dry in the shade, which finishes the process. The wood therefore seems to be possessed of nearly the same qualities as the Brasiletto or Brazil-wood.

Sappan Brasiletto. Clt. 1773. Tree 40 feet.

8 C. DI'GYNA (Rottl. ex Willd. nov. act. nat. cur. 1803. vol. 4. p. 198. t. 3.) prickly; leaves with 8-10 pairs of pinnæ, each pinna bearing 10-12 pairs of oblong-linear, obtuse leaflets; racemes simple; flowers usually digynous. ♄. S. Native of the East Indies. Ovary hairy. Stamens not exceeding the petals. Legumes 1-2, glabrous, ovate, oblong, ending in an incurved mucrone. Pedicels of flowers very long. Flowers yellow.

Digynous-flowered Brasiletto. Tree.

9 C. MIMOSOÌDES (Lam. dict. 1. p. 462. ill. t. 335. f. 2.) prickly; leaves with 6-12 pairs of pinnæ, each pinna bearing 8-12 pairs of oval-oblong, obtuse leaflets; racemes hispid; calyxes glabrous. ♄. S. Native of Malabar.—Rheed. mal. 6. t. 8. Leaves sensible to the touch. Flowers yellow. Legume oval-oblong, few-seeded, woolly.

Mimosa-like Brasiletto. Clt. 1806. Shrub 6 to 8 feet.

10 C. CUCULLA'TA (Roxb. hort. beng. p. 32.) prickly; prickles hooked; leaves with 4-5 pairs of pinnæ, each pinna bearing 4-5 pairs of elliptic, acuminated, glabrous leaflets; racemes forming terminal panicles; flowers crowded; upper segment of the calyx long, cucullate, and arched. ♄. ◡. S. Native of the East Indies. Flowers yellow. Legume unknown.

Cucullate-sepalled Brasiletto. Shrub cl.

11 C. TORTUÒSA (Roxb. hort. beng. p. 32.) prickly; prickles hooked; young branches and rachis clothed with rusty down; leaves with about 15 pairs of pinnæ, each pinna bearing 18-20 pairs of sessile, linear, oblong, retuse leaflets, which are glaucous beneath; flowers racemose; stamens length of petals. ♄. ◡. S. Native of Sumatra. Flowers yellow.

Twisted Brasiletto. Clt. 1820. Shrub cl.

12 C. MICROPHY'LLA (Martius, mss. in herb. Lamb.) unarmed; leaves with 8-10 pairs of pinnæ, each pinna bearing 8-10 pairs of small, oblong-roundish leaflets, which are pubescent and pale beneath, but shining above; rachis of leaves beset with pedicellate glands and pubescence; racemes terminal, simple; legume straight, acuminated, 3-4-seeded. ♄. S. Native of Brazil, in the desert of Bahia. Flowers yellow.

Small-leafletted Brasiletto. Shrub.

13 C. DESERTO'RUM (Martius, mss. in herb. Lamb.) unarmed; leaves usually with 1-2 pairs of pinnæ, each pinna bearing usually 7 broad, alternate, ovate-elliptic, glabrous leaflets, which are sessile and oblique at the base; racemes crowded with flowers, terminal, aggregate. ♄. S. Native of Brazil, in the desert of Bahia. Flowers yellow. Legumes unknown.

Desert Brasiletto. Tree.

14 C. BI'JUGA (Swartz, obs. 166.) prickly, but glabrous in every part; leaves with 2 pairs of pinnæ, each pinna bearing 2 pairs of obcordate leaflets; flowers panicled, on short pedicels. ♄. S. Native of Jamaica. Ponciàna bíjuga and Cæsalpínia vesicària, Lin. spec. 545.—Sloan. hist. 2. t. 181. f. 2, 3. Flowers yellow. Stamens equal in length to the corolla. Legume oval-oblong, few-seeded, black, furrowed. All parts of the tree have a strong balsamic scent when bruised. The leaflets are broad.

Two-paired-leaved Brasiletto. Clt. 1770. Tree 15 to 20 ft.

15 C. BAHAME'NSIS (Lam. dict. 1. p. 461.) prickly, but glabrous in every part; leaves with 3 pairs of pinnæ, each pinna bearing 3 pairs of obovate, emarginate leaflets; flowers panicled. ♄. S. Native of the Bahama islands. Catesb. car. 2. t. 51. Flowers whitish. Legume somewhat stipitate, linear, acute. The value of this wood for dycing has occasioned a scarcity of it in the Bahama islands.

Bahama Brasiletto. Tree.

16 C. CRI'STA (Lin. spec. 544.) prickly, but glabrous in every part; leaves with 1-3 pairs of pinnæ; leaflets obovate, nearly obcordate; racemes simple; pedicels thrice the length of the flowers; petals shorter than the calyx. ♄. S. Native of Jamaica. Plum. gen. 28. t. 9. Flowers yellow. Legume linear, somewhat stipitate, acute, glabrous, 7-8-seeded. Leaflets broad. Great quantities of the wood are sent yearly from the West Indies to England for dyeing, under the name of *Brazil-wood.*

Crested Brasiletto. Clt? Tree 15 to 20 feet.

17 C. GLANDULÒSA (Bert. in herb. Balb. D. C. prod. 2. p. 482.) prickly; leaves with 3 pairs of pinnæ, each pinna bearing 5 pairs of oval, glabrous leaflets, with glandular margins; racemes simple, and are as well as the calyxes pubescent. ♄. S. Native of St. Domingo. Legume sessile, flat, oblong-linear, apiculated by the style, beset with pubescence, and a few brown glands, which are only seen under a lens. C. Bertèrii, Spreng. in herb. Balb.

Glandular Brasiletto. Tree.

18 C. GLABRA'TA (H. B. et Kunth, nov. gen. amer. 6. p. 326.) unarmed, quite glabrous; leaves with 3-4 pairs of pinnæ, each pinna bearing 4-5 pairs of oblong-elliptic leaflets, which are rounded at both ends and coriaceous; racemes numerous, crowded at the tops of the branches; stamens hardly exceeding the corolla in length; legumes oblong, rather torulose. ♄. S. Native of Peru, between Caxamarca and Magdalena. Flowers yellow.

Glabrous Brasiletto. Tree.

19 C. CACALA'CO (Humb. et Bonpl. pl. equin. 2. t. 137.) prickly, glabrous; leaves with 4-5 pairs of pinnæ, each pinna bearing 3-4 pairs of obovate-roundish, emarginate, membranous, shining leaflets; racemes terminal, simple; rachis and pedicels rather hairy; stamens hardly exceeding the corolla; legumes torulose. ♄. S. Native of Mexico, between Chilpancingo and Zumpango. H. B. et Kunth, nov. gen. amer. 6. p. 328. *Cacalàco* is the vernacular name of the tree.

Cacalaco Brasiletto. Clt. 1824. Tree 10 to 20 feet.

20 C. PAPA'I (Ruiz, et Pav. fl. per. 4. t. 375.) unarmed; leaves impari-bipinnate, with 5-7 pairs of pinnæ, each pinna bearing 6-7 pairs of small, obtuse leaflets; racemes lateral; filaments filiform, hairy; legumes straight, mucronate. ♄. S. Native of Peru. Flowers small.

Papai Brasiletto. Shrub.

21 C. PRÆ'COX (Ruiz, et Pav. fl. per. 4. t. 376.) leaves abruptly bipinnate; petiole ending in a spine; pinnæ 3 pairs, each pinna bearing 5-7 pairs of small, emarginate leaflets; stipular spines strong, conical; legumes straight. ♄. S. Native of Peru.

Early Brasiletto. Tree.

22 C. EXOSTE'MMA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 483.) unarmed, glabrous; leaves with 3-4 pairs of pinnæ, each pinna bearing 3-4 pairs of ovate, obtuse leaflets; racemes terminal, simple; stamens twice the length of the corolla. ♄. S. Native of Mexico. Corolla yellow. Calyx and stamens reddish. This species comes very near *C. Cacaláco.*

Exserted-crowned Brasiletto. Tree 20 feet.

23 C. PULCHE'RRIMA; unarmed; petioles, calyx, and rachis of flowers clothed with rusty down; leaves with numerous pairs of pinnæ and leaflets; leaflets elliptic-lanceolate, oblique at the base and mucronate at the apex, pubescent beneath, with revolute edges; calyx rusty; racemes forming a terminal panicle ♄. S. Native of Brazil, in the province of Bahia, Martius. (v. s. in herb. Lamb.)

Very-fair Brasiletto. Tree.

24 C. SELLO'I; unarmed; young branches and rachis of leaves beset with glandular bristles; panicle, calyx, and under side of leaves rusty; leaves with numerous pairs of pinnæ and leaflets; leaflets lanceolate, mucronate, shining above; racemes forming a terminal panicle. ♄. S. Native of Brazil. Sello. Flowers yellow. (v. s. in herb. Lamb.)

Sello's Brasiletto. Tree.

Sect. IV. **Libidi'bia** (*Libidibi* is the name of the legume at Curaçoa). Legume oblong, spongy, incurved laterally, concrete between the seeds inside, and somewhat many-celled.

25 C. CORIA'RIA (Willd. spec. 2. p. 532.) unarmed, glabrous; leaves with 6-7 pairs of pinnæ, each pinna bearing 15-20 pairs of linear, obtuse leaflets; racemes panicled; pedicels shorter than the flowers. ♄. S. Native of Curaçoa, Carthagena, St. Domingo, in salt marshes by the sea-side. Ponciàna coriària, Jacq. amer. 123. t. 175. f. 36. C. coriària, Kunth, mim. t. 45. C. Thomæ'a, Spreng. in herb. Balb. The legumes are called *Libidibi*, and are used in tanning leather when ripe by the Spaniards and natives. The flowers are small and yellow.

Hide Brasiletto. Tree 15 to 20 feet.

26 C. DU'BIA (Spreng. syst. 2. p. 343.) leaves with 12 pairs of pinnæ, each pinna bearing 2-4 pairs of oblong, oblique, mucronate leaflets, which are discoloured beneath; racemes panicled, and are as well as the calyxes clothed with rusty down; legume 1-seeded, ♄. S. Native of Brazil. Sello.

Doubtful Brasiletto. Tree.

† *Species not sufficiently known.*

27 C. LEBBEKOÌDES (D. C. prod. 2. p. 483.) nearly unarmed, glabrous; leaves abruptly bipinnate, with 3-4 pairs of pinnæ, each pinna bearing 6-7 pairs of ovate, obtuse, unequal leaflets; legumes compressed, flat, elongated, linear, membranous. ♄. G. Native of China. Protuberances under the leaves almost spinose. Legume almost like that of *Acàcia Lébbek*. Umbilical funicle straight. Flowers unknown.

Lebbek-like Brasiletto. Tree.

28 C.? PUNCTA'TA (Willd. enum. 445.) unarmed; leaves impari-bipinnate; pinnæ impari-pinnate; leaflets elliptic, obtuse, mucronate, dotted. ♄. S. Native of Brazil. Ponciàna punctàta, Poir. suppl. 4. p. 449. The dots on the leaves vanish on drying. Perhaps a species of *Moringa*.

Dotted-leaved Brasiletto. Clt. 1820. Shrub 6 feet.

29 C.? ECHINA'TA (Lam. dict. 1. p. 461.) prickly; leaves bipinnate; leaflets ovate, obtuse; legumes echinated. ♄. S. Native of Brazil, where the wood is used for dyeing. Guilandìna echinàta, Spreng. syst. 2. p. 327. Perhaps a true species of *Guilandìna*. Flowers yellow. This species is said to produce the best Brazil-wood or *Brasiletto*.

Echinated-podded Brasiletto. Tree.

30 C.? CASSIOÌDES (Willd. enum. 444.) stipulas spinose; leaves with 2-3 pairs of pinnæ, each pinna bearing 6-7 pairs of oblong, retuse leaflets; petioles rather pilose. ♄. S. Native of South America. Ponciàna cassioìdes, Poir. suppl. 4. p. 448. Flowers and legumes unknown.

Cassia-like Brasiletto. Clt. 1821. Shrub.

31 C.? MUCRONA'TA (Willd. enum. 444.) prickly; leaves bipinnate, with 3 pairs of pinnæ, each pinna bearing 7 pairs of oblong, obtuse, mucronate, glabrous leaflets. ♄. S. Native of Brazil. Ponciana mucronàta, Poir. l. c. Flowers and legumes unknown.

Mucronate-leafletted Brasiletto. Shrub.

32 C.? PLUVIÒSA (D. C. prod. 2. p. 483.) unarmed; leaves impari-bipinnate, with 6-8 pairs of pinnæ, which are abruptly pinnate, bearing 10-12 pairs of unequal, rhomboid-ovate, glabrous leaflets; gland axillary, ovate; racemes terminal; pedicels and calyxes clothed with rufous velvety down. ♄. S. Native of Brazil. Cubæ'a pluviòsa, Leandr. sacr. ined. According to the testimony of Leandre, water flows from the young branches, and falls from them in drops like rain. The superior segment of the calyx is longer than the rest. The vexillum is shorter than the other petals. Stamens with the filaments villous at the base. Legume 1-celled, few-seeded. All ex Leandr.

Rainy Brasiletto. Tree 40 to 60 feet.

33 C. PROCE'RA (Poppig. ex Spreng. syst. 2. p. 343.) leaves simply pinnate, with many pairs of oblong-linear, obtuse, glabrous leaflets; racemes few-flowered; stamens about equal in length to the corolla. ♄. S. Native of Cuba. Flowers yellow.

Tall Brasiletto. Clt. 1824. Tree.

† *Species only known by name from Roxburgh's Hortus Bengalensis, p. 32. and p. 90.*

1 *C. enneaphýlla*, Roxb. 2 *C. oleospérma*, Roxb. 3 *C. Chinénsis*, Roxb. 4 *C. lácerans*, Roxb. 5 *C. resupinàta*, Roxb. 6 *C. paniculàta*, Roxb. 7 *C. Sumatràna*, Roxb. 8 *C. polyphýlla*, Roxb.

Cult. Cæsalpínia is a genus of fine flowering trees and shrubs, but in our collections they are never allowed to grow to a size large enough for flowering, in consequence of their being prickly, and are not admired on that account. A mixture of loam and peat suits them best. Cuttings are difficult to root, but sometimes will succeed if taken off from the mother plant in a growing state and planted in sand, with a hand-glass placed over them in a moist heat.

CCL. POINCIA'NA (in honour of M. de Poinci, once governor of the Antilles, and a patron of botany). Lin. gen. 515. Lam. ill. t. 333. Gærtn. fruct. 2. t. 150. D. C. prod. 2. p. 483. —Poíncia, Neck. elem. 1282.

Lin. syst. *Decándria, Monogýnia*. Calyx cup-shaped at the base, permanent, 5-cleft, lower segment arched. Petals 5, stipitate, upper one difformed. Stamens 10, very long, all fertile, with the filaments hairy at the base. Style very long. Legume flat, compressed, 2-valved, somewhat many-celled from the seeds being separated by a kind of cellular spongy substance. Seeds obovate, compressed, with the endupleura gelatinous when placed in water. Embryo with flat cotyledons, and an oval plumule.—Very elegant prickly or unarmed shrubs and trees, with abruptly-bipinnate leaves, and corymbous panicles of shewy flowers, on long bractless pedicels.

1 P. PULCHE'RRIMA (Lin. spec. 554.) prickly; leaflets obovate; calyx glabrous; petals on long stipes, fringed. ♄. S. Native of the East Indies and tropical Africa, from whence it has migrated to South America and the West India Islands. Reich. gart. mag. t. 93. D. C. legum. mem. xi. t. 23. f. 111. Sims, bot. mag. 995.—Merian. sur. t. 45.—Rheed. mal. 6. t. 1.—Rumph. amb. 4. t. 20. Cæsalpínia pulchérrima, Swartz, obs. 166. To this species the *P. pulchérrima*, *P. alàta*, and *P. trijuga* of Burm. ind. p. 333. appertain. The Barbadoes flower-fence is planted in the West Indies as hedges to divide the lands, whence the English name. It is called *Spanish carnation* in some of our West Indian colonies. Sir Hans Sloane calls it *wild-senna*, and Dr. Browne calls it *Barbadoes-pride*. Its French name is *Pounciade* or *fleurs de Paradis*. Ligon says the seeds were first carried to Barbadoes from the Cape de Verd Islands. The flowers are beautifully variegated with a deep red or deep orange colour, yellow, and some spots of green; they have a very agreeable odour, sometimes the flowers are deep orange, and sometimes yellow, without any admixture. All parts of the plant are thought to be very powerful amenegogues, and are frequently used for that purpose among the negroes.

Beautiful Barbadoes-flower-fence. Fl. Jul. Sept. Clt. 1691. Shrub 6 to 8 feet.

2 P. INSI'GNIS (Kunth, mim. t. 44. H. B. et Kunth, nov. gen. amer. 6. p. 333.) prickly; calyx glabrous; petals entire, standing on very short stipes. ♄. S. Native of South America. Flowers copper-coloured, painted with purple veins.

Noble Flower-fence. Fl. June, July. Clt. 1823. Shrub 6 to 10 feet.

3 P. ELA'TA (Lin. spec. 554.) unarmed; leaflets linear, obtuse,

ending in a small acumen; calyx clothed with velvety tomentum; petals fringed, on long stipes. ♄. S. Native of the East Indies and Abyssinia. Cæsalpínia elàta, Swartz, obs. 166. Leaves with 5-6 pairs of pinnæ, each pinna bearing many pairs of small leaflets, which are clothed with white tomentum beneath. Flowers with yellow petals, and dark purple filaments. Buds and pods silky.

Tall Flower-fence. Clt. 1778. Tree 15 to 20 feet.

4 P. Roxbu'rghii; unarmed; branches and panicle clothed with rusty down; leaves with 11 pairs of pinnæ, each pinna bearing 18-20 pairs of trapezoid-oblong, retuse leaflets; calyx and legumes woolly; petals fringed, stipitate. ♄. S. Native of the East Indies. Cæsalpínia inérmis, Roxb. hort. beng. p. 90. but not of Lin. Flowers with yellow petals, and purple filaments.

Roxburgh's Flower-fence. Tree.

5 P. compre'ssa (Sesse et Moc. in herb. Lamb.) unarmed; leaves with 3 pairs of pinnæ, each pinna bearing 4-5 pairs of elliptic, obtuse, emarginate, glaucous leaflets; petals entire, about twice the length of the calyx, on short stipes; stamens much exserted. ♄. S. Native of Mexico and Peru. Racemes terminal, simple. Pedicels an inch long. Flowers with yellow petals and purplish stamens.

Compressed Flower-fence. Shrub 8 to 10 feet.

6 P. hi'spida; branches beset with stiff curved bristles; leaves with 10 pairs of pinnæ, each pinna bearing 10-11 pairs of obovate emarginate leaflets, with a bristle in the notch at the end; petals crenated, on short stipes. ♄. S. Native of Mexico, Pavon. Racemes terminal, few-flowered. Pedicels 2 inches long. Flowers apparently yellow. (v. s. in herb. Lamb.)

Hispid Flower-fence. Shrub 6 to 10 feet.

7 P. Gillie'sii (Hook. bot. misc. 1. p. 129. t. 34.) unarmed; leaves bipinnate; leaflets oblong; petals glandular, denticulately-ciliated at the apex; legume acinaciform, glandular, 1-celled, dry. ♄. S. Native of Chili, about Mendoza. Flowers sulphur-coloured; they have a sickly disagreeable smell, and are considered by the common people in Chili to be injurious to the sight; hence the vernacular name *mal de ozos*. The shrub will not grow unless in irrigated places.

Gillies's Flower-fence. Shrub 4 to 6 feet.

Cult. Beautiful shrubs, with very showy flowers, and are therefore worth cultivating in every collection of stove plants. They require to be kept in a strong heat to have them to flower freely. A mixture of loam and peat is the best soil for them. Young cuttings may be rooted if planted in a pot of sand, with a hand-glass placed over them, in a moist heat; but the plants are usually raised from seeds received from abroad.

CCLI. MEZONEU'RUM (from *μεσος, mesos*, the middle, and *νευρον, neuron*, a nerve; in reference to the seminiferous suture of the pod being expanded into a wing). Desf. mem. mus. 4. p. 245. D. C. prod. 2. p. 484.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5 sepals, which are concrete at the base; the lower one arched, involving the others, which are orbicular before expansion. Petals 5, unguiculate, upper one the smallest. Stamens 10, declinate, villous at the base. Style incurved. Legume foliaceous, flat, ovate-oblong, indehiscent, 1-celled, many-seeded, having the seminiferous suture expanded into a wing.—Trees, with abruptly and oppositely bipinnate leaves, having twin hooked prickles at the base of each pair of pinnæ. Racemes simple, bractless. This genus is nearly allied to *Cæsalpínia*, but it is distinguished from it by the winged legume.

1 M. gla'brum (Desf. l. c. t. 10.) leaves glabrous; legume very flat. ♄. S. Native of the Island of Timor.

Glabrous Mezoneurum. Tree 20 feet.

2 M. pube'scens (Desf. l. c. t. 11.) leaves pubescent; legume inflated and reticulated in the middle part. ♄. S. Native of Java.

Pubescent Mezoneurum. Tree 20 feet.

Cult. See *Poinciàna* for culture and propagation.

CCLII. REICHA'RDIA (in honour of John James Reichard, author of a Systema Plantarum, 4 vol. 8vo. Frankfort, 1779 and 1780., and other botanical works). Roth, nov. spec. 210. but not of his bot. abhandl. nor of his cat. bot. D. C. prod. 2. p. 484.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, joined into a campanulate crenulated calyx. Petals 6-10, unequal, disposed in a somewhat papilionaceous manner. Stamens 10, declinate, distinct, cohering together beneath the middle by a beard. Ovary somewhat pedicellate. Style filiform. Stigma dilated. Legume samaroid, ending in an oblong wing. This genus is not sufficiently known.

1 R. hexape'tala (Roth. l. c.) corolla 6-petalled; leaves abruptly bipinnate, and are, as well as the stems, prickly. ♄. S. Native of the East Indies. Cæsalpínia ligulàta, Heyne ex Roth. Flowers about the size of those of *E'rvum*.

Six-petalled Reichardia. Clt. 1824. Tree 10 feet.

2 R.? decape'tala (Roth, l. c.) corolla 10-petalled; leaves abruptly and simply pinnate; stem prickly. ♄. S. Native of the East Indies. Cæsalpínia, spec. nov. Heyne ex Roth. Legume unknown.

Ten-petalled Reichardia. Tree.

Cult. See *Poinciàna* for culture and propagation.

CCLIII. LABI'CHEA (in memory of M. Labiche, an officer of the French ship Uranie, who accompanied Freycenet in his voyage round the world; he died on his passage to the Moluccas). Gaud. in Freycenet, voy. part. bot. p. 486. t. 16.

Lin. syst. *Diándria, Monogýnia.* Calyx of 5 sepals, nearly regular, deciduous. Petals 5, roundish-obovate, rather orbicular, nearly equal, spreading, exceeding the calyx. Stamens 2, hypogynous; filaments very short; anthers 2-celled, thick, arched, unequal, opening by a suboperculate pore. Ovary on a short stipe, obliquely ovate-oblong, compressed, ending in a subulate style, containing 2 ovula. Stigma simple. Fruit unknown.—An unarmed shrub, with alternate, sessile, imparipinnate leaves, bearing 1-5 pairs of opposite, lanceolate, mucronate, coriaceous leaflets. Stipulas petiolar, minute. Racemes terminal, many-flowered. Flowers alternate, pedicellate, yellow. Pedicels bracteate at the base.

1 L. cassioìdes (Gaud. l. c.) ♄. G. Native of New Holland, on the western coast, at a place called in French Baie des chiens marins, and in English Shark's Bay.

Cassia-like Labichea. Shrub 3 to 4 feet.

Cult. This shrub will grow well in a mixture of loam and peat, and cuttings will probably root if planted in a pot of sand, with a bell-glass placed over them.

CCLIV. HOFFMANSE'GGIA (in honour of John C. Hoffmansegg, author of Flore Portugaise, in conjunction with Link Berlin, 1806 and following years). Cav. icon. 4. p. 63. D. C. prod. 2. p. 484.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, joined at the base, permanent. Petals 5, unguiculate, spreading, glandular at the base, the superior one the broadest. Stamens 10, with the filaments beset with glandular pili, one of which is usually castrated. Stigma clavate. Legume linear, compressed, dry, many-seeded.—Herbs or subshrubs, with bipinnate leaves, the pinnæ sometimes abruptly, sometimes impari-pinnate, and with a pedicellate gland at the base of the petiole on one or both sides. Racemes opposite the leaves. Flowers yellow.

1 H. falca'ria (Cav. icon. 4. t. 392.) stems decumbent, hardly suffruticose; leaves with 3-6 pairs of pinnæ, with an odd one, each pinna bearing 3-6 pairs of oval-oblong, glaucous leaflets; legumes falciform. ♃. S. Native of Chili, on the mountains about Mendosa, and of Peru. Lárrea glaúca, Ort. dec. p. 15. Root creeping, tuberous. Flowers yellow.

Sickle-podded Hoffmanseggia. Fl. July, Aug. Clt. 1806. Pl. decumbent.

2 H. trifolia'ta (Cav. icon. 4. t. 393. f. 1.) stems almost wanting; leaves with 3 pinnæ; leaflets ovate, hoary from tomentum; legumes straight, villous. ♃. S. Native of South America, near Port Desire. Flowers yellow.

Trifoliate Hoffmanseggia. Pl. ½ foot.

3 H. prostra'ta (Lag. in litt. ex D. C. prod. 2. p. 485.) stems almost wanting; leaves with 2 pairs of pinnæ, without an odd one; leaflets ovate-oblong, rather villous; legumes straight, pubescent. ♃. S. Native of Peru, about Lima. Flowers yellow.

Prostrate Hoffmanseggia. Pl. ¼ foot, prostrate.

4 H. pilòsa; stems wanting; leaves radical, with 3 pairs of pinnæ, each pinna bearing numerous, crowded, imbricate leaflets; racemes radical, simple, few-flowered. ♃. S. Native of Peru. Cæsalpínia pilòsa, Ruiz et Pav. in herb. Lamb. Petioles and peduncles very pilose. Root tapering. Flowers yellow.

Pilose Hoffmanseggia. Pl. ¼ foot.

Cult. The species of this genus are small herbaceous plants. They grow best in a mixture of peat and loam, and are increased by seeds, which will ripen in this country.

CCLV. MELANOSTI'CTA (from μελας, *melas*, black, and στικτος, *stictos*, marked; in reference to the leaves and calyxes being beset with black glands, which have the appearance of [illegible] legum. mem. xii. prod. 2. p. 485.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, nearly equal, joined together at the base into a short permanent tube, but free at the apex, and deciduous. Petals 5, nearly equal, elliptic, attenuated at the base, length of the calyx. Stamens 10, distinct; filaments rather villous at the base from branched hairs. Legume compressed, ovate-oblong, hairy, 4-ovulate.—A humble shrub, native of the Cape of Good Hope, with somewhat fascicled roots, some of which are cylindrical, and others thickened into tubers. Leaves bipinnate, with 2 pairs of pinnæ, each pinna bearing 6-8 pairs of leaflets, with the terminal leaflet elongated. Stipulas pinnatifid. Racemes elongated. This genus is very nearly related to *Pomària*, but the fruit is not sufficiently known.

1 M. Burche'llii (D. C. l. c. t. 69.) ♄. G. Native of the Cape of Good Hope. Burch. cat. no. 2345. Cæsalpínia Melanostícta, Spreng. syst. append. p. 169. Leaves and calyxes dotted with black sessile glands, whence the generic name.

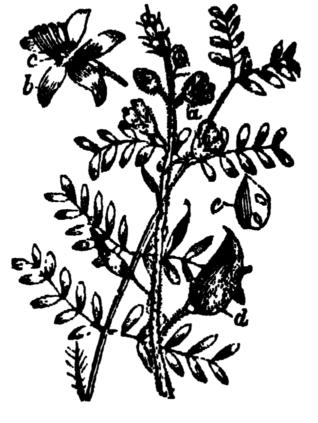
Burchell's Melanosticta. Shrub 1 foot.

Cult. See *Hoffmanséggia* for culture and propagation. The plant is increased by dividing at the root.

CCLVI. POMA'RIA (in honour of — Pomar, physician to Philip III. of Spain). Cav. icon. 5. p. 1. t. 402. D. C. prod. 2. p. 485.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, joined at the base into a short tube, 5-cleft at the apex (f. 56. *a.*), the segments deciduous. Petals 5 (f. 56. *b.*), on short claws, the uppermost one concave, and shorter than the rest. Stamens 10, free (f. 56. *c.*), declinate, hairy at the base (f. 56. *c.*). Style filiform, crowned by a capitate stigma. Legume oblong, compressed (f. 56. *d.*), 2-valved, 1-celled, 2-seeded (f. 56. *e.*). Seeds ovate.—A shrub, with abruptly bipinnate leaves, pinnatifid stipulas, and axillary racemes of flowers. Branches, calyxes, and corollas beset with glands. This genus is very nearly allied to *Hoffmanséggia.*

FIG. 56.



1 P. glandulòsa (Cav. l. c.) ♄. S. Native of New Spain, near Queretaro, and of North America, on the banks of the Canadian river. Flowers yellow.

Glandular Pomaria. Shrub 6 feet.

Cult. See *Hoffmanséggia* for culture and propagation.

CCLVII. HÆMATO'XYLON (from αἱμα, *haima*, blood, and ξυλον, *xylon*, wood; logwood is well known for its red colour). Lin. gen. no. 525. Lam. ill. t. 340. D. C. prod. 2. p. 485.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-lobed, the tube permanent, but the lobes are deciduous, oblong, and obtuse. Petals 5, hardly longer than the calyx. Stamens 10; filaments pilose at the base; anthers glandless. Style capillary. Legume compressed, flat, lanceolate, acuminated at both ends, 1-celled, 2-seeded, with the sutures indehiscent, but the valves burst longitudinally to relieve the seeds. Seeds transversely oblong. Cotyledons 2-lobed.—A tree, with unarmed branches, or with spines under the leaves. Flowers racemose, hermaphrodite.

1 H. Campechia'num (Lin. spec. 549.) ♄. S. Native of the Bay of Campeachy at Honduras, and other parts of the Spanish West Indies, but now cultivated in Jamaica and other West India Islands, &c. Plench. icon. t. 329. Woodv. med. bot. p. 48. t. 17. Cat. car. 3. t. 66. Sloan. hist. 2. t. 10. f. 1-4. Leaves abruptly-pinnate, in fascicles; leaflets obovate, obcordate. Flowers yellow. Logwood is generally crooked, and seldom thicker than a man's thigh. It was first cultivated in Jamaica in 1715 from seeds brought from the Bay of Campeachy. It makes impenetrable and beautiful fences. Both the bark and wood are gentle subastringents; but the last excels, and adds a sweetness to its virtue, which makes it more agreeable to the palate. The wood is principally used in dyeing.

Campeachy or Common Logwood. Clt. 1732. Tree 20 ft.

Cult. Logwood grows well in a mixture of sand and peat; and cuttings will root if planted in a pot of sand, with a hand-glass placed over them in heat; but the plants are generally raised from seeds sent or brought from the West Indies.

CCLVIII. PARKINSO'NIA (in honour of John Parkinson, an apothecary of London, author of Paradisis Terrestris, 1629, and Theatrum Botanicum, 1649). Plum. gen. 25. Lin. gen. no. 513. Lam. ill. t. 336. D. C. prod. 2. p. 485.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, equal, spreadingly reflexed. Petals 5, ovate, flat, upper one roundish, on a long claw. Stamens 10, rather declinate, a little longer than the claw of the superior petal. Style filiform, rather ascending. Legume linear-oblong, acuminated at both ends, torose at the seeds, but compressed between them. Seeds oblong, with the endopleura tumid, and with a linear hylum. Embryo with oblong cotyledons, and an ovate radicle.—A shrub, furnished with solitary or tern straight prickles or spines. Leaves pinnate; leaflets usually deciduous or abortive. Petioles linear, very long, winged. Racemes loose. Flowers beautiful yellow.

1 P. aculea'ta (Lin. hort. cliff. 157. t. 13.) ♄. S. Native of

South America and the West India Islands, and now cultivated in most parts of the world within the tropics. Jacq. amer. 121. t. 80. pict. 62. t. 119. D. C. legum. mem. xi. t. 21. f. 112. germ. Flowers yellow, sweet-scented, disposed in pendulous racemes. In Jamaica the shrub is called *Jerusalem-thorn*, and the French in the West Indies call it *Genet épineux*.

Prickly Parkinsonia. Clt. 1739. Shrub 8 to 10 feet.

Cult. This is a most elegant shrub in the West Indies when in flower, but in our stoves it is seldom preserved throughout the winter, although seeds of it are received annually from the West Indies, and great numbers of plants raised yearly.

CCLIX. CA'DIA (*Kadi* is the Arabic name of the tree). Forsk. descr. p. 90. D. C. prod. 2. p. 486.

LIN. SYST. *Decándria, Monogýnia.* Calyx campanulate, 5-cleft, glandular on the inside of the tube at the base. Petals 5, equal, inserted in the calyx. Stamens 10, with the filaments gibbously geniculated at the base; anthers glandless. Ovary pedicellate. Stigma sessile, acute. Legume linear, many seeded, 2-valved, on a short stipe.—An unarmed shrub, with impari-pinnate leaves, linear, opposite or alternate leaflets, and pedicellate solitary flowers.

1 C. VA'RIA (Lher. diss. in mag. ency. 5. p. 29.) ♄. G. Native of Arabia Felix. C. purpùrea, Willd. spec. 548. Spændóncea tamarindifòlia, Desf. dec. phil. 7. p. 259. Panciática purpùrea, Piccio, diss. Corolla at first white, but as it fades it becomes rose-coloured.

Variable Cadia. Clt. 1777. Shrub 5 to 6 feet.

Cult. See *Ceratònia* for culture and propagation.

CCLX. ZUCCA'GNIA (in honour of Attilius Zuccagni, M.D. once director of the botanic garden at Florence). Cav. icon. 5. p. 2. t. 403. but not of Thunb. D. C. prod. 2. p. 486.

LIN. SYST. *Decándria, Monogýnia.* Calyx 5-lobed, with a turbinate tube, and oblong obtuse lobes, the lower one rather the longest. Petals 5, ovate, the upper one broader and concave. Stamens 10, nearly equal, pilose at the base. Style filiform. Stigma funnel-shaped. Legume nearly ovate, compressed, 1-celled, 2-valved, 1-seeded, hairy. Seed fixed to the top of the suture.—Clammy shrubs, with abruptly pinnate leaves, and racemes of saffron-coloured flowers.

1 Z. PUNCTA'TA (Cav. icon. 5. p. 2. t. 403.) clammy; leaves abruptly pinnate; racemes terminal. ♄. G. Native of Chili, on the mountains. Flowers saffron-coloured.

Dotted Zuccagnia. Shrub 4 to 5 feet.

2 Z.? ANGULA'TA (Hook. in Beech. voy. p. 22.) stems glabrous, and branches angular; leaves conjugately-pinnate and sub-bipinnate; leaflets minute, ovate-orbicular; racemes terminal, clothed with glandular pubescence. ♄. G. Native of Chili, about Coquimbo.

Angular-branched Zuccagnia. Shrub.

Cult. See *Ceratònia* for culture and propagation.

CCLXI. CERATO'NIA (from κερατωνια of Theophrastus, from κερατιον, *keration*, a horn or pod; shape of pods). Lin. gen. 1167. Lam. ill. t. 859. Síliqua, Tourn. inst. 344.

LIN. SYST. *Polygàmia, Diœ'cia.* Flowers polygamous or diœcious. Calyx 5-parted. Petals wanting. Stamens 5. Stigma sessile, orbicular. Legume linear, coriaceous, indehiscent, many seeded, many celled from the seeds being intercepted by a kind of fleshy substance, and with the valves thick and pulpy on the inside.—Trees, with thick trunks, ever-green abruptly-pinnate, coriaceous shining leaves, and racemes of small red flowers. Legumes containing edible pulp.

1 C. SÍLIQUA (Lin. spec. 1513.) unarmed; leaflets oval, obtuse, flat, coriaceous, shining, dark green. ♄. G. Native of the south of Europe, Mauritania, and the Levant. Cav. icon. t. 113. Andr. bot. rep. 567. D. C. legum. xi. t. 23. f. 114. germ. Tasano in act. nap. 1787. p. 248. t. 18. f. 2.—Blackw. herb. t. 209. The carob-tree is much cultivated in the south of Europe for the sake of the pods, the pulp of which is eaten; they are 4 inches and more in length, of a dusky ferruginous colour, as well as the seeds. Ignorance of eastern manners and natural history induced some persons to fancy that the locusts which John the Baptist fed on were the tender shoots of this plant, and that the wild honey was the pulp in the pods of the carob, whence it has the name of St. John's bread; there is better reason to suppose that the shells of the carob-pod might be the husks which the prodigal son desired to partake of with the swine.

Silique-podded Ceratonia or Carob-tree, or St. John's-bread. Fl. Sept. Oct. Clt. 1570. Tree 30 to 50 feet.

2 C.? CHILE'NSIS (Mol. chil. ed. gall. 338.) branches spiny; leaflets oval, keeled. ♄. G. Native of Chili. Perhaps a species of *Prosòpis*.

Chili Ceratonia. Tree 20 to 30 feet.

Cult. Loam and sand is a good mixture for the carob-tree, and ripened cuttings will strike root if planted in sand, with a hand-glass placed over them.

CCLXII. CASTANOSPE'RMUM (from καστανον, *kastanon*, a chestnut, and σπερμα, *sperma*, a seed; in reference to the seeds, which taste like chestnuts). Cunningh. in Hook. bot. misc. 1. p. 241. t. 51 and t. 52.

LIN. SYST. *Decándria, Monogýnia.* Calyx coloured, somewhat bilabiate, with a short tube, upper lip bifid, lower one trifid. Petals 5, papilionaceous, with the wings and keel nearly equal in length. Stamens 10, free. Ovary on a long stipe. Legume stipitate, large, oblong-cylindrical, 2-valved, usually 4-seeded; valves coriaceous, spongy inside.—A large tree, with impari-pinnate leaves, and lateral rather compound racemes of flowers. Leaflets broad, smooth, and entire.

1 C. AUSTRA'LE (Cunningh. l. c.) ♄. G. Native of New Holland, in Morton Bay. The legumes are produced from 2 years old wood, containing usually 4 seeds as large as Spanish chestnuts, which are eaten by the natives about Morton Bay on all occasions, and they have when roasted somewhat of the flavour of Spanish chestnuts, and even Europeans who have subsisted on them for 2 or 3 days together have found no bad effects from them when roasted.

Southern Morton Bay Chestnut. Clt. 1828. Tree 40 to 50 ft.

Cult. For culture and propagation see *Ceratònia.*

CCLXIII. HARDWI'CKIA (in honour of Major General Thomas Hardwicke, F.R.S. F.L.S. &c. of the East India Company's artillery). Roxb. cor. 3. p. 6. hort. beng. p. 33. D. C. prod. 2. p. 486.

LIN. SYST. *Octo-Decándria, Monogýnia.* Sepals 4, but usually 5, ovate, equal, hardly cohering at the base. Corolla none. Stamens 8, but usually 10, free, inserted in the bottom of the calyx, or perhaps in the torus, the 5 which alternate with the sepals are a little larger than the rest. Anthers ovate, somewhat apiculated. Style short. Stigma peltate. Legume lanceolate, 1-celled, 1-seeded, 2-valved, dehiscent at the apex. Seed hanging from the apex of the legume, cuneated, membranous on the posterior side.—Smooth Indian trees, with abruptly-pinnate leaves, bearing 1 or many pairs of leaflets. Stipulas small, caducous. Panicles terminal and axillary. Flowers of a dirty yellow colour.

1 H. BINA'TA (Roxb. cor. 3. t. 209.) leaves with 1 pair of leaflets; petiole ending in a bristle; leaflets opposite, obliquely

ovate, semi-cordate, 3-nerved. ♄. S. Native of Coromandel, on the mountains. Flowers dirty yellow. The wood is excellent.

Binate-leaved Hardwickia. Clt. 1820. Tree 40 feet.

2 H. pinna'ta (Roxb. hort. beng. p. 33.) leaves with 3 pairs of alternate, ovate-lanceolate, acuminated leaflets, which are 1-nerved in the middle, the ultimate one almost terminal. ♄. S. Native of the East Indies. Flowers dirty yellow.

Pinnate-leaved Hardwickia. Clt. 1818. Tree 40 to 50 feet.

Cult. The species of *Hardwickia* grow freely in a light loamy soil, and large cuttings root readily if planted in sand, with a hand-glass placed over them, in heat.

CCLXIV. JONE'SIA (in honour of the celebrated Sir William Jones, whose knowledge of botany, independent of his other incomparable qualifications, entitles him to this mark of distinction). Roxb. in asiat. res. 4. p. 355. D. C. prod. 2. p. 487. —Saràca, Burm. ind.

Lin. syst. *Hepto-Octándria, Monogýnia.* Calyx with 2 ovate-roundish opposite bracteas at the base, coloured and funnel-shaped, with a long closed fleshy tube, and a 4-lobed spreading limb, the lobes ovate. Petals none. Stamens 8 (sometimes 7-9), rising from the throat of the calyx, much exserted beyond the calyx, free, or sometimes connected at the base. Ovary stipitate, with the lower part of the stipe adnate to the tube of the calyx, but free in the upper part. Style filiform. Legume 4-8-seeded, compressed, flat, acinaciform, with callous sutures. —Asiatic unarmed trees, with abruptly-pinnate leaves, and somewhat fasciculate racemes of flowers. The more recent name of Roxburgh has been preferred to the more ancient one of Burman, and Linnæus Saràca, to prevent its being confounded with *Saràcha.*

1 J. Aso'ca (Roxb. hort. beng. p. 26.) stem arboreous. ♄. S. Native of Malabar, Java, and Bengal. Hook, bot. mag. t. 3018.—Rheed. mal. 5. t. 59. Jonèsia pinnàta, Willd. spec. 2. p. 287. Saràca arboréscens, Burm. fl. ind. 85. t. 25. f. 2. Saràca I'ndica, Lin. mant. 98. Leaves with 2-3 pairs of oblong, shining, firm leaflets, and orange-red flowers. *Ushoka* is the Bengal name of the tree.

Asoca Jonesia. Fl. June, Jul. Clt. 1796. Tr. 12 to 20 ft.

2 J. sca'ndens (Roxb. hort. beng. p. 26.) stem climbing. ♄. S. Native of Sumatra. The rest unknown.

Cult. For culture and propagation, see *Hardwickia.*

CCLXV. TACHIGA'LIA (*Tassi* or *Tachigali* is the name of *T. paniculàta* in Guiana). Aubl. guian. 1. p. 372. exclusive of the fruit. Lam. ill. 339. D. C. prod. 2. p. 487.—Cubæ'a, Schreb. gen. no. 702.—Valentìnia, Neck. elem. no. 1283. but not of Swartz.—Tássia, Rich. ined.—Tàchia, Pers. ench. no. 1077. but not of Aublet.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, joined together into an obconical striated tube, with the free parts rather unequal and obtuse. Petals 5, inserted in the throat of the calyx, unequal. Stamens 10, exserted, with the filaments villous at the base, the 3 shortest ones erect. Ovary somewhat stipitate. Style filiform, acute. Legume compressed, flat, membranous, indehiscent, 1-seeded, oblong, nearly as in *Dalbérgia.* —Trees, with abruptly pinnate leaves, with the petioles as well as the peduncles trigonal, and panicles of yellow flowers, which are bractless, and crowded in a spicate manner along the branches of the panicle.

1 T. panicula'ta (Aubl. l. c. t. 143. f. 1.) leaves with 6 pairs of opposite, ovate-oblong, acuminated leaflets. ♄. S. Native of Guiana, on the banks of rivers, where it is called *Tassi* or *Tachigàli.*

Panicled-flowered Tachigalia. Tree 60 feet.

2 T. trigòna (Aubl. l. c. f. 2.) leaves with 6 alternate leaflets. ♄. S. Native along with the preceding, of which it is perhaps only a variety. Cubæ'a trigòna, Willd.

Trigonal-peduncled Tachigalia. Tree 60 feet.

3 T. bi'juga (D. C. prod. 2. p. 487.) leaves with 2 pairs of opposite, coriaceous, shining leaflets, which are glaucous beneath. ♄. S. Native of Brazil. Cubæ'a bíjuga, Spreng. neue entd. 1. p. 290. Cássia tetraphýlla, Desv.

Two-paired-leafletted Tachigalia. Clt. 1822. Tr. 20 to 30 ft.

4 T. emargina'ta; leaves with usually 4 pairs of elliptic, emarginate, coriaceous leaflets, which are discoloured beneath; racemes compound, pubescent. ♄. S. Native of Brazil. Sello. Cubæ'a emarginàta, Spreng. syst. 2. p. 345.

Emarginate-leafletted Tachygalia. Tree.

Cult. For culture and propagation see *Hardwíckia*, p. 436.

CCLXVI. BARY'XYLUM (from *βαρυς, barys*, heavy, and *ξυλον, xylon*, wood; the wood of the tree is very heavy). Lour. coch. p. 266. D. C. prod. 2. p. 487.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5, ovate-oblong, reflexed, equal, deciduous sepals, which are hardly concrete at the base. Petals 5, roundish, nearly equal, on short claws. Stamens 10, free, unequal, hypogynous? Anthers 4-celled. Style filiform. Legume thick, obtuse, nearly terete, a little curved, many-seeded. Seeds roundish, angular.—A tree, with brownish-red, heavy wood, abruptly pinnate, glabrous leaves, with few pairs of leaflets, and loose racemes of yellow flowers.

1 B. ru'fum (Lour. l. c.) leaflets oblong, obtuse. ♄. G. Native of Cochin-china, on the mountains. Wood iron-coloured, very heavy and very hard.

Brown-wooded Baryxylum. Tree 50 feet.

Cult. For culture and propagation, see *Ceratònia*, p. 435.

CCLXVII. MOLDENHAWE'RA (in honour of John James Moldenhawer, author of Tentamen in historiam plantarum Theophrasti, 1 vol. 8vo. Hamburgh, 1791.). Schrad. in Gött. anz. 1821. p. 718. D. C. prod. 2. p. 488.—Dolichonèma, Neuw. reis. vol. 2. with a figure ex flora, 1821. p. 303. and 329.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5 sepals, which are concrete at the base. Petals 5, nearly equal. Stamens 10, free, glabrous, 9 of which are fertile and shorter than the claws of the petals, the other one 3-times longer than the rest, sterile, and bearing a pilose anther, which is dissimilar to those on the 9 fertile filaments. Style 1. Legume linear-oblong.—A tree, with simply or doubly pinnate leaves and yellow flowers. This genus is allied to *Cássia* and *Tachigàlia*, according to the author.

1 M. floribu'nda (Schrad. l. c.). ♄. S. Native of Brazil. Cubæ'a speciòsa, Spreng. syst. append. 170.

Bundle-flowered Moldenhawera. Tree.

Cult. For culture and propagation see *Hardwíckia*, p. 436.

CCLXVIII. HUMBO'LDTIA (in honour of Alexander Baron de Humboldt, the celebrated American traveller and naturalist). Vahl. symb. 3. p. 106. but not of Ruiz, et Pav. D. C. prod. 2. p. 488.—Bátschia, Vahl. symb. 3. p. 39. t. 56. but not of Walt. Mœnch. nor Thunb.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a short tube, 4-cleft; segments oblong, nearly equal. Petals 5, nearly equal, inserted in the mouth of the calyx. Stamens 5, glabrous. Ovary pedicellate. Style filiform. Legume oblong, compressed. —An unarmed tree, with flexuous branches, abruptly pinnate leaves, bearing about 4-6 pairs of ovate-oblong, acuminated leaflets, the lower pair situated at the very base of the petioles and appearing like stipulas. Stipulas truly transversely linear-oblong. Racemes axillary, with a solitary bractea under each pedicel, but with 2 bracteoles at the top of each pedicel.

1 H. LAURIFÒLIA (Vahl. l. c.) leaflets 3-5 pairs; hind lobes of stipulas drawn out, acute; branches thickened at the internodes. ♄. S. Native of Java. Bátschia laurifòlia, Vahl. l. c.

Laurel-leaved Humboldtia. Tree 30 to 40 feet.

Cult. For culture and propagation see *Hardwickia*, p. 436.

CCLXIX. HETEROSTEMON (ἑτερος, *heteros*. variable, and στημων, *stemon*, a stamen, in reference to the variable length of the stamens, as well as in some being fertile and others sterile). Desf. mem. mus. 4. p. 248. D. C. prod. 2. p. 488.

LIN. SYST. *Monadélphia, Octándria.* Calyx tubular, 4-cleft, girded at the base by 2 connate, calyculate bracteas, the segments oblong and acute. Petals 3, obovate, inserted in the throat of the calyx. Stamens 8, unequal, long, declinate, monadelphous below and pilose above, the 3 lower ones are longer and fertile, and 5 bearing barren 2-lobed anthers. Stipe of the ovary concrete with the calyx. Style filiform. Legume flat, tapering to both ends, many seeded.—A tree, with abruptly pinnate leaves and winged petioles, bearing linear, obtuse, emarginate, glabrous leaflets. Flowers large, few, somewhat corymbous. This genus is allied to *Tamarindus.*

1 H. MIMOSOÌDES (Desf. l. c. t. 12.) ♄. S. Native of Brazil.

Mimosa-like Heterostemon. Tree.

Cult. See *Tamarindus* for culture and propagation, p. 438.

CCLXX. AMHE'RSTIA (named by Dr. Wallich after the Right Honourable Countess Amherst and her daughter Lady Sarah Amherst, the zealous friends and constant promoters of all branches of natural history, especially botany, who, during their residence in India performed an arduous and extensive journey to the northern regions of Northern and Western Hindoostan, spending many weeks among the mountains near the Himalaya, where they obtained a very interesting collection of preserved specimens of plants). Wall. pl. rar. asiat. 1. p. 1. t. 1.

LIN. SYST. *Diadélphia, Decándria.* Sepals 4, connate into a tube at the base, which is permanent and bears the staminiferous column at the apex, girded by 2 large opposite bracteas at the base, which are valvate in æstivation. Petals 5, unequal, 2 lower ones very minute and curved, lateral ones cuneiform, divaricate, upper one large, spreading, obcordate, and unguiculate. Stamens 10, 9 of the filaments joined together into a long tube, but free at the apex, alternate ones shortest, the tenth free, but adnate to the pedicel of the ovary at the base. Anthers versatile, all fertile. Ovary stipitate, falcate, 4-6-ovulate, with the stipe adhering to the calycine tube. Style filiform, crowned by a small convex stigma. Legume pedicellate, flat, oblong, few-seeded.—A tree, with large, impari-pinnate leaves, bearing 6-8 pairs of leaflets, and long pendulous axillary racemes of showy scarlet flowers.

1 A. NÓBILIS (Wall. l. c.). ♄. S. Native of the Burman Empire, in the garden of a decayed kioun, a sort of monastery, 2 miles from the right bank of the Saluen River, and 27 miles from the town of Martaban, but its native place of growth is still unknown, as the trees found in the garden have undoubtedly been planted there. The flowers are large, of a fine vermilion colour, diversified with yellow spots. This tree, when in foliage and blossom is the most superb object that can possibly be imagined, and not surpassed by any plant in the world. The Burmese name of the tree is *Thoka.* Handfuls of flowers were presented as offerings in the cave before the images of Buddha. Along with this tree were found some trees of *Mesùa férrea* and *Jonèsia Asòca.* It is not a little remarkable that the priests of these parts should have manifested so good a taste as to select three sorts of trees as ornaments to their objects of worship which can hardly be surpassed in beauty.

Noble Amherstia. Tree 30 to 40 feet.

Cult. For culture and propagation see *Hardwíckia*, p. 436.

CCLXXI. TAMARINDUS (*Tamar*, in Arabic is the name of the date, *Indus*, Indian; Indian date). Lin. gen. no. 46. Lam. ill. t. 25. D. C. prod. 2. p. 488.

LIN. SYST. *Monadélphia, Enneándria*, and *Decándria.* Calyx tubular at the base, cleft; the 3 upper lobes are reflexed and oblong. 2 lower ones also reflexed and joined together into one broad, 2-nerved lobe, which is usually bidentate at the apex. Petals 3, alternating with the 3 upper lobes of the calyx, the 2 lateral ones ovate, and the middle one cucullate. Stamens 9-10, 2 or 3 of which are longer than the others, monadelphous at the base and antheriferous, the other 7 very short and sterile. Style subulate. Legume pedicellate, acinaciform, compressed, 1-celled, 3-6-seeded, the valves filled with pulp between the epicarp and endocarp. Seeds ovate-quadrate, obliquely truncate at the hylum. Cotyledons unequal at the base.—Trees with abruptly pinnate leaves, bearing many pairs of small leaflets, and racemes of flowers.

1 T. I'NDICA (Lin. spec. 48. exclusive of the synonyme of Lœfl.) legumes elongated, 8-12-seeded, 6-times or more longer than broad. ♄. S. Native of the East Indies and the tropical parts of Africa. Woodv. med. bot. t. 166.—Rheed. mal. 1. t. 23.—Rumph. amb. 2. t. 23.—Blackw. herb. t. 221. D. C. legum. mem. xi. t. 24. f. 113. germ. A large spreading tree, with the leaves of a pale colour. Flowers with a straw-coloured calyx and yellow petals, beautifully streaked with red, and purple filaments and brown anthers. The timber of the *Tamarind*-tree is heavy, firm, and hard; sawed into boards it is converted to many useful purposes in building. The pulp contained in the pods is used both in food and medicine. The tamarinds which are brought from the East Indies are darker and drier, but contain more pulp; being preserved without sugar they are fitter to be put into medicines than those from the West Indies, which are much redder, but being preserved with sugar are more pleasant to the palate. The use of *tamarinds* was first learned from the Arabians; they contain a larger proportion of acid with the saccharine matter than is usually found in acid fruits. The epicarp of the pod is thin, and the acid pulp for which they are esteemed is the sarcocarp. *Tamarinds* are preserved in two ways; commonly by throwing hot sugar from the boilers on the ripe pulp; but a better method is to put alternate layers of *tamarinds* and powdered sugar in a stone jar. By this means the *tamarinds* preserve their colour, and taste more agreeably. Preserved *tamarinds* should be fresh and juicy, and should have an agreeable acid taste. They should not have a musty smell; the seeds should not be soft and swollen; and the blade of a knife should not get a coating of copper by being immersed among them. *Tamarinds* contain sugar, mucilage, citric acid, supertartrate of potass, tartaric acid, and malic acid. In medicine the pulp of *tamarinds*, taken in the quantity of from 2 to 3 drachms to an ounce or more, proves gently laxative and purgative, and at the same time by its acidity quenches thirst and allays immoderate heat. It increases the action of the sweet purgatives *cassia* and *manna*, and weakens that of the resinous cathartics. Salts, whose base is potass, form an improper addition to *tamarinds*, for they are decomposed, and the tartaric acid of the fruit is precipitated in the form of supertartrate of potass.

East Indian Tamarind. Fl. June, July. Clt. 1633. Tree 40 to 60 feet.

2 T. OCCIDENTA'LIS (Gærtn. fruct. 2. p. 310. t. 146.) legumes short, 1-4-seeded, hardly 3-times longer than broad. ♄. S. Native of South America and the West India Islands. Jacq. amer. p. 10. t. 179. f. 98. Blackw. herb. t. 201. Flowers with a straw-coloured calyx and yellower petals streaked with red, and purplish stamens. A large spreading tree. The pods of the West Indian *tamarind* are shorter and redder than those of

the East Indian *tamarind*, and are not so good. In many parts of America, particularly in Curaçoa, the natives eat abundance of the pulp raw without any inconvenience, except that of gently relaxing the body. In Martinico they eat even the unripe fruit. In the West Indies it is frequently made an ingredient in punch.

West Indian Tamarind. Fl. Feb. Clt. 1633. Tr. 30 to 50 ft.

Cult. Loam and peat is a good mixture to grow the species of *tamarind* in. Cuttings will root if planted in a pot of sand, with a hand-glass placed over them, in heat; but as seeds are annually received both from the East and West Indies, this is an unnecessary mode of increasing the plants. The seeds should be raised on a hot-bed, and the plants put into separate pots, as soon as they are about 2 or 3 inches high.

CCLXXII. CA'SSIA (*κασσια*, *cassia*, of Dioscorides. According to Olaus Celsus, this name is to be traced to the Hebrew *ketzioth*, rendered by *κασιαν* in the Septuagint, and Latinized by *cassia*). Lin. gen. 514. Lam. ill. t. 332. Collad. mon. 1816. in 4to. D. C. prod. 2. p. 489.

Lin. syst. *Decándria*, *Monogýnia*. Calyx of 5 sepals, which are hardly connected together at the base (f. 57. *a.*) and more or less unequal. Petals 5, unequal. Stamens 10, free, unequal (f. 57. *c. d.*), 3 lower ones the longest, the 4 middle ones short and straight, the 3 superior ones (f. 57. *d.*), bearing abortive difformed anthers. Fertile anthers opening by 2 pores at the apex (f. 57. *f.*). Ovary stipitate, usually arched. Legume dehiscent, compressed, transversely many-celled inside; cells 1-seeded.—Shrubs or herbs, with abruptly pinnate leaves and opposite leaflets. The petioles are usually glandular. The flowers of all are yellow.

Sect. I. Herpe'tica (Amboyna name of *C. alàta*, var. *β.*). D. C. in Collad. mon. p 91. prod. 2. p. 492. Calyx of 5 bluntish sepals. Anthers opening by 2 pores at the apex. Legumes flat, membranous, dehiscent, furnished with an acute foliaceous wing on the back, and divided internally into many cells by transverse dissepiments; cells rather pulpy inside. Seeds horizontal, compressed, nearly obcordate.—Perennial herbs, furnished with a large concave bractea under each flower.

1 C. ALA'TA (Lin. spec. 541.) leaves with 8-12 pairs of obovate-oblong, glabrous leaflets, outer ones the largest, lower ones approximating to the axils; petioles glandless. ♃. S. Native of South America and the West India Islands. Sloan. hist. t. 175. f. 1. C. Herpética, Jacq. obs. 2. t. 45. f. 2. Flowers large, yellow. The leaves are finely pubescent on the under surface, according to H. B. et Kunth, nov. gen. amer. 6. p. 347. This is therefore a different plant.

Var. β, Rumphiàna (D. C. prod. 2. p. 492.) racemes short, few-flowered. ♃. S. Native of Java. Herpética, Rumph. amb. 7. t. 18. C. alàta, Burm. fl. ind. 96. Perhaps a proper species.

Winged-podded Cassia. Clt. 1731. Pl. 6 feet.

2 C. BRACTEA'TA (Lin. fil. suppl. 232.) leaves with 10 pairs of oblong, obtuse leaflets, which are soft and hoary beneath; petioles glandless. ♃. S. Native of Surinam. Flowers yellow. Leaves more than a foot long.

Bracteate-flowered Cassia. Fl. April, Dec. Cl. 1822. Pl. 6 ft.

Sect. II. Se'nna (*Senna* or *Sena mecki*, the Arabic name for senna). Tourn. inst. t. 390. Gærtn. fruct. 146. D. C. in Collad. mon. 92. prod. 2. p. 492. Sepals obtuse. Anthers opening by 2 pores at the apex. Legumes membranous, broad, flat, and compressed, hardly dehiscent, torose at the seeds, divided internally into many cells by transverse dissepiments; cells hardly pulpy inside. Seeds vertical, compressed, nearly obcordate, shorter than the breadth of the legume, but the length of the funicle.

3 C. OBOVA'TA (Collad. mon. p. 92.) leaves with 6-7 pairs of obovate, obtuse leaflets; petioles glandless; legumes flat, compressed, arched, tumid, and a little crested in the middle. ♄. S. but ⊙. in the gardens. Native of Egypt, Senegal, and Rome; cultivated in the south of Europe and the West Indies for its leaves, which are one kind of *Senna*. C. Sénna, Lam. ill. t. 332. f. 2. *a. b. d.* and f. 3. *b. f. g.* Jacq. fil. ecl. 1. t. 87. Flowers yellow. This is the Italian officinal *senna*.

Obovate-leafletted or Italian Senna. Fl. July, Aug, Clt. 1640. Pl. 1 to 2 feet.

4 C. LANCEOLA'TA (Forsk. ægypt. p. 85.) leaves with 4-5 pairs of oval-lanceolate, acute leaflets; petiole glandular; legumes flat, compressed, straightish, tumid in the middle. ♄. S. Native of Upper Egypt. Lam. ill. t. 332. f. 2. *c.* and f. 3. *a.* Cássia orientàlis, Pers. ench. 1. p. 457. C. acutifòlia, Delil. ill. ægyp. 75. t. 27. f. 1. Flowers yellow. This is the officinal Alexandrian *senna*.

Senna is the leaves of *C. lanceolàta* and *C. obovàta*, both natives of Egypt; they are mixed with the pods. Those of the former are most esteemed; they are of a lively yellowish green colour, while those of the latter are green without any yellowish cast. With the true *senna* are mixed the leaves of another plant, *Cynánchium A'rquel*. Rouillion says that at Cairo the traders mix these in the proportion of 500 of *C. lanceolàta* and 300 of *C. obovàta* and 200 of *Cynánchium A'rquel*. But the greater part of the *senna* now used in this country is of a different kind. It is called East Indian. In America they now use the leaves of *C. Marylándica*. In medicine *senna* is a very useful cathartic, operating mildly and yet effectually; and if judiciously dosed and managed, rarely occasioning the bad consequences which too frequently follow the exhibition of the stronger purges. Its nauseous flavour, and its being apt to gripe, are the only inconveniences complained of in this drug. These are best obviated by adding some aromatic substance to the *senna*, as cardamon, ginger, cinnamon, &c., and by facilitating its operating by drinking plentifully of any mild diluent. *Senna* may be given in substance to the extent of half a drachm night and morning. It is more conveniently given in the form of infusion, which is generally made by pouring 6 ounces of boiling water upon from 2 to 6 drachms of senna leaves in a teapot, and letting it stand about an hour. *Senna* ought never to be used in decoction, Green says, because it becomes perfectly inert by the total dissipation of the nauseous and volatile principle, on which its purgative effects depend. The tincture, on account of the menstruum, cannot be given in doses large enough to have any effect.

Lanceolate-leafletted or Alexandrian Senna. Fl. July, Aug. Clt.? Shrub 2 to 3 feet.

5 C. LIGUSTRINOÌDES (Schranck, in akad. munch. 6. p. 179.) leaves with 5 pairs of glabrous, lanceolate leaflets, the lower ones the smallest; petioles glandless?; flowers racemose; legumes much compressed, glabrous, rounded at the apex. ♄. S. Native of Arabia. Flowers yellow. This kind of *senna* is confused with the Alexandrian *senna* in the shops.

Privet-like or Arabian Senna. Fl. July, Aug. Clt. 1800. Shrub 1 foot.

6 C. PISTACIÆFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 349.) leaves with 6 pairs of oblong leaflets, which are retuse at the apex and glabrous above but pubescent beneath; petioles glandless; flowers racemose; legumes transversely veined. ♄. S. Native of South America, between Popayan and Meneses. Flowers yellow.

Pistachio-leaved Senna. Tree 24 feet.

7 C. STROBILA'CEA (H. B. et Kunth, nov. gen. amer. 6. p. 347.) leaves with 11-12 pairs of oblong, emarginate leaflets, which are rather pilose above, but pubescent beneath; petioles glandless; racemes axillary; bracteas large; legumes com-

pressed, torulose. ♄. S. Native of South America, on the banks of the river Magdalena, near the Bocca of St. Bartholomew. Flowers yellow.

Strobile-like-racemed Senna. Tree 12 to 20 feet.

8 C. Tara'ntan (H. B. et Kunth, nov. gen. amer. 6. p. 348.) leaves with 11 pairs of oblong, acute leaflets, which are pilose above but pubescent beneath; petioles glandless; flowers racemose?; legumes compressed, torulose. ♄. S. Native of South America, near Cumana, where it is called *Tarantan*.

Tarantan Senna. Fl. July, Aug. Clt. 1817. Tree.

9 C. fraxinifòlia (H. B. et Kunth, nov. gen. amer. 6. p. 349.) leaves with 9-11 pairs of oblong, obtuse, glabrous leaflets; petioles glandless; racemes axillary, corymbose; legumes compressed, short. ♄. S. Native of South America, between the river Amazon and the town of Jaen de Bracamoros. C. cuspidàta, Willd. enum. p. 445. Flowers yellow.

Ash-leaved Senna. Shrub 3 to 6 feet.

10 C. Brownia'na (Kunth, mim. p. 135. t. 41.) leaves with 8-13 pairs of oblong, obtuse, mucronate, rather ciliated, glabrous leaflets; racemes axillary, length of leaves; legumes oblong-linear, mucronate, furnished with a narrow wing on both sutures. ♄. S. Native of Mexico, near Guanaxuato. H. B. et Kunth, nov. gen. amer. 6. p. 350. Flowers yellow.

Brown's Senna. Shrub 12 feet.

11 C. Richardia'na (Kunth, mim. p. 139. t. 42.) leaves with 18-20 pairs of oblong leaflets, which are puberulous beneath, with a small gland on the petiole, between the lower pair; panicle terminal; legumes compressed, membranous, transversely veined, glabrous. ♄. S. Native of South America, on the banks of the river Atabapo, near the head of the Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 351. Flowers yellow.

Richard's Senna. Fl. July, Aug. Clt. 1823. Shrub.

Sect. III. Chamæse'nna (χαμαι, *chamai*, on the ground, and *senna*; dwarf senna). D. C. in Collad. mon. p. 95. prod. 2. p. 493. Sepals obtuse. Anthers oblong, opening by 2 pores at the apex. Legumes compressed, dehiscent, rather tumid at the sutures, divided internally into many cells, by complete or incomplete transverse dissepiments. Cells not pulpy inside. Seeds vertical, compressed, ovate, or somewhat square, about equal to the breadth of the legume, but longer than the funicle.

§ 1. *Trigonelloìdeæ* (*Trigonélla*, and *idea*, like; plants with the habit of *Trigonélla*). *Annual plants, having the leaves furnished with but few pairs of leaflets.*

12 C. seri'cea (Swartz, fl. ind. occ. 2. p. 724.) leaves with 4 pairs of oval leaflets, which are clothed with silky hairs, with subulate glands on the petiole, one between each pair of leaflets; legumes hairy, somewhat tetragonal, transversely somewhat articulated. ⊙. S. Native of the West Indies and Brazil. C. sensitìva, Jacq. icon. rar. t. 459. C. ornithopoìdes, Lam. dict. 1. p. 644.

Silky Wild-senna. Fl. May, Aug. Clt. 1731. Pl. 1 foot.

13 C. cilia'ta (Hoffm. verz. 1824. p. 208.) leaves with 3-4 pairs of obovate, acutish, pubescent leaflets, which are ciliated with silky down, and furnished with stipitate glands on the petiole, one between each of the pairs of leaflets, except the outer pair; spikes axillary, somewhat capitate; legumes terete, beaked, impressed. ⊙. S. Native of Cuba. Perhaps sufficiently distinct from *C. sericea.*

Ciliated-leafletted Wild-senna. Fl. Ju. Jul. Clt. 1820. Pl. 1 ft.

14 C. obtusifòlia (Lin. spec. 539. exclusive of the synonyme of Rumph.) leaves with 3 pairs of obovate, obtuse leaflets, which are pubescent beneath, with an oblong, cylindrical, acute gland on the petiole, between the lower pair of leaflets; stipulas linear-subulate; legumes long, slender, recurved. ⊙. S. Native of Cuba and Jamaica among rubbish. C. Tòra, H. B. et Kunth, nov. gen. amer. 6. p. 35. which was gathered in the fields of Popayan.—Dill. hort. elth. 71. t. 62. f. 72. Sloane, jam. t. 180. f. 5.

Obtuse-leaved Wild-senna. Fl. July, Aug. Clt. 1732. Pl. 1 to 2 feet.

15 C. hu'milis (Collad. mon. p. 96.) leaves with 3 pairs of obovate, obtuse leaflets, with an oblong gland on the petiole between the lower pair; petiole without an awn at the apex; legumes arched, compressed, with callous margins. ⊙. S. Native of South America, Caribbee Islands, and Carolina. C. Tòra β, Lin. spec. 538. C. Tàla, Desv. journ. bot. 1814. p. 73. ?—Plum. ed. Burm. t. 76. f. 2.

Humble Wild-senna. Fl. Ju. Jul. Clt. 1810. Pl. 1 to 2 ft.

16 C. Tòra (Lin. spec. 538. exclusive of var. β and the synonyme of Mill.) leaves with 3 pairs of obovate, obtuse leaflets, with an oblong gland between each of the 2 lower pairs on the petiole; petiole ending in a bristle; legumes straight, compressed, with callous margins. ⊙. S. Native of the East Indies, Arabia, Japan, and Cochin-china. Dill. elth. 72. t. 63. f. 73. C. fœ'tida, Sal. prod. 326. C. gallinària, Collad. mon. p. 96. C. toroìdes, Hortul. C. obtusifòlia and C. Tòra, Burm. ind. p. 95. exclusive of the synonymes.—Rumph. amb. 5. t. 97. f. 2.

Tora Wild-senna. Fl. Aug. Clt. 1693. Pl. 2 to 5 feet.

17 C. Lime'nsis (Lam. dict. 1. p. 643.) leaves with 3-4 pairs of obovate, very blunt, glabrous leaflets; racemes axillary, many flowered, about equal in length to the leaves. ⊙. S. Native of Peru. Perhaps the same as *C. pentagònia*, of Mill. fig. t. 82. from Campeachy.

Lima Wild-senna. Pl. 1 to 2 feet.

18 C. cilia'ris (Collad. mon. p. 98.) leaves with 2-3 pairs of semi-orbicular, veiny leaflets, the 2 outer ones the largest; stipulas cordate, lanceolate, with ciliated margins. ⊙. S. Native of the East Indies. C. Tagèra, Lin. spec. 538. exclusive of the synonyme of Rheed. Plant filiform, procumbent.

Ciliary-stipuled Wild-senna. Pl. procumbent.

19 C. Tage'ra (Lam. dict. 1. p. 643. but not of Lin.) leaves with 3 pairs of obovate leaflets; peduncles very short, 1-flowered; legumes straight, linear. ⊙. ? S. Native of Malabar, where it is called *Ponnam-Tagera*. Rheed. mal. 2. p. 103. t. 53.

Tagera Wild-senna. Fl. July. Clt. 1803. Pl. 2 to 3 feet.

§ 2. *Coluteoìdeæ* (from *Colùtea*, and *idea*, like; plants with the habit of *Colùtea*). *Plants shrubby. Leaves with few or many pairs of leaflets.*

* *Interglandulòsæ* (from *inter*, between, and *glandula*, a gland). *Glands situated on the petioles, between the pairs of leaflets.*

20 C. venu'stula (H. B. et Kunth, nov. gen. amer. 6. p. 352.) leaves with 3-4 pairs of obovate-elliptic, puberulous leaflets, which are rounded at the apex, with a gland on the petiole above the lower pair; panicle terminal, with 2-flowered branches; legumes linear, beaked, puberulous. ♄. S. Native of South America, near Cumana, in arid places.

Pretty Wild-senna. Shrub.

* * *Jugiglandulòsæ* (from *jùgum*, a yoke, and *glandula*, a gland). *Glands one or more on the petiole between the pairs of leaflets.*

21 C. vimínea (Lin. amœn. 5. p. 397.) leaves with 2 pairs of ovate-oblong, acuminated, glabrous leaflets, with an oblong acute gland on the petiole between the lower pair; petiole ending in an awn; spines tridentate, on the old branches. ♄. ◡. S. Native of Jamaica, on the Blue Mountains, and of Porto Rico.—Sloane, jam. 2. t. 180. f. 6, 7. A rambling or climbing shrub.

Twiggy Wild-senna. Clt. 1786. Shrub cl.

22 C. CHRYSÓTRICHA (Collad. mon. p. 99. t. 13.) leaves with 2 pairs of rather pubescent ovate leaflets, lower pair the shortest and rounded on the outside, with an oblong gland on the petiole between the lower pair; spines tridentate on the old branches. ♄. S. Native of Guiana. C. chrysocárpa, Desv. journ. bot. 1814. p. 72. C. virgàta, Rich. act. soc. hist. nat. par. p. 108. but not of Swartz. A rambling shrub. Ovary clothed with silky, adpressed, yellow hairs, whence the specific name.

Golden-haired Wild-senna. Shrub rambling.

23 C. RUGÒSA; branches and peduncles pubescent; leaves with 2 pairs of elliptic, obtuse leaflets, which are oblique at the base and somewhat emarginate and mucronate at the apex, pubescent beneath, with the veins and nerves very prominent; racemes forming a terminal panicle; petiole bearing glands, one between each pair of leaflets; stipulas subulate. ♄. S. Native of Brazil. Sello (v. s. in herb. Lamb.).

Wrinkled-leaved Wild-senna. Shrub.

24 C. MACRANTHE'RA (D. C. in Collad. mon. p. 99. t. 8.) leaves with 2 pairs of oval-oblong, glabrous, acuminated leaflets, with an oblong-ovate gland on the petiole between the lower pair; petiole ending in a thick caducous bristle. ♄. S. Native of Brazil. Ovary linear, a little arched, clothed with adpressed pubescence.

Long-anthered Wild-senna. Fl. June, July. Clt. 1824. Sh.

25 C. SCA'NDENS (Ruiz, et Pav. in herb. Lamb.) branches angular, pubescent; leaves smooth, membranous, with 2 pairs of elliptic-oblong, acute, cuspidate leaflets, lower pair one half smaller than the upper; petiole bearing a large obtuse gland between the lower pair of leaflets; stipulas and bracteas lanceolate-subulate; racemes long, puberulous, shorter than the leaves. ♄. ⌒. S. Native of Guayaquil.

Climbing Wild-senna. Shrub cl.

26 C. QUINQUANGULA'TA (Rich. act. soc. hist. nat. par. p. 108.) leaves with 2 pairs of ovate coriaceous, acuminated leaflets, which are glabrous above but pubescent beneath, and unequal at the base, with an ovate thick gland between each of the pairs on the petiole; panicle terminal. ♄. S. Native of Cayenne, in woods. Branches pentagonal, smoothish. Ovary hoary, a little arched. Stigma large, ovate, petaloid. The legume being unknown, the section to which the present plant belongs is doubtful.

Five-angled-branched Wild-senna. Fl. Ju. Jul. Clt. 1818. Shrub 2 to 4 feet.

27 C. APOUCOUI'TA (Aubl. guian. 1. p. 379. t. 146.) leaves with 2-3 pairs of ovate-oblong, acuminated, glabrous leaflets, which are shining above, with an ovate sessile gland between each of the pairs on the petiole; racemes axillary. ♄. S. Native of Guiana, along the banks of the river Sinemari. C. acuminàta, Willd. spec. 2. p. 517. but not of Mœnch. C. nítida, Rich. act. soc. hist. nat. par. p. 108. *Apoucouita* is the name of the shrub in Guiana.

Apoucouita Wild-senna. Shrub 4 to 8 feet.

28 C. SENNOÌDES (Jacq. icon. rar. t. 70.) leaves with 2-3 pairs of obovate glabrous leaflets, the lower ones the roundest, with an oblong sessile gland on the petiole between the lower pair; stipulas linear-subulate, spreading. ♄. S. Native of the East Indies. Racemes axillary.

Senna-like Cassia. Fl. July, Aug. Clt. 1808. Sh. 3 to 4 ft.

29 C. ALCAPARI'LLO (H. B. et Kunth, nov. gen. amer. 6. p. 355.) leaves with 2-3 pairs of oblong glabrous leaflets, which are rounded at the apex, with a gland on the petiole between the lower pair; racemes axillary and terminal, loose. ♄. S. Native of Peru, in hot places near Olleros, where it is called *Alcaparillo*. The legume, according to Bonpland, is terete; it is therefore probably a species of *Chamæfistula*.

Alcaparillo Wild-senna. Shrub.

30 C. BICAPSULA'RIS (Lin. spec. 538.) leaves with 3 pairs of obovate, rather marginate, glabrous leaflets, lower ones the roundest, with a somewhat globose gland on the petiole between the lower pair, which is attenuated at the base; stipulas linear-subulate, spreading. ♄. S. Native of the West Indies, Surinam, and St. Martha. Plum. ed. Burm. t. 76. f. 1. Jacq. fragm. t. 58. Merian, sur. t. 32. C. inflàta, Spreng. in herb. Balb.

Var. β, aristàta (D. C. prod. 2. p. 495.) leaflets mucronate at the apex. ♄. S. Native of Guadaloupe. C. Bertèrii, Coll. hort. rip. p. 30. t. 34.

Var. γ, quadrijuga (D. C. l. c.) leaves with 4 pairs of obtuse leaflets.

Bicapsular Wild-senna. Fl. May, June. Clt. 1739. Shrub 4 to 6 feet.

31 C. ARGE'NTEA (H. B. et Kunth, nov. gen. amer. 6. p. 358.) leaves with 3 pairs of sub-elliptic leaflets, which are rounded at the apex, and clothed with silky pubescence, but silvery beneath, with a gland on the petiole between the lower pair; flowers axillary, solitary, and disposed in racemes at the tops of the branches; legumes slender, clothed with adpressed pubescence. ♄. S. Native of Mexico, on the banks of the river Mescala.

Silvery Wild-senna. Shrub 3 to 4 feet.

32 C. GENICULA'TA; clothed with scurfy stellate tomentum; leaves with 3 pairs of ovate oblique leaflets, tapering to the apex, with a hairy gland on the petiole between the lower pair; racemes short, corymbose, axillary; legumes articulated. ♄. S. Native of Peru. (v. s. in herb. Lamb.)

Jointed-podded Wild-senna. Shrub.

33 C. MOLLÍSSIMA (Humb. et Bonpl. in Willd. enum. 440.) leaves with 3 pairs of ovate acuminated leaflets, which are clothed with soft pubescence beneath; petiole pilose, bearing a hairy gland between each pair of leaflets. ♄. S. Native of South America. Legumes unknown.

Very-soft Wild-senna. Clt. 1816. Shrub.

34 C. RENIFÓRMIS; branches pubescent; leaves with 3 pairs of elliptic, acuminated, glabrous leaflets, tapering to both ends, lower ones the smallest, with an elongated gland between each pair; stipulas large, reniform, acuminated on one side. ♄. S. Native of Brazil, Sello. Perhaps a species of *Chamæfistula*.

Kidney-shaped-stipuled Wild-senna. Shrub.

35 C. ARTEMISIOÌDES (Gaud. in D. C. prod. 2. p. 495.) clothed in every part with velvety canescent down; leaves with 3-4 pairs of linear-filiform leaflets, with a small gland on the petiole between the lower pair; racemes axillary, 5-8-flowered, a little shorter than the leaves. ♄. G. Native of New Holland, in the interior of the country.

Wormwood-like Wild-senna. Fl. June, July. Clt. 1820. Sh. 2 to 3 feet.

36 C. GLUTINÒSA (D. C. prod. 2. p. 495.) leaves with 3-4 pairs of oblong, acuminated, glabrous leaflets, which are clammy as well as the branches, with a small sessile gland on the petiole between the lower pair; racemes axillary, usually 4-flowered. ♄. G. Native of New Holland, on the eastern coast. Legume broad, linear, on a short stipe, mucronate by the style.

Clammy Wild-senna. Shrub.

37 C. OXYADE'NA (D. C. prod. 2. p. 475.) leaves with 4-5 pairs of obovate glabrous leaflets, outer ones the longest, all glaucous beneath; petioles glabrous, furnished with a subulate acute gland, which is situated between the lower pair of leaflets. ♄. S. Native of Jamaica. C. díscolor, Desv. journ. bot. 1814. p. 73? C. frutéscens, Mill. dict. no. 2.

Sharp-glanded Wild-senna. Shrub 5 to 6 feet.

38 C. DÍSPAR (Willd. enum. 441.) leaves with 4-5 pairs of oblong usually obtuse leaflets, outer ones the largest, with a gland between each pair on the petiole. ♄. S. Native of South America. Compare it with *C. floribúnda*.

Unequal-leafletted Wild-senna. Fl. Ju. July. Clt. 1824. Sh.

39 C. ACAPULCE'NSIS (H. B. et Kunth, nov. gen. amer. 6. p. 353.) leaves with 4 pairs of obovate-elliptic leaflets, which are rounded at the apex, glabrous above, but puberulous beneath, and dotted, with a gland on the petiole between the lower pair; peduncles axillary, 2-flowered. ♄. S. Native of Mexico, near Acapulco.

Acapulco Wild-senna. Fl. June, July. Clt. 1823. Shrub 3 to 4 feet.

40 C. GLAU'CA (Lam. dict. 1. p. 647.) leaves with 4-6 pairs of oval, acutish, glaucous leaflets, with a sessile oblong gland on the petiole between each of the 3 lower pairs; stipulas linear, subulate, spreading. ♄. S. Native of the East Indies. C. Surraténsis, Burm. ind. 97.

Glaucous Wild-senna. Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

41 C. FŒTIDI'SSIMA (Ruiz et Pav. in herb. Lamb.) pubescent; leaves with 5 pairs of elliptic-lanceolate cuspidate leaflets, which are glaucous beneath, with a gland on the petiole between the lower pair; racemes axillary, shorter than the leaves. ♄. S. Native of Mexico. Flowers pale, with purple veins.

Very-fetid Wild-senna. Shrub.

42 C. SULPHU'REA (D. C. in Collad. mon. p. 84.) leaves with 5-6 pairs of oval-oblong leaflets, which are glaucous beneath, in the adult state they are glabrous, but when young they are puberulous, as well as the branches and petioles; petioles furnished with glands, one between each of the 3 or 4 lower pairs of leaflets; stipulas linear-subulate, rather falcate; racemes axillary, erect, shorter than the leaves. ♄. S. Native of the East Indies and the Mauritius, where it is probably cultivated. Rheed. mal. 6. t. 9. and t. 10. C. arboréscens, Vahl. symb. 3. p. 56. but not of Mill. Robínia Javánica, Burm. fl. ind. 163. Legume flat, compressed, 4-5 inches long, erect. Flowers sulphur-coloured.

Sulphur-coloured-flowered Wild-senna. Fl. June, July. Clt. 1800. Shrub 5 to 10 feet.

43 C. COLUTEOÌDES (Collad. mon. p. 102. t. 12.) leaves with 5-6 pairs of ovate, retuse, glabrous leaflets, outer ones the longest, with an oblong gland on the petiole between the lower pair; corymb terminal; 2 of the stamens are very long. ♄. S. Native country and legumes unknown.

Colutea-like Wild-senna. Shrub 4 to 6 feet.

44 C. NEMORÒSA (H. B. et Kunth, nov. gen. amer. 6. p. 358.) leaves with 5-7 pairs of elliptic, emarginate, glabrous leaflets, with a gland on the petiole between the lower pair; peduncles axillary and terminal, 2-flowered. ♄. S. Native of South America, in the province of Jaen de Bracamoros in groves. Said to be allied to *C. polyphýlla*.

Grove Wild-senna. Shrub 1 to 2 feet.

45 C. BIFLÒRA (Lin. amœn. 5. p. 397.) leaves with 6-8 pairs of oval-oblong or obovate, rather glabrous leaflets, with a subulate gland on the petiole between the lower pair; peduncles 2-4-flowered, much shorter than the leaves. ♄. S. Native of South America and the West India Islands. Sims, bot. mag. t. 810.—Plum. ed. Burm. t. 78. f. 1.

Var. β, sempervìrens (D. C. cat. hort. monsp. p. 90. no. 56.) leaflets emarginate, glabrous; flowers smaller.

Two-flowered Wild-senna. Fl. April, Dec. Clt. 1766. Shrub 4 to 6 feet.

46 C. GEMINIFLÒRA (Moc. et Sesse, in Collad. mon. p. 103. t. 3.) leaves with 6 pairs of oval equal leaflets; petioles glandless? peduncles axillary, bifid, 2-flowered. ♄. S. Native of Mexico. Very like the preceding species.

Twin-flowered Wild-senna. Fl. June, July. Clt. 1824. Shrub 4 to 6 feet.

47 C. OBCORDA'TA (Swartz, herb. Wicks. obs. fl. St. Barth. p. 411.) stems angular, glabrous; branches terete, pubescent; leaves with 3-7 pairs of obcordate, cuspidate, glabrous leaflets, with a pedicellate gland on the petiole between the lower pair; legumes compressed, pubescent; peduncles sub-terminal, filiform, 1-flowered, bibracteolate both at the base and in the middle. ♄. S. Native of the Island of St. Bartholomew. Flowers large, yellow.

Obcordate-leafletted Wild-senna. Shrub.

48 C. PA'LLIDA (Vahl. ecl. amer. 3. p. 12.) leaves with 5-6 pairs of oval glabrous leaflets, outer ones somewhat cuneated and mucronate, with a clavate gland on the petiole between the lower pair; peduncles axillary, usually 4-flowered. ♄. S. Native of St. Martha. Legume linear, straight.

Pale-flowered Wild-senna. Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

49 C. TOMENTÒSA (Lam. dict. 1. p. 647.) leaves with 6-8 pairs of oval-oblong obtuse leaflets, which are nearly glabrous above, but clothed with hoary tomentum beneath; petiole furnished with glands, usually with one between each pair of leaflets; legumes compressed, pubescent. ♄. S. Native of South America, near Santa-Fe-de-Bogota. H. B. et Kunth, nov. gen. amer. 6. p. 345. C. multiglandulòsa, Jacq. icon. rar. 1. t. 72.

Var. β, álbida (Ort. dec. 8. p. 92.) leaves with 2-5 pairs of oblique oval leaflets; glands subulate. ♄. S. Native of New Spain. Flowers pale yellow.

Tomentose Wild-senna. Fl. July, Sept. Clt. 1822. Shrub 5 to 7 feet.

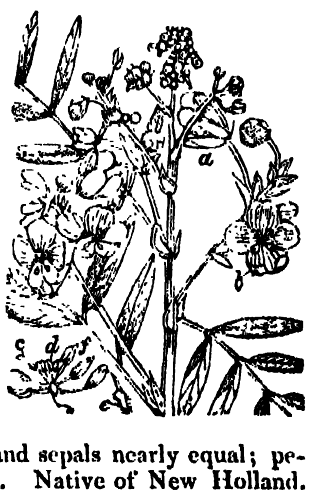
50 C. CA'NA (Nees et Mart. nov. act. bonn. 12. p. 33.) leaves with 6-8 pairs of oblong, oblique, acutish leaflets, which are tomentose beneath, with a large subulate gland between each pair except the lower one; stipulas reniform, one of them furnished with a cuspidate lobe on one side; racemes axillary. ♄. S. Native of Brazil, at Barra-das-Veredas. The whole shrub is clothed with canescent tomentum. The legume is unknown, but the plant itself is said to be nearly allied to *C. tomentòsa*.

Hoary Wild-senna. Shrub 4 to 6 feet.

51 C. MEXICA'NA (Jacq. hort. schœnbr. t. 203.) leaves with 5-7 pairs of oval-oblong, bluntish pubescent, ciliated leaflets, which are unequal at the base, with an ovate-cylindrical gland on the petiole between the lower pair; petioles and branches velvety. ♄. S. Native of Mexico and St. Domingo.

Mexican Wild-senna. Fl. June, July. Clt. 1824. Shrub 6 to 10 feet.

FIG. 57.



52 C. BARCLAYA'NA (Sweet, fl. austr. t. 32.) leaves with 6-8 pairs of linear-lanceolate, acute, glabrous leaflets, with a fascicle of glands between each of the pairs of pinnæ, and one large depressed one at the base of the petiole; peduncles axillary and terminal, many-flowered, shorter than the leaves; 4 of the stamens sterile. ♄. G. Native of New Holland. (f. 57.)

Barclay's Wild-senna. Fl. June, Aug. Clt. 1824. Shrub 2 to 4 feet.

53 C. AUSTRA'LIS (Hook. bot. mag. 2676.) leaves with 12 pairs of oblong-lanceolate leaflets, with a subulate pedicellate gland between each of the pairs; petals and sepals nearly equal; peduncles usually 4-flowered. ♄. G. Native of New Holland. Flowers large, yellow.

Southern Wild-senna. Fl. June, Aug. Clt. 1824. Shrub 3 to 4 feet.

89 C. ni′gricans NA (Balb. herb. ex D. C. prod. 2. p. 496.)
of linear-oblong, v pairs of elliptic mucronate leaflets, which are
gland on the petio se, with a thick obtuse gland on the petiole,
Arabia Felix. C. base, and sometimes between the lower pair;
haps belonging to a aves, as well as the petioles and branches
Blackish Wild-sen peduncles axillary, short, few-flowered. ♄.
Domingo. It is allied to *C. frondòsa*, but

* * * * *Eglandulo* being very obtuse, not acutely ovate, as in
there are no glands

Petioles without glan na. Shrub 5 to 6 feet.

90 C. aphy′lla (aves with 3 pairs of ovate, glabrous, mucro-
n are margined with white, with a pedicellate
stipulas wanting; st between the lower pair; stipulas linear, lan-
cent at the apex. ers axillary, racemose. ♄. S. Native of
Buenos Ayres. . Bertèrii, Coll. hort. rip. p. 30. t. 24.
Leafless *Sota's* Wild-senna. Fl. May, July. Clt. 1824. Sh. 8 to 10 ft.

56 C. stipula′cea (Ait. hort. kew. 2. p. 52.) leaves with 8 pairs of ovate-lanceolate glabrous leaflets, with a gland on the petiole between the lower pair; stipulas ovate, large. ♄. S. Native of Chili. Feuill. per. 2. p. 56. t. 42.

Large-stipuled Wild-senna. Fl. June, Aug. Clt. 1786. Shrub.

57 C. auricula′ta (Lin. spec. 542.) leaves with 8-12 pairs of oval, obtuse, rather mucronate leaflets, which are puberulous when young, but at length become nearly glabrous, with numerous subulate glands on the petiole; stipulas reniform; racemes axillary; bracteas oval-oblong, mucronate. ♄. S. Native of the East Indies.—Pluk. alm. t. 314. f. 4. Glands on the petioles sometimes wanting.

Auricled Wild-senna. Fl. June, July. Clt. 1777. Sh. 4 to 6 ft.

58 C. Gaudichau′di (Hook. in Beech. voy. append. p. 81.) leaves with 4 pairs of elliptic-oblong, rather emarginate, glabrous leaflets, which are pale beneath, with a linear obtuse gland on the petiole between the lower pair; stipulas subulate; racemes axillary, shorter than the leaves; legumes pendulous, linear, compressed, membranous, usually 8-seeded. ♄. G. Native of the Sandwich Islands.

Gaudichaud's Wild-senna. Shrub.

59 C. Chatelainia′na (Gaud. in Freycenet, voy. part. bot. p. 485. t. 111.) leaves with 4-5 pairs of lanceolate-linear, thickish, glabrous leaflets, with stipitate glands on the petiole, one below each pair of leaflets; umbels axillary, stalked, few-flowered; sepals obtuse; legumes membranous, flat, smooth. ♄. G. Native of New Holland, on the western coast.

Chatelain's Wild-senna. Shrub.

60 C. suffruticòsa (Roth, nov. spec. 213.) leaves with 9 pairs of oval, obtuse, rather pilose leaflets, which are glaucous beneath, with a pedicellate gland between each of the 2 lower pairs on the petiole; stipulas linear, rather falcate; corymbs fastigiate. ♄. S. Native of the East Indies.

Suffruticose Wild-senna. Shrub.

61 C. fastigia′ta (Vahl. symb. 3. p. 57.) leaves with 9 pairs of oblong, obtuse, glabrous leaflets, with a pedicellate gland between each of the pairs of pinnæ on the petiole; calyx clothed with canescent villi. ♄. S. Native of the East Indies.

Fastigiate Wild-senna. Fl. June, July. Clt. 1810. Shrub 4 to 6 feet.

62 C. frondòsa (Ait. hort. kew. 2. p. 35.) leaves with 9 pairs of oval-oblong, smoothish, bluntish leaflets, with a cylindrical gland on the petiole between the lower pair; racemes axillary, shorter than the leaves. ♄. S. Native of South America.

Var. α, tenuíssima (Zucc. obs. no. 70.) branches and petioles rather pubescent; leaflets smaller. ♄. S. Native of Cuba, about the Havannah.

Var. β, crísta (Jacq. icon. rar. 1. t. 74.) branches and petioles smoothish; leaflets larger. ♄. S. Native of Florida and St. Domingo.

Var. γ, pubéscens (Collad. mon. p. 106.) branches clothed with velvety down, as well as the under surface of the leaves. ♄. S. Native of St. Domingo.

Var. δ, galegifòlia (Collad. l. c.) glabrous; leaflets larger, deep green; flowers sublateral.

Frondose Wild-senna. Fl. March, April. Clt. 1769. Shrub 3 to 6 feet.

63 C. polyphy′lla (Jacq. icon. rar. t. 460.) leaves with 10-12 pairs of elliptic-obtuse, somewhat mucronate, ciliated leaflets, with an oblong gland on the petiole between the lower pair; peduncles 2-flowered, shorter than the leaves. ♄. S. Native of Porto-Rico. There is sometimes a gland between more of the pairs of leaflets than the lower one.

Many-leafletted Wild-senna. Fl. June, July. Clt. 1816. Sh. 4 to 6 feet.

64 C. lute′scens; stems clothed with yellowish tomentum, as well as the petioles and under surface of the leaves, peduncles, and calyxes; upper surface of the leaflets hardly pubescent; leaves with 7-8 pairs of lanceolate, mucronate leaflets, which are oblique at the base; petiole bearing glands, one between each pair of leaflets; racemes shorter than the leaves, somewhat corymbose at the apex. ♄. S. Native of Peru. C. pubéscens, Ruiz et Pav. in herb. Lamb. Stem simple.

Yellowish Wild-senna. Shrub.

65 C. aura′ntia (Ruiz et Pav. in herb. Lamb.) pubescent; leaves with 6 pairs of elliptic, oblique, obtuse, mucronate leaflets, with an acute gland on the petiole between the lower pair; racemes axillary, longer than the leaves. ♄. S. Native of Peru. Flowers orange-coloured.

Orange-flowered Wild-senna. Shrub.

66 C. angustisi′liqua (Lam. dict. 1. p. 649.) leaves with 10 pairs of oblong, acute, awned leaflets, with a pedicellate gland on the petiole between the lower pair of leaflets; legumes linear, compressed. ♄. S. Native of St. Domingo. Plum. ed. Burm. t. 78. f. 2. Flowers large.

Narrow-podded Wild-senna. Shrub 6 to 8 feet.

67 C. margina′ta (Willd. enum. 444. but not of Roxb.) leaves with usually 15 pairs of linear-elliptic leaflets, with a subulate gland on the petiole between each of the pairs. ♄. S. Native of Surinam; the rest unknown.

Margined Wild-senna. Shrub.

68 C. Sellòi; branches and petioles pubescent; leaves with numerous pairs of lanceolate-linear mucronate leaflets, which are glaucous beneath, with a gland between the lower pair; racemes forming terminal panicles. ♄. S. Native of Brazil, Sello.

Sello's Wild-senna. Shrub.

69 C. callia′ntha (Meyer, prim. esseq. 169.) leaves with 24 pairs of oblong-linear, glabrous leaflets, with a subulate gland on the petiole between the lower pair; racemes terminal; legumes glabrous. ♄. S. Native of Guiana, near Essequibo. Flowers large. According to Meyer this species is allied to *Poncidna.*

Beautiful-flowered Wild-senna. Shrub.

70 C. Mutisia′na (Kunth, mim. p. 142. t. 43. nov. gen. amer. 6. p. 359.) leaves with 40-50 pairs of oblong-linear leaflets, which are rounded at the apex, puberulous above, but hairy-pubescent beneath, as well as the petioles; branches very hispid; glands on the petiole, one between each pair of leaflets; racemes axillary, solitary, and twin. ♄. S. Native of New Granada. Legume linear, membranous, glabrous. Seeds 20-26.

Mutis's Wild-senna. Shrub.

* * * *Basiglandulòsæ* (from *basis*, the base, and *glandula*, a gland; leaves furnished with a gland at the base of the petiole). *Leaves with a sessile gland at the base of the petiole.*

71 C. longisíliqua (Lin. fil. suppl. 230.) leaves with 4-5 pairs of ovate-oblong, acute, glabrous leaflets, outer ones the

longest, with acute glands on the petiole, one beneath or between the lower pair of leaflets, and another between the outer pair. ♄. S. Native of St. Domingo. From the situation of the glands this species appears to be intermediate between the present and the preceding division of the genus.

Long-siliqued Wild-senna. Fl. June, July. Clt. 1800. Shrub 3 to 6 feet.

72 C. falca'ta (Lin. spec. 539.) leaves with 4 pairs of ovate-lanceolate, retro-falcate leaflets, outer ones the largest, and with the outer side broadest, with a gland at the base of the petiole. ⊙. S. Native of South America.

Falcate-leafletted Wild-senna. Pl. 1 to 2 feet.

73 C. venenífera (Meyer, prim. esseq. 167.) leaves with 4 pairs of oval hairy leaflets, with a gland at the base of the petiole; racemes axillary, few-flowered; legumes pubescent. ♄. S. Native of Guiana, near Essequebo, in bushy sandy places, where it is called *Piami*, and where the roots are used by the inhabitants to intoxicate fish by throwing them in the water.

Poison-bearing Wild-senna. Shrub 3 to 6 feet.

74 C. Ægypti'aca (Willd. enum. 442.) leaves with 6 pairs of lanceolate, acute, glabrous leaflets, outer ones the largest, with a lanceolate gland at the base of the petiole; racemes terminal; peduncles 2-flowered. ♄. S. Native of Egypt.

Egyptian Wild-senna. Fl. May. Clt. 1822. Sh. 3 to 4 ft.

75 C. occidenta'lis (Lin. spec. 539.) leaves with 4-6 pairs of ovate-lanceolate leaflets, with pubescent margins, and with a thick gland at the base of the petiole; peduncles short, 2-4-flowered, lower ones axillary, the rest disposed in a terminal raceme; legumes flat, compressed, with the sutures tumid. ⊙. S. Native of South America and the West India Islands. Sloane, hist. 2. p. 175. f. 3, 4. Ker, bot. reg. t. 83. C. planisíliqua, Lin. spec. 540. C. Caroliniàna, Walt. car. 135? ex Ell. sketch. 471. C. occidentàlis, Burm. ind. 96. This is a very common species about Kingston in Jamaica, where it is called *stinking-weed*. The tops of the plant are commonly employed in all resolutive baths, and it is accounted a very powerful ingredient on such occasions.

Var. β, *glàbra* (D. C. prod. 2. p. 497.) leaflets nearly elliptic, glabrous. C. geminiflòra, Schranck, hort. mon. t. 26.

Var. γ, *aristàta* (D. C. l. c.) leaflets ovate-lanceolate, with pubescent margins, awnedly-mucronate at the apex. Collad. m[illegible] p. 108.

Occidental Wild-senna. Fl. May, Aug. Clt. 1759. Sh. 1 to 2 ft.

76 C. purpu'rea (Roxb. et Jacq. fil. ex Schrad. in litt. D. C. prod. l. c.) leaves with 5 pairs of ovate-lanceolate glabrous leaflets, with a small obtuse gland at the base of the petiole; peduncles 3 times shorter than the leaves, 4-6-flowered. ♄. S. Native of the East Indies. Lindl. bot. reg. 856. Stems purple at the base. Flowers yellow, as in the rest of the species. Legume unknown. Very like *C. occidentàlis*.

Purple-stemmed Wild-senna. Fl. June, Aug. Clt. 1821. Sh. 3 to 4 feet.

77 C. fœ'tida (Ruiz et Pav. in herb. Lamb.) hairy; leaves with 5 pairs of ovate acute leaflets; racemes axillary, about the length of the leaves; legumes ovate, membranous, cuspidate. ♄. S. Native of Chili. Stipulas ovate, oblique at the base. Petiole bearing a gland below some of the pairs of leaflets.

Fetid Wild-senna. Shrub.

78 C. hirsu'ta (Lin. fil. suppl. p. 231.) leaves with 4-6 pairs of hairy, broadly-ovate, acuminated leaflets, with a depressed gland at the base of the petiole; racemes axillary, short, crowded; calyx very villous. ♄. S. Native of South America. C. Caraccasàna, Jacq. hort. schœnbr. t. 270.

Hairy Wild-senna. Fl. July. Clt. 1778. Shrub 3 to 6 feet.

79 C. linea'ris (Michx. fl. bor. amer. 1. p. 261.) leaves with
5-6 pairs of oval-lanceolate, acute, glabrous
at the base of the petiole; peduncles ushai p. 500.) leaves with 2
lary, and terminal; legumes linear, straight. pilose leaflets; petioles
Carolina. Said to be nearly allied to C. occ s hispid and clammy;

Pubescent Wild-senna. Fl. June, July. Clt. 1818. Sh. 6 ft.

82 C. Ca'nca (Cav. descrip. pl. 131.) leaves with 6 pairs of ovate-lanceolate, somewhat ciliated leaflets, with a sessile gland at the base of the petiole; flowers sub-umbellate; legumes almost quadrangular. ♄. S. Native of Cumana. Lag. ex Rod. in ann. scienc. nat. 1802. vol. 5. p. 70. Perhaps sufficiently distinct from *C. occidentàlis*.

Canca Wild-senna. Shrub 2 to 3 feet.

83 C. sulca'ta (D. C. cat. hort. monsp. p. 90. no. 58.) leaves with 6-9 pairs of oval-oblong bluntish leaflets, which are pubescent beneath and on the margins, with an ovate thick gland at the base of the petiole; branches glabrous, furrowed. ♄. S. Native of South America. Collad. mon. p. 110. t. 6. C. cérnua, Balb. cat. hort. taur. 1813. p. 22.

Furrowed Wild-senna. Fl. Ju. July. Clt. 1820. Sh. 2 to 3 ft.

84 C. ruscifòlia (Jacq. icon. rar. 1. p. 71.) leaves with 6 pairs of ovate-lanceolate, almost glabrous leaflets, with a terete gland at the base of the petiole; legumes compressed, oblong-linear, tapering at both ends, with the sutures prominent. ♄. S. Native of Caraccas. H. B. et Kunth, nov. gen. amer. 6. p. 355.

Ruscus-leaved Wild-senna. Clt. 1816. Shrub 4 to 6 feet.

85 C. ligu'strina (Lin. spec. 541.) leaves with 7 pairs of lanceolate, acuminated, rather ciliated leaflets, with a terete erect gland, which is rather distant from the base of the petiole. ♄. S. Native of America, from Cayenne to Virginia.—Dill. hort. elth. 350. t. 250. f. 328.

Privet-like Wild-senna. Fl. July. Clt. 1726. Sh. 5 to 6 feet.

86 C. robinioìdes (Willd. enum. 443.) leaves with 6-9 pairs of lanceolate, acuminated, glabrous leaflets, with a sessile gland at the base of the petiole. ♄. S. Native of South America.

Robinia-like Wild-senna. Clt. 1823. Tree 10 to 20 feet.

87 C. Maryla'ndica (Lin. spec. 541.) leaves with 8-9 pairs of ovate-oblong, equal, mucronate leaflets, with an ovate gland at the base of the petiole; racemes axillary, many-flowered, shorter than the leaves; legumes compressed, linear, hispid, at length glabrous. ♃. H. Native of North America, in temperate places. Schkuhr, handb. 1. t. 113.—Dill. hort. elth. t. 260. f. 339. Root with black fibres. The leaves are used in North America as a substitute for senna.

Maryland Wild-senna. Fl. Aug. Oct. Clt. 1723. Pl. 2 to 3 ft.

88 C. polya'ntha (Moc. et Sesse, in Collad. mon. p. 112. t. 2.) leaves with 12 pairs of oval mucronate leaflets, with an ovate thick gland at the base of the petiole; flowers panicled, corymbous; legumes compressed, and furnished with a narrow wing on both sutures. ♄. S. Native of New Spain.

Many-flowered Wild-senna. Shrub.

89 C. ni'gricans (Vahl. symb. 1. p. 30.) leaves with 14 pairs of linear-oblong, very blunt, mucronate leaflets, with a sessile gland on the petiole beneath the leaflets. ♄. G. Native of Arabia Felix. C. procúmbens, Forsk. cat. arab. p. 111. Perhaps belonging to a different section.

Blackish Wild-senna. Fl. June, July. Clt. 1817. Sh. proc.

Wild-senna. Shrub 3 feet Sh. 8 to 10

91 C. barba'ta (Nees et Mart. nov. act. bonn. 12. 32.) leaves with 1-2 pairs of ovate-oblong obtuse leaflets, which are pubescent beneath; petioles and branches clothed with seabrous pubescence; petiole glandless; racemes axillary and terminal, elongated. ♄. S. Native of Brazil, on the road to Felisbert. Sutures of the anthers bearded. Stipulas setaceous. Legume hairy. Said to be allied to *C. Apoucouíta.*

Bearded-anthered Wild-senna. Shrub 4 to 5 feet.

92 C. ellí'ptica (H. B. et Kunth, nov. gen. amer. 6. p. 356.) leaves with 2-3 pairs of elliptic retuse leaflets, which are hairy above, and clothed with canescent pubescence beneath; petiole glandless; racemes axillary. ♄. S. Native near Cumana, Turbaco, and Campeachy. Legume linear, glabrous.

Elliptic-leafletted Wild-senna. Fl. June, July. Clt. 1818. Tree 20 to 30 feet.

93 C. triflòra (Vahl. ecl. amer. 3. p. 11.) leaves with 2 pairs of oblong obtuse leaflets, which are clothed with hoary villi beneath; petiole glandless; peduncles axillary, pubescent, 3-4-flowered. ♄. S. Native of the Island of Santa Cruz. Legume unknown, and therefore the section to which the plant belongs is doubtful.

Three-flowered Wild-senna. Shrub.

94 C. cane'scens (H. B. et Kunth, nov. gen. amer. 6. p. 357.) leaves with 3 pairs of leaflets, which are rounded at the apex, hairy above, and clothed with hoary tomentum beneath, upper ones elliptic, the rest smaller and roundish-ovate; petiole glandless; racemes axillary, pendulous. ♄. S. Native of South America, near Guayaquil. Legume linear, glabrous, warted.

Canescent Wild-senna. Shrub.

95 C. Peraltea'na (H. B. et Kunth, nov. gen. amer. 6. p. 356.) leaves with 3-4 pairs of oblong leaflets, which are rounded at the apex, puberulous above, but clothed with canescent pubescence beneath; petiole glandless; racemes axillary. ♄. S. Native of Mexico, about Campeachy. Legume unknown.

Peralt's Wild-senna. Tree.

96 C. nu'tans (Moc. et Sesse, in Collad. mon. p. 113. t. 4.) leaves with 2-5 pairs of oval glabrous leaflets, the lower pair the smallest; petiole glandless; branches beset with blunt tubercles; peduncles axillary, racemose, nodding. ♄. S. Native of Mexico.

Nodding-branched Wild-senna. Shrub.

97 C. emargina'ta (Lin. spec. 538.) leaves with 4 pairs of ovate, obtuse, or rather emarginate leaflets, clothed with hairy pubescence beneath, as well as the branches and petioles; petioles glandless; racemes axillary, crowded. ♄. S. Native of Jamaica and St. Domingo. Sloane, hist. 2. p. 180. f. 1-4.

Emarginate-leafletted Wild-senna. Fl. May, June. Clt. 1759. Tree.

98 C. pi'cta; glabrous; leaves with 5 pairs of ovate-elliptic, cuspidate leaflets, which are oblique at the base; petiole glandless; racemes axillary and terminal; legumes flat, membranous. ♄. S. Native of Guayaquil. Flowers pale yellow, painted with purple veins.

Painted-flowered Wild-senna. Shrub.

99 C. atoma'ria (Lin. spec. 540.) leaves with 5 pairs of ovate tomentose leaflets; petioles terete, glandless, rather ferruginous. ♄. S. Native of South America. C. latifòlia, Desf. cat. hort. par. ed. 1. p. 182.?

Atom-bearing Wild-senna. Fl. June, July. Clt. 1810. Shrub 4 to 6 feet.

100 C. Dominge'nsis (Spreng. neue entd. 3. p. 55.) leaves with 4-6 pairs of oblong, acuminated, glabrous leaflets, ending in an awn; petioles glandless; racemes panicled, very long. ♄. S. Native of St. Domingo. Leaflets on long petiolules. Legumes flat, very glabrous, rather shining, 1½ inch long, on a short pedicel within the calyx.

St. Domingo Wild-senna. Shrub.

101 C. angustifòlia (Vahl. symb. 1. p. 29.) leaves with 7 pairs of lanceolate glabrous leaflets, outer ones the largest; petioles glandless; legumes pendulous. ♄. S. Native of Arabia.

Narrow-leafletted Wild-senna. Shrub.

102 C. flòrida (Vahl. symb. 3. p. 57.) leaves with 7 pairs of oval-oblong, glabrous, emarginate leaflets; petioles glandless; racemes axillary, many-flowered; bracteas spatulate, ending in a long mucrone. ♄. S. Native of the East Indies.

Florid Wild-senna. Fl. Ju. July. Clt. 1820. Sh. 5 to 6 feet.

103 C. Sia'mea (Lam. dict. 1. p. 648.) leaves with 8-9 pairs of ovate-oblong, obtuse, glabrous leaflets; petioles glandless; legumes flat, compressed, marginated. ♄. S. Native about Siam.

Siam Wild-senna. Shrub.

104 C. dumetòrum (Bert. ined. D. C. prod. 2. p. 499.) leaves with 9 pairs of oval leaflets, which are obtuse at both ends, and pubescent beneath, outer ones the largest, and obovate; petioles glandless, and are, as well as the branches, pubescent; legumes very flat, attenuated at the base, but obtuse and mucronate at the apex. ♄. S. Native of St. Martha. Stipulas rather spinose. Perhaps distinct from the following.

Hedge Wild-senna. Shrub.

105 C. catha'rtica (Mart. reis. bras. ex Schlecht. Linnæa. 5. p. 41.) plant beset with pili, which are glandular at the base, and viscid; petioles glandless; leaves with 8-10 pairs of oblong, elliptic, bluntish, almost mutic leaflets, which are rather unequal at the base; peduncles axillary; legumes linear, rather convex, an inch long. ♄. S. Native of Brazil.

Cathartic Wild-senna. Shrub.

106 C. reticula'ta (Willd. enum. p. 443.) leaves with 10 pairs of oblong leaflets, which are rounded and obtuse at both ends, and pubescent beneath, outer ones the largest; petioles glandless; legumes compressed. ♄. S. Native of Para, in Brazil.

Reticulated-leaved Wild-senna. Shrub.

107 C. specta'bilis (D. C. cat. hort. monsp. p. 90. no. 57.) leaves with 10-12 pairs of ovate-lanceolate, acuminated, mucronate leaflets; petioles glandless; stipulas linear-subulate; racemes loose, terminal. ♄. S. Native of Caraccas. Collad. mon. p. 115. t. 7. Legume unknown.

Showy Wild-senna. Fl. June, July. Clt. 1820. Shrub 4 to 6 feet.

108 C. aversiflòra (Herb. mss. Hook. bot. mag. 2638.) leaves with 7 pairs of obovate leaflets, with a fulvous oblong gland on the petiole between the lower pair; peduncles 2-flowered, axillary, glabrous; stipulas hispid; legume falcate. ♄. S. Native of Brazil. Flowers large.

Contrary-flowered Wild-senna. Fl. June, Sept. Clt. 1820. Shrub 6 feet.

109 C. SETI'GERA (D. C. prod. 2. p. 499.) leaves with 10-12 pairs of leaflets, which are glabrous, as well as the branches; leaflets oval-oblong, obtuse at both ends, each ending in a deciduous bristle, glaucous beneath; petioles glandless; racemes axillary and terminal, disposed in panicles; legumes flat. ♄. S. Native of the East Indies.

Bristle-bearing Wild-senna. Shrub.

110 C. MONTA'NA (Roth. nov. spec. 214.) leaves with about [illegible] pairs of oblong-oval, somewhat emarginate leaflets, which are glabrous on both surfaces; petioles glandless; racemes axillary; flowers heptandrous. ♄. S. Native of the East Indies.

Mountain Wild-senna. Shrub.

111 C. TIMORIE'NSIS (D. C. prod. 2. p. 499.) leaves with 12-15 pairs of oval-oblong leaflets, which are obtuse at both ends, muricated with awns, and clothed with hairy pubescence beneath; petioles glandless, and are as well as the branches puberulous; racemes many-flowered, shorter than the leaves; legumes flat, immarginate. ♄. S. Native of the Island of Timor.

Timor Wild-senna. Shrub.

SECT. IV. BASEOPHY'LLUM (from βασις, *basis*, and φυλλον, *phyllon*, a leaf; in reference to the lower pair of leaflets being at the base of the petiole). D. C. in Collad. mon. p. 115. Sepals obtuse. Stamens nearly equal. Anthers oblong, all fertile, opening by 2 chinks at the apex. Legume flat, compressed, 1-celled, destitute of pulp. Seeds vertical, compressed, oval, longer than the funicle, but hardly shorter than the breadth of the valves.

112 C. CYTISOI'DES (D. C. in Collad. mon. p. 116. t. 14.) leaves with 3 pairs of obovate-orbicular, glabrous leaflets, the lower pair approximating the axil, with a sessile gland on the petiole, between the 2 lower pairs of leaflets. ♄. S. Native of Brazil.

Cytisus-like Cassia. Shrub.

SECT. V. A'BSUS (a name which Prosper Alpinus gave to *C. A'bsus*, from the name of a river in Palestine). D. C. in Collad. mon. p. 116. prod. 500. Sepals bluntish or acutish. Pe[illegible] nearly equal. Stamens 5-10, nearly equal, all fertile. [illegible]hers opening by 2 chinks at the apex. Legumes flat, compressed, destitute of pulp, 1-celled, or many-celled from obsolete dissepiments. Seeds vertical, or parallel to the valves, ovate, compressed, with the funicle short and scale-formed.—Annual herbs or subshrubs. Leaves with 2 pairs of leaflets. Bracteoles small, along the pedicels.

113 C. A'BSUS (Lin. spec. 537.) leaves with 2 pairs of obovate, glabrous, ciliated, dotted leaflets, with small glands on the petiole between the lower pair of leaflets; branches and petioles pubescent; lower flowers solitary in the axils of the leaves, upper ones disposed in a naked terminal raceme. ⊙. S. Native of Ceylon (Burm. zeyl. t. 97.) and Egypt, also of Jamaica, where it has probably been introduced. Collad. mon. p. 77. and 117. Jacq. ecl. 1. t. 53. Flowers copper-coloured or yellow, pentandrous. The seeds are used in ophthalmia, when reduced to powder.

Absus Cassia. Fl. June, July. Clt. 1777. Pl. 2 to 3 feet.

114 C. HÍSPIDA (Collad. mon. p. 118.) leaves with 2 pairs of ovate-roundish, glabrous, dotless leaflets; petioles glandless; branches and legumes hispid; racemes terminal, naked, elongated. ⊙. S. Native of Cayenne. C. A'bsus, Aubl. guian. 1. p. 381. exclusive of the synonymes. C. hispídula, Vahl. ecl. amer. 3. p. 10. Sepals acuminated.

Hispid Cassia. Pl. 1 to 2 feet.

115 C. THONNI'NGII (D. C. prod. 2. p. 500.) leaves with 2 pairs of ovate, acute, ciliated, viscid, pilose leaflets; petioles glandless; stems peduncles, and calyxes hispid and clammy; lower flowers axillary and solitary, upper ones disposed in a terminal raceme. ⊙. S. Native of Guinea. C. viscòsa, Vahl. herb. but not of Kunth. Flowers copper-coloured, drying brown.

Thonning's Cassia. Fl. June, July. Clt. 1824. Pl. 1½ ft.

116 C. VISCÒSA (H. B. et Kunth, nov. gen. amer. 6. p. 360.) leaves with 2 pairs of obovate, emarginate, ciliated leaflets, and are as well as the petioles glandular, clammy, and pilose; branches, pedicels, and calyxes clothed with clammy pili; racemes terminal and lateral, many-flowered. ♄. S. Native of New Granada, near Contreras and Ibagne. Flowers yellow.

Clammy Cassia. Shrub 5 to 6 feet.

117 C. PAUCIFLÒRA (H. B. et Kunth, l. c.) leaves with 2 pairs of elliptic, obtuse, clammy leaflets; petiole glandless; branches and pedicels clammy; racemes terminal, few-flowered. ♄. S. Native of Mexico, near La Venta del Peregrino. C. brachystàchya, Moc. et Sesse, fl. mex. icon. ined. Very like the preceding species.

Few-flowered Cassia. Shrub 2 to 3 feet.

118 C. LOTOI'DES (H. B. et Kunth, l. c.) leaves with 2 pairs of obovate, glabrous leaflets, which are rounded at the apex; petioles glandless; branches and pedicels clothed with clammy hairs; racemes terminal. ♄. S. Native of Cumana, near Caripe, and in sand on the banks of the Orinoco. Procumbent. Flowers yellow, large.

Lotus-like Cassia. Fl. June, July. Clt. 1820. Sh. procumb.

SECT. VI. CHAMÆCRI'STA (a name given by Breynius to this section). Breyn. prod. 2. p. 29. D. C. in Collad. mon. p. 118. prod. 2. p. 500.—Grimáldia, Schrank, ex Biroli, cat hort. bot. taur. 1815. p. 36. Sepals acuminated, nearly equal. Stamens 10, or only 5-7 from abortion. Anthers oblong, glabrous, opening by 2 pores at the apex. Legumes flat, compressed, dehiscent, destitute of pulp. Seeds vertical, compressed, ovate, or nearly square.—Herbs or subshrubs. Stipulas many-nerved at the base. Pedicels bearing 2 acute bracteoles each, axillary, sometimes joined with the branches at the base, and therefore may be said to be supra-axillary. Flowers and fruit erect. Leaflets lapping over each other, when in sleep or at night.

§ 1. *Bauhiniànæ* (plants whose leaves appear like those of *Bauhínia*). *D. C. prod. 2. p. 501. Leaves usually with 1 or 2 pairs of leaflets, rarely with 3-4 pairs.*

119 C. BAUHINIÆFÒLIA (Kunth, mim. p. 123. t. 37.) leaves with 1 pair of obovate, emarginate, obliquely cordate leaflets, with the margins undulately repand, and puberulous on both surfaces; petioles glandless, and are as well as the branches clothed with soft pubescence; stipulas cordate, acuminated; peduncles 1-3, axillary, 1-flowered, bibracteate, pilose at the apex as well as the calyxes. ♄. S. Native on the sandy banks of the Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 364.

Bauhinia-leaved Cassia. Shrub 2 to 3 feet.

120 C. COTINIFÒLIA; glabrous; leaves with 1 pair of roundish, retuse, coriaceous, repand leaflets; racemes bristly, simple, and panicled. ♄. S. Native of Brazil. Sello. (v. s. herb. Lamb.)

Cotinus-leaved Cassia. Shrub 6 to 10 feet.

121 C. DIPHY'LLA (Lam. dict. 1. p. 642.) leaves with 1 pair of obovate, 5-7-nerved leaflets, which are unequal at the base, and quite glabrous, as well as the branches; stipulas lanceolate, cordate, ciliated at the base, permanent; petiole ending in an awn. ♄. S. Native of Porto Rico, Cayenne, and about Acapulco. Cav. icon. 6. t. 600.

Two-leaved Cassia. Fl. May, July. Clt. 1781. Shrub 1 to 2 feet.

122 C. BIFOLIA'TA (D. C. in Collad. mon. 120. t. 9. f. B.) leaves with 1 pair of leaflets, which are as well as the branches and petioles pilose; leaflets obovate, 3-5-nerved at the base; stipulas cordate, lanceolate, ciliated; petiole without any awn. ♄. S. Native of Brazil, very common about Rio Janeiro. C. pentándra, Raddi, pl. bras. add. p. 20. Flowers pentandrous, ex Raddi. C. nummulària, Vahl. ined. C. rotundifòlia, Pers. is perhaps the same, ex Juss. Legume puberulous.

Bifoliate Cassia. Fl. June, July. Clt. 1820. Sh. 1 to 2 ft.

123 C. FABAGINIFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 363.) leaves with 1 pair of obovate, rather retuse, obliquely cordate, ciliated, glabrous leaflets; petioles glandless, and are as well as the branches beset with soft hairs; pedicels 1-2-together, axillary, 1-flowered, bibracteate, glabrous. ♄. S. Native of Mexico, on the burning mount Jorullo.

Fabago-leaved Cassia. Shrub 1 to 2 feet.

124 C. CULTRIFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 363.) leaves with 1 pair of oblong-lanceolate, falcately-ensiform, glabrous leaflets, which are denticulately ciliated at the apex; petioles furnished with 1 gland beneath the leaflets; branches marked by a pilose line; pedicels axillary, solitary, 1-flowered, hairy, bibracteate. ♄. S. Native on the banks of the river Orinoco.

Knife-leaved Cassia. Shrub 1 to 2 feet.

125 C. LINEARIFÒLIA; leaves with 1 pair of long, linear, coriaceous, glabrous, acuminated leaflets; sepals acute. ♄. S. Native of Brazil. Sello. (v. s. herb. Lamb.)

Linear-leafletted Cassia. Shrub 2 to 3 feet.

126 C. PU'LCHRA (H. B. et Kunth, nov. gen. 6. p. 362.) leaves with 2 pairs of obovate-oblong, glabrous leaflets, which are rounded at the apex; petiole furnished with 1 gland beneath the leaflets; branches marked with 2 rows of stiff hairs; pedicels axillary, solitary, 1-flowered, bibracteate, hispid. ♄. S. Native of South America, near San Carlos del Rio Negro.

Fair Cassia. Shrub 1 to 2 feet.

127 C. GRA'CILIS (Kunth, mim. p. 120. t. 36.) leaves with 2 pairs of obovate-oblong, obtuse, glabrous leaflets; branches also glabrous; petiole bearing 1 gland beneath the leaflets; pedicels solitary, axillary, 1-flowered, bibracteate, glabrous, twice the length of the leaves. ♄. S. Native on the banks of the river Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 360. Legume glabrous, rather twisted.

Slender Cassia. Fl. June, July. Clt. 1817. Sh. 1 to 2 ft.

128 C. ROTUNDIFÒLIA (Pers. ench. 1. p. 456.) leaves with 2 pairs of roundish leaflets; branches rather villous; stipulas small, ovate, acuminated, about equal in length to the petioles; pedicels axillary, 1-flowered, elongated. ♄. S. Native of Brazil. Legume pubescent, flat, 10-12-seeded, length of pedicel.

Round-leafletted Cassia. Shrub 1 to 2 feet.

129 C. PERSOÒNII (Collad. mon. p. 119.) leaves and branches glabrous; leaves with 2 pairs of obovate veiny leaflets; stipulas lanceolate, adpressed, about equal in size to the leaflets. ♄. S. Native of Cayenne. C. lanceolàta, Pers. ench. 1. p. 456. but not of Forsk.

Persoon's Cassia. Shrub 1 to 2 feet.

130 C. UNIFLÒRA (Spreng. neue entd. 1. p. 291.) leaves with 2 pairs of glabrous, obovate-lanceolate, veiny leaflets; branchlets pubescent; petioles glandular in the middle; stipulas cordate-lanceolate; pedicels axillary, 1-flowered, 10-times longer than the petioles. ♄. S. Native of Brazil. Flowers reddish. According to Neuw. reis. bras, vol. 2. the leaflets are shining and silky beneath, with a gland on the petiole between the lower pair. The flowers corymbous, and the legumes covered with yellow hairs. This is perhaps the same or perhaps a different species.

One-flowered Cassia. Shrub 1 to 2 feet.

131 C. BRE'VIPES (D. C. in Collad, mon. p. 119. t. 9. f. A.) leaves with 2 pairs of glabrous leaflets; young branches and petioles tomentose; leaflets oblong; stipulas cordate-lanceolate, many-nerved at the base; petioles glandless; pedicels axillary, 1-flowered, rather shorter than the petioles. ♄. S. Native of Panama.

Short-pedicelled Cassia. Shrub 1 to 2 feet.

132 C. KUNTHIA'NA (Schlecht. et Cham. in Linnæa. 5. p. 599.) stems trailing, filiform, puberulous; leaves distich, with 3 pairs of approximate leaflets; rachis ending in a bristle-like mucrone; leaflets obliquely-obovate, mucronulate, 3-nerved, and reticulately veined, glabrous, obsoletely ciliated; petiole pubescent, bearing a gland between the lower pair of leaflets; stipulas cordate, ovate, acuminated, pungent, many-nerved, ciliated; peduncles axillary, solitary, bibracteate, pubescent on the inner side, exceeding the leaves. ♄. S. Native of Mexico, on hills near Hacienda de la Laguna.

Kunth's Cassia. Shrub procumbent.

133 C. FOLIÒSA; branches pubescent; leaves with 3-4 pairs of elliptic, obtuse, mucronate, glabrous leaflets; pedicels 2-3, axillary; sepals acute; legumes flat, lanceolate; stipulas linear-subulate. ♄. S. Native of Peru. (v. s. in herb. Lamb.)

Leafy Cassia. Shrub.

134 C. TENE'LLA (H. B. et Kunth, nov. gen. amer. 6. p. 365.) leaves with 2-4 pairs of oblong, glabrous leaflets; stems procumbent, puberulous; petioles bearing 1 gland, puberulous; pedicels puberulous, axillary, solitary, 1-flowered, bibracteate. ♄. S. Native on the banks of the river Orinoco, near San Borja.

Weak Cassia. Fl. June, July. Clt. 1820. Sh. procumbent.

135 C. MUCRONA'TA (Spreng. syst. 2. p. 341.) leaves with 3 pairs of oblong-elliptic, mucronate, glabrous leaflets, with an urceolate gland between the lower pair; peduncles axillary, 1-flowered. ♄. S. Native of Brazil.

Mucronate-leaved Cassia. Shrub 1 to 2 feet.

§ 2. *Mimosìdeæ* (from *Mimòsa*, and *idea*, like; plants with the habit of *Mimòsa*). *D. C. prod. 2. p. 502. Leaves with from 5 to 50 pairs of leaflets.*

136 C. LINEA'TA (Swartz, fl. ind. occ. p. 726.) erect; leaves with 5 pairs of oblong, obtuse, mucronulate leaflets, which are pubescent beneath, but glabrous above as well as the petioles and branches, with a sessile gland at the base of the petiole; pedicels 1-flowered, axillary, and lateral; legumes hairy. ♄. S. Native of Jamaica, among rubbish.

Lined-leaved Cassia. Fl. Ju. Jul. Clt. 1818. Sh. 1 to 3 ft.

137 C. CUNEA'TA (D. C. in Collad. mon. p. 121.) erect; leaves with 5 pairs of obovate-cuneated, very blunt, mucronate leaflets, which are pubescent beneath as well as the branches and petioles, with a sessile gland at the base of the petiole; pedicels axillary, aggregate; legumes pubescent, spirally twisted. ♄. S. Native of South America.

Cuneate-leafletted Cassia. Shrub 1 to 2 feet.

138 C. PROSTRA'TA (Humb. et Bonpl. in Willd. enum. 441.) prestrate; leaves with 5-7 pairs of oblong-linear, cultriform, obtuse, mucronate leaflets; petiole pilose, bearing a pedicellate gland at the base; pedicels axillary, solitary, 1-flowered, glabrous; legumes pubescent. ♃. S. Native of South America, near the Orinoco. Stipulas and petioles ciliated at the base. H. B. et Kunth, nov. gen. amer. 6. p. 365.

Prostrate Cassia. Fl. May, Aug. Clt. 1819. Pl. prostrate.

139 C. PYGMÆ'A (D. C. mem. soc, nat. gen. 2. p. 2. t. 131.) prostrate; leaves with 4-6 pairs of linear, mucronate leaflets,

which are pubescent as well as the branches and petioles; petiole bearing a pedicellate gland at the base; pedicels solitary, axillary, 1-flowered, longer than the leaves,, bibracteate above the middle; legumes rather pubescent. ♃. S. Native of St. Domingo.

Pygmy Cassia. Pl. prostrate.

140 C. PILÒSA (Lin. spec. 540.) erect; leaves with 5 pairs of oblong, ciliated leaflets, ending in a bristle; petioles glandless; stems straight, and are as well as the petioles beset with long, spreading, stiff hairs; pedicels axillary, 1-flowered, solitary, bibracteate at the base, longer than the leaves. ♃. S. Native of Jamaica. Swartz, obs. 160.

Pilose Cassia. Fl. June, July. Clt. 1818. Pl. 1 to 2 feet.

141 C. GRA'MMICA (Spreng. neue entd. 3. p. 55.) erect; leaves with 6-7 pairs of canescent, pubescent leaflets; branches and petioles clothed with velvety hairs: leaflets oblong, mucronate, veiny beneath, with a pedicellate gland on the petiole below the lower pair of leaflets; pedicels axillary, solitary, 1-flowered, length of petiole; legumes pubescent. ♄. S. Native of Cuba and St. Domingo.

Written-veined Cassia. Pl. 1 to 2 feet.

142 C. SE'RPENS (Lin. spec. 541.) plant rather procumbent; leaves with 7 pairs of oblong-linear, mucronate leaflets; petioles and branches glabrous, with a sessile gland on the petiole beneath the leaflets; pedicels 2-3-together in a fascicle, supra-axillary, 1-flowered, shorter than the petioles; legumes smoothish, apiculated by the style. ⊙. S. Native of Jamaica. Swartz, obs. 161. Collad. mon. 128. Flowers small.

Creeping Cassia. Pl. procumbent at the base.

143 C. FASCICULA'TA (Michx. fl. bor. amer. 1. p. 262.) leaves with 8-9 pairs of oblong-linear, mucronate leaflets, with a sessile gland on the petiole; pedicels in lateral fascicles; legumes smooth, rather arched. ♃. G. Native of Pennsylvania, Virginia, and Carolina. Ell. sketch. 473.

Fascicled-flowered Cassia. Pl. 1 to 2 feet.

144 C. TRIFLÒRA (Jacq. hort. schœnbr. t. 480.) erect; leaves with 6-10 pairs of oblong, obtuse, mucronulate, glabrous, rather ciliated leaflets, with a sessile gland on the petiole beneath the lower pair; petioles and branches puberulous; pedicels 3 in a fascicle, supra-axillary, bibracteolate above the middle, shorter than the petioles; bracteoles and stipulas linear-lanceolate, [illegible]y-nerved. ⊙. ? S. Native country unknown. C. venòsa, Castign. ex Zucc. cent. 1. p. 68. Flowers large.

Three-flowered Cassia. Fl. June, July. Clt. 1816. Pl. 1 ft.

145 C. POLYADE'NA (D. C. mem. soc. hist nat. gen. 2. p. 2. t. 132.) erect; leaves with 6-8 pairs of oblong, obtuse, glabrous leaflets, which are cuneated at the base; branches and petioles glabrous; glands 2-4 on the petiole, sessile, placed beneath and among the pairs of leaflets; pedicels 2-3-together, in a fascicle, supra-axillary, bibracteolate above the middle, shorter than the petioles; bracteoles and stipulas acute and small. ⊙. ? S. Native of Guadaloupe. Nearly allied to *C. glandulòsa*, but differs in the glands being sessile.

Many-glanded Cassia. Pl. 1½ foot.

146 C. BURMA'NNI (D. C. prod. 2. p. 502.) erectish? leaves with 7-9 pairs of oblong, awnedly mucronate, glabrous, rather ciliated leaflets, with a sessile gland at the base of the petiole; pedicels axillary, bracteolate, in fascicles; legumes glabrous, but puberulous at the sutures. ♄. G. Native of the Cape of Good Hope. C. flexuòsa, Burm. prod. fl. cap. p. 12. exclusive of the synonymes.

Burmann's Cassia. Fl. June, July. Clt. 1810. Pl. 1 foot.

147 C. VIRGA'TA (Swartz, fl. ind. occ. p. 728.) erect; leaves with 10 pairs of ovate-lanceolate, mucronate leaflets, which are rather villous beneath, with a pedicellate gland on the petiole beneath the lower pair; pedicels hairy, 1-flowered, axillary, longer than the petioles. ♄. S. Native of Jamaica and St. Domingo.

Twiggy Cassia. Fl. June, Jul. Clt. 1810. Sh. 2 to 3 feet.

148 C. SWA'RTZII (Wicks. obs. fl. st. Barth, p. 411.) branches pubescent; leaves with 9-12 pairs of obliquely linear, glabrous leaflets, which are obtuse and mucronate at the apex; petiole furnished with a gland at the base; stipulas lanceolate, acuminated, pubescent on the outside; sepals acuminated. ♄. S. Native of the island of St. Bartholomew. Flowers large. Legume compressed, marginated, a little curved, glabrous, 8-10-seeded. Allied to *C. virgàta.*

Swartz's Cassia. Shrub 1 foot.

149 C. BREVIFÒLIA (Lam. dict. 1. p. 651.) plant diffuse; leaves with 10-12 pairs of oblong, glabrous, obtuse, somewhat 3-nerved leaflets; petiole glandless; stipulas lanceolate-linear, acuminated; pedicels 1-flowered, axillary, twice the length of the leaves, bibracteolate above the middle. ♄. S. Native of Madagascar. Leaflets a line long.

Short-leafletted Cassia. Shrub 1 foot.

150 C. NI'CTITANS (Lin. spec. 549. exclusive of the synonyme of Rumph.) erectish; leaves with 8-12 pairs of oblong-linear, obtuse, mucronate leaflets; petioles villous, bearing a somewhat pedicellate gland beneath the lower pair of leaflets; pedicels supra-axillary, very short; legumes pubescent. ⊙. G. Native of the West Indies, Carolina, and Pennsylvania. Lin. hort. cliff. t. 36.—Pluk. t. 314. f. 5. Grimáldia assúrgens, Schrank. Flowers pentandrous.

Twinkling Cassia. Fl. July. Clt. 1800. Pl. 1 foot.

151 C. CHAMÆCRISTA (Lin. spec. 542. exclusive of the synonyme of Comm.) erect; leaves with 10-12 pairs of oblong-linear, mucronate leaflets, with a sessile gland on the petiole, beneath the lower pair; pedicels 2-3-together, in a fascicle, supra-axillary, shorter than the petioles; legumes rather hispid. ♄. S. Native of the West Indies, Carolina, and Virginia. Abbot. insect. Georg. t. 94. Curt. bot. mag. 107. C. pulchélla, Salisb. prod. p. 326. Flowers small. The leaves are a good substitute for senna.

Var. β, *stricta* (Schrank, hort. mon. t. 34.) leaves with 10 pairs of leaflets; flowers nearly axillary. ⊙. S. Native of Jamaica.

Ground-crista or Dwarf Cassia. Fl. June, Sept. Clt. 1699. Pl. 1 foot.

152 C. GLANDULÒSA (Lin. spec. 542.) erect; leaves with 10-12 pairs of oblong, mucronate, glabrous leaflets, with a pedicellate gland on the petiole beneath the lower pair, and some between the leaflets; pedicels aggregate, supra-axillary; legume smoothish. ⊙. S. Native of the West Indies. Collad. mon. p. 129.

Glandular Cassia. Fl. July, Aug. Clt. 1822. Pl. 1 foot.

153 C. CINE'REA (Schlecht. et Cham. in Linnæa. 5. p. 599.) a much-branched procumbent shrub, clothed with grey adpressed down; leaves with 12-15 pairs of linear, rather cultriform, obliquely semi-cordate leaflets, with a marginal mucrone each; petiole furnished with a gland beneath the lower pair of leaflets; stipulas ovate-lanceolate, acuminated, 5-nerved; pedicels solitary or twin, axillary, or supra-axillary, bibracteate; stamens all fertile. ♄. S. Native of Mexico, on the sea-shore between Tecoluta and Villa Rica. Legume 4-12-seeded, black.

Cinereous Cassia. Shrub procumbent.

154 C. PAVONIA'NA; stem pubescent, simple; leaves with 10-20 pairs of linear, cuspidate, nerved leaflets; stipulas subulate, nerved; peduncles 1-2-flowered, bracteate; petiole bearing a gland beneath the lower pair of leaflets. ♄. S. Native of Peru. (v. s. in herb. Lamb.)

Pavon's Cassia. Pl. 2 feet.

155 C. mimosoídes (Lin. spec. 543.) erect; leaves with 10-12 pairs of linear, mucronate leaflets, with a pedicellate gland on the petiole between the lower pair; pedicels axillary, 1-2-together, 1-flowered, much shorter than the petioles; branches pubescent; legumes glabrous. ⊙.? S. Native of Java and Ceylon.

Mimosa-like Cassia. Fl. Sept. Clt. 1806. Pl. 2 feet.

156 C. calycioi'des (D. C. in Collad. mon. 125. t. 20. f. B.) erect; leaves with 10-13 pairs of linear, mucronate leaflets, which are lined with nerves beneath, with a pedicellate gland on the petiole beneath the lower pair; branches, petioles, and legumes pilose; peduncles axillary, divided nearly to the base into 2 or 3 1-flowered pedicels. ⊙. S. Native of Cayenne.

Calycium-like Cassia. Pl. 1 foot.

157 C. flavi'coma (H. B. et Kunth, nov. gen. amer. 6. p. 366.) branches clothed with soft, yellow villi; leaves with 12-13 pairs of linear-oblong, pubescent leaflets, with a stipitate gland immediately under the lower pair; pedicels 1-2, rather supra-axillary, beset with villi. ♄. S. Native of South America, on the banks of the Orinoco.

Yellow-haired Cassia. Shrub 1 to 2 feet.

158 C. ramosíssima (H. B. et Kunth, nov. gen. amer. 6. p. 367.) branches tomentose; leaves with 12-15 pairs of linear-oblong glabrous leaflets, with rather scabrous margins, and with the nerve pilose beneath; petiole bearing a stipitate gland beneath the lower pair of leaflets; pedicels usually solitary, supra-axillary, villously pubescent. ♄. S. Native of Mexico, on the mount Jorullo. Legume unknown.

Much-branched Cassia. Shrub 1 to 2 feet.

159 C. tristícula (H. B. et Kunth, nov. gen. amer. 6. p. 367.) branches hairy; leaves with 14-16 pairs of oblong-linear, cultriform, pilose leaflets, with a stipitate gland on the petiole beneath the lower pair; pedicels solitary or twin, pilose, hardly supra-axillary; legumes pilose. ♄. S. Native of New Granada, near Fusagasuga, and of Mexico, near Jalapa. C. hírta, H. W. no. 7988.

Darkish Cassia. Shrub 1 to 2 feet.

160 C. Felipe'nsis (H. B. et Kunth, nov. gen. amer. 6. p. 368.) branches hairy, tomentose; leaves with usually 12 pairs of linear-oblong, acutely piliferous, glabrous, rather ciliated leaflets, with a small sessile gland on the petiole beneath the lower pair, and some also between the pairs; pedicels 1-2-together, pubescent, hardly supra-axillary. ♄. S. Native of South America, in the province of Jaen de Bracamoros, near San-Felipe.

San-Felipe Cassia. Shrub 1 to 2 feet.

161 C. propínqua (H. B. et Kunth, nov. gen. amer. 6. p. 369.) branches densely clothed with yellow pubescence; leaves with 10-14 pairs of oblong-linear glabrous leaflets, which are a little ciliated on the margins; petiole bearing a stipitate gland immediately under the ultimate pair of leaflets; pedicels 3-4-together, pubescent, supra-axillary; legumes pubescent, 8-10-seeded. ♄. S. Native of Cumana, near Caripe, and on mount Cocollar, and of Mexico. Very like *C. Æschynómene.*

Related Cassia. Shrub 3 to 4 feet.

162 C. Cape'nsis (Thunb. prod. 79. fl. cap. ed. Schultes, 1. p. 388.) erect; leaves with 12-18 pairs of linear leaflets, ending each in a somewhat hooked point, and with a sessile gland at the base of the petiole; branchlets villous; pedicels axillary, solitary, 1-flowered, bibracteolate in the middle. ♄. G. Native of the Cape of Good Hope, among grass. Collad. mon. p. 124. t. 19. B. Lodd. bot. cab. 511.

Cape Cassia. Fl. June. Clt. 1810. Shrub 1 foot.

163 C. pu'mila (Lam. dict. 1. p. 651.) plant diffusely procumbent; leaves with 12-15 pairs of linear, rather mucronate, ciliated leaflets, with a pedicellate gland on the petiole beneath the lower pair; pedicels nearly axillary, 1-flowered, solitary, bibracteate above the middle, much shorter than the petioles; branches and legumes pubescent. ⊙. S. Native of the East Indies. C. procumbens, Lin. spec. ed. 1. p. 380. but not, ed. 2. Collad. mon. p. 127.—Pluk. alm. t. 120. f. 1.

Dwarf Cassia. Fl. June, July. Clt. 1816. Pl. proc.

164 C. procu'mbens (Willd. spec. 2. p. 530.) procumbent; leaves with many pairs of leaflets; petioles glandless. ⊙. H. Native of Virginia and Carolina. Lin. spec. ed. 2. p. 543.

Procumbent Cassia. Fl. June, July. Clt. 1806. Pl. proc.

165 C. diffu'sa (D. C. mem. soc. hist. nat. gen. 2. p. 130.) plant diffusely procumbent, smoothish; leaves with 8-15 pairs of linear mucronate leaflets, with a pedicellate gland on the petiole beneath the lower pair; pedicels supra-axillary, solitary, bibracteate in the middle, much shorter than the petioles; legumes glabrous. ⊙. S. Native of Porto-Rico.

Diffuse Cassia. Shrub proc.

166 C. pedicella'ris (D. C. prod. 2. p. 504.) branches pubescent; leaves with 15-20 pairs of glabrous, linear, mucronate leaflets, with a pedicellate gland on the petiole beneath the lower pair; pedicels 1-flowered, solitary, length of the leaves; legumes glabrous. ♄. S. Native of St. Domingo. Nearly allied to *C. diffúsa*, but the flowers are 3 times the size.

Pedicellate Cassia. Shrub diffuse.

167 C. ripa'ria (H. B. et Kunth, nov. gen. amer. 6. p. 269.) branches pubescent; leaves with 16-19 pairs of linear glabrous leaflets, which are adpressedly ciliated on the margins; petiole bearing a stipitate gland beneath the ultimate pair of leaflets; pedicels 1-2, pilose, supra-axillary; legumes pilose. ♄. S. Native on the banks of the river Magdalena, near Mompex.

River-side Cassia. Shrub 1 to 2 feet.

168 C. Æschynómene (D. C. in Collad. mon. p. 127. t. 17.) plant rather diffuse; leaves with 18-20 pairs of linear, mucronate, glabrous leaflets; petiole smoothish, bearing a sub-sessile gland beneath the lower pair of leaflets; pedicels supra-axillary, aggregate, short; flowers heptandrous. ⊙. S. Native of St. Domingo. Breyn. cent. t. 24. Legume rather puberulous.

Æschynomene-like Cassia. Fl. June, July. Clt. 1810. Sh. 1 ft.

169 C. stipula'ta; stem, petioles, and peduncles thickly beset with horizontal, stiff, yellowish hairs; leaves with 18-20 pairs of lanceolate, cuspidate, hairy, nerved leaflets; stipulas ovate, cuspidate, nerved, oblique at the base, tapering muc[illegible] the apex. ♄. S. Native of Peru. (v. s. in herb. Lamb.)

Stipulate Cassia. Shrub 1 to 2 feet.

170 C. patella'ria (D. C. in Collad. mon. p. 125. t. 16.) erect, clothed with villous pubescence; leaves with 18-20 pairs of linear cuspidate leaflets, with 1 or 2 sessile glands along the petiole; pedicels supra-axillary, short, in fascicles; calyx and legumes hairy. ⊙. S. Native of Cayenne and Panama.

Little-Dish Cassia. Pl. 1 to 2 feet.

171 C. Parkeria'na (D. C. prod. 2. p. 565.) erect, puberulous; leaves with 20 pairs of oblong, mucronate, glabrous leaflets, with a pedicellate turbinate gland on the petiole beneath the lower pair; peduncles supra-axillary, branched, many-flowered; legumes shining, rather pilose. ♄. S. Native about Demerara. Habit of *C. Leschenaultiàna*, but differs in the glands being pedicellate.

Parker's Cassia. Fl. Aug. Sept. Clt. 1817. Sh. 1 to 2 feet.

172 C. Otterbe'inii (Mey. prim. esseq. 169.) leaves with 20 pairs of oblong-linear glabrous leaflets, with a pedicellate gland on the petiole between the lower pair: petioles, pedicels, and branches clothed with canescent pili; pedicels 2-3-together, extra-foliaceous; legumes shining, rather pilose. ♄. S. Native of Guiana, in bushy places near Essequebo.

Otterbein's Cassia. Shrub 1 to 2 feet.

173 C. a'spera (Muhl. cat. ex Ell. sketch. p. 474.) erect, hispid; leaves with 24 pairs of linear-lanceolate ciliated leaflets; petiole bearing a turbinate gland beneath the lower pair of leaflets; peduncles few-flowered, supra-axillary; flowers either heptandrous or enneandrous, with 3 of the stamens longer than the rest. ⊙. H. Native of Georgia, in the Island of Eding. Habit of *C. nictitans*.

Rough Cassia. Fl. July, Aug. Clt. 1818. Pl. 1 to 2 feet.

174 C. Leschenaultia'na (D. C. mem. soc. hist. nat. gen. 2. p. 132.) erect; leaves with 20-25 pairs of oblong-linear cuspidate leaflets, which are blunt at both ends; petiole bearing a sessile gland beneath the lower pair of leaflets, and ending in an awn at the apex, and is, as well as the branches, pubescent; pedicels in fascicles; supra-axillary; flowers heptandrous. ⊙. H. Native of Bengal. Stamens very unequal. Pedicels when in fruit about 3-4 lines long. Stipulas ending in long taper points, many-nerved at the base, 8 lines long. Calyx smoothish.

Leschenault's Cassia. Shrub 1 to 2 feet.

175 C. Wallichia'na (D. C. l. c.) erect; leaves with 20-25 pairs of oblong-linear mucronate leaflets, which are obtuse at both ends; petioles bearing a sessile gland beneath the lower pair of leaflets, and ending in a bristle at the apex, and is, as well as the branches and calyxes, pubescent; pedicels in fascicles, supra-axillary; flowers decandrous. ⊙. H. Native of Nipaul. C. dimidiàta, Roxb. hort. beng. p. 32. D. Don, prod. fl. nep. 247. Stamens nearly equal. Stipulas 4-6 lines long. Sometimes there are 2 glands on the petiole, one between each of the 2 lower pairs of leaflets.

Wallich's Cassia. Fl. June, July. Clt. 1817. Pl. 1 foot.

176 C. angusti'ssima (Lam. dict. 1. p. 650.) erect; leaves with about 30 pairs of very small, linear, mucronate leaflets; stipulas lanceolate-setaceous; peduncles twin or 2-parted, and are hairy as well as the branches. ⊙. S. Native of Java and Amboyna, ex Rumph. amb. 6. t. 67. f. 1.

Very-narrow-leafletted Cassia. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

177 C. flexuòsa (Lin. spec. 513. but not of Burm.) erect; leaves with 25-35 pairs of oblong-linear 3-nerved leaflets; stipulas obliquely cordate, acuminated; pedicels axillary, usually solitary. ⊙. S. Native of Brazil. Breyn. cent. 65. t. 23.

Flexuous-stemmed Cassia. Fl. July, Aug. Clt. 1810. Pl. 1 [illegible] feet.

178 C. Guinee'nsis; stem erect, simple, flexuous; leaves with 4 pairs of oval-lanceolate, entire, acute, glabrous leaflets; pedicels 1-flowered, axillary, and terminal. ♄. S. Native of Guinea, in the Island of St. Thomas.

Guinea-stamened Cassia. Shrub 1 foot.

179 C. microphy'lla (Willd. spec. 2. p. 529.) erect; leaves with about 50 pairs of oblong-linear leaflets; petioles narrowly margined between the pairs of leaflets, and bearing a sessile gland beneath the lower pair of leaflets; pedicels solitary, supra-axillary; legumes villous. ♄. S. Native of the Island of Santa-Cruz. Stem branched, pubescent. Stipulas lanceolate, acuminated. Perhaps many species are confused under this name.

Var. β, *Guineénsis* (D. C. prod. 2. p. 505.) leaves with about 40 pairs of leaflets; petiole not margined; pedicels solitary. ⊙. S. Native of Guinea. C. geminàta, Vahl. ex herb. Puer.

Var. γ, *hecatophýlla* (D. C. in Collad. mon. p. 128. t. 18.) glands usually twin beneath the leaflets; pedicels 2-3, aggregate; legumes at length smoothish. ⊙. S. Native of Tobago.

Var. δ, *Senegalénsis* (D. C. l. c.) leaves with about 40 pairs of leaflets; petiole a little marginate; legumes smoothish. ⊙. S. Native of Senegal, at Richard-Tole.

Small-leafletted Cassia. Fl. June, Sept. Clt. 1810. Pl. 1 ft.

180 C. arena'ria (H. B. et Kunth, nov. gen. amer. 6. p. 370.) branches flexuous, tetragonal, puberulous; leaves with 45-50 pairs of linear glabrous leaflets, with rather hispid scabrous margins, lower ones and stipulas ciliated; petiole bearing 2 glands beneath the lower pair of leaflets; peduncles 1-2, pilose, axillary. ♄. S. Native on the banks of the Orinoco, near Maypures, in sandy shady places.

Sand Cassia. Fl. June, May. Clt. 1819. Shrub 1 to 2 ft.

† *Species not sufficiently known.*

181 C. tetraphy'lla (Coll. mon. 130.) leaves with 2 pairs of ovate leaflets; stems procumbent; flowers solitary, axillary; legumes hairy. ⊙. S. Native of Mexico, about Vera Cruz. C. procúmbens, Mill. dict. no. 20. but not of Lin. Perhaps the same as *C. hispida*.

Four-leafletted Cassia. Pl. proc.

182 C. Desvau'xii (Coll. mon. 131.) leaves with 2 pairs of glabrous, veiny, ovate-lanceolate leaflets; stem shrubby; legumes villous. ♄. S. Native of South America. C. tetraphýlla, Desv. journ. bot. 1814. p. 72. but not of Mill.

Desvaux's Cassia. Shrub.

183 C. latifòlia (Meyer, prim. esseq. 166.) leaves with 2 pairs of oblong glabrous leaflets, with a large gland between the lower pair, and a small one between the superior pair. ♄. S. Native of Guiana. Flowers large, yellow.

Broad-leafletted Cassia. Shrub 6 to 8 feet.

184 C. gla'bra (Coll. mon. 131.) leaves with 2 pairs of obliquely ovate-roundish, obtuse, quite glabrous, veiny leaflets; branches angular, glabrous. ♄. S. Native of Brazil. C. venòsa, Desv. journ. bot. 1814. p. 72. but not of Zucc.

Glabrous Cassia. Shrub.

185 C. arbore'scens (Mill. dict. no. 15. but not of Vahl.) leaves with 2 pairs of oblong-ovate leaflets, which are villous beneath; flowers corymbose; stem erect, arboreous; legumes compressed. ♄. S. Native of Mexico, about Vera Cruz.

Arborescent Cassia. Tree 20 to 30 feet.

186 C. auri'ta (Coll. mon. p. 131.) leaves with 2 pairs of oblong-lanceolate, eared leaflets, with a large ovate gland between the lower pair. ♄. S. Native of Brazil. Vand. fl. lus. et bras. in Rœm. script. p. 104.

Eared-leafletted Cassia. Shrub or tree.

187 C. Cube'nsis (Hoffmans. verz. 1824. p. 209.) leaves with 2-3 pairs of ovate, acuminated, ciliated, rather pilose leaflets, which are unequal at the base, outer ones the largest, with a gland on the petiole between the lower pair; legumes slender, terete, obtuse, somewhat incurved. ♄. S. Native of Cuba.

Cuba Cassia. Shrub 6 to 8 feet.

188 C. mona'ntha (D. C. prod. 2. p. 506.) leaves with 3 pairs of ovate, acuminated, villous leaflets; flowers solitary, axillary; legumes erect, terete; stem erect, herbaceous. ⊙. S. Native of Mexico, about Campeachy. C. uniflòra, Mill. dict. no. 5.

One-flowered Cassia. Pl. 1 foot.

189 C. Mille'ri (Coll. mon. p. 132.) leaves with 3 pairs of obtuse emarginate leaflets; stems pilose; flowers solitary, axillary, longer than the petioles; legumes flat. ♄. S. Native of Jamaica. C. emarginàta, Mill. dict. no. 13. but not of Lin.

Miller's Cassia. Shrub.

190 C. villòsa (Mill. dict. no. 14.) leaves with 3 pairs of oblong-oval, equal, villous leaflets; legumes articulated; stem erect, arboreous. ♄. S. Native of Mexico, about Campeachy. Flowers small, straw-coloured.

Villous-leaved Cassia. Tree 14 to 16 feet.

191 C. homophy'lla (Hoffmans. verz. 1824. p. 209.) leaves with 3-4 pairs of elliptic-oblong, obtuse, glabrous leaflets, outer ones hardly larger than the others; petiole furnished with 1 or 2 subulate sessile glands between 1 or 2 of the lower pairs of

leaflets. ♄. S. Native country, flowers, and fruit unknown. Said to be allied to C. *occidentàlis.*

Equal-leafletted Cassia. Shrub.

192 C. HOUSTONIA'NA (Coll. mon. p. 132.) leaves with 4 pairs of oblong-ovate leaflets; stems procumbent; peduncles axillary, 2-flowered. ⊙. S. Native of Jamaica. C. biflòra, Mill. dict. no. 14. but not of Lin.

Houston's Cassia. Pl. proc.

193 C. MACRADE'NA (Collad. mon. p. 132.) leaves with 4 pairs of oblong, eared, mucronate leaflets, bearing a large orbicular gland at the base of the petiole. ♄. S. Native of Brazil. Vand. in Rœm. script. p. 104.

Long-glanded Cassia. Shrub.

194 C. PUBI'GERA (Lag. gen. et spec. p. 14. no. 184.) leaves with 4 pairs of rather hairy, ovate, acuminated leaflets, outer ones lanceolate, with a conical, somewhat pedicellate gland at the base of the petiole.—Native of Guayaquil.

Pubigerous Cassia. Shrub.

195 C. ARACHOÌDES (Burch. cat. no. 1680. ex trav. 1. p. 341.) leaves with 4-5 pairs of obovate leaflets, which are rounded or obcordate at the apex; stems herbaceous, trailing; racemes simple, axillary; legumes oval-orbicular, membranous, flat.—Native of the Cape of Good Hope.

Arachis-like Cassia. Pl. trailing.

196 C. SINOUEA'NA (Gailliaud, fl. a meroe, 1826.) branches tomentose at the apex; leaves with 7 pairs of obtuse interglandular leaflets, pubescent on the back and margins. ♄. G. Native of Egypt, about Singue.

Singue Wild-senna. Shrub.

197 C. ASCHRE'K (Forsk. descrip. p. 86.) leaves with 4-5 pairs of oval-oblong, glabrous, obtuse, acuminated leaflets, with a subulate gland between each pair; legumes flat. ⊙.? G. Native of Arabia at Mor, where it is called *Aschrek.*

Aschrek Cassia. Pl. 1 foot?

198 C. PLUMIE'RI (D. C. prod. 2. p. 506.) leaves with 5 pairs of ovate-lanceolate glabrous leaflets; legumes compressed, long, straight, pendulous, torose at the seeds. ♄. G. Native of Guadaloupe. Plum. ed. Burm. t. 77. C. planisíliqua, Lam. dict. 1. p. 645. but not of Lin.

Plumier's Cassia. Tree.

199 C. FRUTE'SCENS (Mill. dict. no. 2.) leaves with 5 pairs of ovate glabrous leaflets, outer ones the longest; stem shrubby; legumes long, terete. ♄. S. Native of Jamaica.

Shrubby Cassia. Shrub 5 to 6 feet.

200 C. HÍRTA (Willd. enum. suppl. 23.) leaves with 5 pairs of oblong hairy leaflets, with an oblong gland on the petiole between the lower pair; stipulas subulate; branches hairy. ♄. S. Native country unknown.

Hairy Cassia. Shrub.

201 C. SA'BAK (Gailliaud, fl. a meroe, 1826.) branches smooth, ferruginous; corolla an inch and a half; flowers numerous. ♄. S. Native of Egypt, on mount Aqaro, where it is called *Sabak*, and where the inhabitants use the husks of the pods to tan leather.

Sabak Cassia. Shrub.

202 C. SUMATRA'NA (Roxb. ex Horn. hort. hafn. suppl. p. 135.) leaves with 4-8 pairs of elliptic coriaceous leaflets, which are retuse and mucronate at the apex. ♄. S. Native of Sumatra.

Sumatra Cassia. Shrub.

203 A. EGLANDULÒSA (Dum. Cours. bot. cult. ed. 2. vol. 6. p. 34.) leaves with 7 pairs of ovate-orbicular, mucronate, glabrous leaflets, which are palest beneath; petioles glandless. ♄. S. Native country unknown.

Glandless Cassia. Shrub 4 to 6 feet.

204 C. TUBERCULA'TA (Collad. mon. p. 133.) leaves with 7-8 pairs of oblong acuminated leaflets, lower ones the smallest; petiole glandless; stem angular, tubercled. ♄. S. Native of Brazil. Vand. in Rœm. script. p. 104.

Tubercled-stemmed Cassia. Shrub.

205 C. DECÍPIENS (Desv. journ. bot. 1814. p. 73.) leaves with usually 8 pairs of linear-lanceolate, acute, quite glabrous leaflets; legumes compressed, elongated, somewhat reniform. ♄. S. Native of America.

Deceiving Cassia. Shrub.

206 C. SOPHEROÌDES (Collad. mon. p. 134.) leaves with 8-10 pairs of lanceolate, acute, glabrous leaflets, with rather villous margins; petiole bearing an oblong gland at the base; legumes compressed. ♄. S. Native of the East Indies. C. Sophèra, Lam. dict. 1. p. 649. but not of Lin.

Sophera-like Cassia. Shrub 6 to 8 feet.

207 C. CHAMÆCRISTOÌDES (Collad. mon. p. 134.) leaves with many pairs of linear leaflets; stems procumbent, frutescent; flowers large, solitary, axillary; legumes glabrous. ♄. S. Native of Mexico, about Vera Cruz. C. chamæcrísta, Mill. dict. no. 17. but not of Lin.

Chamæcrista-like Cassia. Shrub proc.

208 C. HORNEMA'NNI (D. C. prod. 2. p. 507.) erect; leaves with many pairs of elliptic, ciliated, mucronate leaflets, bearing one sessile gland on the petiole. ⊙. S. Native country unknown. C. venòsa, Horn. hort. hafn. suppl. p. 46. but not of Zucc.

Hornemann's Cassia. Pl. 1 to 2 feet.

209 C. MULTÍJUGA (Rich. in act. soc. hist. nat. par. 108.) arboreous, quite glabrous; leaves with 20-25 pairs of oblong elliptic leaflets, which are white beneath; panicle terminal, multiple. ♄. S. Native of Cayenne.

Many-paired-leafletted Cassia. Tree 20 to 30 feet.

210 C. DÍSCOLOR (Herb. Desv. Hamilt. prod. p. 38.) stem shrubby; leaves with usually 6 pairs of obovate, oblong, rather emarginate, glabrous leaflets, cinereous beneath; flowers terminal, sub-racemose; legumes broad, oblong, compressed. ♄. S. Native of Jamaica.

Discoloured-leaved Cassia. Shrub.

211 C. HIRSU'TA (Herb. Desv. Hamilt. prod. p. 38.) stem shrubby; leaves with usually 6 pairs of ovate, obtuse, mucronulate leaflets, which are tomentose beneath; flowers axillary, spicate; legume glabrous, compressed, very long, and linear. ♄. S. Native of Jamaica.

Hairy Cassia. Shrub.

Cult. All the species of *Cássia* are of easy culture; they thrive best in a mixture of loam and peat, and cuttings of the shrubby kinds root readily in sand under a hand-glass; those of the stove species in heat. The *C. Marylándica* being the only hardy perennial species, should be grown in a sheltered situation in peat soil, and it may either be increased by seeds or by dividing the plant at the root in spring.

CCLXXIII. DELA'RIA (Delar, evidently the name of some botanist). Desv. obs. legum. ex in Schlecht. Linnæa. 2. p. 510.

LIN. SYST. *Decándria, Monogýnia.* Calyx spathaceous, 5-toothed, marcescent. Vexillum large, spreading. Stamens 10, fertile. Ovary sessile or stipitate. Stigma acute. Legume elongated, few-seeded.—Shrubs, with alternate simple leaves.

1 D. OVALIFÒLIA (Desv. l. c.) leaves oval-elliptic, canescent beneath; flowers axillary; legumes hairy, usually twin. ♄. S. Native of Brazil. Cássia simplicifòlia, Desv. journ. bot. 1814, p. 72. D. C. prod. 2. p. 505.

Oval-leaved Delaria. Shrub.

2 D. PYRIFÒLIA (Desv. l. c.) ♄. S. Native of Guinea. Nothing further is known to us of this plant.

Pear-leaved Delaria. Shrub.

Cult. A mixture of loam and peat is the soil best suited to the species of *Delària*, and cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them in heat.

CCLXXIV. CHAMÆFI'STULA (*chamæ*, a word usually applied in botany to signify false, and *fistula*, a pipe; in reference to the cylindrical pods; but it has nothing to do with the true *Fístula*, which is the *Cathartocárpus Fístula*). Cássia, section II. Chamæfístula, D. C. in Collad. mon. p. 87. D. C. prod. 2. p. 490.—Chamæcássia, Breyn. prod. 2. p. 28.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, very obtuse, hardly joined at the base, more or less unequal. Petals 5, unequal. Stamens 10, free, unequal, the 3 lower ones longest, the 4 middle ones short and straight, and the 3 superior ones bearing difformed abortive anthers. Anthers opening by 2 pores at the apex. Ovary stipitate. Legumes terete, hardly dehiscent, slender, membranous, divided by transverse dissepiments into 1-seeded divisions internally, and filled with pulp. Seeds elliptic, compressed, horizontal.—Trees or shrubs, with abruptly pinnate leaves, bearing glands on the petioles. Flowers of all yellow.

* *Leaves with 2 pairs of leaflets. Petiole bearing a gland between the lower pair of leaflets.*

1 C. bacilla'ris; leaves with 2 pairs of ovate, obtuse, oblique leaflets, with a gland on the petiole between the lower pair; racemes axillary, pedunculate; legumes cylindrical, acute. ♄. S. Native of Surinam. Cássia bacillàris, Lin. fil. suppl p. 231. Houst. rel. t. 17. Jacq. fragm. t. 85. f. 4.? Cathartocárpus Bacíllus, Lindl. bot. reg. t. 881. Legume a foot long, terete.

Rod Bastard-cassia. Fl. Ju. Jul. Clt. 1782. Tr. 12 to 14 ft.

2 C. speciòsa; leaves with 2 pairs of rather coriaceous unequal-sided leaflets, which are shining above and glabrous, but densely clothed with tomentose pubescence beneath, ultimate pair twice the size of the other, obovate-oblong, with a cylindrical gland on the petiole between the lower pair; corymbs terminal. ♄. S. Native of Brazil. Cássia mícans, Nees. in fl. 1821. p. 329. C. speciòsa, Schrad. in gœtt. anz. 1821. p. 718. Ovary nearly terete, on a short stipe, thickly clothed with yellow hairs. Style short, glabrous, uncinate, thick. Anthers large.

Showy Chamæfistula. Fl. June, July. Clt. 1816. Tree.

3 C. inæquila'tera; leaves with 2 pairs of ovate, rather acuminate, glabrous leaflets, which are unequal-sided at the base, with a sessile gland on the petiole between the lower [illegible] racemes axillary, pedunculate; legumes incurved. ♄. S. tive of St. Martha. C. inæquilátera, Bert. ined. ex. D. C. prod. 2. p. 490. Very like the following species, but differs in being glabrous.

Unequal-sided-leafletted Chamæfistula. Tree 20 feet.

4 C. macrophy'lla; leaves with 2 pairs of elliptic-oblong, bluntish leaflets, which are glabrous above, but clothed with soft hairs beneath as well as the branchlets and petioles, with an obtuse gland on the petiole between the lower pair of leaflets; racemes axillary, pedunculate; legumes incurved. ♄. S. Native of New Granada, at the mouth of the river Sinu near Carthagena. Cássia macrophýlla, Kunth, mim. p. 126. t. 38. nov. gen. amer. 6. p. 340. Lateral leaflets nearly equal at the base.

Long-leaved Chamæfistula. Tree.

5 C. pube'rula; leaves with 2 pairs of unequal-sided, elliptic-oblong, acute leaflets, which are glabrous above, but clothed with adpressed pubescence beneath, as well as on the branches and petioles, lower pair smaller, ovate-roundish, with an oblong-conical gland on the petiole between the lower pair; racemes axillary, pedunculate. ♄. S. Native of New Granada. Cássia pubérula, H. B. et Kunth, nov. gen. amer. 6. p. 341.

Puberulous Chamæfistula. Tree.

6 C. oxyphy'lla; leaves with 2 pairs of unequal-sided, acuminately-mucronate leaflets, which are pubescent above, but clothed with soft tomentose pubescence beneath, superior pair oblong, lower small and ovate, bearing an oblong, clavate gland on the petiole between the lower pair; racemes few-flowered. ♄. S. Native of New Andalusia, on Mount Cocollar. Cássia oxyphýlla, Kunth, mim. p. 129. t. 39. H. B. et Kunth, nov. gen. amer. 6. p. 342.

Sharp-leafletted Chamæfistula. Tree 50 feet.

7 C. melanoca'rpa; leaves with 2 pairs of ovate-lanceolate, acuminated leaflets, which are shining above and quite glabrous beneath, as well as the branches and petioles, lower pair one half smaller than the outer pair; gland cylindrical, acute, situated on the petiole between the lower pair of leaflets; racemes pedunculate, axillary; legumes straight, terete. ♄. S. Native of Jamaica. Cássia melanocárpa, Bert. ined. ex. D. C. prod. 2. p. 491. Legume smooth, black, on a short stipe within the calyx, obtuse, mucronulate by the style, rather torulose.

Black-fruited Chamæfistula. Tree 20 to 30 feet.

8 C. pro'minens; leaves with 2 pairs of ovate-elliptic, acuminated, glabrous leaflets, lower pair the smallest, with a prominent gland between; branches and peduncles pubescent; racemes forming a large, terminal, corymbous panicle. ♄. S. Native of Brazil. Sello. Legume unknown. (v. s. herb. Lamb.)

Prominent-glanded Chamæfistula. Tree.

9 C. Ruizia'na; leaves with 2 pairs of broad, elliptic, obtuse, glabrous leaflets, which are oblique at the base, with a large obtuse gland between the lower pair on the petiole; racemes twin, short, corymbous, axillary. ♄. S. Native of Guiaquil. Cássia macrophýlla, Ruiz et Pav. in herb. Lamb.

Ruiz's Chamæfistula. Tree 20 to 30 feet.

10 C. oblìqua; leaves with 2 pairs of elliptic, acuminated, glabrous leaflets, with a prominent gland on the petiole between the lower pair; peduncles about the length of the leaves; flowers corymbosely umbellate. ♄. S. Native of Peru. Cássia oblíqua, Ruiz et Pav. in herb. Lamb. Legume unknown. Lower pair of leaflets the smallest.

Oblique-leafletted Chamæfistula. Tree.

11 C. e'legans; glabrous; leaves with 2 pairs of oblique, elliptic, acuminated, coriaceous leaflets, lower pair the smallest, with a prominent ovate-conical gland on the petiole between each pair. ♄. S. Native of Peru. Legumes unknown. Perhaps a species of *Cássia*.

Elegant Chamæfistula. Tree.

* * *Leaves with 3 or more pairs of leaflets.*

12 C. astroi'tes; clothed in every part with stellate, flocky tomentum; leaves with 3-4 pairs of leaflets, floral ones with only 2 pairs; leaflets obliquely ovate-lanceolate, acuminated, ultimate ones the largest, with a clavate gland on the petiole, between the lower pair, or one between each of the two lower pairs; stipulas setaceous; racemes axillary, pedunculate, corymbose; bracteas filiform. ♄. S. Native of Mexico, in Plan del Rio. Cássia astroìtes, Schlecht. et Cham. in Linnæa. 5. p. 597. Legume elongated, somewhat moniliform.

Starry-haired Chamæfistula. Tree.

13 C. corymbòsa; leaves with 3 pairs of oblong-lanceolate, rather falcate leaflets, which are glabrous as well as the branches, with an oblong gland on the petiole between the lower pair; peduncles 3-5-flowered; legumes cylindrical, 4-times longer than the pedicel. ♄. G. Native of Buenos Ayres. Cássia corymbòsa, Lam. dict. 1. p. 644. Jacq. fragm. t. 101. f. 1. Curt. bot. mag. 633. C. crassifòlia, Ort. dec. 10. p. 122. Cássia falcàta, Dum. Cours. bot. cult. ed. 2. vol. 6. p. 35.

Corymbose-flowered Chamæfistula. Shrub 6 to 10 feet.

14 C. infla'ta; leaves with usually 3 pairs of obovate-roundish, glabrous leaflets, which are glaucous beneath, with a clavate gland on the petiole between the lower pair; racemes panicled; legumes inflated. ♄. S. Native of South America,

on the banks of the river Magdalena. Cássia inflàta, Spreng. syst. 2. p. 336.

Inflated-podded Chamæfistula. Shrub.

15 C. CONTÓRTA; erect, branched; leaves with 3 pairs of obovate, pubescent, mucronate leaflets; pedicels axillary, solitary, 1-flowered; legume linear, subterete, twisted. ♄. S. Native of Guinea, in the island of St. Thomas. Flowers large, yellow.

Twisted-podded Chamæfistula. Shrub.

16 C. CROTALARIOI'DES; leaves with 3-4 pairs of oval, rather mucronate, pubescent leaflets, with a sessile elongated gland on the petiole, between each of the pairs of leaflets, except the upper one; branches pubescent; legumes ovate-oblong, puberulous, mucronate. ♄. S. Native of South America. Cássia crotalarioìdes, Kunth, mim. t. 40. Sepals oblong, bluntish, 3-nerved. Stipulas linear, subulate, elongated. Perhaps a species of *Cássia*.

Crotalaria-like Chamæfistula. Shrub 1 to 2 feet.

17 C. FLORIBU'NDA; leaves with 3-5 pairs of oblong-lanceolate, glabrous leaflets, with an oblong gland on the petiole between the lower pair; branches glabrous; peduncles many-flowered; legumes nearly cylindrical, 3-times the length of the pedicel. ♄. S. Native of New Spain. Cássia floribúnda, Cav. ex. Collad. mon. p. 88. Cássia corymbòsa, Ort. dec. p. 124. but not of Lam.

Bundle-flowered Chamæfistula. Fl. June, July. Clt. 1818. Tree or shrub.

18 C. HERBERTIA'NA; leaves with 5 pairs of lanceolate, acuminated leaflets, which are smoothish above but pubescent beneath as well as the branches and petioles; petiole bearing small, sessile glands, one between each pair of leaflets, except the 2 extreme pairs; racemes axillary and terminal, sub-corymbose. ♄. S. Native of Barbadoes. Cássia Herbertiàna, Lindl. bot. reg. 1422. Flowers large, straw-coloured.

Herbert's Chamæfistula. Fl. Aug. Sept. Clt. 1828. Shrub 9 to 10 feet.

19 C. LÆVIGA'TA; leaves with 3-5 pairs of ovate-lanceolate, acuminated, glabrous leaflets, with an oblong, acutish gland between each of the pairs on the petiole; branches glabrous. ♄. S. Native of New Spain. Cássia lævigàta, Willd. enum. 441. Cássia septentrionàlis, Zucc. cent. no. 69. Cássia grandiflòra, Desf. cent. hort. par. but not of Pers. Cássia elégans, H. B. et Kunth, nov. gen. amer. 6. p. 342. Hern. mex. p. 376. f. 1.?

Smooth Chamæfistula. Shrub 6 to 12 feet.

20 C. PE'NDULA; leaves with 4 pairs of oblong, rounded leaflets, which are glaucous beneath, and glabrous on both surfaces as well as the branches; petiole bearing a clavate gland between the lower pair of leaflets; racemes axillary, many-flowered; legumes terete, rather torulose, glabrous. ♄. S. Native of New Granada, near Guadua. Cássia péndula, Willd. enum. 1. p. 440. H. B. et Kunth, nov. gen. amer. 6. p. 343.

Pendulous-racemed Chamæfistula. Fl. July, Aug. Clt. 1820. Shrub 10 to 12 feet.

21 C. INDE'CORA; leaves with 4 pairs of obovate-oblong leaflets, which are rounded at the apex, glabrous above, but clothed with soft pubescence beneath as well as the branches and petioles; petiole bearing a gland between the lower pair of leaflets; peduncles axillary, many-flowered; legumes compressed, puberulous. ♄. S. Native of Caraccas. Cássia indécora, H. B. et Kunth, nov. gen. amer. 6. p. 343. Legume 5-6 inches long, divided internally into about 75 cells.

Indecorous Chamæfistula. Tree.

22 C. TORÒSA; leaves with 4-7 pairs of ovate-lanceolate, glabrous leaflets, with a gland at the base of the petiole; branches glabrous; legumes cylindrical, torulose. ♄. G. Native of China. Cássia toròsa, Cav. descrip. pl. p. 131. Cássia Chinénsis, Jacq. icon. rar. t. 73. but not of Lam. Cássia torulòsa and Cássia I'ndica, Poir. suppl. 2. p. 126. and p. 127.

Torose-podded Chamæfistula. Fl. June, July. Clt. 1816. Shrub 6 feet.

23 C. CHINE'NSIS; leaves with 3-5 pairs of oval, acutish leaflets, which are smoothish as well as the branches; petiole bearing a solitary gland; peduncles very short, 3-4-flowered. ♄. G. Native of China. Cássia Chinénsis, Lam. dict. 1. p. 644. but not of Jacq. Cássia grandiflòra, Pers. ench. 1. p. 457. but not of Desf.

China Chamæfistula. Fl. June. Clt. 1807. Sh. 4 to 6 ft.

24 C. GIGA'NTEA; leaves with 4-5 pairs of oval leaflets, which are attenuated at the base, and obtusely, somewhat emarginate and mucronate at the apex, glabrous as well as the branches; petiole glandless; racemes axillary, rather velvety, the upper ones disposed in a kind of panicle. ♄. S. Native of Jamaica, where it is cultivated under the name of *Cássia arboréscens*. Cássia gigántea, Bert. ined. ex. D. C. prod. 2. p. 492. Sepals roundish. Pedicels crowded, an inch long. Bracteas subulate. Legumes unknown.

Giant Chamæfistula. Tree 20 to 30 feet.

25 C. EXCE'LSA; leaves with 10-20 pairs of elliptic-oblong leaflets, which are unequal at the base, mucronate at the apex, smoothish above and shining, but pubescent beneath as well as the petioles and peduncles; corymbs of flowers panicled. ♄. S. Native of Brazil. Cássia excélsa, Schrad. in gœtt. anz. p. 717. Cássia fastigiàta, Nees. et Neuw reis. bras. ex. flora, 1821. p. 308. and p. 329.

Tall Chamæfistula. Tree.

26 C. COROMANDELIA'NA; leaves with 6-10 pairs of lanceolate acute leaflets, which are glabrous as well as the branches; petiole bearing an ovate thick gland near its base; legumes terete, smooth. ♄. S. Native of the East Indies. Cássia Coromandeliàna, Jacq. fragm. 67. t. 100, [illegible] like *C. toròsa*.

Coromandel Chamæfistula. Fl. June, Jul. Clt. 1823. Tr.

27 C. SOPHE'RA; leaves with 8-10 pairs of lanceolate, acute, nearly equal leaflets, which are glabrous as well as the branches; petiole bearing an oblong gland at the base. ♄ [illegible] Native of India in shady woods, as well as of Egypt and China. Cássia Sophèra, Lin. spec. 542.—Rumph. amb. 5. t. 97. f. [illegible]—Rheed. mal. 2. t. 52.—Burm. zeyl. t. 98. Racemes corymbous. Flowers large, pale yellow. Perhaps numerous species are con[illegible] under the name of *C. Sophèra*.

Sophera Chamæfistula. Fl. Jul. Sept. Clt. 1658. Sh. 4 to 10 ft.

Cult. See *Cássia* for culture and propagation, p. 450.

CCLXXV. CATHARTOCA'RPUS

(καθαιρω, *cathairo*, to purge, and καρπος, *karpos*, the fruit; in reference to the pulp contained in the pods being cathartic). Pers. ench. 1. p. 459.—Bactyrilòbium, Willd. enum. 440.—Cássia, Gærtn. fruct. 2. t. 147. Cássia, sect. 1. Fístula, D. C. in Collad. mon. p. 83. prod. 2. p. 489.

LIN. SYST. *Decándria, Monogýnia*. Sepals very blunt, hardly joined at the base, more or less unequal. Petals 5, unequal. Stamens 10, free, unequal, the 3 lower ones longest, the 4 middle ones short and straight, 3 upper ones bearing abortive, difformed anthers. Anthers ovate, opening by 2 chinks at the apex. Ovary stipitate. Legumes terete, or a little compressed, indehiscent, woody, with elevated sutures, transversely many-celled inside, the cells 1-seeded, and filled with cathartic pulp. Seeds elliptic, rather compressed, horizontal. Trees with abruptly pinnate leaves and pendulous or erect racemes of large yellow flowers. The trees much resemble the *Laburnum* when in full flower in their native countries.

1 C. GRA'NDIS (Pers. ench. 1. p. 459.) leaves with 10-20

pairs of oval-oblong leaflets, which are equal at the base, mucronate at the apex, puberulous above, but clothed with soft tomentum beneath, when young tomentose; petiole glandless; racemes axillary, shorter than the leaves; legumes compressed, wrinkled, very long. ♄. S. Native of the Caribbee islands, Guiana, Brazil, and between Turbaco and Carthagena, &c. Cássia grándis, Lin. fil. suppl. 230. Cássia móllis, Vahl. symb. 3. p. 57. Jacq. fragm. t. 85. f. 3. in fruit. Cássia Brasiliàna, Lam. dict. 1. p. 649.—Breyn. cent. t. 21. but not t. 14. Legumes a little compressed, a foot and a half long.

Great Purging-cassia. Clt. 1820. Tree 30 to 40 feet.

2 C. ferrugi'neus; leaves with 13-20 pairs of oblong-linear, short-acuminated leaflets, which are cuneated on the upper side at the base, and clothed with tomentose pubescence beneath; petiole glandless; racemes about equal in length to the leaves, erect; branches angularly furrowed. ♄. S. Native of Brazil. Bactyrilòbium ferrugíneum, Schrad. in Gœtt. anz. 1821. p. 713. Cássia ferruginea, Schrad. in litt. 1825. Hardly distinct from the preceding species, according to Nees. in flor. 1821. p. 328.

Rusty Purging-cassia. Tree 30 to 40 feet.

3 C. moscha'tus; leaves with 14-18 pairs of oblong leaflets, which are rounded at the apex, and clothed with soft pubescence on both surfaces; petiole glandless; legumes cylindrical. ♄. S. Native of South America, near Mompox, on the banks of the river Magdalena. Cássia moschàta, H. B. et Kunth, nov. gen. amer. 6. p. 358. The pulp in the fruit has a musky scent according to Bonpland.

Musky Purging-cassia. Tree 40 feet.

4 C. speciòsus; leaves with 14 pairs of oblong acutish leaflets, which are smoothish above but clothed with soft pubescence beneath; petiole glandless; racemes many-flowered; legumes terete, rather compressed, undulately annulated. ♄. S. Native of South America, on the banks of the river Magdalena, near the town of Teneriffe. Cássia speciòsa, H. B. et Kunth, nov. gen. amer. 6. [illegible]. Cássia Humboldtiàna, D.C. prod. 2. p. 489.

Showy Purging-cassia. Clt. 1826. Tree 40 feet.

5 C. margina'tus; leaves with 12-15 pairs of oval-oblong, unequal leaflets, which are obtuse, emarginate, and mucronate at the apex, clothed with velvety down beneath, as well as the branches and petioles; racemes axillary, much shorter than the leaves. ♄. S. Native of Coromandel. Cássia marginàta, Roxb. hort. beng. p. 31. Cássia Roxbúrghii, D. C. prod. 2. p. 489.

Marginate-leaved Purging-cassia. Clt. 1810. Tree 20 ft.

6 C. Trinita'tis; leaves with 8-10 pairs of ovate-oblong, acuminated leaflets, which are rather puberulous, and shining a little above, but paler, and clothed with rather villous down beneath; petioles glandless, and are as well as the branches and peduncles clothed with fine velvety down; panicle terminal. ♄. S. Native of the island of Trinidad. Cássia Trinitàtis, Reichb. in Sieb. pl. exsic. trin. no. 57.

Trinidad Purging-cassia. Clt. 1820. Tree 20 to 30 feet.

7 C. Sieberia'nus; leaves with 8-10 pairs of ovate-oblong shining leaflets, which are pale and beset with very minute pubescence beneath; petioles glandless; branches, peduncles, and calyxes clothed with fine velvety down; racemes loose, bracteate. ♄. S. Native of Senegal. C. Javánica affinis, Sieb. pl. exsic. seneg. no. 48. Cássia Sieberiàna, D. C. prod. 2. p. 489.

Sieber's Purging-cassia. Tree 20 to 30 feet.

8 C. conspi'cuus (G. Don, in edin. phil. journ. 1824.) leaflets ovate-lanceolate, acuminated, and emarginate, 3-nerved at the base, white beneath; stipulas subulate; racemes pendulous, loose; legumes terete, with elevated sutures. ♄. S. Native of Sierra Leone, where the pods are called "Monkey drum-sticks." The tree has much the appearance of Laburnum when in flower.

Conspicuous Purging-cassia. Fl. Feb. Clt. 1793. Tree 20 to 30 feet.

9 C. Java'nicus (Pers. ench. 1. p. 459.) leaves with 12-15 pairs of ovate, obtuse, glabrous leaflets; petioles glandless; racemes axillary; legumes nearly cylindrical, very long, and transversely torose. ♄. S. Native of Java and the Moluccas, &c. Cássia Javánica, Lin. spec. 542. exclusive of the synonymes.—Rumph. amb. 2. t. 22. Cássia Bacíllus, Gærtn. fruct. 1. p. 318. Flowers flesh-coloured. Legumes 2 feet long, rather thick, containing a black cathartic pulp as the rest of the species, which is given to horses, hence its name, *Horse-cassia*, in the East Indies.

Java Purging-cassia. Clt. 1779. Tree 30 to 40 feet.

10 C. exce'lsus; leaves with 7 pairs of ovate-oblong, acutish leaflets, beset with minute scattered hairs on both surfaces; petioles glandless. ♄. G. Native of South America, near Porto-Cabello, and in the valleys of Araguen. Cássia excélsa, H. B. et Kunth, nov. gen. amer. 6. p. 339. but not of Schrad. Cássia Bonplandiàna, D. C. prod. 2. p. 490. Flowers and fruit unknown. Nearly allied to *C. Fistula.*

Tall Purging-cassia. Tree 30 to 40 feet.

11 C. Atte'leh; leaves bipinnate, glandless, glabrous; leaflets ovate-oblong, glaucous-green; legumes long, cylindrical; seeds covered with green pulp when mature. ♄. G. Native of Egypt, at Abo Qoulgui, in the province of Qamanay, where it is called *Atteleh.* Cássia Attèleh, Gailliaud, in fl. meroe, 1826. Nearly related to *C. Fistula.*

Atteleh Purging-cassia. Tree 20 feet.

12 C. Fi'stula (Pers. ench. 1. p. 459.) leaves with 4-6 pairs of ovate, rather acuminated, glabrous leaflets; petioles glandless; racemes loose, bractless; legumes cylindrical, rather obtuse, smooth. ♄. S. Native of the East Indies, from whence it has been introduced to South America and the West Indies. Cássia Fístula, Lin. spec. 540. Gærtn. fruct. 2. t. 147. f. 1. Woodv. med. bot. t. 164. Regn. bot. with a figure, Lam. ill. t. 332. Neck. voy. ægypt. p. 21. t. 4.—Rumph. amb. 2. t. 21. Plench. icon. t. 327. Pods cylindrical, with elevated sutures, 1-2 feet long, containing a black sweet pulp. This pulp is an easy and gentle laxative. There are two sorts of this drug in the shops, one brought from the East Indies, the other from the West. The pods of the latter are generally large, rough, thick, rounded, and the pulp nauseous; those of the former are smaller, smoother, the pulp blacker, and of a sweeter taste, and are preferred to the other. Such pods should be chosen as are heavy and new, and do not make any rattling noise, from the seeds being loose within, when shaken, indicating that the pulp is dried up. The pulp should be of a bright shining black colour, and have a sweet taste. The greatest part of the pulp dissolves both in water and alcohol, and may be extracted from the pod by either. In the shops they boil the bruised pods in water, and evaporate the solution to a due consistence. Vauquelin has analyzed the pulp, and found it to consist of parenchyma, gluten, gelatine, gum, extractive, and crystallizable sugar. In medicine, the pulp from its saccharine and extractive constituents is a gentle laxative, and is recommended in a dose of some drachms in costive habits. In larger quantities it generally excites nausea, although some recommend it.

Fistula-podded Purging-cassia or Pudding Pipe-tree. Fl. June, July. Clt. 1731. Tree 30 to 50 feet.

13 C. rhombifòlius; leaves with 3-4 pairs of ovate-roundish, very blunt, glabrous leaflets; petioles glandless; racemes loose. ♄. S. Native of the Island of Timor. Cássia rhombifòlia, Roxb. hort. beng. p. 31. Cássia Fístula, var. β. ? ovàta, D. C. prod. 2. p. 490.

Rhomb-leafletted Purging-cassia. Tree 20 to 30 feet.

14 C. læ'ta; leaves with 4 pairs of thin elliptic-oblong leaflets, which are rather hairy above, and clothed with soft hairy pubescence beneath; petioles glandless; peduncles 4-8-flowered. ♄. S. Native near Guayaquil, on the sea shore. Cássia læ'ta, H. B. et Kunth, nov. gen. amer. 6. p. 340. Legume unknown.

Mild Purging-cassia. Tree 30 to 40 feet.

15 C. fistuloìdes; leaves bipinnate, with 2 pairs of pinnæ, each pinna bearing 6 pairs of leaflets; racemes erect; legumes terete, obtuse. ♄. S. Native of Mexico. C. fístula, Moc. et Sesse, fl. mex. icon. ined. Cássia fistuloìdes, Collad. mon. p. 87. t. 1. This is a very doubtful species of *Cathartocárpus* from the form of the leaves.

Fistula-like Purging-cassia. Tree 20 feet.

Cult. See *Cássia* for culture and propagation, p. 450.

CCLXXVI. EXO'STYLIS (from εξω, *exo*, without, and στυλος, *stylos*, a style; in allusion to the style being much exserted beyond the other parts of the flower). Schott. in Spreng. syst. append. 406.

Lin. syst. *Decándria, Monogýnia.* Calyx clavate, 5-cleft, 3 of the segments revolute. Petals 5, nearly equal, conniving imbricately, inserted in the middle of the throat of the calyx. Stamens 10, nearly equal, dilated at the base; anthers sagittate, cuspidate. Style elongated, simple. Legume thick, many-seeded.—A tree, with impari-pinnate leaves, and racemes of rose-coloured flowers.

1 E. venu'sta (Schott, l. c.) A tree, with villous branches, impari-pinnate leaves, ovate, rather pilose leaflets, and subracemose bracteate peduncles. ♄. S. Native of Brazil.

Beautiful Exostylis. Tree.

Cult. See *Copaifera* for culture and propagation, p. 456.

CCLXXVII. METROCY'NIA (an anagram of *Cynometra*, to which genus the present is nearly allied). Pet. Th. gen. mad. no. 76. D. C. prod. 2. p. 507.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, joined together into a campanulate tube at the base, with the lobes long and coloured. Petals 5. Stamens 10; filaments hairy, with the anthers inserted on their tops. Ovary pedicellate, hairy. Style length of stamens. Legume short, somewhat reniform, 1-seeded, warted or plaited.—A shrub from Madagascar, with abruptly-pinnate leaves, bearing few pairs of leaflets. Flowers disposed in dense spikes. This genus is very nearly allied to *Schótia* and *Cynomètra* according to M. Du Petit Thouars.

1 M. Commersònii (D. C. prod. 2. p. 507.) ♄. S. Native of Madagascar. Shrub smooth. Leaves with 2 pairs of leaflets, the lower pair at the base of the petiole, the upper pair at the apex. Leaflets coriaceous, elliptic-obovate, emarginate.

Commerson's Metrocynia. Shrub 4 to 6 feet.

Cult. See *Copaífera* for culture and propagation, p. 456.

CCLXXVIII. AFZE'LIA (in honour of Adam Afzelius, M.D. professor of botany in the university of Upsal in Sweden, who in his younger days resided many years at Sierra Leone, where he collected a large herbarium of the vegetables of that country, very few of which he published). Smith, in Lin. trans. 4. p. 221. D. C. prod. 2. p. 507.

Lin. syst. *Decándria, Monogýnia.* Calyx tubular, with a 4-cleft deciduous limb. Petals 4, unguiculate, upper one largest. Stamens 10, 8 of which are fertile, and the 2 superior ones sterile. Style subulate. Stigma acute. Legume ligneous, many-celled. Seeds arillate at the base; aril cup-shaped, one-half the length of the seed. Embryo straight, at the base of the seed, with a somewhat inclosed radicle and fleshy cotyledons. Flowers disposed in racemes, blood-coloured. This genus is not well known.

1 A. Africa'na (Smith, l. c.) 8 of the stamens fertile. ♄. S. Native of Sierra Leone. Seeds black, with scarlet aril, which becomes yellow on drying. Leaves abruptly pinnate.

African Afzelia. Tree.

2 A. Pancòvia (D. C. prod. 2. p. 507.) 7 of the stamens fertile. ♄. S. Native of Guinea. Pancòvia bíjuga, Willd. spec. 2. p. 285. Smith in Rees' cycl. vol. 26. Afzèlia bíjuga, Spreng. syst. append. 170. Leaves with 2 pairs of leaflets.

Pancovius's Afzelia. Tree.

Cult. See *Copaífera* for culture and propagation, p. 456.

CCLXXIX. MELANO'XYLON (from μελας μελανος, *melas melanos*, black, and ξυλον, *xylon*, wood; wood black). Schott, in Spreng. syst. append. p. 406.

Lin. syst. *Decándria, Monogýnia.* Calyx deeply 5-cleft. Petals 5, nearly equal. Stamens 10, hairy. Legume compressed, falcate. Seeds furnished with a winged arillus each.

1 M. Bra'una (Schott, l. c.) ♄. S. Native of Brazil. A tree, with reddish brown wood, impari-pinnate leaves, oblong-lanceolate leaflets, which are hairy beneath, and panicled racemes of flowers. Flowers clothed with rusty tomentum.

Brauna Melanoxylon. Tree.

Cult. For culture and propagation see *Copaífera*, p. 456.

CCLXXX. ACO'SMIUM (from ακοσμια, *acosmia*, want of ornament; a tree without beauty). Schott, in Spreng. syst. append. 406.

Lin. syst. *Decándria, Monogýnia.* Calyx campanulate, 4-5-cleft. Petals 5, spreading. Stamens 10, inserted in the bottom of the calyx. Ovary elongated, perhaps a legume.

1 A. lentiscifòlium (Schott, l. c.) ♄. S. Native of Brazil. A shrub, with impari-pinnate leaves, elliptic-lanceolate shining leaflets, and yellow flowers. Racemife[illegible] branches leafless. Sweètia tamarindifòlia, Spreng. syst. 2. p. 21[illegible]

Lentiscus-leaved Acosmium. Shrub.

Cult. For culture and propagation see *Copaife*[illegible] p. 456.

CCLXXXI. SCHO'TIA (so named by Jacquin in [illegible]our of Richard Van der Schot, his companion in his travels). [illegible] coll. 1. p. 93. Lam. ill. t. 331. D. C. prod. 2. p. 507.—Sc[illegible] Thunb.

Lin. syst. *Decándria, Monogýnia.* Sepals 5, coloured, joined together at the base. Petals 5, lateral ones incumbent. Stamens 10; filaments glabrous; anthers glandless. Ovary pedicellate. Style filiform. Legume unknown.—Trees, with rigid branches, abruptly-pinnate leaves, few-flowered racemes, and vermilion-coloured flowers.

Sect. I. Schòtia (see genus for derivation). Calyx tubular at the base, with 5 erect lobes. Fruit unknown. Leaves abruptly pinnate.

1 S. speciòsa (Jacq. icon. rar. 1. t. 75. Andr. bot. rep. t. 348.) leaves with 7-10 pairs of oval-lanceolate, acuminated leaflets, ending each in a spine-like mucrone; stipulas subulate, ♄. S. Native of Senegal and the Cape of Good Hope. Guayàcum A'frum, Lin. spec. 547. S. A'fra, Thunb. prod. 79. Theodòra speciòsa, Med. mon. p. 16. t. 1. Flowers scarlet.

Showy Schotia. Fl. July, Dec. Clt. 1759. Sh. 5 to 6 feet.

2 S. tamarindifòlia (Afz. ex bot. mag. t. 1153.) leaves with 8-10 pairs of ovate, bluntish, mucronate or awnless leaflets, rather gibbous in front at the base. ♄. S. Native of the Cape of Good Hope. Ait. hort. kew. ed. 2. vol. 3. p. 33. Flowers crimson. Legume broad, large, arched, reticulately veiny, and with the sutures thickened.

Tamarind-leaved Schotia. Fl. May, Sept. Clt. 1795. Shrub 5 to 6 feet.

3 S. STIPULA'TA (Ait. hort. kew. ed. 2. vol. 3. p. 33.) leaves with 5 pairs of oval, acute, mucronate leaflets; stipulas dimidiately ovate, falcate, mucronate. ♄. G. Native of the Cape of Good Hope. Flowers crimson.

Stipulaceous Schotia. Fl. May, Sept. Clt. 1794. Sh. 5 to 6 ft.

4 S. ALA'TA (Thunb. fl. cap. ed. Schult. 1. p. 389.) leaves with usually 4 pairs of cuneiform cut, usually convolute leaflets, which are reflexed at the apex. ♄. G. Native of the Cape of Good Hope. Flowers axillary, pedunculate. Petiole furnished with a narrow wing.

Winged Schotia. Fl. June, July. Clt. 1816. Sh. 4 to 6 feet.

SECT. II. SCHOTIA'RIA (an alteration from the generic name). D. C. prod. 2. p. 508. Legume turgid. Leaves simple.

5 S. SIMPLICIFÒLIA (Vahl. ined. D. C. prod. 2. p. 508.) leaves oval, emarginate, obtuse, quite smooth, shining, quite entire, 3-nerved, and reticulately veined; racemes terminal; rachis, calyxes, and pedicels clothed with short velvety down; stamens exceeding the petals, and the petals exceeding the calyx. ♄. S. Native country unknown. Legume turgid according to Vahl.

Simple-leaved Schotia. Shrub 4 to 6 feet.

SECT. III. OMPHALOBIOÌDES (from *Omphalobium*, a genus in Connaràceæ, and *idea*, like; resembles that genus in habit). D. C. prod. 2. p. 508. Sepals only connected a very little at the base. Filaments somewhat monadelphous at the very base. Legume on a short pedicel, oval, compressed, almost indehiscent, 1-celled, and 2-seeded. Seed girded by an ample aril at the base.

6 S. LATIFÒLIA (Jacq. fragm. 23. t. 15. f. 4.) leaves with 2-4 pairs of obovate, very blunt, mucronate leaflets; sepals 4; petals oblong, hardly atten[illegible]ous, 4 times longer than the calyx; legume 2-seeded. ♄. G. Native of the Cape of Good Hope. Omphalòbium Schòtia, Jacq. ecl. icon. ined. Petals and stamens purple and white. Seeds orbicular, brown, furnished with a yellow arillus.

Broad-leaved Schotia. Fl. May, July. Clt. 1810. Sh. 6 ft.

Cult. The species of this genus are very elegant when in flower. They succeed best in a cool part of a stove, as the green-house is rather too cold for them in winter, although they are natives of the Cape of Good Hope. The soil best suited for them is a mixture of loam, peat, and sand, and ripened cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them in a moderate heat.

CCLXXXII. COPAI'FERA (from *Copaiba*, the Brazilian name for the balsam of Capevi, and *fero*, to bear; trees producing the balsam of Capevi). Lin. gen. no. 542. Desf. mem. mus. p. 375. H. B. et Kunth, nov. gen. amer. 7. p. 265. D. C. prod. 2. p. 509. Hayne, pl. offic. ex Schlecht. Linnæa. vol. 1. p. 425.—Copàiva, Jacq. amer. 133.

LIN. SYST. *Decándria, Monogýnia.* Calyx bractless. Sepals 4, connected at the very base, spreading, small, and equal. Petals wanting. Stamens 10, distinct, nearly equal; anthers oblong. Style filiform. Legume stipitate, obliquely elliptic, coriaceous, somewhat compressed, 2-valved, 2-ovulate, 1-seeded. Seed elliptic, wrapped in a fleshy arillus. Embryo straight, with a sublateral radicle.—Trees, natives of the tropical parts of America, with impari-pinnate leaves, and coriaceous, somewhat unequal, ovate leaflets. Flowers white, disposed in panicles.

* *Leaves impari-pinnate; leaflets reticulated with ribs.*

1 C. BEYRÍCHII (Hayne in Schlecht. Linnæa. 1. p. 425.) leaves with 2-3 pairs of equal-sided leaflets, each ending in a long emarginate acumen, lower ones oblong, upper ones lanceolate, hardly with pellucid dots. ♄. S. Native of Brazil. Hayne, pl. offic. t. 12.

Beyrich's Balsam of Capevi tree. Tree 20 to 30 feet.

2 C. GUIANE'NSIS (Desf. mem. mus. 7. p. 376.) leaves with 2-4 pairs of equal-sided leaflets, each ending in a long apiculated point, lower ones ovate, upper ones oblong, full of pellucid dots. ♄. S. Native of Guiana, near the Rio Negro. Hayne, pl. offic. t. 13.

Guiana Balsam of Capevi tree. Clt. 1817. Tree 30 to 40 ft.

3 A. MA'RTII (Hayne, l. c.) leaves with 2-3 pairs of ovate, equal-sided, dotless leaflets, ending each in a short emarginate acumen. ♄. S. Native of Brazil. Hayne, pl. offic. t. 15.

Martius's Balsam of Capevi tree. Tree 30 to 40 feet.

4 C. JACQUINIA'NA (Hayne, l. c.) leaves with 2-5 pairs of ovate, incurved, unequal-sided, bluntly acuminated leaflets, full of pellucid dots. ♄. S. Native of Martinique, Trinidad, &c. Hayne, t. 14. C. officinàlis, Lin. spec. 557. Jacq. amer. t. 86. Lam. ill. t. 342. Woodv. med. bot. 3. t. 137. H. B. et Kunth, nov. gen. 7. t. 659. The trees which produce the *balsam of Capevi*, or *Copaiva*, are natives of the Spanish West India Islands, and of some parts of South America, and the resinous juice flows in considerable quantities from incisions made in the trunk. The juice is clear and transparent, of a whitish or pale yellow colour, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker; when long kept it becomes nearly as thick as honey, retaining its clearness; but it has never been observed to grow dry or solid, as other resinous juices do. The best resin of Copaiva comes from Brazil. Pure resin of Copaiva dissolves entirely in alcohol; the solution has a very fragrant smell. Distilled with water it yields a large quantity of a limpid essential oil, but no benzoic acid; it is therefore not a balsam, but a turpentine, a combination of resin and volatile oil. In medicine the resin of Copaiva is a useful tonic, but in some degree irritating. In large doses it proves purgative, and promotes urine, and is supposed to clean and heal exulcerations in the urinary passages more effectually than any of the other resinous fluids. The resin has been principally celebrated in chronic catarrh, gleets, and the fluor albus, and externally as a vulnerary. The dose of this medicine rarely exceeds 20 or 30 drops, though some authors direct 60 or upwards. It may be conveniently taken in the form of an emulsion, into which it may be reduced by triturating it with oil of almonds, with a thick mucilage of gum-arabic, or with the yolk of eggs, till they are well incorporated, and then gradually adding a proper quantity of water.

Jacquin's Balsam of Capevi tree. Tree 30 to 40 feet.

5 C. BÍJUGA (Hayne, l. c.) leaves with 2 pairs of incurved, oval, bluntly-acuminated, unequal-sided leaflets, which are full of pellucid dots. ♄. S. Native of Brazil. Hayne, pl. offic. t. 16.

Two-paired-leafletted Balsam of Capevi-tree. Tree 30 to 40 feet.

6 C. MULTÍJUGA (Hayne, l. c.) leaves with 6-10 pairs of somewhat incurved, unequal-sided leaflets, ending each in a long apiculated acumen, lower ones ovate-oblong, upper ones lanceolate, all full of pellucid dots. ♄. S. Native of Brazil. Hayne, pl. offic. t. 17. f. c.

Many-paired-leafletted Balsam of Capevi tree. Tree 30 to 40 feet.

** *Leaves impari-pinnate; leaflets reticulately veined.*

7 C. JUSSI'EI (Hayne, l. c.) leaves with 5-6 pairs of incurved, nearly equal-sided leaflets, each ending in a long mucronate acumen, lower ones ovate-lanceolate, upper ones oval-oblong, all full

of pellucid dots; petioles glabrous. ♄. S. Native of Peru. Hayne, pl. offic. t. 17. *f.*

Jussieu's Balsam of Capevi tree. Tree 30 to 40 feet.

8 C. **nítida** (Mart. mss. Hayne, l. c.) leaves with 2-4 pairs of incurved, unequal-sided, obtusely-acuminated leaflets, with hardly any pellucid dots, lower ones broad-ovate, upper ones oblong-ovate; petioles and peduncles glabrous. ♄. S. Native of Brazil. Heyne, pl. offic. t. 17. *a.*

Shining-leaved Balsam of Capevi tree. Tree 30 to 40 feet.

9 C. **la'xa** (Hayne, l. c.) leaves with 3-4 pairs of equal-sided, somewhat incurved, emarginate leaflets, lower ones ovate-cordate, upper ones ovate-oblong, all full of pellucid dots; petioles pubescent; peduncles villously tomentose. ♄. S. Native of Brazil. Hayne, pl. offic. t. 18.

Loose Balsam of Capevi tree. Tree 40 feet.

10 C. **Langsdórfii** (Desf. mem. mus. 7. p. 376. Hayne, l. c.) leaves with 3-5 pairs of equal-sided, obtuse leaflets, lower ones ovate, upper ones ovate-elliptic, all full of pellucid dots; petioles and peduncles pubescent. ♄. S. Native of Brazil. Hayne, pl. offic. t. 19.

Langsdorff's Balsam of Capevi tree. Tree 30 to 40 feet.

11 C. **coria'cea** (Mart. mss. Hayne, l. c. p. 427.) leaves with 2-3 pairs of elliptic, equal-sided, emarginate dotless leaflets; petioles and peduncles nearly glabrous. ♄. S. Native of Brazil. Hayne, pl. offic. t. 20.

Coriaceous-leaved Balsam of Capevi tree. Tree 40 feet.

12 C. **cordifòlia** (Hayne, l. c.) leaves with usually 5 pairs of nearly equal-sided, emarginate, dotless leaflets, lower ones ovate-cordate, upper ones elliptic-obovate; petioles and peduncles clothed with pubescent tomentum. ♄. S. Native of Brazil. Hayne, pl. offic. t. 21.

Heart-leafletted Balsam of Capevi tree. Tree 30 to 40 feet.

13 C. **Sellòi** (Hayne, l. c.) leaves with 3-4 pairs of somewhat unequal-sided, hardly dotted leaflets, lower ones ovate, upper ones lanceolate; petioles and peduncles tomentose. ♄. S. Native of Brazil. Hayne, pl. offic. t. 22.

Sello's Balsam of Capevi tree. Tree 30 to 40 feet.

14 C. **oblongifòlia** (Hayne, l. c.) leaves with 6-8 pairs of elliptic-oblong, nearly equal-sided, emarginate leaflets, full of pellucid dots; petioles and peduncles pubescent. ♄. S. Native of Brazil. Hayne, pl. offic. t. 23. *a.*

Oblong-leafletted Balsam of Capevi tree. Tree 30 to 40 feet.

15 C. **trapezifòlia** (Hayne, l. c.) leaves with 4-7 pairs of ovate-trapeziform leaflets, which are for the most part emarginate, full of pellucid dots; petioles pubescent. ♄. S. Native of Brazil.

Var. α, crassiúscula (Hayne, l. c.) leaflets for the most part alternate, thicker, full of pellucid dots. Hayne, l. c. t. 23. *b.*

Var. β, tenélla (Hayne, l. c.) leaflets for the most part opposite, thinner, and very full of pellucid dots. Hayne, l. c. t. 23.

Trapezium-leaved Balsam of Capevi tree. Tree 30 to 40 ft.

† *A species not sufficiently known.*

16 C. **dispe'rma** (Willem. herb. maur. p. 34.) fruit 2-seeded. ♄. S. Native of the Mauritius.

Two-seeded Balsam of Capevi tree. Tree.

Cult. Sandy loam is the best soil for the species of *Copaífera.* Ripened cuttings will root if planted in a pot of sand plunged in heat, under a hand-glass.

CCLXXXIII. CYNOME'TRA

(from κυων, *kyon*, a dog, and μητρα, *metra*, a matrix; shape and consistence of pods). Lin. gen. 519. Lam. ill. t. 331. D. C. prod. 2. p. 509.—Cynomòrium. Rumph. amb. 1. p. 163. but not of Lin.

Lin. syst. *Decándria, Monogýnia.* Calyx bractless, deciduous, with a very short tube, and a 4-parted limb; the lobes reflexed and pencilled at the apex. Petals 5, oblong, equal. Stamens 10, distinct; anthers bifid at the apex. Legumes half round, fleshy, indehiscent, 1-celled, 1-seeded, tubercled on the outside. Seed filling the cell, and fixed to the middle of the suture. Embryo straight, with thickish, roundish cordate cotyledons.—Trees, with bifoliate leaves and red flowers rising from the main trunk of the trees. Legumes brown, edible.

§ 1. *Genuìnæ* (*genuinus*, genuine; this division contains the genuine species). *Leaves with one pair of leaflets.*

1 C. **caulifløra** (Lin. spec. 547.) trunk floriferous; leaflets emarginate at the apex. ♄. S. Native of the East Indies. Lam. ill. t. 331. f. 1.—Rumph. amb. 1. t. 62. Peduncles rising in fascicles from the trunk, bracteolate, with many pedicels rising in racemes from the roundish bracteas, sometimes short and few-flowered, sometimes elongated and many-flowered. Perhaps two species are confused under *C. cauliflòra.* Flowers white.

Stem-flowered Cynometra. Clt. 1804. Tree 30 to 40 feet.

2 C. **ramiflòra** (Lin. spec. 547.) branches floriferous; leaflets acuminated at the apex. ♄. S. Native of the East Indies. Lam. ill. t. 331. f. 2.—Rumph. amb. 1. t. 63.—Rheed. mal. 4. t. 31. Flowers white. Seed compact, whitish, covered with a thin pellicle, having an astringent taste, but without any smell.

Branch-flowered Cynometra. Tree 60 feet.

§ 2. *Dùbiæ* (from *dubius*, doubtful, this division contains doubtful species of the genus). *Leaves with many pairs of leaflets.*

3 C. **polya'ndra** (Roxb. cor. 3. t. 286.) branches floriferous; peduncles axillary, short, many-flowered; leaves abruptly pinnate, with 2-3 pairs of leaflets. ♄. S. Native of the East Indies, on the mountains of Silhet. Flowers white, polyandrous. Legume fleshy, not tubercled on the outside. This tree is perhaps generically distinct from *Cynometra*, from the stamens being 40-50 in number in each flower, and probably hypogynous, and therefore it comes near to *Swártzia.*

Polyandrous Cynometra. Tree 40 feet.

4 C. **pinna'ta** (Lour. coch. p. 268.) racemes terminal; leaves impari-pinnate. ♄. G. Native of Cochin-china. Leaflets lanceolate, glabrous. Calyx 5-parted. Stamens 10. Legume very thick, yellow, not tubercled on the outside. Perhaps [illegible] distinct genus.

Pinnate-leaved Cynometra. Tree 60 feet.

Cult. For culture and propagation see *Copaífera.*

CCLXXXIV. IN'TSIA

(*Intsi* is the name of *I. Madagascariénsis* in Madagascar). Pet. Th. gen. nov. mad. p. 22. no. 75. D. C. prod. 2. p. 509.

Lin. syst. *Enneándria, Monogýnia.* Calyx campanulate at the base, 5-parted. Petal one, unguiculate, opposite the ovary. Stamens 9, 3 of which are fertile, longer, and declinate. Legume oblong, compressed, 3-4-seeded. Seeds oblong, with the intervals between the seeds filled with medulla.—Tall trees, with pinnate leaves.

1 I. **Madagascarie'nsis** (D. C. prod. 2. p. 509.) leaves with 2 pairs of leaflets, and an odd one; flowers corymbose; stamens 9, 6 of which are sterile. ♄. S. Native of Madagascar, where it is called *Intsi.*

Madagascar Intsia. Tree 60 feet.

2 I.? **Amboine'nsis** (D. C. prod. 2. p. 509.) leaves abruptly-pinnate, with 2 pairs of leaflets; flowers somewhat panicled; sterile filaments 3. ♄. S. Native of the Moluccas. Caju-Bessi or Metrosíderos Amboinénsis, Rumph. amb. 3. p. 21. t. 10. This tree is placed in the present genus by M. Du Petit

Thuars, but not without some doubt, and Loureiro refers it to *Baryxylum*.

Amboyna Intsia. Tree 60 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCLXXXV. EPE'RUA (the tree is called in Guiana *Vovapa-Tabaca*, and the fruit *eperu*, signifying a sabre, from the shape of the pods). Aubl. guian. 1. p. 369. t. 142. D. C. prod. 2. p. 510.—Rotmánnia, Neck. elem. no. 1284.—Panzèra, Willd. spec. 2. p. 540.

Lin. syst. *Monadélphia, Decándria.* Sepals 4, thick, and concave, connected together into a permanent urceolate tube at the base, with the sides incumbent, upper one the broadest. Petal 1, roundish, fringed, inserted in the middle of the calyx. Stamens 10, long; filaments thickened, and rather villous at the base, and joined into a short monadelphous ring. Ovary stipitate. Style long, filiform. Legume compressed, dry, coriaceous, falciform, 2-valved, 1-4-seeded, when young it is tomentose.—A tree, with abruptly-pinnate leaves, bearing 2-3 pairs of ovate, acuminated, shining leaflets. Panicle pendulous, on a long peduncle, constantly composed of numerous distant racemes. Flowers red.

1 E. FALCA'TA (Aubl. l. c.) ♄. S. Native of Guiana, in woods, where it is called *Vouapa*, according to Delessert's herbarium. Dimórpha falcàta, Smith in Rees's cycl. no. 3. The inhabitants of Guiana make handles to their hatchets of the wood of this tree.

Falcate-podded Eperua. Tree 40 to 50 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCLXXXVI. PARIVO'A (the Guiana name of [illegible] tree). Aubl. guian. 2. p. 756. t. 303. D. C. prod. 2. p. 510 Adlèria, Neck. elem. no. 1286.—Dimórpha, Willd. spec. 3. p. 971.

Lin. syst. *Diadélphi*[illegible] 2 bracteoles on the [illegible]side, 3-5-cleft; tube urceolate; segments thick and blunt. Petal 1, large, roundish, convolute, inserted in the calyx. Stamens 10; filaments long, 9 of which are joined together at the base, and the tenth loose. Ovary stipitate. Style long, filiform. Legume thick, compressed, oval, 2-valved, 1-seeded.—A tree, with abruptly-pinnate leaves, bearing 3-4 pairs of ovate, acuminated, shining leaflets. Flowers purple, in short racemes. Perhaps sufficiently distinct from *Epérua*.

1 P. GRANDIFLÒRA (Aubl. l. c.) ♄. S. Native of Cayenne, along the banks of rivers. Dimórpha grandiflòra, Willd. l. c. Rudge in Lin. trans. 9. p. 180. t. 20. Petal almost 2 inches long, purple. The trunk of the tree is more than 2 feet in diameter, and the wood is reddish, solid, and compact; and is used in Cayenne for various important purposes.

Great-flowered Parivoa. Clt. 1821. Tree 30 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCLXXXVII. ANTHONO'TA (from ανθος, *anthos*, a flower, and νωτος, *notos*, the back; in reference to the flower being only furnished with one petal, which is behind). Beauv. fl. d'ow. 1. p. 70. t. 42. D. C. prod. 2. p. 510.

Lin. syst. *Decándria, Monogýnia.* Bractea 2-lobed, situated under the calyx. Calyx petaloid, 4-cleft, 3 of the lobes are lanceolate and acute, the fourth broader and emarginate. Petal one, standing on a long claw, with a spoon-shaped emarginate limb. Stamens 10, free, 3 of which are very long, and 7 shorter than the calyx. Ovary sessile, compressed, ovate. Style filiform, crowned by a somewhat bifid stigma. Legume compressed, flat, hardly dehiscent, 1-celled, many-seeded, somewhat reticulated from transverse wrinkles. Seeds orbicular, flat.—A glabrous shrub, without stipulas. Leaves abruptly-pinnate, with 2-3 pairs of coriaceous, elliptic-oblong, acuminated leaflets; petiole terete. Racemes axillary, very short. This genus is allied to *Oútea*, *Vouàpa* and *Parivòa*.

1 A. MACROPHY'LLA (Beauv. l. c.) ♄. S. Native of Western Africa, between Waree and Buonopozo, along the banks of rivulets. Leaflets 8-10 inches long.

Long-leafletted Anthonota. Shrub 6 to 8 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCLXXXVIII. OU'TEA (*Joutay* is the name of *O. paniculàta* in Guiana). Aubl. guian. 1. p. 28. Juss. gen. 347. Vahl. enum. 2. p. 38.—Macrolòbium, spec. Schreb. et Willd.

Lin. syst. *Triándria, Monogýnia.* Calyx 5-cleft, furnished with 2 opposite bracteas at the base. Petals 5, 4 of which are very minute or almost wanting, the fifth large, and undulately plicate. Stamens 3-4, long, free, when 4 the fourth is sterile. Ovary pedicellate, terminated by a long style. Legume compressed, 1-celled (1-seeded? ex ovarium).—Trees, natives of Guiana, with abruptly-pinnate leaves, and racemes of flowers.

1 O. MULTI'JUGA (D. C. prod. 2. p. 510.) leaves with 3-5 pairs of obovate-cuneated, oblong, very blunt, retusely emarginate leaflets. ♄. S. Native of French Guiana. Stamens 3. Perhaps sufficiently distinct from the following species.

Many-paired-leafletted Outea. Tree.

2 O. GUIANE'NSIS (Aubl. guian. 1. p. 28. t. 9.) leaves with 2 pairs of elliptic-oblong obtuse leaflets. ♄. S. Native of French Guiana. Stamens 4, of which one is sterile and villous. Lam. ill. t. 26. Macrolòbium pinnàtum, Willd. spec. 1. p. 186. Macrolòbium U'tea, Gmel. syst. 93.

Guiana Outea. Clt. 1825. Tree 50 feet?

3 O. BI'JUGA (D. C. prod. 2. p. 511.) leaves with 2 pairs of leaflets; flowers triandrous, and with 6 sterile filaments. ♄. S. Native of the East Indies. Macrolòbium bíjugum Coleb. Lin. trans. vol. 12. p. 359. t. 17.

Two-paired-leafletted Outea. Clt. 1823. Shrub 10 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCLXXXIX. VOUA'PA (the name of the first species in Guiana). Aubl. guian. 1. p. 25. Juss. gen. p. 350. D. C. prod. 2. p. 511.—Macrolòbium species, Schreb. et Willd. Macrolòbium, Vahl. enum. 2. p. 37.—Kruegèria, Neck. elem. no. 1389.

Lin. syst. *Triándria, Monogýnia.* Calyx 4-cleft, furnished with 2 opposite bracteoles at the base. Petal one, flat. Stamens 3. Legume pedicellate, coriaceous, 1-seeded.—Trees, natives of Guiana, bearing only one pair of leaflets. Flowers disposed in racemes. This genus is perhaps not sufficiently distinct from *Oútea*.

1 V. BIFÒLIA (Aubl. guian. 1. p. 25. t. 7.) leaflets sessile, ovate, acuminated, oblique; bracteas with one elevated nerve each; lobes of calyx spreading, about equal in length to the corolla; legumes winged on one side. ♄. S. Native of Guiana and of Maranham in Brazil, where we have seen it in great plenty. Macrolòbium hymenæoìdes, Willd. spec. 1. p. 186. Macrolòbium Vuàpa, Gmel. syst. 1. p. 93. M. bifòlium, Pers. ench. 1. p. 39. Petals violaceous.

Two-leafletted Vouapa. Clt. 1823. Tree 60 feet.

2 V. SIMÌRA (Aubl. guian. 1. p. 26. t. 8.) leaflets petiolulate, somewhat obovate-lanceolate, equal at the base; legumes oval, with smooth margins. ♄. S. Native of Guiana, where it is called *Simira*. Macrolòbium sphærocárpum, Willd. spec. 1. p. 186. Macrolòbium Simìra, Gmel. syst. 1. p. 93. Vouàpa violàcea, Lam. ill. no. 420. Petals violaceous.

Simira Vouapa. Tree 40 to 50 feet.

3 V. STAMÍNEA (D. C. prod. 2. p. 510.) leaflets sessile, lanceolate-oblong, bluntish; segments of calyx reflexed; stamens 3 times the length of the corolla; legumes obsoletely margined

on one side. ♄. S. Native of Guiana, in the Island of Arowabisch. Macrolòbium staminèum, Meyer. esseq. 18.

Stamineous Vouapa. Tree 30 to 40 feet.

4 V. phaseloca'rpa (Hayne, get. darst. vesch. ex Schlecht. Linnæa. vol. 5. p. 20.) leaflets sessile, obovate-oblong, rounded, and emarginate at the apex, and unequal at the base; legumes channelled on both margins. ♄. S. Native of Brazil?

Phaselus-fruited Vouapa. Tree.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCXC. HYMENÆ'A (from *Hymen*, the god of marriage; in reference to the twin leaflets). Lin. gen. no. 512. Gærtn. fruct. 2. p. 305. t. 144. Lam. ill. t. 330. D. C. prod. 2. p. 511.—Coùrbaril, Plum. gen. t. 36.

Lin. syst. *Decándria, Monogýnia.* Calyx furnished with 2 bracteoles at the base, tubular, coriaceous; tube urceolate; limb 5-parted, the 2 lower segments for the most part joined, all deciduous. Petals 5, unequal, sessile, lower one usually boat-shaped. Stamens 10, distinct, inflated in the middle. Ovary pedicellate, beardless. Style filiform. Legume woody, ovate-oblong, indehiscent, 1-celled, many-seeded, filled with dry farinaceous, filamentose pulp. Embryo straight, with fleshy cotyledons, and a globose radicle.—Trees, with bifoliate leaves, and corymbs of white or yellowish flowers.

* *Leaflets glabrous.*

1 H. venòsa (Vahl. eclog. 2. p. 31.) leaflets oblong, unequal-sided, but equal at the base, ending each in a long obtuse acumen. ♄. S. Native of Cayenne. Flowers of panicle sessile. Calyx silky, shining.

Veiny-leaved Locust-tree. Tree 40 feet.

2 H. latifòlia (Hayne, gat. dars. vesch. ex Schlecht. Linnæa. 5. p. 18.) leaflets roundish-ovate, nearly equal-sided, equal at the base, but emarginate at the apex. ♄. S. Native of South America. H. obtusifòlia, Willd. herb.

Broad-leafletted Locust-tree. Tree.

3 H. confertiflòra (Mart. mss. Hayne, l. c.) leaflets ovate, unequal-sided, but equal at the base, ending in a long obtuse acumen. ♄. S. Native of Brazil.

Crowded-flowered Locust-tree. Tree.

4 H. confertifòlia (Hayne, l. c.) leaflets oblong, unequal-sided, and unequal at the base, ending in a short acumen. ♄. S. Native of Brazil.

Crowded-leaved Locust-tree. Tree.

5 H. cou'rbaril (Lin. spec. 537.) leaflets oblong-ovate, unequal-sided, and unequal at the base, ending in a long acumen; legume oblong, compressed, yellowish, shining. ♄. S. Native of South America. Vahl. eclog. 2. p. 30. Lam. ill. t. 330. f. 1. D. C. legum. mem. xii. t. 26. f. 120. germ. Jacq. amer. pict. p. 63. t. 264. f. 65. Flowers of panicle pedicellate. Petals yellow, striped with purple. Stamens purple. The filamentose white substance contained in the pods is as sweet as honey, and is eaten by the Indians with great avidity. It is purgative when fresh gathered, but loses this quality as it grows old. Between the principal roots of the tree exudes a fine transparent resin, white, yellowish or red, which is collected in large lumps, and is called gum-anime. It makes the finest varnish that is known, superior even to the Chinese lac; for this latter use it is dissolved in the highest rectified spirits of wine. It burns readily, and with a clear flame, emitting a grateful and fragrant smell, for which reason it is sometimes ordered by way of fumigation in the chambers of persons labouring with asthmas or suffocative catarrhs. Its vapours not only strengthen the head, but all parts of the body affected with cold. Some apply it outwardly, dissolved in oil or spirits of wine, to strengthen the nerves. An oil may be distilled from it, useful in palsies, in cramps, and contractions of the sinews. The solution in spirits has been thought not inferior to guiacum in venereal cases. The inner bark is an excellent vermifuge in spirit or decoction. The wild bees are fond of building their nests in this tree. The timber of old trees is reckoned excellent, and is in great request for wheel-work in sugar-mills, particularly for cogs to the wheels, being extremely hard and tough; it is so heavy that a cubic foot weighs a hundred pounds; it also takes a fine polish. *Courbaril* is the name of the tree in some parts of South America.

Courbaril Locust-tree or Gum-anime-tree. Tree 40 to 60 ft.

6 H. stilboca'rpa (Hayne, l. c.) leaflets oblong, unequal-sided, and unequal at the base, ending in a short acumen; legume nearly cylindrical, smooth, and shining. ♄. S. Native of South America.

Shining-fruited Locust-tree. Tree.

7 H. Candollea'na (H. B. et Kunth, nov. gen. amer. 6. p. 323. t. 566.) leaflets oblong, unequal-sided, but equal at the base, and emarginate at the apex. ♄. S. Native of Mexico, about Acapulco. Peduncles terminal, many-flowered. Flowers pedicellate. Calyx 4-parted, clothed with fine canescent down.

De Cando[illegible]'s Locust-tree. Tree 30 feet.

8 H. stigo[illegible]a'rpa (Mart. mss. Hayne, l. c.) leaflets somewhat cordate-[illegible]ng, unequal-sided, and unequal at the base, obtuse at the [illegible]; legume oblong, compressed, beset with white dots. ♄. S. [illegible]ive of Brazil.

Dotted-fruited Locust-tree. Tree.

** *Leaflets clothed with villous tomentum.*

9 H. rotunda'ta (Hayne, l. c.) leaflets semicordate, ovate, unequal-sided, and unequal at the base, rounded at the apex. ♄. S. Native of South America.

Roun[illegible]-leafletted Locust-tree. Tree.

10 H. [illegible]lfersia'na (Hayne, l. c.) leaflets oblong, unequal-sided, [illegible] at the base; lower leaflets [illegible]what semi-cordate; corymbs axill[illegible] and terminal. ♄. S. Native of South America.

Olfers's Locust-tree. Tree.

11 H. Martia'na (Hayne, l. c.) leaflets nea[illegible] elliptic, unequal-sided, retuse, and very unequal at the base; [illegible]rymbs terminal. ♄. S. Native of Brazil.

Martius's Locust-tree. Tree.

12 H. Selloia'na (Hayne, l. c.) leaflets oblong-oval, une[illegible]-sided, very blunt, unequal at the base; corymbs terminal. ♄. Native of Brazil.

Sello's Locust-tree. Tree.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCXC. (*a*) TRACHYLO'BIUM (from τραχυς, *trachys*, rough, and λοβος, *lobos*, a pod; pods rough on the outside). Hayne, gat. dars. veschr. ex Schlecht. Linnæa. vol. 5. p. 19.

Lin. syst. *Decándria, Monogýnia.* Calyx bibracteolate at the base, tubular, coriaceous; tube urceolate; limb 5-parted, with the segments deciduous, 2 upper ones usually connected. Petals 3, nearly equal, on long claws. Stamens 10, free. Ovary pedicellate, bearded. Legume coriaceous, suberose, indehiscent, 1 or few-seeded, filled with solid pulp.—Trees, with bifoliate leaves, and panicles of white flowers.

1 T. Martia'num (Hayne, l. c.) leaflets sessile, coriaceous, nearly veinless, ovate-lanceolate, unequal-sided, and unequal at the base, ending in an emarginate acumen. ♄. S. Native of Brazil. Hymenæ'a verrucòsa, Lam. dict. p. 306. T. Tanroujou, Juss. gen. in a note, p. 351. Panicle divaricate; peduncles many-flowered. Legume warted. Ovary stipitate, 5-ovulate.

Martius's Trachylobium. Clr. 1808. Tree.

2 T. Hornemannia'num (Hayne, l. c.) leaflets on very short petiolules, coriaceous, oblong, unequal-sided, and unequal at

the base, ending in a long obtuse acumen. ♄. S. Native of South America.

Hornemann's Trachylobium. Tree.

3 T. GÆRTNERIA'NUM (Hayne, l. c.) leaflets on short petiolules, very coriaceous, nearly veinless, oval-ovate, unequal-sided, abruptly acuminated, and unequal at the base. ♄. S. Native of Madagascar. Hymenæ'a verrucòsa, Gærtn. fruct. 2. p. 306. t. 139. f. 7.

Gærtner's Trachylobium. Tree.

4 T. LAMARCKIA'NUM (Hayne, l. c.) leaflets on short petioles, rather coriaceous, reticulately veined, oval-ovate, unequal-sided, and unequal at the base, ending in a short acumen. ♄. S. Native of Madagascar? Hymenæ'a verrucòsa, Lam. ill. t. 330. f. 2.

Lamarck's Trachylobium. Tree.

5 T. FLORIBU'NDUM; leaflets oblong, unequal at the base, coriaceous, ending in a blunt acumen; panicles axillary, branched; flowers pedicellate; legumes ovate, hairy, 1-2-seeded. ♄. S. Native of South America, near Angostura. Hymenæ'a floribúnda, H. B. et Kunth, nov. gen. amer. 6. p. 323. t. 567.

Bundle-flowered Trachylobium. Tree 60 feet.

Cult. For culture and propagation see *Copaífera*, p. 456.

CCXCI. SCHNE'LLA (meaning unknown). Raddi, mem. pl. bras. add. p. 32. D. C. prod. 2. p. 512.

LIN. SYST. *Decándria, Monogýnia.* Calyx coriaceous, campanulate, 5-toothed. Petals 5, unguiculate, nearly equal. Stamens 10. Style wanting. Legume truncate. Leaves 2-lobed, like those of *Bauhinia.* It is said by the author to be a genus intermediate between *Hymenæ'a* and *Bauhínia.*

1 S. MICROSTA'CHYA (Raddi, l. c.) lobes of leaves ovate, obtuse; branches cirrhiferous. ♄. ◡. S. Native of Brazil, near Rio Janeiro, in hedges. Young branches, calyxes, peduncles, and petioles clothed with rusty tomentum.

Small-spiked Schnella. Shrub cl.

2 S. MACROSTA'CHYA (Raddi, l. c. f. 4.) lobes of leaves [illegible] roundish; flowers in spikes; spikes axillary and terminal, very long. ♄. ◡. [illegible] Native of Brazil, about Rio Janeiro, on the high mountains.

Long-spiked Schnella. Shrub cl.

3 S. SMILA'CINA; climbing; branches cirrhiferous; leaves undivided, ovate, acuminated, 5-nerved, glabrous; racemes spicate, elongated. ♄. ◡. S. Native of Brazil. Caulótrepus smilácinus, Schott, in Spreng. syst. append. p. 406.

Smilax-like Schnella. Shrub cl.

Cult. For culture and propagation see *Bauhínia.*

CCXCII. BAUHI'NIA (named by Plumier in memory of the two famous botanists of the 16th century, John and Caspar Bauhin, brothers; the leaves being simple but 2-lobed, which circumstance, it is said, gave occasion to Plumier to name this genus from the two brothers). Plum. gen. t. 13. Lin. gen. no. 511. Lam. ill. t. 329. D. C. legum. mem. xiii. prod. 2. p. 512.

LIN. SYST. *Decándria, Monogýnia.* Sepals 5, irregularly connected together into a 5-cleft calyx, or cleft laterally, membranous. Petals 5, spreading, oblong, rather unequal, upper one usually distant from the rest. Stamens 10, sometimes 9 of which are sterile and monadelphous (f. 58. *c.*), and the tenth loose and fertile (f. 58. *e.*), sometimes all are monadelphous at the base, with all or only 5 or 3 of them fertile; the rest sterile. Ovary long, pedicellate. Legume 1-celled, 2-valved, many-seeded. Seeds compressed, oval, with the endopleura tumid. Embryo straight, with an ovate radicle, and flat cotyledons.—Shrubs, with 2-lobed leaves, constantly composed of 2-joined leaflets at the top of the petiole, sometimes nearly altogether free, sometimes nearly joined together to the apex, but usually joined together more or less, and with an awn in the recess. Flowers disposed in racemes.

SECT. I. CASPA'RIA (in memory of Caspar Bauhin, see genus). Kunth, ann. sc. nat. 1. p. 85. nov. gen. amer. 6. p. 317. D. C. prod. 2. p. 512.—Bauhínia, Cav. but not of Kunth. Stamens 10, of which 9 are monadelphous, short, and sterile (f. 58. c.), the tenth one long and antheriferous, and almost free from the rest. Ovary stipitate. Racemes terminal, simple, leafless.

1 B. DIVARICA'TA (Lin. spec. 535.) leaves obtuse at the base; leaflets hardly connected to the middle, free parts oblong, acute, 2-nerved, diverging; petals lanceolate. ♄. S. Native of South America. Lin. hort. cliff. p. 156. t. 15. Flowers white.

Divaricate-lobed-leaved Mountain-ebony. Fl. June, Sept. Clt. 1742. Shrub 5 to 6 feet.

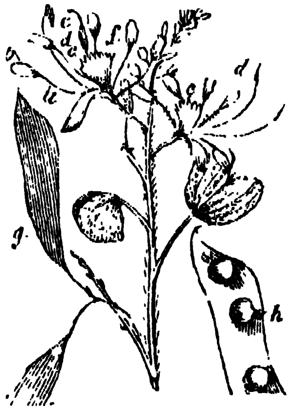
2 B. LAMARCKIA'NA (D. C. prod. 2. p. 512.) leaves cordate at the base, glabrous above, pubescent on the nerves beneath; leaflets joined together to the middle, 2-nerved, free parts bluntish, and rather diverging; petals lanceolate. ♄. S. Native of South America. B. divaricàta, Lam. dict. 1. p. 389. exclusive of the synonyme, ex Desf. cat. hort. par. p. 211. B. retùsa, Poir. suppl. 1. p. 699. but not of Roxb. Flowers white.

Lamarck's Mountain-ebony. Clt. 1818. Shrub 6 feet.

3 B. SPATHA'CEA (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 2. p. 512.) leaves glabrous, emarginately cordate both at the base and apex; leaflets connected beyond the middle, 2-nerved, free parts oval, obtuse; petals lanceolate. ♄. S. Native of New Spain. Flowers white, 4-petalled according to the figure. Calyx spathaceous.

Spathaceous-calyxed Mountain-ebony. Clt. 1823. Sh. 6 ft.

FIG. 58.



4 B. SUBROTUNDIFO'LIA (Cav. icon. 5. t. 406.) leaves hardly cordate at the base, clothed with hairy tomentum beneath; leaflets connected to the middle, ovate, obtuse, almost semi-orbicular; petals oblong, on long claws (f. 58. *b.*). ♄. S. Native of Calava, near Manilla, and in the vicinity of Acapulco. The plant from the Philippine Islands [illegible] much more tomentose than that found in the vicinity of Acapulco. Petals red.

Roundish-leaved Mountain-ebony. Shrub 6 feet.

5 B. LUNA'RIA (Cav. icon. t. 407.) leaves glabrous; leaflets free, or joined to the middle, 3-nerved, ovate-roundish; racemes simple, tomentose; claws of petals very long and pilose. ♄. S. Native of the vicinity of Acapulco and Calava. Petals red.

Moon-leaved Mountain-ebony. Clt. 1820. Shrub 6 feet.

6 B. PES-CA'PRÆ (Cav. icon. t. 404.) leaves glabrous, glaucous beneath, coriaceous, cordate at the base; leaflets connected beneath the middle, oblong, 3-nerved, the free parts nearly parallel when young, but at length diverging at the apex; petals oblong, on long claws, and are hairy as well as the sterile stamens. ♄. S. Native of Mexico, about Acapulco, on the sea-shore. Caspària pes-càpræ. H. B. et Kunth, nov. gen. amer. 6. p. 318. Petals reddish.

Goat's-foot-leaved Mountain-ebony. Shrub 6 feet.

7 B. AURI'TA (Ait. hort. kew. 2. p. 48.) leaves glabrous, cordate at the base; leaflets connected the fourth part of their length, oblong-lanceolate, nearly parallel, 6-8-nerved; petals ovate, on short stipes. ♄. S. Native of Jamaica. Mill. fig. t. 61. B. divaricàta β, Lin. spec. 535. Flowers white.

Eared Mountain-ebony. Fl. Aug. Sept. Clt. 1756. Shrub 4 to 6 feet.

8 B. PORRE'CTA (Swartz, prod. p. 66.) leaves cordate at the

base, with the nerves on the under side as well as the petioles and branches puberulous; leaflets connected to about the middle, ovate, acuminated, 3-4-nerved, nearly parallel; petals lanceolate. ♄. S. Native of Jamaica and St. Domingo. Sims, bot. mag. 1708. Jacq. schœnbr. t. 100. Plum. ed. Burm. t. 44. f. 2. Petals white.

Stretched-out Mountain-ebony. Clt. 1737. Sh. 10 to 12 ft.

9 B. LATIFÒLIA (Cav. icon. t. 405.) leaves ovate or cordate at the base, young ones, petioles, and branchlets puberulous; leaflets connected beyond the middle, broadly ovate, 3-nerved, acute, and rather diverging at the apex; petals lanceolate, stipitate, a little undulated. ♄. S. Native of New Spain. In a specimen sent from the Botanic Garden at Madrid to De Candolle, the pedicels, calyxes, and ovaries were downy. Flowers white.

Broad-leaved Mountain-ebony. Clt. 1818. Shrub 5 to 6 ft.

10 B. CA'NDIDA (Ait. hort. kew. 2. p. 49.) leaves cordate at the base, pale and pubescent beneath; leaflets connected a little beyond the middle, ovate-oblong, bluntish; sepals smooth, ending in a long taper point. ♄. S. Native of Java and other parts of the East Indies. Flowers white.

White-flowered Mountain-ebony. Fl. May, June. Clt. 1777. Shrub 4 to 6 feet.

11 B. ACUMINA'TA (Lin. spec. 536.) leaves rather cordate at the base, smoothish; leaflets connected beyond the middle, ovate, acuminated, parallel, 4-nerved; sepals attenuated; petals broadly ovate, hardly stipitate. ♄. S. Native of Malabar.—Rheed. mal. t. 34. B. acuminàta, Burm. ind. 94. exclusive of the synonymes of R. Brown and Sloane. Bauhìnia, Burm. zeyl. 45. Flowers pure white, void of scent.

Acuminated-leaved Mountain-ebony. Clt. 1808. Sh. 5 to 6 ft.

SECT. II. PAULE'TIA (in honour of John James Paulet, M.D. who published a work at Paris in 1791, entitled Tabula plantarum fungosarum). Cav. icon. 5. p. 5. D. C. prod. 2. p. 513. Stamens 10, somewhat monadelphous at the very base, all fertile, or the 5 alternate ones are sterile, and the other 5 fertile. Ovary stipitate.

* *Prickly or spiny shrubs.*

12 B. PAULE'TIA (Pers. ench. 1. p. 455.) spines stipular; leaves glabrous, ovate at the base; leaflets ovate, obtuse, parallel, 4-nerved, connected beyond the middle; peduncles axillary, 2-flowered, constituting a leafy raceme; petals and sepals linear, acute; the 5 fertile stamens very long. ♄. S. Native of the vicinity of Panama. Paulètia aculeàta, Cav. icon. t. 410. P. spinòsa, Poir. suppl. 1. p. 599. B. Panaménsis, Spreng. syst. 2. p. 384. Petals yellowish red.

Paulet's Mountain-ebony. Clt. 1820. Shrub 6 to 8 feet.

13 B. GLANDULÒSA (D. C. prod. 2. p. 513.) spines stipular; leaves nearly orbicular, rather cordate, membranous, pubescent beneath, and full of glandular dots; leaflets connected, semi-ovate, 4-nerved, obtuse, divaricate; flowers 1-3, opposite the leaves; calyx hairy on the outside; petals oblong-lanceolate. ♄. S. Native of New Barcelona. Paulètia glandulòsa. H. B. et Kunth, nov. gen. amer. 6. p. 314. Flowers white. Fruit unknown. Allied to *B. Paulètia.*

Glandular Mountain-ebony. Shrub.

14 B. GRANDIFLÒRA (Juss. in Poir. suppl. 1. p. 600.) spines stipular; leaves roundish, cordate at the base, tomentose beneath; leaflets connected to the middle, ovate, obtuse, 3-4-nerved; branchlets and calyxes pubescent; peduncles axillary, 1-3-flowered, constituting a raceme; bracteoles ending in a setaceous acumen; stamens shorter than the petals. ♄. S. Native of Peru. Hook, bot. misc. 1. p. 218. t. 91. Flowers white.

Great-flowered Mountain-ebony. Clt. 1820. Shrub.

15 B. LEPTOPE'TALA (Moc. et Sesse, fl. mex. icon. ined. D.C. prod. 2. p. 513.) spines stipular; leaves cordate at the base, glabrous; leaflets ovate, acuminated, 3-nerved, parallel, connected beyond the middle; peduncles axillary, 2-flowered, constituting a leafy raceme; petals linear, acute; 5 fertile stamens very long. ♄. S. Native of New Spain. Flowers greenish. Very nearly allied to *B. Paulètia.*

Slender-petalled Mountain-ebony. Clt. 1818. Sh. 4 to 6 ft.

16 B. ACULEA'TA (Lin. spec. 535.) spines stipular; leaves rather cordate at the base, glabrous; leaflets ovate, obtuse, 3-nerved, connected nearly to the apex; petals lanceolate, deeply crenated; stamens 9-10, incurved. ♄. S. Native of South America. Plum. ed. Burm. t. 44. f. 1. Jacq. amer. p. 119. t. 177. ed. pict. p. 60. t. 260. f. 31. Flowers large, white, with a somewhat unpleasant scent, like *Savin.*

Prickly Mountain-ebony. Fl. June, Aug. Clt. 1737. Sh. 4 to 6 feet, climbing.

17 B. ROTUNDA'TA (Mill. dict. no. 7.) spines stipular; leaves somewhat cordate at the base; lobes rounded; petals 3 inches long, about the length of the stamens; flowers lateral. ♄. S. Native of Carthagena, in New Spain. Flowers large, white.

Rounded-leaved Mountain-ebony. Tree 20 feet.

18 B. FORFICA'TA (Link, enum. 1. p. 404.) stem prickly; leaves cordate at the base, glabrous; leaflets connected to the middle, stretched out, 4-nerved; petals lanceolate. ♄. S. Native of Brazil. Flowers white. Stamens not described.

Pincer-leaved Mountain-ebony. Clt. 1823. Sh. 4 to 6 feet.

19 B. EMARGINA'TA (Mill. dict. no. 5.) stem prickly; leaves cordate at the base, tomentose beneath; leaflets orbicular, connected almost to the apex. ♄. S. Native of New Spain, at Carthagena. Flowers large, terminal, of a dirty white colour.

Emarginate-leaved Mountain-ebony. Shrub 4 to 6 feet.

* * *Unarmed shrubs.*

20 B. INE'RMIS (Pers. ench. 1. p. 455. but not of Forsk.) leaves ovate at the base, ferruginous beneath; leaflets oblong, acute, 4-nerved, parallel, connected a little beyond the middle; racemes terminal, leafless, simple; petals linear; stamens 10, fertile; anthers glabrous. ♄. S. Native of Mexico, about Acapulco. Paulètia inérmis, Cav. icon. t. 409. H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers white.

Unarmed Mountain-ebony. Clt. 1810. Shrub 6 to 8 feet.

21 B. RUFE'SCENS (Lam. dict. 1. p. 391. ill. 321. f. 2.) leaflets distinct, semiorbicular, 3-nerved, glabrous; petals lanceolate; stamens 10, fertile; anthers hairy. ♄. S. Native of Senegal and Gambia and the Cape of Good Hope, as well as of the Mauritius. B. rubéscens, Pers. ench. 1. p. 455. Flowers pale red.

Rufescent Mountain-ebony. Clt. 1810. Shrub 5 to 6 feet.

22 B. PARVIFLÒRA (Vahl. symb. 3. p. 55.) leaves roundish, glabrous above and shining, but glaucous beneath and pilose on the nerves; leaflets distinct, roundish, 3-nerved; racemes leafless, longer than the leaves; petals linear; stamens 10, villous at the base. ♄. S. Native of the East Indies. Calyx spathaceous, villous before expansion. Perhaps a climbing shrub.

Small-flowered Mountain-ebony. Clt. 1808. Shrub 5 to 6 ft.

23 B. MADAGASCARIE'NSIS (Desv. journ. bot. 1814. 1. p. 74.) leaves cordate at the base, quite smooth; leaflets obtuse, 3-nerved, rather ascending; stamens 10, the 5 alternate ones very short; petals on long claws, oval, acute. ♄. S. Native of Madagascar. Leaves about an inch long. Flowers white.

Madagascar Mountain-ebony. Clt. 1826. Sh. 5 to 6 feet.

24 B. U'NGULA (Jacq fragm. 22. t. 15. f. 1.) leaves ovate at the base, clothed with soft villi; leaflets connected beyond the middle, ovate, obtuse, parallel, 3-nerved; flowers axillary; petals elliptic, unguiculate; stamens 10? fertile. ♄. S. Na-

tive of Caraccas. B. aculeàta, Jacq. amer. 119. t. 177. f. 2. Flowers white.

Clawed-petalled Mountain-ebony. Clt. 1817. Sh. 5 to 6 ft.

25 B. UNGULA'TA (Lin. spec. 535.) leaves ovate at the base; leaflets connected to the middle, oval-oblong, parallel, with the inner side straight; petals subulate; stamens 10, alternate 5 short. ♄. S. Native of South America. Flowers white.

Ungulated-petalled Mountain-ebony. Clt.? Tr. 18 to 20 ft.

26 B. VARIEGA'TA (Lin. spec. 535.) leaves cordate at the base, glabrous; leaflets broadly-ovate, obtuse, 5-nerved, connected beyond the middle; petals ovate, nearly sessile; stamens 10, the 5 longest fertile. ♄. S. Native of Malabar. Rheed. mal. 1. t. 34. Calyx bursting lengthwise. Flowers in loose, terminal racemes. Petals red marked with white, and yellow at the base.

Var. β, *Chinénsis* (D. C. prod. 2. p. 514.) leaves rounded at the base; petals acute, lilac, with 1 purple spot at the base of each. ♄. S. Native of China. Braam. icon. chin. t. 26.

Variegated-flowered Mountain-ebony. Fl. June, July. Clt. 1690. Tree 20 feet.

27 B. CUCULLA'TA (Desv. journ. bot. 1814. 1. p. 74.) leaves roundish, pubescent on the nerves; leaflets ovate, obtuse, 4-nerved, rather ascending; flowers axillary. ♄. S. Native of the East Indies. Nearly allied to *B. variegàta*, but the flowers are said to be smaller. Calyx bursting lengthwise.

Cucullate-leaved Mountain-ebony. Shrub.

28 B. TOMENTÒSA (Lin. spec. 536.) leaves ovate or roundish at the base, under surface villous as well as the petioles, branches, stipulas, peduncles, bracteas, and calyxes; leaflets connected beyond the middle, oval, obtuse, 3-4-nerved; peduncles 1-3-flowered; petals obovate, obtuse; stamens 10, fertile, unequal. ♄. S. Native of Ceylon. Burm. zeyl. p. 44. t. 18. Petals pale yellow, with a red spot at the claw. The native practitioners of India prescri[illegible] flowers of this plant in certain dysenteric affections.

Tomentose Mountain-ebony. Clt. 1808. Shrub 6 to 12 ft.

29 B. PUBESCENS (D. C. legum. mem. xiii.) leaves rather cordate at the base, pubescent beneath and on the petioles; leaflets connected beyond the middle, oval, obtuse, 4-nerved, nearly parallel; peduncles 3-4-flowered; calyx glabrous, spath[illegible]s; petals obovate; stamens 10, fertile. ♄. S. Native of Jamaica. Flowers large, white, much crowded.

Pubescent Mountain-ebony. Clt. 1823. Shrub 4 to 6 feet.

30 B. PI'CTA (D. C. prod. 2. p. 515.) leaves roundish-elliptic, membranous, glabrous; leaflets connected, semi-ovate, acutish, spreading, 5-nerved; racemes terminal, solitary; calyx clothed with rusty tomentum; petals oblong. ♄. S. Native of South America, on the banks of the river Magdalena. Paulètia pícta, H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers white, spotted with red.

Painted-leaved Mountain-ebony. Shrub.

31 B. MULTINE'RVIA (D. C. prod. 2. p. 515.) leaves elliptic, rounded at the base, membranous, shining above, but rather pilose beneath, the nerves ferruginous; leaflets semi-ovate, obtuse, approximate, 5-nerved: flowers racemose; calyx clothed with rusty tomentum; petals linear. ♄. S. Native of Caraccas and on Montana de Capaya. Paulètia multinérvia, H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers snow white. Legume 8-12 inches long. Perhaps the stem is unarmed.

Many-nerved-leaved Mountain-ebony. Clt. 1817. Tr. 20 ft.

32 B. GLAUCE'SCENS (D. C. l. c.) leaves reniform, profoundly cordate, membranous, glaucescent beneath, scattered with minute hairs; leaflets roundish, spreading, 4-nerved. ♄. S. Native of Cumana, on mountains near Caripe. Paulètia? glaucéscens, H. B. et Kunth, nov. gen. amer. 6. p. 316. Perhaps a separate section, and unarmed. Flowers and fruit unknown.

Glaucescent Mountain-ebony. Clt. 1817. Tr. 20 to 30 ft.

33 B. RETICULA'TA (D. C. legum. mem. xiii.) leaves coriaceous, cordate at the base, glabrous, minutely reticulated between the nerves; leaflets broadly ovate, obtuse, connected beyond the middle, diverging at the apex; flowers disposed in nearly sessile fascicles in the axils of the leaves; calyxes and ovaries tomentose; legumes broad, linear, glabrous. ♄. S. Native of Senegal and of Arabia, if *B. inérmis* of Forsk. descrip. p. 85. be the same as *B. platisiliqua*, Perr. in litt. Stamens 10, free, 8 of which are antheriferous. Petals nearly equal. Ovary stipitate. Legume twice the breadth of that of *B. purpùrea*.

Reticulated-leaved Mountain-ebony. Shrub.

34 B. ODORATI'SSIMA (Newm. mss. in herb. Lamb.) leaves broad, cordate; leaflets connected to the middle, 4-nerved, acuminated, coriaceous; racemes long, terminal. ♄. S. Native of Maranham. Flowers large, very sweet-scented.

Very-sweet-scented Mountain-ebony. Shrub.

SECT. III. SYMPHYÒPODA (from συμφυω, *symphyo*, to glue together, and πους ποδος, *pous podos*, a foot; in reference to the foot or stipe of the ovary). D. C. legum. mem. xiii. prod. 2. p. 515. Stamens monadelphous at the base, 3 fertile ones very long, the rest small, sterile, or almost abortive. Ovary stipitate, the stipe adhering to the tube of the calyx. Branches terete.

35 B. RACEMÒSA (Vahl. symb. 3. p. 56. t. 62.) branches terete; leaves cordate at the base, clothed with silky villi beneath as well as on the peduncles, petioles, branches, calyxes, and petals; leaflets broadly ovate, obtuse, connected to the middle, 5-nerved, rather diverging at the apex; racemes somewhat corymbose; petals obovate, obtuse; flowers triandrous. ♄. ◡. S. Native of the East Indies.

Racemose-flowered Mountain-ebony. Clt. 1790. Shrub cl.

36 B. TRIA'NDRA (Roxb. hort. beng. p. 31.) leaves roundish, glabrous; leaflets joined to the middle, 4-nerved; racemes axillary and terminal; legume stipitate, pubescent. ♄. S. Native of the East Indies. Flowers white. Stamens 3, antheriferous. (v. s. herb. Lamb.)

Triandrous Mountain-ebony. Clt. 1823. Shrub.

37 B. PURPU'REA (Lin. spec. 536.) branches terete; leaves cordate at the base, coriaceous, when young they are clothed with rufous tomentum, but at length becoming glabrous; leaflets connected much above the middle, broadly ovate, obtuse, 4-nerved; petals lanceolate, acute. ♄. S. Native of the East Indies and the island of Timor.—Rheed. mal. 1. t. 33. Petals red, one of them streaked with white on the claw. Legume linear, straight, a foot long, apiculated at one end by the style and at the other by the stipe.

Purple-flowered Mountain-ebony. Clt. 1778. Tree.

38 B. RETU'SA (Roxb. hort. beng. p. 31. but not of Poir.) branches terete; leaves cordate at the base, and emarginately retuse at the apex, coriaceous, glabrous; leaflets connected nearly to the apex, 5-nerved, broadly semi-ovate; panicle loose, terminal; stamens 3, antheriferous, the rest wanting. ♄. S. Native of Bengal. Flowers white. Petals ovate, unguiculate, 3-4 lines long.

Retuse-leaved Mountain-ebony. Clt. 1820. Shrub.

39 B. COROMANDELIA'NA (D. C. prod. 2. p. 515.) branches terete; leaves glabrous, cordate at the base; leaflets semi-oval, obtuse, parallel, connected to the middle, 4-nerved; raceme pubescent; petals ovate-lanceolate, acute; stamens 3, very long and antheriferous, the rest short and bristle-formed. ♄. S. Native of India, near Pondicherry.

Coromandel Mountain-ebony. Tree.

40 B. CORYMBÒSA (Roxb. hort. beng. p. 31.) branches terete, cirrhiferous; leaflets cordate at the base, the nerves on the under surface as well as the petioles, branches, and calyxes clothed

with rufous villi; leaflets semi-oval, obtuse, parallel, connected to the middle, 3-nerved; stamens 3; petals ovate, stipitate. ♄. ◡. S. Native of China and the East Indies. D. C. legum. mem. xiii. t. 70. B. scándens, Burm. fl. ind. 94. Flowers white.

Corymbose-flowered Mountain-ebony. Clt. 1818. Shrub cl.

41 B. PO'TTSII; leaves glabrous, roundish, cordate, 11-nerved; lobes obtuse; racemes terminal, corymbose; legumes clothed with rusty silky hairs, ending in a long tail; calyx cleft longitudinally above. ♄. S. Native of Pulo Penang. Potts. (v. s. herb. Lamb.)

Potts's Mountain-ebony. Shrub.

SECT. IV. PHA'NERA (from φανερος, *phaneros*, manifest; from the corolla and calyx spreading much). Lour. coch. p. 37. D. C. prod. 2. p. 516. Stamens 10, somewhat monadelphous at the base, 3 of which are very long and fertile, and 7 small and sterile. Ovary on a short stipe. Branches and stems compressed, climbing.

42 B. ANGUI'NA (Roxb. cor. 3. p. 82. t. 285.) stem climbing, regularly flexuous, compressed, cirrhiferous; leaves glabrous, cordate; leaflets 3-nerved, in the younger plants they are connected to the middle and very much acuminated, in the adult plants they are connected almost to the apex, and ending in a short acumen; panicle terminal. ♄. ◡. S. Native of Malabar, Silhet, and Chittagong.—Rheed. mal. 8. t. 30 and 31. B. scándens, Lin. spec. ed. 1. p. 374. exclusive of the synonyme of Rumph. Flowers small, white. Legume 1-2-seeded. Calyx urceolate, bluntly 5-cleft, girding the alabastrum of corolla like a cup before expansion.

Snake Mountain-ebony. Clt. 1790. Shrub cl.

43 B. LI'NGUA (D. C. prod. 2. p. 516.) stems climbing, angular; branches compressed, cirrhiferous; leaves clothed with rufous villi beneath, cordate; leaflets 3-nerved, semi-ovate, acuminated, connected almost to the middle; racemes few-flowered, erect. ♄. ◡. S. Native of Amboyna and the Moluccas, in woods by the sea-side. Fòlium língua, Rumph. amb. 5. p. 1. t. 1. B. scándens, Lin. spec. ed. 1. p. 374. exclusive of the synonyme of Rheede. Flowers at first whitish, but at length change to a yellowish colour. Petals lanceolate, acute.

Tongue-leaved Mountain-ebony. Shrub cl.

44 B. COCCÍNEA (D. C. prod. 2. p. 516.) stem compressed, unequal; branches climbing, cirrhiferous; leaves shining and rufous beneath, cordate; leaflets 4-nerved, semi-ovate, acuminated, connected to the middle; racemes on long peduncles, pendulous, large. ♄. ◡. G. Native of Cochin-china, in woods. Phánera coccínea, Lour. coch. p. 37. Petals ovate, scarlet. Legume many-seeded.

Scarlet-flowered Mountain-ebony. Shrub cl.

SECT. V. CAULOTRE'TUS (from καυλος, *kaulos*, a stem, and τρεω, *treo*, to fly; in reference to the stems twining to a great height on trees). Rich. herb. ex D. C. prod. 2. p. 516.—Bauhínia, Kunth, ann. sc. nat. p. 84. H. B. et Kunth, nov. gen. amer. 6. p. 319. but not of Cav. Stamens 10, all fertile and free, usually shorter than the petals. Calyx ventricose, 5-toothed, and somewhat 2-lobed. Ovary sessile. Stems usually climbing and compressed. Flowers white or yellowish.

* *Leaflets free to the base.*

45 B. SPLE'NDENS (H. B. et Kunth, nov. gen. amer. 6. p. 319.) stem climbing, cirrhiferous?; branches compressed, glabrous; leaflets free to the base, dimidiately ovate-oblong, 3-nerved, membranous, rather shining above, but clothed with fine, golden, shining down beneath. ♄. ◡. S. Native of South America, on the banks of the Orinoco. Flowers and fruit unknown.

Splendid-leaved Mountain-ebony. Shrub cl.

46 B. OUTI'MOUTA (Aubl. guian. 1. p. 375. t. 144.) stem sarmentose, compressed, cirrhiferous; leaflets free to the base, semi-ovate, acuminated, parallel, 4-nerved, clothed with adpressed silky down beneath; stipulas orbicular, oblique at the base, upper ones permanent; racemes dense, short. ♄. ◡. S. Native of French Guiana. B. Guianénsis, var. Lam. dict. 1. p. 391. Flowers white. The plant is called *Ya-Outimouta* in Guiana.

Outimouta Mountain-ebony. Shrub cl.

47 B. GUIANE'NSIS (Aubl. guian. 1. p. 377. t. 145.) stem sarmentose, compressed, cirrhiferous; leaflets free to the base, semi-ovate, acuminated, 4-nerved, parallel, smoothish beneath, and green on both surfaces; stipulas wanting, very small or deciduous. ♄. ◡. S. Native of Guiana, in woods. Flowers white?

Guiana Mountain-ebony. Clt. 1820. Shrub cl.

48 B. HETEROPHY'LLA (Kunth, mim. t. 46. H. B. et Kunth, nov. gen. amer. 6. p. 319.) stem erect, cirrhiferous; branches terete, and are as well as the calyxes clothed with rusty hairs; leaflets shining, membranous, clothed with adpressed pubescence beneath, obliquely-oblong, rather obtuse, rounded at the base, 4-nerved, lower ones connected to the middle, upper ones free; racemes terminal, solitary, leafless. ♄. ◡. S. Native of South America, in the valleys of Aragun and near Porto Cabello of Caraccas. Flowers white.

Variable-leaved Mountain-ebony. Clt. 1824. Shrub cl.

49 B. INTEGRIFÒLIA (Roxb. hort. beng. p. 90.) leaflets free, 4-nerved; racemes terminal, corymbose; stamens free; tendrils hooked; legumes flat, smooth. ♄. ◡. S. Native of the East Indies. (v. s. in herb. Lamb.)

Entire-leaved Mountain-ebony. Shrub cl.

* * *Leaflets connected to the middle.*

50 B. EMARGINA'TA (Roxb. in herb. Lamb.) leaves large, roundish, emarginate, with a mucrone in the recess, nerved, glabrous, or the leaflets are connected nearly to the apex, 4-nerved; panicles divaricate, terminal; stamens free. ♄. ◡. S. Native of the East Indies. (v. s. herb. Lamb.)

Emarginate-leaved Mountain-ebony. Shrub cl.

51 B. GLA'BRA (Jacq. amer. 119. t. 173. f. 3.) climbing; branches terete; leaves glabrous, cordate at the base; leaflets oval, obtuse, parallel, 4-nerved, connected to the midd[illegible] ◡. S. Native of Carthagena, in woods and among bu[illegible] Petals oval, attenuated at the base, yellowish-green, spott with purple inside. Ovary hairy.

Glabrous Mountain-ebony. Clt. 1810. Shrub cl.

52 B. SUAVE'OLENS (H. B. et Kunth, nov. gen. amer. 6. p. 320.) stem compressed, cirrhiferous; leaves membranous, cordate, pubescent beneath; leaflets semi-ovate, rounded at the apex, connected to the middle, 4-5-nerved; racemes terminal and axillary; calyx clothed with silky pubescence. ♄. ◡. S. Native of New Spain, on the banks of the river Guancabamba near Cavico. Petals white.

Sweet-scented-flowered Mountain-ebony. Shrub cl.

53 B. CUMANE'NSIS (H. B. et Kunth, nov. gen. amer. 6. p. 321.) stem sarmentose; branches glabrous; leaves cordate at the base, pubescent beneath; leaflets membranous, ovate, acutish, 4-nerved, hardly connected to the middle; racemes terminal, solitary, sometimes bifid or cirrhiferous. ♄. ◡. S. Native of Cumana, near Bordones. Lindl. bot. reg. 1133. Lœfl. itin. p. 218.? Moc. et Sesse, fl. mex. icon. ined. ex. D. C. prod. 2. p. 517. B. scándens Americàna, Lin. spec. ed. 2. p. 535. Flowers white.

Cumana Mountain-ebony. Shrub cl.

† *Species not sufficiently known.*

* *Leaflets connected together to the very apex, and therefore the leaves are simple and entire.*

54 B. RICHARDIA'NA (D. C. prod. 2. p. 517.) leaves cordate, 5-7-nerved, acute, quite smooth. ♄. S. Native of Guiana. Caulotrètus cordifòlia, Rich. ined. Perhaps this species belongs to Section IV. but differs from Section *Caulotrètus* in the ovary being stipitate. Flowers white.

Richard's Mountain-ebony. Shrub.

55 B. CINNAMÒMEA (D. C. prod. 2. p. 517.) leaves elliptic, obtuse at the base, quite glabrous, acuminated at the apex; 7-nerved, undivided; legume stipitate, compressed, linear, glabrous, straight. ♄. S. Native of Cayenne. Leaves 3 inches long and 2 broad. The middle nerve is usually double at the base, in consequence of the 2 joined leaflets. Petals 6-9 lines long. Legume 8-9 inches long, standing on a stipe an inch long.

Cinnamon Mountain-ebony. Shrub.

56 B.? DU'BIA; stems simple; leaves alternate, cordate, acuminated, glabrous, obsoletely 3-nerved; racemes terminal; petals very long, linear, reflexed; stamens numerous, very long, but shorter than the style. ♄. S. Native of Maranham. Flowers white.

Doubtful Mountain-ebony. Shrub 1 to 2 feet.

* * *Leaflets connected to the middle into a 2-lobed limb.*

57 B. LATISÍLIQUA (Cav. icon. t. 408.) leaves subcordate at the base, glabrous; leaflets semioval-oblong, acuminated, 5-nerved, connected a third part of their length, approximate at the upper part. ♄. S. Native of the Philippine Islands. Flowers racemose. Legume half a foot long, and an inch and a half broad, broadly winged at the seminiferous suture. Perhaps a proper genus.

Broad-podded Mountain-ebony. Shrub 6 to 8 feet.

58 B. MACROPHY'LLA (Poir. suppl. 1. p. 600.) leaves shining and glabrous above, [illegible] in a hooked beak, [illegible] beneath; leaflets large, hardly connected at the base, semi-ovate, 5-nerved, ending in a long acumen; legume oblong-elliptic, tumid at the sutures. ♄. S. Native of South America? B. chrysophylla, Vahl. ined. Leaflets 6-8 inches long, and 3-4 broad. Perhaps sufficiently distinct from *B. Outimouta*. Flowers unknown.

Long-leaved Mountain-ebony. Shrub.

59 B. RACEMÍFERA (Desv. journ. bot. 1814. 1. p. 74.) stem erect; leaves cordate, cuneated, or the lobes are short, obtuse, divaricate, and acuminated at the apex, 6-nerved; flowers disposed in racemose panicles; calyx villous, somewhat tripartite. ♄. S. Native of South America.

Raceme-bearing Mountain-ebony. Shrub.

60 B. ARMA'TA (Otto, pl. bras. no. 25. in flora, 1821. p. 602.) stem prickly, climbing; leaves 2-lobed; lobes ovate, acute. ♄. S. Native of Brazil.

Armed Mountain-ebony. Shrub cl.

61 B. FA'REK (Desv. journ. bot. 1814. 1. p. 74.) leaves cordate at the base; leaflets hardly connected a fourth part of their length, oblong, acutish, 4-nerved, nearly parallel; petals ovate-lanceolate, stipitate. ♄. S. Native of Abyssinia. Fàrek. Bruce, trav. 5. t. 18. exclusive of the synonyme. The stamens, according to the figure, are monadelphous and all fertile, but according to Desvaux they are diadelphous.

Farek Mountain-ebony. Shrub.

62 B. TAMARINDA'CEA (Gailliaud, voy. meroe. 1826.) leaves cordate, 2-lobed, nearly orbicular; nerves running through the whole upper surface of the leaves from a spacelate gland in the recess, with glands on the under surface at the origin of the confluent nerves; fruit thick, nerved, pulpy inside; seeds egg-shaped, in many series?—Native of Egypt, on mount Aqaro.

Tamarind-like Mountain-ebony. Shrub.

* * * *Leaflets free to the base.*

63 B. DIPHY'LLA (Symes, trav. ava. 1808. t. 7.) leaflets distinct to the base, unequal, obtuse, 5-nerved; tendrils simple, lateral. ♄. S. Native of the East Indies.

Two-leafletted Mountain-ebony. Shrub.

64 B. AMERICA'NA (Delaun. herb. amat. t. 315.) leaves ovate at the base; leaflets parallel at the apex. ♄. S. Native of South America. It differs from B. unguiculàta, Lin. in the stamens being diadelphous, only one of which is fertile.

American Mountain-ebony. Clt. 1800. Shrub 6 feet.

† † *The names of undescribed species, some of which are probably identical with some of those described above.*

1 *B. semibifida*, Roxb. hort. beng. p. 31. 2 *B. Malabárica*, Roxb. l. c. 3 *B. ferruginea*, Roxb. l. c. 4 *B. cordifòlia*, Roxb. l. c. p. 90. 5 *B. anatómica*, Link. enum. 1. p. 405. 6 *B. I'ndica*, Lodd. cat. 7 *B. microphýlla*, Hortul. 8 *B. speciòsa*, Hortul.

Cult. Some of the species of *Bauhinia* are very shewy when in bloom, and some are elegant climbers, well fitted for covering the rafters in stoves or stove conservatories. They all thrive well in a mixture of loam, peat, and sand. Cuttings should be taken off at a joint when the plants are in a growing state, neither too ripe nor too young, and planted in sand, with a hand-glass placed over them in a moist heat. The leaves of the cuttings should be allowed to remain on.

CCXCIII. CE'RCIS (from κερκις, *kerkis*, a shuttlecock; a name given by Theophrastus to this tree). Lin. gen. no. 510. Lam. ill. t. 328. Gærtn. fruct. t. 144. D. C. prod. 2. p. 518. —Siliquástrum, Tourn. inst. t. 414. Mœnch. meth.

LIN. SYST. *Decándria, Monogýnia.* Calyx urceolate at the base and gibbous, bluntly 5-toothed at the apex. Petals 5, unguiculate, all distinct, disposed in a papilionaceous manner; the wings or side petals the largest. Stamens 10, free, unequal. Ovary on a short stipe. Legume oblong, slender, compressed, 1-celled, many-seeded, somewhat winged on the seminiferous suture, and opening on the other suture. Seeds obovate, with tumid, somewhat albuminous endopleura. Embryo straight, with a short radicle, flat cotyledons, and an inconspicuous plumule.—Trees, with simple, many-nerved, cordate leaves, rising after the flowers have decayed. Pedicels 1-flowered, rising from the trunk and branches in fascicles.—This genus is allied to *Bauhinia*. The leaves are probably composed of 2 joined leaflets, forming an entire limb.

1 C. SILIQUA'STRUM (Lin. spec. 534.) leaves very blunt, emarginate, and quite glabrous. ♄. S. Native of the south of Europe, Levant, Spain, south of France, Italy near Rome, and on the Appenines. Duh. arb. ed. nov. t. 7. Sims, bot. mag. 1138. Mill. fig. 253. Siliquástrum orbiculàtum, Mœnch. meth. Flowers of a bright purple colour. There are also varieties with flesh-coloured and white flowers; they are frequently used in salads from their agreeable poignancy. The wood is very beautiful and veined with black, takes an excellent polish, and may be converted to many useful purposes.

Var. β, *parviflòra* (D. C. prod. 2. p. 518.) A shrub, with white spotted branches, and the flowers only about one-half the size of those of the species. ♄. S. Native of Bucharia. Perhaps a proper species.

Siliquastrum, Common Judas-tree, Red-bud or Love-tree. Fl. May, June. Clt. 1596. Tree 20 to 30 feet.

2 C. CANADE'NSIS (Lin. spec. 534.) leaves cordate, acuminate, villous in the axils of the veins beneath. ♄. S. Native from Canada to Virginia, along the banks of rivers. Mill. fig. t. 2. Siliquástrum cordàtum, Mœnch. meth. Flowers red, and are frequently put into salads by the inhabitants of North Ame-

rica, and the French in Canada pickle them. The wood is of the same colour and texture as that of the first species. The legumes stand on a long pedicel, and are apiculated at the apex by a longer style. The young branches dye wool of a very fine colour. The tree is called *red-bud* in America.

Var. β, pubéscens (Pursh, fl. amer. sept. p. 308.) leaves pubescent beneath.

Canadian Judas-tree. Fl. May, June. Clt. 1730. Tree 12 to 20 feet.

Cult. These trees are usually planted with other flowering trees and shrubs as ornaments to pleasure grounds, and for their singular beauty deserve a place in every garden and shrubbery; for when the trees have arrived at a pretty good size the branches are so thickly beset with flowers as scarcely to be seen, and the singular shape of their leaves makes a very agreeable variety in summer. They are generally raised from seeds, which should be sown about the end of March on a bed of light earth; they may also be propagated by layers, but plants raised from seeds thrive best.

CCXCIV. PALO'VEA (an alteration from the Guiana name of the shrub). Aubl. guian. 1. p. 365. t. 141. Lam. ill. t. 323. D. C. prod. 2. p. 518.—Ginnània, Scop. ex Schreb. gen. no. 691. Neck. elem. no. 1285.

Lin. syst. *Enneándria, Monogýnia.* Bracteoles 2 under the calyx, joined into a 2-lobed involucel; tube of calyx obconical, exserted from the involucel, with a 4-5-lobed limb; lobes spreading. Petals 3-4, deciduous, the inner one bearing something like a sterile anther. Stamens 9, exserted beyond the tube of the calyx; filaments free, very long, subulate, replicate before the expansion of the flowers, as in the order *Melastomàceæ.* Anthers when young linear, 2-celled, straight, fixed by the middle. Ovary stipitate, linear, compressed. Style filiform, glabrous, biplicate when young, crowned by a roundish stigma. Legume (ex Aubl.) oblong, compressed, 2-valved, 1-celled, 6-7-seeded.—A shrub, with alternate, elliptic, quite entire, glabrous leaflets, which are acuminated at both ends, and pedicellate flowers, which are disposed in umbels at the tops of the branches. Pedicels bracteate.

1 P. Guiane'nsis (Aubl. l. c.) ♄. S. Native of Guiana, in woods. Corolla red.

Guiana Palovea. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Bauhínia*, p. 463.

CCXCV. ALOE'XYLON (from αλοη, *aloe*, of Dioscorides, the Aloe, and ξυλον, *xylon*, wood; this tree produces the aloes-wood of the shops). Lour. cochin. p. 267. D. C. prod. 2. p. 518.

Lin. syst. *Decándria, Monogýnia.* Calyx of 4 sepals or 4-parted; sepals acute, deciduous, lower one falcate, incurved, nearly twice the length of the rest. Petals 5, unequal, longer than the calyx. Stamens 10, distinct. Ovary compressed, curved. Style filiform. Legume woody, smooth, falcate, 1-seeded. Seed oblong, curved, arillate.—A tree, with erect branches, simple, alternate, lanceolate, quite entire, petiolate leaves, and terminal flowers. This genus is hardly known.

1 A. Agallòchum (Lour. l. c.) ♄. G. Native of Cochinchina, on the highest mountains, and the Molucca Islands.—Rumph. amb. 2. p. 29. t. 9. ex Lour. Cynomètra Agallòcha, Spreng. syst. 2. p. 327. The wood is white and scentless, and has long been used as a perfume. Aloes-wood is held in high estimation in the East on account of its fragrant odour as a perfume, for which purpose it is applied to clothes and apartments, and as a cordial medicine in fainting fits, and in cases of paralytic affection. By the Chinese and Heathen Moors it was used as incense in their sacrifices; and employed for setting the most precious jewels that are wrought in the East Indies. It was formerly deemed in that part of the world of greater value than gold, and various fables have been invented as to the origin of the tree that yields it. Some have feigned that it grew in Paradise, and that it was conveyed from thence by the rivers, which overflowed their banks, and swept off the trees in their way. Others pretend that it grows on inaccessible mountains, where it is guarded by wild beasts. The calambac or eagle-wood should not be confounded with the aloes-wood. See *Aquilària.*

Agallocha or Aloes-wood. Tree 60 feet.

Cult. For culture and propagation see *Bauhínia*, p. 463.

CCXCVI. AMA'RIA (meaning unknown). Seb. Mutis in sem. nuev. gran. 1810. p. 25. D. C. prod. 2. p. 519.

Lin. syst. *Monadélphia, Decándria.* Calyx cylindrical, rounded at the base, permanent, 5-cleft; lobes linear, cohering at the apex, and dehiscent on the sides. Petals 5, equal, obovate, spreading, keeled from the base to the apex. Stamens 10, subulate, erect, monadelphous at the base. Ovary oblong, stipitate; stipe adnate to the calyx. Style filiform, crowned by a capitate stigma. Legume very long, compressed, pedicellate, torose at the seeds, 1-celled, 2-valved, dehiscent. Seeds many, roundish, compressed.—American shrubs, with simple cordate leaves. This genus is unknown to European botanists, but it appears to be allied to *Jonèsia*, from the stipitate ovary, and in the stipe adhering to the calyx.

1 A. petiola'ta (Seb. Mutis. l. c.) leaves petiolate; flowers terminal. ♄. S. Native of New Granada, in the temperate parts.

Petiolate-leaved Amaria. Shrub 4 to 6 feet.

2 A. sessilifòlia (Seb. Mutis. l. c.) leaves sessile, almost stem-clasping; flowers axillary; peduncles many-flowered. ♄. S. Native of New Granada, in temperate places.

S[illegible] in the[illegible]et.

Cult. For culture and propagation see *B[illegible]hinia*, p. 463.

CCXCVII. BOWDI'CHIA (in honour of T. E[illegible]owdich, who was sent on a mission to Ashantee in Western Afric[illegible] H. B. et Kunth, nov. gen. amer. 6. p. 376. D. C. prod. 2. p. 5[illegible]

Lin. syst. *Decándria, Monogýnia.* Calyx turbinate, campanulate, 5-toothed; teeth acute, erect, 2 superior ones appr[illegible]mate. Petals 5, free, disposed in a kind of papilionaceous manner, lateral ones the longest. Stamens 10? free. Legume stipitate, 10-ovulate, compressed, membranous, winged on the seminiferous suture, 1-celled, indehiscent. Embryo straight.—An unarmed tree, with impari-pinnate leaves, clothed with rusty tomentum beneath, as also the branches. Flowers violaceous.

1 B. virgilioìdes (H. B. et Kunth, l. c.) ♄. S. Native of South America, near Barbula, Lavilla del Pao, and at the mouth of the Orinoco, where it is commonly called *Alcornoco.* Leaflets 13, lanceolate-oblong, obtuse at both ends.

Virgilia-like Bowdichia. Tree.

Cult. For culture and propagation see *Bauhínia*, p. 463.

CCXCVIII. CRU'DYA (— Crudy, the name of a person who communicated the first specimen of the tree to Schreber). Willd. spec. 2. p. 539. D. C. prod. 2. p. 519.—Crùdya et Cýclas, Schreb. gen. no. 711. and 712.—Apalatòa, Touchiròa, Vouràna, and Parivòa species, Aubl. guian. Touchiròa, Rich. mss.—Waldschmídtia, Neck. elem. no. 1445.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx bibracteate at the base, with the tube short and obconical, and the limb 4-cleft and spreading. Petals wanting. Stamens 8-10, exserted from the tube of the calyx, long, free, rather dilated at the base. Ovary ovate, hairy, rather stipitate. Style filiform. Legume coriaceous, thick, 1-2-seeded.—Guiana trees, with impari-pinnate glabrous leaves, alternate entire leaflets, and axillary simple racemes of flowers. The genus has the habit of *Swártzia*, but is not well known.

1 C. SPICA'TA (Willd. spec. 2. p. 539.) leaflets 9-13, oblong-lanceolate, equal at the base, acuminated at the apex. ♄. S. Native of Guiana, in woods. Apalatòa spicàta, Aubl. guian. 1. p. 383. t. 147. exclusive of fig. 5 and 6. ex Kœn. in ann. bot. 1. p. 358. t. 8. f. 5.

Spicate-flowered Crudya. Tree 30 feet.

2 C. AROMA'TICA (Willd. spec. 2. p. 540.) leaflets 3, elliptic, obtuse at the base and equal, but acuminated at the apex. ♄. S. Native of Guiana, in woods. Touchiròa aromática, Aubl. guian. 1. p. 385. t. 148. Lam. ill. t. 339. Racemes 4 times shorter than the leaves, hardly pedunculate. Flowers greenish. Legume 1-seeded, girded by a wing, ex Aubl. but his description is doubtful according to Richard. Wood aromatic.

Aromatic Crudya. Tree 40 to 50 feet.

3 C. PARIVÒA (D. C. prod. 2. p. 520.) leaflets 3, ovate, very unequal at the base, acuminated at the apex; racemes equal in length to the leaves, on long peduncles. ♄. S. Native of Guiana, in woods. Parivòa tomentòsa, Aubl. guian. 2. p. 759. and 304. Touchiròa Parivòa, Rich. herb. Flowers purple. The stamens are 10 and distinct, and the ovary is hairy.

Parivoa Crudya. Tree 20 feet.

4 C. VOUARA'NA (D. C. prod. 2. p. 520.) leaflets 6, ovate, acute; petiole angular. ♄. S. Native of Guiana, in woods. Vouaràna Guianénsis, Aubl. guian. suppl. p. 12. t. 374. Touchiròa Vouaràna, Rich. mss. Flowers unknown. *Vouarana* is the name of the tree in Guiana.

Vouarana Crudya. Tree 10 feet.

Cult. For culture and propagation see *Copaífera*, p. 456.

CCXCIX. DIA'LIUM (διάλιον, a name employed for the Heliotropium by some Greek writers; it comes from διαλύω, but the plant of the Greeks has nothing to do with the present). Burm. fl. ind. [illegible] Lin. mant. 24. D. C. prod. 2. p. 520.—Diàlium et [illegible], Schreb.—Arùna, Aublet. guian. 1. p. 15.—Cléyria, N. [illegible] elem. no. 897.

LIN. SYST. *Diándria, Monogýnia.* Calyx 5-parted or of 5 sepals; sepals oval, obtuse, concave, equal in length, 2 outer ones rather the broadest. Petals none. Stamens 2, inserted in the receptacle on the superior side of the flower; anthers thick, erect, 2-celled. Ovary ovate, sessile. Style subulate, bluntish. Legume pulpy inside, 1-2-seeded. Seeds compressed.—Trees, with impari-pinnate glabrous leaves, and panicled racemes of small flowers. This genus is nearly allied to *Codàrium.*

1 D. I'NDUM (Lin. mant. 24.) panicle simple, drooping; leaflets elliptic-oblong, acute; anthers 3 times the length of the filaments. ♄. S. Native of Java. D. Javánicum, Burm. ind. p. 12. exclusive of the synonyme of Rumph. D. I'ndum, Smith in Rees' cycl. vol. 11. no. 11. Calyx clothed with white velvety down on the outside.

Indian Dialium. Tree 20 to 30 feet.

2 D. DIVARICA'TUM (Vahl. enum. 1. p. 303.) panicle compound, erect; leaflets ovate, acuminated; anthers shorter than the filaments. ♄. S. Native of Guiana, in woods. Aroùna Guianénsis, Aubl. guian. 1. p. 16. t. 5. Arùna divaricàta, Willd. spec. 1. p. 49. Legume oval, compressed, indehiscent, dry. Leaflets exstipellate, the ultimate one longer and narrower than the others.

Divaricate Dialium. Tree 30 to 40 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCC. CODA'RIUM (from κωδιον, *kodion*, the hide of a beast; in reference to the consistence and hairiness of the pods). Sol. in Vahl. enum. 1. p. 302. ed. 2. p. 400. Afz. in Schrad. new. journ. 2. p. 233.

LIN. SYST. *Diándria, Monogýnia.* Calyx 5-parted; lobes equal, spreading; the tube permanent. Petal one, linear-lanceolate, flattish. Stamens 2, inserted in the calyx, free, erect; filaments longer than the anthers; anthers ovate, 2-celled. Legume clothed with black or brown velvety down, 2-valved, 1-seeded. Seeds surrounded by mealy pulp. Albumen, ex Afz. (perhaps endopleura) large, and shell-formed. Cotyledons elliptic. Radicle hemispherical. Plumule ligulate, acute.—Trees, native of Guinea, with impari-pinnate leaves, bearing 2-3 pairs of coriaceous leaflets. Flowers small, reddish, disposed in terminal branched panicles.

1 C. ACUTIFÒLIUM (Afz. l. c.) leaflets unequal, bluntly somewhat acuminated, the same colour on both surfaces, glabrous. ♄. S. Native of Guinea, particularly of Sierra Leone. C. nítidum, Vahl. enum. 1. p. 303. Diàlium Guineénse, Willd. in Rœm. arch. 1. p. 31. t. 6. Codàrium Solándri, Vahl. enum. p. 302. Hort. trans. 5. p. 460. The pulp in the pods is dry and mealy; it is eaten by the natives of Sierra Leone under the name of tamarinds, as well as that of the next species.

Acute-leaved Velvet-tamarind. Fl. Feb. Clt. 1793. Tree 12 to 20 feet.

2 C. OBTUSIFÒLIUM (Afz. l. c. Vahl. enum. 2. p. 401.) leaflets equal, rounded at the apex, the same colour on both surfaces, glabrous. ♄. S. Native of Sierra Leone, and other parts of Guinea.

Obtuse-leafletted Velvet-tamarind. Fl. Feb. Clt. 1824. Tree 12 to 20 feet.

3 C. DI'SCOLOR (D. C. prod. 2. p. 520.) leaflets elliptic-oblong, attenuated at both ends, glabrous above, but clothed with very minute velvety pubescence beneath. ♄. S. Native of Sierra Leone, and other parts of Guinea.

Discoloured-leaved Velvet-tamarind. Tree 14 to 20 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

CCCI. VATA'IREA (meaning not explained). Aubl. guian. 2. p. 755. t. 302. D. C. prod. 2. p. 521.

LIN. SYST. unknown. Flowers unknown. Legume coriaceous, roundish, compressed, ferruginous, wrinkled on one side, with membranous margins, 1-celled, indehiscent. Seed large, roundish, flattened. Embryo straight.—A tree, with impari-pinnate leaves, alternate, oval, glabrous, stiff leaflets, which are cinereous on the under surface. This genus is analogous to *Pterocárpus* from its fruit, but differs in the embryo being straight.

1 V. GUIANE'NSIS (Aubl. l. c.) ♄. S. Native of Guiana, on the banks of rivers. The tree is called *Graine à d'artre.*

Guiana Vatairea. Tree 50 feet.

Cult. See *Copaifera* for culture and propagation, p. 456.

Tribe XI.

DETARIEÆ (plants agreeing with *Detàrium* in important characters). D. C. legum. mem. xiii. prod. 2. p. 521. Calyx 4-lobed, globose before expansion; lobes valvate. Petals wanting. Stamens 10-25, perigynous, nearly free. Legume fleshy. Cotyledons thick.—African trees, with impari-pinnate leaves. This tribe agrees with *Swartzieæ* in the calyx, but with *Cassieæ* in the rest of the characters. It comes very near to the order *Amygdalàceæ* in the drupaceous fruit, and the icosandrous flowers.

CCCII. DETA'RIUM (*Detar* is the name of the tree in Senegal). Juss. gen. 365. D. C. prod. 2. p. 521.

LIN. SYST. *Decándria, Monogýnia.* Calyx 4-cleft; lobes valvate before expansion. Alabastrum globose. Petals wanting. Stamens 10; filaments distinct, alternate ones shortest. Ovary globose, hispid. Style and stigma one. Drupe orbicular, thick, soft, farinaceous, containing a large, hard, orbicular, compressed, nut, smooth on the sutures, reticulated with interwoven fibres in the valves, 1-celled, 1-seeded. Seed large, smooth, compressed, blackish, exalbuminous. Embryo straight, with thick, transversely oval cotyledons, a short radicle, and an ovate plumule.—A tree, with alternate and impari-pinnate leaves, ovate obtuse glabrous leaflets, which are velvety beneath. Racemes axillary, branched, shorter than the leaves.

1 D. Senegale'nse (Gmel. syst. 3. p. 700.) ♄. S. Native of Senegal and Gambia.

Senegal Detarium. Tree 40 feet.

Cult. See *Copaifera* for culture and propagation, p. 456.

CCCIII. CORDY'LA (from κορδυλη, *kordyle*, a club; shape of calyx before expansion). Lour. coch. p. 500. D. C. prod. 2. p. 521.—Cordýlia, Pers. ench. 2. p. 260.

Lin. syst. *Icosándria, Monogýnia.* Calyx campanulate, 4-cleft, pear-shaped before expansion; lobes acute, valvate in æstivation. Corolla none. Stamens 30-35, subulate, rather monadelphous at the very base. Ovary stipitate, ovate, acute. Style short. Legume stipitate, 1-celled, many-seeded. Seeds 6, ovate.—A tree, with impari-pinnate leaves, bearing 19-21 oblong, emarginate, glabrous leaflets, and axillary racemes of flowers, which are much shorter than the leaves. Stamens long, copper-coloured. Berry edible. This genus comes very near *Detàrium.*

1 C. Africa'na (Lour. l. c.) ♄. S. Native of the eastern coast of Africa.

African Cordyla. Tree 40 to 50 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

† *Genera belonging to Leguminòsæ, but are not sufficiently known, and are therefore not received among the tribes.*

CCCIV. CRUMI'NIUM (meaning not explained). Desv. obs. legum. in Schlecht. Linnæa. 2. p. 512.

Lin. syst. unknown. Calyx cup-shaped, truncate. Petals and stamens unknown. Legume compressed, flat, many-seeded, margined on both sides.

1 C. gigá'nteum (Desv. l. c.) ♄. ? S.

Giant Cruminium. Tree?

Cult. See *Copaifera* for culture and propagation, p. 456.

CCCV. PHYLLOLO'BIUM (from φυλλον, *phyllon*, a leaf, and λοβος, *lobos*, a pod; in reference to the flat membranous pods). Fisch. in Spreng. nov. prov. 33. D. C. prod. 2. p. 521.

Lin. syst unknown. Calyx campanulate, 5-cleft; teeth equal, subulate. Corolla papilionaceous; the vexillum a little larger than the rest of the petals. Legume turgid, compressed at the sutures, falcate, 6-10-seeded, 2-valved, opening only at one of the sutures.—A flexuous herb, beset with adpressed pubescence, with impari-pinnate leaves, bearing 6 pairs of oval glabrous leaflets. Racemes axillary, usually 6-flowered. Bracteas linear, shorter than the pedicels. Flowers greyish white. According to Sprengel this genus is allied to *Cajànus* and *Rudólphia*, but according to Link it is allied to *Indigófera* and *Tephròsia.*

1 P. Chine'nse (Fisch. l. c.) ♃. S. Native of China.

China Phyllolobium. Pl.

2 C. Zanzibare'nse (Boger. mss.) ♃. S. Native of Zanguebar.

Zanguebar Phyllolobium. Clt. 1826. Pl.?

Cult. A mixture of peat and sand will suit the species of this genus, and cuttings will root in the same kind of earth, with a hand-glass placed over them in heat.

CCCVI. AMPHINO'MIA (from αμφι, *amphi*, around, and νομος, *nomos*, order; flowers regular?). D. C. legum. mem. xiv. prod. 2. p. 522.—Hermánnia spec. Lin.—Connàris species, Thunb.

Lin. syst. *Monadélphia, Decándria.* Calyx ovate, ventricose, permanent, 5-cleft; segments lanceolate, spreading. Petals 5, unguiculate, spatulate. Filaments 10, monadelphous at the base; anthers minute. Ovary ovate, rugose. Style one, lateral, filiform, simple, obtuse. Legume roundish, crowned by the style, muricated, 1-celled, 2-valved; valves concave. Seeds numerous, fixed to the superior suture, many of which are abortive, and one of them roundish-reniform.—A decumbent hairy herb, with ovate stipulas, trifoliate leaves, obovate leaflets, and axillary and terminal peduncles, each bearing 3-4 bracteate flowers at the top. The description is taken from the figure of Thunb.

1 A. decu'mbens (D. C. l. c.) ♃. G. Native of the Cape of Good Hope. Hermánnia triphýlla, Lin. amœn. 6. p. 91. but not of Cav. Connàris decúmbens, Thunb. in Rœm. arch. 1. p. 1. t. 1.

Decumbent Amphinomia. Pl. decumbent.

Cult. A mixture of loam and peat will suit this plant, and cuttings will root in sand under a hand-glass.

CCCVII. SARCO'DUM (from σαρκωδης, *sarcodes*, fleshy; legume). Lour. coch. p. 462. D. C. prod. 2. p. 522. Sarcòdium, Pers. ench. no. 1752.

Lin. syst. *Diadélphia, Decándria.* Calyx cup-shaped, truncate at the apex above, but acutely 3-toothed on the lower side. Vexillum ovate, ascending; wings oblong, short, flat; keel falcate. Stamens diadelphous. Legume fleshy, terete, equal, many-seeded.—A climbing unarmed shrub, with pinnate leaves, bearing many pairs of woolly leaflets. Spikes terminal. Flowers rose-coloured.

1 S. [illegible] (Lour. l. c.) ♄. [illegible] Native of Cochin-china, in woods. Leaves perhaps abruptly or perhaps impari-pinnate; leaflets ovate-oblong, acuminated. [illegible]

Climbing Sarcodum. Shrub cl.

Cult. A mixture of loam, peat, and sand will suit this shrub, and ripened cuttings will root if planted in sand, with a hand-glass placed over them.

CCCVIII. VARE'NNEA (named by De Candolle to recall the useful works of M. Varenne de Fenille on agriculture, and vegetable physiology). D. C. legum. mem. xiv. prod. 2. p. 522.—Vibórquia, Orteg. dec. 5. p. 66. t. 9. but not of Thunb. nor Mœnch, nor Roth.

Lin. syst. *Monadélphia, Decándria.* Calyx tubularly campanulate, permanent, 5-toothed, the 2 superior teeth the broadest. Petals 5, disposed in a sub-papilionaceous manner, having the vexillum cuneiform and emarginate; wings spatulate and falcate, and the carina of 2 spatulate petals, which are concave above. Stamens 10, monadelphous, with the sheath cleft in front (ex Ortega), diadelphous, the tenth one free (ex icon. fl. mex. ined.) Ovary oblong. Style filiform, subulate. Stigma capitate. Legume oblong, compressed, flat, rather falcate, 1-seeded. Seed fixed to the top of the legume, oblong-reniform.—A shrub, with impari-pinnate leaves, bearing many pairs of ovate, entire, stipellate leaflets, the odd or terminal one obcordate, but often deficient. Racemes numerous, spicate, disposed in a panicle. Flowers small, white. The place which this genus should occupy in the order is uncertain. It is said to be allied to *Nissòlia* and *Pterocárpus.*

1 V. polysta'chya (D. C. prod. 2. p. 522.) ♄. S. Native of Mexico. Vibórquia polystàchya, Orteg. l. c. Moc. et Sesse, fl. mex. icon. ined. Leaves with about 20 pairs of leaflets. Flowers about 30, in a raceme.

Many-spiked Varennea. Shrub 1 to 2 feet.

Cult. See *Sarcòdum* for culture and propagation, p. 466.

CCCIX. CRAFO'RDIA (named apparently after some botanist or horticulturist of the name of Craford). Rafin. spech. 1. p. 159. D. C. prod. 2. p. 522.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, 5-cleft; segments nearly equal. Corolla papilionaceous, with a large reflexed vexillum, adpressed wings, which are auricled at the base, and an obtuse keel, which is longer than the wings. Stamens 10, diadelphous. Ovary linear. Style filiform; stigma dot-formed, glabrous. Legume usually 2-seeded, linear, torulose, striated. Seed oblong-reniform.—A twining plant, with impari-pinnate leaves; leaflets oblong, mucronate, sessile. Peduncles longer than the leaves, somewhat spicate; bracteas scarious, subulate, permanent, ciliated. Flowers white. This genus is allied to *Galèga* and *Colùtea* according to the author, but from both and from *Tephròsia* it differs in the 2-seeded legume.

1 C. bractea'ta (Rafin. l. c.) ♃. F. Native of Pennsylvania, on the banks of the river Susquehannah.

Bracteate Crafordia. Pl. tw.

Cult. Peat or vegetable earth is a good soil for this plant, and cuttings will be easily rooted.

CCCX. AMMODE'NDRON (from αμμος, *ammos*, sand, and δενδρον, *dendron*, a tree; habitation of the shrub). Fisch. in D. C. legum. mem. xvi. prod. 2. p. 528. Led. fl. alt. 2. p. 110.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-cleft, sub-bilabiate, permanent, at length reflexed. Corolla papilionaceous; wings and dipetalous keel equal and connivent. Stamens 10, distinct. Legume flat, membranous, 1-seeded from abortion, marginated by a wing, samaroid. Seed reniform, compressed.—A small, neat, silky shrub, having the petioles hardening into spines. Leaves bif[illegible]; leaflets lanceolate. Flowers [illegible]ple, disposed in racemes. This genus is closely allied to *Halimodéndron*, which genus it ought to have followed in the body of the order.

1 A. Sieve'rsii (Fisch. l. c.) ♄. H. Native of Siberia, in salt fields in the desert of Soongaria, and at the river Bekun. Leaflets lanceolate, silky white on both surfaces. Sophòra argéntea, Pall. act. petrop. 1792. p. 373. t. 8. Podalýria argéntea, Willd. spec. 2. p. 502.—Sophòra bifòlia, Pall. astr. p. 124. t. 91. Robínia argéntea, Sievers.

Sievers's Sand-tree. Shrub 2 to 4 feet.

Cult. For culture and propagation see *Halimodéndron*, p. 241.

CCCXI. LACA'RA (meaning unknown). Spreng. neue entd. 3. p. 56. D. C. prod. 2. p. 528.

Lin. syst. *Decándria, Monogýnia.* Calyx campanulate, 5-toothed. Petals 5, unequal, unguiculate, nerved, concave. Stamens 10, free, inserted in the bottom of the calyx, pilose at the base, longer than the petals. Anthers versatile. Capsule? pilose.—A shrub, with alternate, simple, quite entire, petiolate, coriaceous, unequal, triple-nerved leaves, and axillary racemes of flowers. The fruit of this genus is unknown.

1 L. tripline'rvia (Spreng. l. c.) ♄. S. Native of Brazil. Leaves a span long, and a hand in breadth.

Triple-nerved Lacara. Shrub.

Cult. For culture and propagation see *Copaífera*, p. 456.

CCCXIII. HARPA'LYCE (from *Harpalyce* in mythology, the daughter of Clymenus, remarkable for her beauty; in reference to the beauty of the plant). Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 2. p. 528.

Lin. syst. *Monadélphia, Decándria.* Calyx bilabiate, deciduous, bibracteolate at the base, both lips lanceolate, acuminated, and entire. Corolla papilionaceous, with an obovate vexillum, auricled wings, and a 2-edged, elongated, acuminated, rather twisted keel. Stamens 10, monadelphous. Style filiform, incurved with the carina. Legume compressed, flat, narrow at the base, ovate-oblong at the apex, 4-5-seeded, mucronate by the style.—An erect herb, suffrutescent at the base, with impari-pinnate leaves, and axillary peduncles, which are longer than the leaves, bearing racemes of large red flowers. This genus appears to be allied to *Phasèolus* from the bibracteolate calyx, and the incurved carina, but differs particularly from that genus in the leaves being impari-pinnate, but in consequence of the legume being 2-seeded, and the leaves being impari-pinnate, the genus is probably allied to *Astrágalus*, but the calyx is very distinct.

1 H. formòsa (D. C. prod. 2. p. 523.) ♄. S. Native of New Spain, in the hot regions. Astragàlus carnòsus, Moc. et Sesse, fl. mex. ined.

Showy Harpalyce. Pl. 1 foot.

Cult. For culture and propagation see *Hoffmanséggia*, p. 133.

CCCXIII. DIPLOPRION (from διπλοος, *diploos*, double, and πριων, *prion*, a saw; in reference to the legume being serrated on all sides). Viv. fl. lib. p. 48. t. 19. f. 2. D. C. prod. 2. p. 523.

Lin. syst. *Monadélphia, Decándria.* Calyx tubular, 5-toothed. Corolla papilionaceous. Filaments 10, connected. Legume 1-celled, flat, many-seeded, spirally involute, serrated on both margins.—An annual hairy herb, 2-3 inches long, with petiolate trifoliate leaves, ovate lanceolate stipulas, and axillary peduncles, bearing each a head of yellow flowers. This genus is allied to *Medicàgo* according to the habit, but from the legume it appears to be more nearly allied to *Biserrula*, but it is not sufficiently known.

1 D. medicaginoìdes (Viv. l. c.) ⊙. H. Native of Libya, in the great Syrtis, in fields.

Medick-like Diploprion. Pl. 2 to 3 inches.

Cult. The seeds of this plant only require to be sown in the open border in a dry warm situation.

CCCXIV. RIVE'RIA (in honour of Manano de Rivero, director of the government mines of Columbia; native of Arequipa, in Peru). H. B. et Kunth, nov. gen. amer. 7. p. 266. D. C. prod. 2. p. 524.

Lin. syst. unknown. Flowers unknown. Legume stipitate, obliquely-elliptic, compressed, mucronate, chartaceous, 2-valved, 1-seeded. Seed oblong-reniform, fixed to the lower part of the pod, covered with friable white substance. Cotyledons thick. Radicle small, situated beneath the apex of the embryo, pointing to the bottom.—An unarmed tree, with impari-pinnate leaves, bearing 1-3 pairs of coriaceous leaflets, having the petiole winged. Peduncles usually terminal. Perhaps this genus belongs to tribe *Geoffrèæ*, near *Andìra*, or perhaps to tribe *Cassieæ*, near *Copaífera*.

1 R. nìtens (H. B. et Kunth, nov. gen. amer. 7. p. 266. t. 659.) ♄. S. Native of South America, near Jaen de Bracamoros.

Shining Riveria. Tree.

Cult. See *Copaífera* for culture and propagation, p. 456.

† † *Additional genera.*

CCCXV. DO'NIA (to the memory of the late Mr. George Don, of Forfar, whose numerous discoveries have so eminently enriched the Flora of his native land). G. and D. Don, mss. in herb. Lamb. but not of R. Brown nor Pursh.

Lin. syst. *Diadélphia, Decándria.* Calyx campanulate, 5-toothed or 5-cleft. Corolla papilionaceous. Vexillum ovate-lanceolate, acuminate, rather shorter than the keel, reflexed;

wings lanceolate, acuminate, spreading, half the length of the keel, which is cymbiform, and composed of one petal. Stamens 10, diadelphous, one of which is separate from the rest; anthers incumbent. Style long, filiform; stigma truncate. Legume oblong, swollen, coriaceous, 1-celled. Seeds many, reniform, disposed in 2 rows, attached by a funicle to the lower suture.—Procumbent, herbaceous, perennial herbs or subshrubs, with impari-pinnate leaves, and foliaceous, adnate permanent stipulas. Flowers large, crimson, about 2 inches long, disposed in umbels or racemes.

1 D. **puni'cea**; suffruticose, minutely pubescent; leaflets alternate, oblong, retuse, coriaceous; flowers racemose; calyx 5-toothed; legumes smooth. ♄. G. Native of New Zealand, where it was first discovered by Sir Joseph Bankes and Dr. Solander, who gave it the name of *Cliánthus puníceus*. Flowers large, crimson.

Scarlet-flowered Donia. Shrub 1 to 2 feet.

2 D. **speciòsa**; herbaceous, very villous; leaflets opposite, lanceolate, acute; flowers umbellate; calyx 5-cleft; legume silky. ♃. G. Native of New Holland, at Regent's Lake. Flowers large, crimson.

Showy Donia. Pl. procumbent.

3 D. **formòsa**; plant herbaceous, very villous; leaflets opposite, obovate; flowers racemose; calyx 5-cleft; legume silky. ♃. G. Native of the North-west coast of New Holland, at the Curlew river. Capt. King.

Beautiful Donia. Pl. procumbent.

Cult. Elegant plants, resembling the *Sutherlándia frutéscens*, when in bloom, their flowers being large, and of a crimson colour. Should ever any of the species be introduced to our gardens, we would recommend their being grown in an equal mixture of loam, peat, and sand, and cuttings will no doubt strike root in the same kind of soil, under a bell-glass.

CCCXVI. MEGASTE'GIA (from *μεγας*, *megas*, large, and *στεγος*, *stegos*, a covering; in reference to the large bracteas, which enclose the flower before expansion).

Lin. syst. *Monadélphia*, *Decándria*. Bracteas 2, large, inclosing the flower before expansion. Calyx bilabiate, upper lip bifid, lower one trifid. Corolla papilionaceous, not much longer than the calyx. Stamens 10, monadelphous? Legume unknown. —A herbaceous plant, densely clothed in every part with fuscous hairs. Leaves with 10-12 pairs of ovate acuminated leaflets. Pedicels elongated, 1-flowered, solitary or twin, axillary. Flowers large, red or purple.

1 M. **speciòsa**. ♃. G. Native of Mexico. Pavon, Astrágalus ammódytes, Ruiz et Pav. in herb. Lamb. Perhaps the same genus as *Harpályce*.

Showy Megastegia. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Hoffmanséggia*, p. 433.

CCCXVII. SEBI'PIRA (meaning unknown.) Mart. reis. bras. ex Schlecht. Linnæa. 5. p. 44.

Lin. syst. *Decándria*, *Monogýnia*. Calyx tubular, cylindrical, somewhat equally 5-toothed. Corolla of 5 petals, disposed in a somewhat papilionaceous manner; petals erect, unguiculate, flat, crenulated, having the vexillum almost quadrate, shorter than the wings and petals of the keel. Stamens 10, free; anthers globose. Stigma capitate. Legume compressed, linear, membranous, 1-celled, many-seeded, winged on one side. Seeds obovate. Embryo straight. This genus belongs to Tribe *Cassieæ*, and ought perhaps to follow *Copaifera*, p. 455. of the present volume.

1 S. **ma'jor** (Mart. l. c.) leaves pinnate, with many pairs of alternate, oblong-lanceolate, obtuse leaflets, which are glaucous beneath and hoary; panicle of flowers spreading. ♄. S. Native of Brazil.

Larger Sebipira. Shrub or tree.

Cult. See *Copaifera* for culture and propagation, p. 456.

† *Additional Leguminous plants.*

Tribe I. *Sophòreæ*, p. 108.

1 **Baptísia mìnor** (Lehm. in nov. act. bonn. 14. p. 803. and p. 113. no. 8. of the present volume,) stem erect, solid; leaflets rhomboid-lanceolate; stipulas lanceolate, longer than the petioles; racemes axillary, bracteate; bracteas cordate, lanceolate, lower ones permanent; vexillum entire. ♃. H. Native of North America. Baptísia austràlis, Hortul. Plant glaucous and pruinose. Flowers blue. This plant differs from the true *B. austràlis* in the stem being solid and always smaller, in the lower bracteas being permanent, and lastly in the vexillum being entire, which in *B. austràlis* is appendiculate at the base.

Smaller Baptisia. Fl. June, July. Pl. 1 to 2 feet.

2 **Gompholòbium Knightea'num** (Lindl. bot. reg. 1468.) leaves ternate and pinnate; leaflets roundish-obovate, ovate, and linear, mucronate, and glabrous; cymes terminal, pedunculate, length of the leaves. ♄. G. Native of New Holland. Flowers rose-coloured. Leaflets variable in shape.

Knight's Gompholobium. Fl. July, Aug. Clt. 1831. Sh. 1 ft.

Tribe II. *Lòteæ*. *Subtribe* I. *Genísteæ*, p. 126.

3 **Crota'laria bupleurifòlia** (Schlecht. et Cham. in Linnæa. 5. p. 575.) pubescent; stem angularly winged, dichotomously branched; leaves on short petioles, ovate-elliptic, obtuse at both ends, and mucronate; flowers usually twin, pedunculate, near the base of the branches; bracteas rather joined, opposite, stipula-form[illegible]ated at the apex. ⊙. S. Native of Mexico, near Hacienda de la Laguna. Flowers blue, rather smaller than those of *C. verrucòsa*. Lin. [illegible] 134. no. 12. of the present volume, and to which it is nearly allied.

Bupleurum-leaved Crotalaria. Pl. 1 to 2 feet.

4 **Crota'laria bractea'ta** (Schlecht. et Cham. in Linnæa. 5. p. 575.) plant exstipulate; leaves sessile, oblong, obtuse, mucronate, attenuated at the base, clothed with yellowish tomentum beneath, as well as on the branches and calyxes; branches terete; racemes elongated, opposite the leaves, or somewhat terminal on long peduncles; peduncles bracteate; corolla equal in length to the calyx; calycine segments linear, elongated, acuminated, and very acute; legumes glabrous, rather clavate, many-seeded. ⊙. S. Native of Mexico, at Hacienda de la Laguna. Flowers propped by bracteas on short pedicels. Corolla flesh-coloured. This species comes nearly to *C. Paulinia*, p. 136. no. 35. of the present volume.

Bracteate-flowered Crotalaria. Pl. 1½ foot.

5 **Geni'sta Tenòrii**; stems diffusely prostrate; branches angular, striated, and villous; leaves oval-oblong, acute, pilose on both surfaces; flowers axillary, solitary, on short peduncles; calyx somewhat cylindrical, pilose; the teeth setaceous; corolla glabrous; vexillum of a copper-yellow colour, about equal in length to the keel. ♄. H. Native of Lucania, on the mountains. G. depréssa, Tenore, fl. neap. prod. append. 5. but not of Bieb. This species differs from *G. prostràta*, Lam. p. 153. no. 72. of the present volume, in the leaves being pilose on both surfaces, in the calyx being hairy, and lastly in the calycine teeth being setaceous.

Tenore's Genista. Shrub prostrate.

6 **Onònis peduncula'ris** (Lindl. bot. reg. 1446.) herbaceous, diffuse, beset with glandular pubescence; leaves obovate, toothed, simple; stipulas quite entire, shorter than the petiole; pe-

duncles long, 1-flowered, awned, arched, at length recurved. ♄. G. Native of Teneriffe. Flowers variegated with white and rose colour. Leaves all simple.

Pedunculate-flowered Rest-harrow. Fl. April. Clt. 1830. Shrub 1 foot.

7 Onònis conjuga'ta (herb. Lamb.) leaves bifoliate, nerved, glabrous, oblique, obtuse; stipulas large, adnate to the stem at the base, ovate-cordate, acuminated and mucronate; petiole ending in a spine; legume hairy; sepals acute, lanceolate, longer than the corolla; pedicels 1-flowered, axillary, solitary. ♄. G. Native of Mexico.

Conjugate-leaved Rest-harrow. Shrub 1 to 2 feet.

8 Onònis bícolor (Moris. elench. Sard. fasc. iii.) plant clothed with clammy glandular villi; leaves trifoliate; leaflets oblong-obovate, serrately toothed at the apex; stipulas large, length of petioles; peduncles axillary, awned, 1-2-flowered, about equal in length to the leaves; corolla twice the length of the calyx, but the legumes are 3-times longer than it and drooping. ⊙. H. Native of Sardinia, in fields, on the south side. Corolla pale yellow, having the keel tipped with purple. It comes very near to *O. viscòsa*, Lin. no. 14. of the present volume, in habit, but differs in the leaflets being equal in size and shape, and in the corolla and legume being much longer than the calyx; it also differs from *O. geminiflòra*, Lag. p. 160. no. 29. and *O. biflòra* of Desf. p. 159. no. 121. of the present volume, in the hairs being tipped with red glands.

Two-coloured-flowered Rest-harrow. Fl. June, Jul. Pl. 1 ft.

Subtribe II. *Trifolièæ*, p. 167.

9 Trigone'lla azu'rea (Meyer. verz. pfl. p. 136.) plant clothed with soft pubescence; stem branched, diffuse; stipulas ovate-cuspidate, toothed; leaflets obovate, toothed; heads dense-flowered, pedunculate; legumes villous, nearly linear, compressed, nerved, 4-6-seeded, ending in a hooked beak. ⊙. H. Native of Persia, on hills near Baku, Lenkeran, and Swant. Trifòlium cœrulescens, Bieb. fl. taur. 3. p. 509. Flowers blue. To follow *T. cærùlea*, Ser. p. 174. no. 1. of the present volume.

Azure-flowered Trigonella. Pl. 1 foot.

10 Trigone'lla arcua'ta (Meyer, verz. pfl. p. 136.) plant pubescent, diffuse; leaflets obovate, denticulated; stipulas semi-sagittate, toothed at the base; umbels sessile, 6-8-flowered; common peduncle awnless; legume pubescent, nearly terete, erect, arched, reticulately veined. ⊙. H. Native of Persia, on the mountains of Talusah, near Swant. To follow *T. Monspeliaca*, Lin. p. 175. no. 20. of the present volume.

Arched-podded Trigonella. Pl. diffuse.

11 Trigone'lla mona'ntha (Meyer, verz. pfl. p. 137.) plant diffuse, puberulous; leaflets obovate, and are as well as the semi-sagittate stipulas toothed or cut; legumes axillary, solitary, sessile, elongated, terete, straightish, reticulately veined. ⊙. H. Native of Persia, near Lenkeran and Swant. To follow *T. prostràta*, p. 174. no. 7. of the present volume.

One-flowered Fenu-Greek. Pl. diffuse.

12 Trigone'lla Mexica'na; stem erect, leaflets obovate, cuneiform, obcordate, sharply toothed at the apex; stipulas lanceolate, subulate, ciliated; racemes pedunculate; legumes reticulated, mucronate, rather falcate, many-seeded. ⊙. H. Native of Mexico. Flowers white or yellow. To follow *T. striàta*, Lin. p. 174. no. 11. of the present volume.

Mexican Trigonella. Pl. ½ to 1 foot.

13 Trifòlium spinulòsum (Dougl. mss. Hook, fl. bor. amer. 133.) prostrate, glabrous; leaflets oblong, acute at both ends, spinulously denticulated, and terminating in a stiff spine; stipulas ovate, acuminated, shining, serrated; involucrum 1-leaved, laciniately multifid; heads of flowers globose, longer than the involucrum; calycine teeth narrow-subulate, pungent, straight, a little shorter than the corolla. ♃. H. Native of North-west America, very common near springs in the valleys between Spokan and Kettle Falls. This species is allied to *T. fimbriàtum*, Lindl. p. 185. no. 53. of the present volume, but is sufficiently distinct. The vexillum and wings are shorter and more acute, the flowers smaller, white, the keel and wings tipped with a fine purple, and the whole plant more slender. This plant might prove perhaps very useful as a clover, the herbage forming a dense, short sward. It is extremely nutritive, and preferred to every thing else by deer and horses in its native country.

Spinulose-toothed Trefoil. Pl. prostrate.

14 Trifòlium polyphy'llum (Meyer, verz. pfl. p. 139.) quite glabrous; leaves radical, petiolate; leaflets 7-9, nearly linear, serrulated; stipulas subulate; scape naked; flowers umbellate, becoming at length reflexed; corolla twice the length of the calyx; calycine teeth nearly equal, subulate; ovary biovulate. ♃. H. Native of the western region of Caucasus, at the height of 3600 or 4300 feet. Allied to *T. alpìnum*, Lin. p. 192. no. 131. of the present volume.

Many-leafletted Trefoil. Pl. ¼ to ½ foot.

15 Lòtus austra'lis (Andr. bot. rep. 624.) stem pilose, herbaceous, and perhaps procumbent; leaflets and stipulas about equal in size, obovate-lanceolate; peduncles elongated; flowers 3-6, disposed in racemose heads at the tops of the peduncles; calycine segments longer than the tube; stamens diadelphous, the alternate filaments of the 9 connected ones very dissimilar to the others. ♃. G. Native of New Holland. Flowers large, showy, pink, or rose-coloured. Sims, bot. mag. 1365. This plant should follow *L. Aràbicus*, Lin. p. 197. no. 27. of the present volume.

Southern Bird's-foot Trefoil. Fl. July, Aug. Clt. 1800. Pl. ascending.

16 Hosa'ckia unifolia'ta (Hook, fl. bor. amer. 135.) plant decumbent, hairy, much branched; leaves usually with 1 leaflet, rarely with 2 or 3, almost sessile; leaflets oval, acute at both ends; stipulas obsolete; peduncles 1-flowered, with 1 ovate bractea under the flower. ⊙. H. Native of North America, on the shores of the Columbia. Corolla yellow. This species approaches *H. decúmbens*, Benth. in the size and shape of the leaflets and in the hairiness, but in its flowers to *H. parviflòra*, Benth. p. 200. no. 4. of the present volume.

One-leafletted Hosackia. Pl. decumbent.

Subtribe III. *Clitòriæ*, p. 201.

17 Psora'lea physòdes (Dougl. mss. Hook, fl. bor. amer. p. 136.) smoothish; leaves pinnately trifoliate, rarely with 5 leaflets; leaflets broadly rhomboid-ovate, acute, mucronate, obscurely glandular, terminal one on a long petiole; racemes pedunculate, loose, axillary, longer than the leaves; calyx much inflated, hairy, hardly shorter than the corolla, with the teeth nearly equal. ♃. H. Native of North America, on the banks of streams, in open sandy, and gravelly soils, from the great falls of the Columbia to the Rocky Mountains. Legumes glandular, 1-seeded. It is easily distinguished from the other species by its broader leaflets, as well as by its large inflated calyx, which almost conceals the flower. The plant comes nearest to *P. incàna*, Nutt. p. 203. no. 42. of the present volume.

Bladder-calyxed Psoralea. Pl. 1½ foot.

18 Psora'lea brachia'ta (Dougl. mss. Hook, fl. bor. amer. p. 137. t. 53.) stem erect, flexuous, a little branched, very villous; leaves palmately 5-foliate, clothed with adpressed hairs; leaflets elliptic; peduncles axillary, elongated, longer than the leaves; racemes oblong, spicate, rather loose; bracteas and teeth of calyx leafy and lanceolate; flowers erect. ♃. F. Native of North America, on the plains of the Saskatchawan, from Carlton House to Edmonton House. Root fusiform. Flowers

with a white vexillum and a blue keel, which is united to the wings. According to Mr. Douglas this is the *Navet de Praire* of Canadian voyagers and not the *P. esculénta*, Pursh, p. 203. no. 40. of the present volume, to which the present plant comes nearest. The roots, though stringy, dry, and tough, and containing but little farinaceous matter, are gathered and eaten by the Cree Indians raw, or sometimes roasted.

Brachiate Psoralea. Pl. 1 to 1½ foot.

19 Gly'cine involucra'ta (Wall. pl. rar. asiat. 3. p. 22. t. 241.) branches filiform, long, twining, pilose; leaflets oval, ciliated; racemes dense, axillary; peduncles usually with 2 whorles of 3 roundish bracteas at the base. ♄. ⌒. G. Native of Nipaul, also in Sirmore and Kamaon. Flowers white, tipped with pink.

Involucrated-racemed Glycine. Shrub tw.

Subtribe IV. *Galègeæ*, p. 222.

20 Petaloste'mon orna'tum (Dougl. mss. Hook, fl. bor. amer. p. 138.) spikes of flowers oblong-cylindrical; bracteas longer than the calyx, which is very villous; leaves with 2-3 pairs of elliptic-oblong, glabrous leaflets. ♃. F. Native of North-west America, frequent in the arid prairies near the Blue Mountains, of Lewis's River. Bracteas subulate, hairy. Corolla rose-coloured. This species comes near to *P. cárneum*, Michx. p. 222. no. 2. of the present volume.

Ornamented Petalostemon. Pl. 1 foot.

21 Caraga'na Bu'ngei (Led. fl. ross. alt. ill. t. 464.) leaves with 2-3 pairs of broad-elliptic, distant leaflets, which are cuneated at the base, but rounded and truncate at the apex, ending in a spine-like mucrone, rather silky on both surfaces; stipulas spreadingly recurved, spinescent, permanent; petioles pungent, deciduous; peduncles usually solitary, and are as well as the calyxes silky. ♄. H. Native of Altaia, in the desert called *Kuriac*, and near the river Tschuja. Led. fl. alt. 3. p. 264. Corolla yellow. To follow *C. arboréscens*, p. 243. no. 3. of the present volume.

Bunge's Caragana. Fl. June. Shrub 3 to 5 feet.

Subtribe V. *Astragàleæ*, p. 247.

22 Pha'ca abbrevia'ta (Led. fl. ross. alt. ill. t. 330. fl. alt. 3. p. 268.) plant pilose when young, but when in an adult state smooth; stems erect, simple; stipulas lanceolate-linear, reflexed, marcescent; leaves with 21-23 oblong, mucronate leaflets, which are rounded at both ends; peduncles longer than the leaves; flowers numerous, disposed in a short raceme; corolla hardly twice the length of the calyx; legumes stipitate, compressed, when young densely clothed with pili. ♃. H. Native of Altaia, in subalpine places at the mouth of the river Abai. Flowers deep yellow. To follow *P. alpìna*, Lin. p. 247. no. 3. of the present volume.

Short-spiked Bastard-vetch. Fl. June, July. Pl. 2 feet.

23 Pha'ca elonga'ta (Hook, fl. bor. amer. p. 140.) stem erect, angular, pubescent, sparingly branched; leaves with 8-10 pairs of oblong-cuneated, retuse leaflets, which are hoary beneath; stipulas small, acuminated, broad at the base, lower ones connected; peduncles much longer than the leaves; racemes elongated, loose; calyxes silky; legumes coriaceous, cylindrical, curved, sessile, acute. ♃. H. Native of North-west America, on the plains of the Saskatchawan. Flowers small, white, or cream-coloured, having the carina tipped with purple. There is a smaller variety of this plant with flexuous stems. This species follows *P. arenària*, Pall. p. 248. no. 7. of the present volume.

Elongated Bastard-vetch. Pl. 1 to 1½ foot.

24 Pha'ca flexuòsa (Hook, fl. bor. amer. p. 141.) stem decumbent, flexuous, angular, sparingly branched; leaves with 6-9 pairs of linear-oblong, obtuse leaflets, which are glabrous above, but clothed with adpressed pili beneath; stipulas small, broad at the base, acuminated, lower ones connected; peduncles longer than the leaves; racemes elongated, loose; calyxes rather silky; legumes coriaceous, cylindrical, straight, sessile, acute. ♃. H. Native of North-west America, abundant on elevated and dry fertile soils of the Red River and Assinaboin. Astràgalus flexuòsus, Dougl. mss. p. 256. no. 33. of the present volume. Flowers purple, very fragrant. This species follows *P. Lappónica*, p. 248. no. 14. of the present volume.

Flexuous-stemmed Bastard-vetch. Pl. 1 foot.

25 Pha'ca collìna (Hook, fl. bor. amer. p. 141.). ♃. H. Native of North-west America, on the sub-alpine ranges of the Blue Mountains. Astrágalus collìnus, Dougl. mss. p. 256. no. 35. of the present volume. Corolla white, with a large purple spot on one of the petals. Stipulas oblong, leafy. The plant is remarkable for the linear leaflets.

Hill Bastard-vetch. Fl. June, July. Pl. 1 foot.

26 Pha'ca pectina'ta (Hook, fl. bor. amer. p. 141. t. 54.). ♃. H. Native of North-west America, in the pastures of the Saskatchawan, and on the Red Deer and Eagle hills, bordering on that river. Flowers large, white. Astrágalus pectinàtus, Dougl. mss. p. 257. no. 53. of the present volume.

Pectinate-leaved Bastard-vetch. Pl. decumbent.

27 Pha'ca podoca'rpa (Hook, fl. bor. amer. p. 142.) plant canescent, much branched, diffuse; stems and branches striated; leaves with 6-9 pairs of broad-linear, obtuse leaflets; stipulas small, ovate, acuminated; peduncles longer than the leaves; racemes loose; legumes oblong, coriaceous, compressed, clothed with appressed hairs, acuminated, tapering into a long stipe at the base, with thickened sutures. ♃. H. Native of North America, on dry, sandy, and barren grounds, at the great falls of the Columbia. Flowers middle-sized, white. This plant should follow *P. arenària*, p. 248. no. 7. of the present volume.

Foot-fruited Bastard-vetch. Fl. June, Aug. Pl. 1 foot.

28 Pha'ca nigre'scens (Hook, fl. bor. amer. p. 143.) clothed with obscure adpressed pili; stems erect and decumbent, branched, striated; leaves with 8-10 pairs of oblong, obtuse leaflets, which are cuneated at the base; racemes for the most part longer than the leaves; stipulas small, ovate, acutish, connate at the base; teeth of calyx a little shorter than the tube; legumes stipitate, oblong, membranous, compressed, glabrous. ♃. H. Native of North America, along the Saskachawan to the Rocky Mountains, and as far north as Fort Franklin on the Mackenzie River. Corolla white or cream-coloured. The present species should follow *Phàca cæspitòsa*, Nutt. p. 248. no. 6. of the present volume. The stems are usually purplish.

Blackish Bastard-vetch. Pl. erect or decumbent.

29 Pha'ca aboriginòrum (Hook, fl. bor. amer. p. 144.). ♃. H. Native of North America, from Lake Winipeg to the Rocky Mountains, and as far north as Bear Lake in lat. 66°. Astrágalus aboriginòrum, Richards, p. 258. no. 61. of the present volume.

Aboriginal Bastard-vetch. Pl. 1 foot.

30 Pha'ca glabriu'scula (Hook, fl. bor. amer. p. 144.) plant glabrous, or with a few scattered hairs; stem erect, nearly simple, striated; leaves with 5-6 pairs of linear-lanceolate, acutish leaflets; stipulas ovate, acute, lower ones connate and larger; legume on a rather long stipe, lanceolate, falcate, compressed, membranous, glabrous. ♃. H. Native of North America, in the valleys of the Rocky Mountains. General aspect very similar to the preceding species, of which it may only be a variety. Corolla white, or bluish, with the keel dark blue.

Smoothish Bastard-vetch. Pl. 1 foot.

31 PHA'CA E'LEGANS (Hook, fl. bor. amer. p. 144.) plant nearly glabrous; stems branched, erect, or assurgent, angular; leaves with 5-7 pairs of oblong, obtuse leaflets, which are cuneated at the base, glabrous above, but clothed with minute adpressed pili beneath; stipulas ovate, acute, rather connate at the base; racemes compact, on long peduncles, exceeding the leaves, but when in fruit much more elongated; legumes sessile, elliptic, inflated, membranous, apiculated, clothed with black velvety down, 3-5-seeded. ♃. H. Native of North America, in the prairies of the Rocky Mountains. There is a smaller ascending variety with shorter racemes, which inhabits the summits of the higher mountains. Leaves glaucous beneath. Flowers of a bright and deep purple. This species should follow *P. Lappónica*, p. 248. no. 14. of the present volume.

Elegant Bastard-vetch. Pl. 1 foot.

32 PHA'CA BISULCA'TA (Hook, fl. bor. amer. p. 145.) stems rather decumbent, smoothish; leaves nearly sessile, with 11-13 pairs of elliptic leaflets, which are clothed with adpressed hairs beneath; stipulas ovate, acute, free; racemes pedunculate, very much elongated; flowers nodding; legumes pendulous, stipitate, linear-cylindrical, bisulcate, clothed with adpressed pubescence. ♃. H. Native of North America, on the plains of the Saskatchawan. Flowers of a rich purple colour. This species should follow *P. brachýtropis*, Stev. p. 248. no. 16. of the present volume.

Bisulcate-podded Bastard-vetch. Pl. 1 to 2 feet.

§ 1. *Acaúles*, p. 249.

33 OXY'TROPIS FOLIOLO'SA (Hook, fl. bor. amer. p. 146.) stemless, and clothed with hoary villi; leaves numerous; leaflets approximate, ovate or ovate-oblong, acutish; scapes pilose, longer than the leaves; heads of flowers broadly ovate, small; flowers crowded, spreading, lower ones reflexed; bracteas linear-subulate, shorter than the calyx, which is beset with black hairs; legumes remotish, deflexed, cylindrical, acute, beset with black hairs. ♃. H. Native of North America, from Carlton House to the Rocky Mountains. Petals bluish purple, their bases nearly white. This species is most nearly allied to *O. montàna*, D. C. p. 249. no. 1. of the present volume.

Leafy Mountain Milk-vetch. Pl. ½ foot.

34 OXY'TROPIS ARGYROPHY'LLA (Led. fl. ross. atl. ill. t. 54.) is *O. argyræ'a*, D. C. p. 249. no. 4. of the present volume.

Silver-leaved Mountain Milk-vetch.

35 OXY'TROPIS SULPHU'REA (Led. fl. ross. atl. ill. t. 55. fl. atl. 3. p. 285.) nearly stemless; leaflets numerous, lanceolate, when young silky; petioles and scapes beset with spreading pili; scapes a little longer than the leaves; flowers horizontal, in dense spikes; bracteas lanceolate-linear, about equal in length to the villous calyx; legumes erectly spreading, ovate-oblong, somewhat 2-celled, acuminated. ♃. H. Native of Altaia, near Riddersk. Corolla sulphur-coloured. To follow *O. campéstris*, D. C. p. 251. no. 26. of the present volume.

Sulphur-coloured-flowered Mountain Milk-vetch. Pl. ½ foot.

36 OXY'TROPUS BREVICAU'LIS (Ledeb. fl. ross. alt. ill. t. 288. fl. alt. 3. p. 284.) plant caulescent, erect, rather silky; stem short; leaflets crowded; stipulas adnate to the petioles, lanceolate, acuminated, ciliated; leaflets ovate-oblong; peduncles twice the length of the leaves; racemes at length elongated; bracteas about half the length of the calyx; legumes cylindrical, erect, pubescent, 1-celled. ♃. H. Native of Altaia, in the Soongarian desert, between mount Ku and Karkarala. Corolla violaceous. Plant tufted. To follow *O. Songàrica*, D. C. p. 250. no. 17. of the present volume.

Short-stemmed Mountain Milk-vetch. Fl. Ju. Aug. Pl. ¼ ft.

§ 2. *Verticillàres*, p. 251.

37 OXY'TROPIS PHYSOCA'RPA (Led. fl. ross. alt. ill. t. 381. fl. alt. 3. p. 272.) stem shrubby, branched; leaves impari-pinnate; leaflets verticillate in fours, oblong or linear, minute, with ciliated margins, and bearded towards the apex; petioles usually permanent; peduncles axillary, usually 3-flowered, rather shorter than the leaves, but at length elongated; calyx rather villous; legumes inflated, muricate, ending in a curved beak. ♄. H. Native of Altaia, on the tops of the alps at the river Tschuja. Corolla violaceous. To follow *O. muricàta*, p. 252. no. 41. of the present volume.

Bladder-fruited Mountain Milk-vetch. Fl. June. Sh. dense.

38 OXY'TROPIS SUBVERTICILLA'TA (Led. fl. ross. alt. ill. t. 292. fl. alt. 3. p. 275.) stem shrubby, branched, very short; leaves impari-pinnate; leaflets somewhat verticillate by pairs of fours, elliptic, silky on both surfaces; petioles hardened, permanent; peduncles axillary, 3-flowered, shorter than the calyx, which is beset with spreading villi; legumes pubescent. ♄. H. Native of Altaia, in the Soongarian desert, between the mountains Kent and Ku. Corolla violaceous. To follow *O. muricàta*, D. C. p. 252. no. 41. of the present volume.

Subverticillate-leaved Mountain Milk-vetch. Fl. July, Sept. Shrub dwarf.

§ 3. *Tragacanthoìdeæ*, p. 252.

39 OXY'TROPIS POLYPHY'LLA (Led. fl. ross. alt. ill. t. 277.) stem shrubby, much branched, short; leaves impari-pinnate; leaflets 11-17, ovate-oblong, silky on both surfaces; petioles hardened, permanent; spikes of flowers sub-capitate, axillary; peduncles elongated, about equal in length to the leaves; calyx clothed with white villi. ♄. H. Native of Altaia, on mountains near the river Tschuja. Corolla violaceous. To follow *O. tragacanthoìdes*, Fisch. p. 252. no. 42. of the present volume.

Many-leafletted Mountain Milk-vetch. Fl. May, Ju. Sh. ½ ft.

40 OXY'TROPIS LEUCOPÒDIA (Led. fl. ross. alt. ill. t. 282. fl. alt. 3. p. 279.) stem shrubby, much branched, short; leaves impari-pinnate; leaflets usually 13, oblong-linear, glabrous; petioles hardened, permanent; peduncles axillary, 2-flowered, very short; calyx covered with thick, elevated corpuscles; legumes rather inflated, glabrous, ending in an acuminated beak. ♄. H. Native of Altaia, on mountains near the river Tschuja. Vexillum and wings yellow. Keel bluish. To follow *O. tragacanthoìdes*, Fisch. p. 252. no. 42. of the present volume.

White-petioled Mountain Milk-vetch. Fl. Ju. Sh. 6 inches.

41 OXY'TROPUS ACIPHY'LLA (Led. fl. ross. alt. ill. t. 281. fl. alt. 3. p. 279.) stem shrubby, much branched; leaves abruptly pinnate, with 2 or 3 pairs of oblong or oblong-linear, pungent leaflets, which are silky on both surfaces; petioles permanent, hardened into spines; peduncles axillary, 2-3-flowered, twice the length of the villous calyx; legumes oblong, acuminated, villous. ♄. H. Native of Altaia, on sandy hills at the river Irtysch. Corolla purplish violet. Shrub forming a dense tuft. To follow *O. tragacanthoìdes*, Fisch. p. 252. no. 42. of the present volume.

Needle-leafletted Mountain Milk-vetch. Pl. May. Sh. tufted.

§ 4. *Caulescéntes.*

42 OXY'TROPIS DIFFU'SA (Led. fl. ross. alt. ill. t. 451. fl. alt. 3. p. 281.) many stemmed, diffuse, beset with adpressed pili; stipulas opposite the leaves, somewhat concrete, ciliated; leaflets ovate-oblong; peduncles at length nearly twice the length of the leaves; flowers racemose; bracteas rather exceeding the pedicels; legumes depressed, mucronate, deflexed, 1-celled.

clothed with adpressed pili. ♃. H. Native of Altaia, in humid places. O. glàbra, D. C.? Corolla bluish violet. To follow *O. pilòsa*, D. C. p. 252. no. 43. of the present volume.

Var. α, *elongàta* (Led. l. c.) stem 1-2 feet high.

Var. β, *pùmila* (Led. l. c.) stem 2-6 inches high.

Diffuse Mountain Milk-vetch. Pl. ½ to 2 feet.

43 Oxy'tropus floribu'nda (D. C. prod. 2. p. 280.) According to Ledebour the following names belong to this species. *O. tères*, D. C. *O. longicúspis*, Ledeb. *O. Fischèri*, D. C. *O. vaginàta*, D. C. *O. tenélla*, D. C.

Bundle-flowered Mountain Milk-vetch. Pl. ½ to 1 foot.

§ 1. *Hypoglottídei*, p. 253.

44 Astra'galus pauciflòrus (Hook, fl. bor. amer. p. 149.) plant decumbent and hoary, beset with adpressed pili; stipulas concrete, opposite the leaves, lower ones entire; leaves with 3-5 pairs of oblong acute leaflets; peduncles rather shorter than the leaves, 2-4-flowered; flowers small, loosely racemose; bracteas length of pedicels; calyx beset with white pili, having the teeth about equal in length to the tube. ♃. H. Native of North America, among the rocks in the more elevated regions of the Rocky Mountains. Root long, descending, rather fusiform. Corolla blue. This species should follow *A. hypoglóttis*, Linn. p. 253. no. 1. of the present volume.

Few-flowered Milk-vetch. Pl. decumbent.

45 Astra'galus multicau'lis (Led. fl. ross. alt. ill. t. 316. fl. alt. 3. p. 295.) caulescent, prostrate, or ascendent, pubescent; stipulas membranous, concrete, opposite the leaves; leaflets oblong or obovate, emarginate, 5-6 pairs; racemes short; peduncles much longer than the leaves; bracteas longer than the pedicels; calyx beset with black or white pili; legumes erect, racemose, glabrous, ovate, triquetrous, short, half 2-celled; cells 1-seeded. ♃. H. Native of Altaia, in muddy salt places near the river Tschuja. Corolla pale purple. To follow *A. hypoglóttis*, p. 253. no. 1. of the present volume.

Many-stemmed Milk-vetch. Fl. May, June. Pl. prostrate.

§ 2. *Dissitiflòri*, p. 255.

46 Astra'galus pube'rulus (Led. fl. ross. alt. ill. t. 291. fl. alt. 3. p. 299.) plant erect, many-stemmed, hoary; stems terete, smooth; leaves stalked, with 6-11 pairs of oblong or oblong-linear retuse leaflets; flowers racemose, drooping; peduncles exceeding the leaves; bracteas lanceolate; tube of calyx twice the length of the teeth; vexillum retuse, longer than the emarginate wings; ovary glabrous. ♃. H. Native of Altaia, on hills at the rivers Ursal and Tschuja. Vexillum pale lilac. To follow *A. sulcàtus*, Lin. p. 255. no. 29. of the present volume.

Puberulous Milk-vetch. Fl. May, June. Pl. 1 foot.

47 Astra'galus vicioìdes (Led. fl. ross. alt. ill. t. 286. fl. alt. 3. p. 301.) stems erect, glabrous, rather sulcate above; leaves petiolate, with 8 pairs of oblong, obtuse leaflets; flowers racemose, drooping; peduncles about twice the length of the leaves; bracteas lanceolate; teeth of calyx not half so long as the tube; vexillum emarginate; wings entire; legumes erect, ovate, triquetrous, coriaceous, 2-celled; cells few-seeded. ♃. H. Native of Altaia, in meadows on both sides of the river Irtysch and elsewhere. Flowers purplish. To follow *A. sulcàtus*, Lin. p. 255. no. 29. of the present volume.

Vetch-like Milk-vetch. Pl. 1 foot.

48 Astra'galus leptocau'lis (Led. fl. ross. atl. ill. t. 284. fl. atl. 3. p. 296.) shrubby, much branched; stem silky; stipulas concrete, opposite the leaves; leaflets oblong, usually 4 pairs, nearly glabrous above, clothed with adpressed pili beneath and on the margins; racemes few-flowered; peduncles more than twice the length of the leaves; calyx beset with white and black hairs; legumes horizontal, oblong, triquetrous, clothed with adpressed pili, 2-celled, more than twice the length of the calyx; cells many-seeded. ♄. H. Native of Altaia, on rocks near the rivulet called Urmuchaika, about Buchtorminsk. Corolla bluish. To follow A. *Hyrcànus*, Pall. p. 256. no. 42. of the present volume.

Slender-stemmed Milk-vetch. Shrub dwarf.

§ 3. *Onobrychoìdei*, p. 257.

49 Astra'galus dia'phanus (Dougl. mss. Hook, fl. bor. amer. p. 151.) plant prostrate, diffuse, pilose; stipulas small, ovate, acuminated; leaves with 5-9 pairs of obovate leaflets; peduncles shorter than the leaves; flowers small, capitate, loose; bracteas ovate, acuminated, minute, rather shorter than the pedicels; legumes rather reflexed, linear, compressed, falcate, somewhat diaphanous, smoothish, 2-celled, many-seeded. ♃. H. Native of North America, abundant on sandy soils near the great falls of the Columbia. Flowers small, purple. This species should follow *A. lentiginòsus*, Dougl. p. 257. no. 49. of the present volume.

Diaphanous-podded Milk-vetch. Pl. prostrate.

50 Astra'galus compre'ssus (Led. fl. ross. alt. ill. t. 289. fl. alt. 3. p. 304.) plant prostrate, suffruticose, silky; leaflets oblong-linear, usually 3 pairs; flowers somewhat capitate; peduncles twice or thrice longer than the leaves; vexillum a little longer than the wings; legumes racemose, erect, linear, compressed, much longer than the calyx, and clothed with adpressed pili. ♃. H. Native of Altaia, at the river Irtysch. To follow *A. arbúsculus*, Pall. p. 258. no. 59. of the present volume.

Compressed-podded Milk-vetch. Fl. April, May. Pl. prost.

51 Astra'galus melanoca'rpus (Fras. cat. Richards. in Frankl. journ. ed. 2. append. p. 28. Hook, fl. bor. amer. p. 150.) plant clothed with silky hoary down; stems short, decumbent; stipulas ovate, acute; leaves with 8-10 pairs of ovate leaflets, which are acute at both ends, but sometimes obovate and obtuse; racemes capitate, loose, 6-8-flowered, longer than the leaves, on longish peduncles; flowers spreading; legumes spreading, elliptic-oblong, coriaceous, nearly 1-celled; wrinkled, blackish-brown. ♃. H. Native of North America, on the plains of the Saskatchawan, and on the Eagle and Red Deer Hills on the same river. Flowers dark purplish-blue, varied with white. Perhaps the same as the *A. Missouriénsis* of Nutt. p. 258. no. 69. of the present volume. Root fusiform.

Black-fruited Milk-vetch. Pl. decumbent.

N. B. *Astrágalus succúmbens*, Dougl. p. 263. no. 139., *A. infléxus*, Dougl. p. 256. no. 34. and *A. glarcòsus*, Dougl. p. 271. no. 241. should follow *A. lentiginòsus*, Dougl. p. 257. no. 49. of the present volume; and *A. Púrshii* should follow *A. Caroliniànus*, p. 263. no. 130.

52 Astra'galus? lotiflòrus (Hook, fl. bor. amer. p. 159.) plant hoary and clothed with adpressed pili; stems short, diffuse; stipulas ovate, acuminated; leaves on rather long petioles; leaflets rather remote, usually 6 pairs, oblong, obtuse; peduncles slender, shorter than the leaves; flowers 3-4, loose, capitate, usually yellow; bracteas subulate, longer than the pedicels; calyx campanulate, clothed with white pili, with the teeth subulate and longer than the tube; petals about equal in length; legumes erectly spreading, ovate, acuminated, compressed, very villous from white hairs, 1-celled, with the upper suture straight, and the lower one arched. ♃. H. Native of North America, about Carlton House on the Saskatchawan. Perhaps a species of *Phàca* very near *Phàca villòsa*. Astrágalus villòsus of Michx.

Lotus-flowered Milk-vetch. Pl. diffuse.

§ 5. *Vesicàrii*, p. 259.

53 Astraga'lus candidíssimus (Led. fl. ross. alt. t. 287. fl.

alt. 3. p. 309.) root creeping; stems herbaceous, erect, clothed with white tomentum; stipulas ovate-lanceolate, acuminated, free, glabrous inside; leaves with 7-10 pairs of nearly orbicular, mucronate leaflets; peduncles about equal in length to the leaves; calyxes woolly, at length bladdery; legumes inflated, ovate, ending in a long reflexed acumen, glabrous, 2-celled, much larger than the calyx. ♃. H. Native of Altaia, in sand at the river Irtysch. Corolla purplish-violet. To follow *A. megalánthus*, D. C. p. 259. no. 80. of the present volume.

Very-white Milk-vetch. Fl. June. Pl. 1 foot.

§ 7. *Annulàres, p.* 259.

54 ASTRA'GALUS ORBICULA'TUS (Led. fl. ross. alt. t. 290. fl. alt. 3. p. 311.) plant villous and procumbent, or erectish; leaves with 6-11 pairs of nearly orbicular mucronate leaflets; stipulas ovate, acute; racemes usually 3-flowered, pedunculate; peduncles one-half the length of the leaves; bracteas and teeth of calyx lanceolate-linear; ovary oblong, densely clothed with pili, on a glabrous stipe. ♃. H. Native of Altaia, in the Soongarian desert. Corolla white. To follow *A. striatéllus*, Bieb. p. 260. no. 86. of the present volume.

Orbicular-leafletted Milk-vetch. Fl. May, June. Pl. proc.

§ 8. *Synochreàti, p.* 261.

55 ASTRA'GALUS RARIFLÒRUS (Led. fl. ross. alt. ill. [illegible]8. fl. alt. 3. p. 313.) plant ascending, suffruticose, clothed with adpressed hoary pili; leaves with 5-11 oblong-linear leaflets; peduncles much longer than the leaves; flowers remote, on short pedicels, secund; legumes subulate, triquetrous, a little arched, horizontal, clothed with white villi, 3 or 4 times longer than the calyx. ♃. H. Native of Altaia, in the Soongarian desert, in dry salt fields about the mountains of Tschingistan. Corolla cream-coloured. To follow *A. microphýllus*, Lin. p. 261. no. 108.

Scarce-flowered Milk-Vetch. Fl. July, Aug. Pl. ascending.

56 ASTRA'GALUS OREA'DES (Meyer, verz. pfl. p. 141.) smoothish; stems diffuse; stipulas all concrete and sheath-formed; leaflets 8-12 pairs, all oblong-elliptic, rather retuse; peduncles shorter than the leaves; legumes crowded, erectish, inflated, nearly globose, mucronate, and pilose. ♃. H. Native of Persia, on mount Kasbek, at the height of 3600 or 4200 feet. Nearly allied to *A. microphýllus*, Lin. p. 261. no. 108.

Oreades Milk-vetch. Pl. diffuse.

57 ASTRA'GALUS DEPAUPERA'TUS (Led. fl. ross. atl. 3. p. 314.) plant erectish, suffruticose, rather silky; leaflets 5-9, oblong, acute at both ends; peduncles exceeding the leaves; flowers few, in umbellate heads; legumes oblong, a little arched, compressed, granular, villous, but at length almost glabrous, 2-celled. ♃. H. Native of Altaia, in dry salt plains, near Loktewsk. Corolla cream-coloured. To follow *A. microphýllus*, Lin. p. 261. no. 108. of the present volume.

Depauperated Milk-vetch. Fl. Aug. Pl. ½ to 1 foot.

§ 9. *Ciceroìdei, p.* 262.

58 ASTRA'GALUS RYTIDOCA'RPUS (Led. fl. ross. alt. ill. t. 293. fl. alt. 3. p. 315.) plant ascending, rather hoary; stipulas ovate, mucronate or acuminated; leaves with 4 pairs of oblong-linear leaflets; peduncles about equal in length to the leaves; spikes capitate, few-flowered; legumes short, nearly globose, didymous, sessile, wrinkled, transversely 2-celled, rather villous, apiculated by the oblique style. ♃. H. Native of Altaia, in islands in the river Tschuja. To follow *A. glycyphýllus*, Lin. p. 262. no. 116. of the present volume.

Rugged-fruited Milk-vetch. Fl. June. Pl. ascending.

§ 10. *Galegifórmes, p.* 263.

59 ASTRA'GALUS CHLORO'STACHYS (Lindl. hort. trans. vol. 7. p. 249. and p. 263. no. 134. of the present volume) stems erect, pubescent; stipulas distinct, separate from the petioles; leaves with 11-12 pairs of oblong pubescent leaflets; racemes pedunculate, many-flowered, longer than the leaves; legumes inflated, a little arched; racemes axillary at the tops of the shoots. ♃. H. Native of Nipaul. Flowers greenish yellow.

Green-spiked Milk-vetch. Fl. Sept. Oct. Clt. 1823. Pl. 2 to 4 feet.

60 ASTRA'GALUS PODOCA'RPUS (Meyer, verz. pfl. p. 142.) plant clothed with adpressed, canescent down; stems branched, diffuse, or erect; stipulas free, lanceolate; leaflets 3-6 pairs, elongated, nearly linear, acute; peduncles very long; spikes dense-flowered, oblong; legumes stipitate, erect, oblong, clothed with pili, longer than the calyx. ♃. H. Native of Persia, near Swant, on the mountains of Talusch, at the height of 2000 feet. Flowers yellowish. To follow *A. galegifórmis*, Lin. p. 263. no. 137. of the present volume.

Foot-fruited Milk-vetch. Pl. 1 to 2 feet.

§ 13. *Tragacánthæ, p.* 265.

61 ASTRA'GALUS SIRI'NICUS (Tenore, fl. neap. prod. 5. ex. Schlecht. Linnæa. 5. p. 102.) shrubby; petioles spinescent; leaves with 14 pairs of elliptic-oblong bluntish leaflets, beset with adpressed pili on both surfaces; peduncles rather shorter than the leaves, from 2-10, disposed in a racemose spike; calyx clothed with black and white hairs; the teeth setaceous: corolla yellow, 3-times the length of the calyx; bracteas linear, setaceous, 3-times the length of the pedicels; legumes villous. ♃. H. Native of Naples, on Mount Sirini, near Lagonegro in rocky meadows. This species differs from *A. retùsus*, Willd. p. 267. no. 185. of the present volume, in the flowers being disposed in racemose spikes, not capitate, in the setaceous teeth of the calyx, and in the linear bracteas. It differs from *A. Massiliénsis*, in the calycine teeth being subulate, not obtuse, and obliquely truncate, in the bracteas being longer than the pedicels, and in the racemose flowers.

Sirini Goat-thorn. Shrub ½ to 1 foot.

§ 15. *Anthylloìdei, p.* 268.

62 ASTRA'GALUS ELLIPSOÌDES (Led. fl. ross. alt. ill. t. 297. fl. alt. 3. p. 319.) nearly stemless and silky white; leaflets 11-23, broad-elliptic, acute at both ends; stipulas ovate, acuminated, silky outside; peduncles a little shorter than the leaves; spikes oblong or globose; calyxes inflated, elliptic, clothed with white pili; legumes somewhat triquetrous, many-seeded, acute, very villous, shorter than the calyx. ♃. H. Native of Altaia. Corolla sulphur-coloured. To follow *A. calycinus*, Bieb. p. 268. no. 197. of the present volume.

Var. α, elongàtus (Led. l. c.) caulescent; leaflets 11-19, remote; spikes oblong-cylindrical; calyx clothed with spreading pili. ♃. H. Native on the mountains of Arkaul and Dolenkara.

Var. β, intermèdius (Led. l. c.) almost stemless; leaflets 11-23, large, crowded; spikes oblong, short; calyx clothed with adpressed pili. ♃. H. Native on exposed hills, near Ustkamenogorsk.

Var. γ, abbreviàtus (Led. l. c.) smaller, stemless; leaflets 11-13; spikes subglobose, few-flowered; calyx clothed with spreading pili. ♃. H. Native of dry fields about the mountains of Tschingistan and Dschigilen.

Ellipsoid-podded Milk-vetch. Fl. May. Pl. dwarf.

63 ASTRA'GALUS SABULETÒRUM (Led. fl. ross. alt. ill. t. 298. fl. alt. 3. p. 321.) nearly stemless, silky white; leaflets 11-19, oblong, acute at both ends; stipulas ovate, acuminated, silky; peduncles about equal in length to the leaves; spikes ovate-globose; calyxes inflated, ovate, clothed with white adpressed

pili, and densely ciliated at the apex; legumes rather triquetrous, many-seeded, acute, villous, longer than the calyx. ♃. H. Native of Altaia, in sand at the rivers Irtysch and Bekun. Corolla rose-coloured. To follow *A. calycinus*, Bieb. p. 268. no. 197.

Sand Milk-vetch. Fl. May. Pl. dwarf.

64 Astra'galus melanótrichos (Led. fl. ross. atl. ill. t. 294. fl. alt. 3. p. 323.) stem erect, shrubby, much branched; branches silky; leaflets 7-9, linear, acute at both ends, with a few scattered strigæ; stipulas ovate-lanceolate, rather adnate to the petiole; peduncles longer than the leaves; spikes short, nearly globose; calyxes inflated, ellipsoid, densely clothed with black hairs at the base, and in the throat; legumes ovate, triquetrous, many-seeded, acutish, pilose, exceeding the calyx. ♄. H. Native of Altaia, on mount Kurtschum not far from Nabaty, at the river Irtysch. Corolla yellow. To follow *A. inflàtus*, D. C. p. 268. no. 205. of the present volume.

Black-haired Milk-vetch. Fl. June. Pl. ½ foot.

65 Astra'galus scleropòdius (Led. fl. ross. alt. ill. t. 295.) stem erect, shrubby, much branched; young branches strigose, adult ones glabrous from the bark being deciduous; leaflets 11-21, oblong, rather mucronate, sparingly strigose; stipulas lanceolate, rather adnate to the petiole; peduncles longer than the leaves, hardened into spines; spikes cylindrical, secund; calyx inflated, ellipsoid, beset with spreading pili; legumes ovate, somewhat triquetrous, many-seeded, acute, pilose, shorter than the calyx. ♄. H. Native of Altaia, on mountains of Kurtschum, at the river Irtysch. Corolla yellow. To follow *A. inflàtus*, D. C. p. 268. no. 205. of the present volume.

Hard-petioled Milk-vetch. Fl. June. Shrub 3 feet.

66 Astra'galus xanthótrichos (Led. fl. ross. alt. ill. t. 296. fl. alt. 3. p. 324.) stem erect, shrubby, much branched; young branches strigose, adult ones silky white; leaflets 7-9, elliptic, rather mucronulate, beset with a few strigæ; stipulas semiovate-lanceolate; peduncles longer than the leaves; spikes subglobose; calyxes inflated, ellipsoid, beset with spreading pili; legumes ovate, somewhat triquetrous, many-seeded, acute, very villous, exceeding the calyx. ♄. H. Native of Altaia, on the mountains of Kurtschum on rocks. Corolla yellow. To follow *A. folliculàris*, Pall. p. 268. no. 206. of the present volume.

Yellow-haired Milk-vetch. Fl. June. Shrub 2 to 3 feet.

67 Astra'galus glomera'tus (Led. fl. ross. alt. ill. t. 299. fl. alt. 3. p. 327.) almost stemless, tufted, glaucous, beset with a few pili; leaflets usually 9, obovate; racemes axillary, 4-8-flowered, almost sessile; calyx at length ruptured; the teeth lanceolate-linear, about half the length of the tube; legumes cylindrical, acuminated, beset with silky strigæ, 2-celled. ♃. H. Native of Altaia, in exposed fields at the river Irtysch, between Woroninsk and Nabaty. Corolla with the vexillum rose-coloured, having a large white spot in the centre, and with the wings and keel whitish, the latter tipped with purple. To follow *A. ammódytes*, Pall. p. 269. no. 210. of the present volume.

Glomerate Milk-vetch. Fl. April, May. Pl. ¼ to ½ foot.

68 Astra'galus hypogæ'us (Led. fl. ross. alt. ill. t. 95. fl. alt. 3. p. 329.) stemless, clothed with long white hairs; leaflets 5-13, rather remote, obovate; flowers aggregate at the roots, exactly sessile; calyx at length ruptured, with the teeth linear, subulate, equal in length to the tube; legumes subglobose, didymous, villous, 1-celled, few-seeded, under ground; vexillum elongated, emarginate, with the margins connate, and the middle tubular. ♃. H. Native of hills and fields near to the river Tscharych and Buchtorm, and in the Soongarian desert. Corolla white. To follow *A. galactites*, p. 269. no. 209.

Underground-podded Milk-vetch. Fl. Aug. Pl. ½ foot.

§ 16. *Caprìni*, *p*. 269.

69 Astra'galus ròseus (Led. fl. ross. alt. ill. t. 300. fl. alt. 3. p. 330.) caulescent, erect or ascending; stem clothed with white villi; leaflets 17-23, obovate-elliptic, clothed with hoary-villi; spike capitate, nearly globose; peduncles short; calyx villous, with the teeth setaceous, exceeding the tube in length, but about equal in length to the corolla; legumes obovate, triquetrous, woolly, 1-celled, a little longer than the tube of the calyx. ♃. H. Native of Altaia, in sandy fields at the river Irtysch. Corolla rose-coloured. To follow *A. longiflòrus*, Pall. p. 269. no. 215. of the present volume.

Rose-coloured-flowered Milk-vetch. Fl. May, June. Pl. ¼ to ½ foot.

70 Astra'galus lactiflòrus (Led. fl. ross. alt. ill. t. 103. fl. alt. 3. p. 333.) plant caulescent, hairy; leaflets 19-23, elliptic; racemes very short, axillary; bracteas lanceolate-linear; calycine teeth lanceolate-linear, thrice the length of the tube, but shorter than the bracteas; corolla glabrous; legumes ovate, rather triquetrous, mucronate, 2-celled, many-seeded, densely clothed with wool. ♃. H. Native of Altaia, in dry fields and on rocks. A. testiculàtus Altàicus, Pall. Corolla milk-coloured. To follow *A. Schanginiànus*, Pall. p. 270. no. 222.

Milk-flowered Milk-vetch. Fl. June. Pl. ¼ to ½ foot.

71 Astra'galus brevifòlius (Led. fl. ross. alt. ill. t. 307. fl. alt. 3. p. 334.) tufted, rather silky; leaflets 7, oblong, petiolulate; peduncles axillary, very short, 1-2-flowered; flowers longer than the leaves; teeth of calyx much longer than the tube; legume inclosed in the calyx, which is silky, membranous, and erect; cells 2-seeded. ♃. H. Native of Altaia, in sterile dry deserts, near the river Tschuja. Corolla sulphur-coloured. To follow *A. Buchtorménsis*, Pall. p. 270. no. 228.

Short-leaved Milk-vetch. Fl. June. Pl. ¼ foot.

§ 17. *Incàni*, *p*. 270.

72 Astra'galus rostra'tus (Meyer, verz. pfl. p. 144.) plant stemless, and densely clothed with hairs, which are fixed by their centre; scape rather shorter than the leaves; leaflets 13-17, nearly linear, acute; calycine teeth shorter than the tube; setaceous; legumes erect, very long, subulate, nearly terete, erectish, ending in a beak. ♃. H. Native of Persia, on the mountains of Tulusch near Swant, at the height of 2000 feet. Allied to *A. Monspessulànus*, Lin. p. 270. no. 233.

Beaked-podded Milk-vetch. Pl. ¼ to ½ foot.

73 A. refra'ctus (Meyer, verz. pfl. p. 144.) plant canescent from adpressed pili, which are fixed by their centre; scapes erect, longer than the leaves; leaflets 19-25, oblong-lanceolate, acute; racemes elongated, loose; calycine teeth subulate, shorter than the tube; legumes deflexed, stipitate, rather trigonal, beaked, beset with black and white hairs. ♃. H. Found along with *A. rostràtus*. Flowers yellow. To follow *A. sanguinoléntus*, Bieb. p. 270. no. 234 of the present volume.

Refracted-podded Milk-vetch. Pl. ¼ foot.

§ 18. *Radiciflòri*, *p*. 271.

74 Astra'galus physoca'rpus (Led. fl. alt. 3. p. 335.) almost stemless; leaflets 17-27, elliptic, rounded at the base or cuneated, mucronate, glaucous, glabrous on both surfaces, but with a few adpressed hairs on the margin, which are fixed by their centre; peduncles about equal in length to the leaves; flowers in dense spikes; legumes inflated, membranous, subglobose, glabrous. ♃. H. Native of Altaia, about Loktewsk, &c. A. physòdes Altàicus, Pall. astr. p. 72. t. 58. Flowers violaceous or dirty yellow. To follow *A. physòdes*, Lin. p. 271. no. 247.

Bladder-fruited Milk-vetch. Pl. ¼ to ½ foot.

Tribe III. *Hedysàreæ*. *Subtribe* II. *Euhedysàreæ*, *p*. 277.

75 Desmòdium purpu'reum (Hook. in Beech. voy. part. bot. p. 62.) stem erect, terete, nearly simple, clothed with adpressed

pubescence; leaflets 3, elliptic, obtuse, veiny, smoothish; stipulas subulate, acuminated; racemes axillary, on rather long peduncles; bracteas lanceolate, acuminated, ciliated; legume 5-6-jointed, joints quadrate, convex on one side, reticulated, scabrous from stiff hairs. ♄. S. Native of the East Indies and the Sandwich Islands. Hedýsarum purpùreum, Roxb. hort. beng. p. 57. Hedýsarum siliquòsum, Burm. zeyl. t. 53. f. 2. Burm. ind. t. 55. f. 2. Flowers purple. This species should follow *D. siliquòsum*, D. C. p. 296. no. 126. of the present volume.

Purple-flowered Desmodium. Shrub.

76 HEDY'SARUM POLYMÓRPHUM (Led. fl. alt. 3. p. 338.) stem ascending; leaves with many pairs of elliptic or oblong leaflets, which are rather silky beneath, or clothed with adpressed pili; spikes pedunculate, crowded; keel a little shorter than the vexillum, but longer than the wings; fruit erect, with the joints wrinkled, and clothed with hoary pubescence. ♃. H. Native of Altaia, in salt marshes at the river Tschuja, not far from the mouth of the river Aigulak. Flowers rose-coloured. To follow *H. ròseum*, Steph. p. 301. no. 18. According to Ledebour, the following are varieties of this plant.

Var. α, pùmilium (Led. fl. alt. l. c.) prostrate; leaflets 5-6 pairs. ♃. H. Native of Altaia.

Var. β, prostràtum (Sievers, Led. l. c.) prostrate; leaflets 6-8 pairs. H. ròseum, Steph. in D. C. prod. 2. p. 342.

Var. γ, adscéndens (Led. fl. ross. alt. ill. t. 51.) ascending; leaflets 7-9 pairs. ♃. H. H. rutidocàrpum, D. C. prod. 2. p. 341.

Var. δ, suberéctum (Led. fl. alt. 3. p. 339.) erectish; leaflets 6-8 pairs. ♃. H. H. Gmelìni, Ledeb. H. Altàicum, Fisch. in D. C. prod. 2. p. 339.

Var. ε, elàtum (Led. l. c.) stem erect; leaflets 8-9 pairs.

Polymorphous Hedysarum. Fl. June, July. Pl. prostrate and erect.

77 HEDY'SARUM NEGLE'CTUM (Led. fl. ross. alt. t. 482. fl. alt. 3. p. 341.) plant caulescent, erect; leaflets ovate-lanceolate, pubescent beneath; racemes elongated, axillary; bracteas exceeding the pedicels; teeth of calyx lanceolate, about equal in length to the tube; vexillum equal in length to the wings, but shorter than the keel; pods pendulous, pilose, with elliptic joints. ♃. H. Native of Altaia, on shady alps at the river Koksun. H. lasiocàrpum, Led. Flowers rose-coloured, but there is also a variety with white flowers.

Neglected Hedysarum. Fl. May, June. Pl. ½ foot.

78 ONOBRY'CHIS VAGINA'LIS (Meyer, verz. pfl. 145.) stipulas large, concrete, opposite the leaves; leaves with 6-9 pairs of ovate or oblong, obtuse or acute leaflets, beset with soft pili beneath as well as on the stem; wings obtuse, unidentate at the base, shorter than the calyx; pods unknown. ♃. H. Native of Persia, on arid hills near Baku. This species comes near to *O. Pallàsii*, Bieb. p. 306. no. 30. but is easily distinguished from it by the concrete stipulas.

Sheathed-stipuled Saintfoin. Pl. 1 foot.

79 ONOBRY'CHIS HETEROPHY'LLA (Meyer, verz. pfl. p. 146.) plant clothed with minute, adpressed, silky down; stems procumbent or assurgent; stipulas free, lanceolate; radical leaves simple and ternate, cauline ones with 2-3 pairs of ovate, or nearly orbicular, mucronulate leaflets; wings acuminated, unidentate at the base, longer than the calyx; legumes very villous, with prickly margins; prickles setaceous, elongated. ♃. H. Native of Persia, in stony dry places on the mountains of Talusch near Swant. Corolla yellowish, but sometimes finely streaked with brown veins. To follow *A. Pallàsii*, Bieb. p. 306. no. 30.

Variable-leaved Saintfoin. Pl. procumbent.

Tribe IV. *Vicièæ, p.* 311.

80 VÌCIA COSTA'TA (Led. fl. ross. alt. ill. t. 108. fl. alt. 3. p. 346.) glabrous; stem compressed, somewhat quadrangular; leaves with usually 6 pairs of rather alternate, petiolulate, reflexed, ovate-oblong, mucronate, ribbed, rather glaucous, somewhat coriaceous leaflets; peduncles 3-8-flowered, about equal in length to the leaves; stipulas semi-sagittate or hastate; teeth of calyx nearly equal, lower one the longest, but one-half shorter than the tube; style bearded at the apex; legumes pendulous, glabrous, nearly cylindrical, 2-4-seeded. ♃. H. Native of Altaia, on rocks at the river Katunja and Tschuja, and on the mountains of Dolen-Kara. Flowers whitish; the keel tipped with purple. To follow *V. sylvática*, p. 316. no. 8.

Ribbed-leaved Vetch. Fl. June, July. Pl. 2 feet.

81 VICIA LILA'CINA (Led. fl. ross. alt. ill. t. 366.) stem weak; leaflets 9-16, ovate-elliptic, alternate or opposite, mucronate, clothed with adpressed pili beneath, the veins anastomosing; stipulas oblong, acuminated, ciliated, entire or semi-sagittate; peduncles many-flowered, exceeding the leaves; vexillum exceeding the keel, but shorter than the wings; style pilose; legumes oblong, compressed, glabrous, usually 3-seeded. ♃. H. Native of Altaia, on mountains near Aleandrowsk, at the river Irtysch. Flowers lilac, smaller than those of *V. Crácca*. To follow *V. biénnis*, Lin. p. 319. no. 49. of the present volume.

Lilac-flowered Vetch. Fl. June, July. Pl. cl.

82 VÌCIA MEGALÓTROPIS (Led. fl. ross. alt. ill. t. 368.) stems and tendrils branched; leaflets numerous, lanceolate-linear, alternate or opposite, mucronate; stipulas very narrow, ciliated, linear, or semi-sagittate; peduncles many-flowered, about equal in length to the leaves, or rather shorter; flowers numerous, imbricate; vexillum and wings about equal in length to the keel; style puberulous at the apex; legumes horizontal, oblong, glabrous, 3-4-seeded, compressed. ♃. ◡. H. Native of Altaia, on mountains at the river Uba, Ulba, Koksun, Tschanysch, &c. Flowers with an emarginate purple vexillum, and with the wings and keel white, tipped with bluish violet. To follow *V. tenuifòlia*, Lin. p. 317. no. 28. of the present volume.

Large-keeled Vetch. Pl. cl.

83 VÌCIA MULTICAU'LIS (Led. fl. ross. alt. ill. t. 50. fl. alt. 3. p. 345.) stems and tendrils nearly simple; leaves with 4-8 pairs of alternate, or opposite, oblong-elliptic, mucronate leaflets; stipulas sub-hastate; peduncles exceeding the leaves, 4-8-flowered; vexillum equal in length to the keel and wings; style puberulous at the apex; legumes horizontal, oblong, somewhat reticulated, 6-8-seeded, rather compressed. ♃. H. Native of Altaia, on mountains. V. alpìna, Pall. itin. 2. p. 568. Flowers almost the colour of the last species.

Many-stemmed Vetch. Fl. May. Pl. cl.

84 E'RVUM AGRIGENTI'NUM (Gussone, in litt. D. C. prod. 2. p. 367.) leaflets 8-10, elliptic, mucronate; tendrils trifid; stipulas semi-sagittate, deeply toothed; peduncles 2-5-flowered, shorter than the leaves; calycine segments linear, equal, longer than the tube; legumes ovate, compressed, puberulous, reticulately veined, 4-seeded. ☉. H. Native of Sicily, about Agrigentum. Allied to *E. tetraspérmum*, but differs in the legumes being broader, puberulous, and in the stipulas being toothed.

Agrigentum Lentil. Pl. 1 foot.

85 LA'THYRUS ALTA'ICUS (Led. fl. ross. alt. ill. t. 53. fl. alt. 3. p. 355.) stem weak, pubescent, tetragonal, but not winged; leaves with 3-5 pairs of oblong or ovate mucronate leaflets, which are pilose beneath; stipulas semi-sagittate, ovate, acuminated, a little toothed; peduncles 2-4-flowered, longer than the leaves; legumes cylindrical, villously pubescent. ♃. H. Native of Altaia, on the lower mountains. Root creeping. Corolla reddish-violet, changing to bluish. To follow *L. palústris*, Lin. p. 334. no. 30. of the present volume.

Altaian Lathyrus. Fl. May, June. Pl. cl.

86 O'ROBUS SUBVILLÒSUS (Led. fl. ross. alt. ill. t. 483. fl. alt.

3. p. 359.) plant clothed with hoary pubescence; root fibrous; stem branched at the base; leaflets 5-9, oblong-linear, mucronate, somewhat attenuated at the base; stipulas lunately-sagittate, profoundly cut; peduncles axillary, 2-3-flowered, twice the length of the leaves; calycine teeth broad-lanceolate; upper one shortest. ♃. H. Native of Altaia, in salt fields at the river Kurtschum. Flowers with a reddish vexillum, yellowish wings, and the keel tipped with blue. To follow *O. lácteus*, Bieb. p. 339. no. 14.

Rather-villous Bitter-vetch. Fl. April, May. Pl. 1 foot.

87 O'robus interme'dius (Led. fl. ross. alt. ill. t. 484.) plant sparingly pilose; stem simple; leaves with 4 pairs of narrow, oblong, apiculated, nerved leaflets; stipulas semi-sagittate or hastate, toothed at the base or entire, much shorter than the leaflets; peduncles axillary, 4-8-flowered, longer than the leaves; calycine teeth equal in length to the tube, upper ones the shortest. ♃. H. Native of Altaia, about the metal mines of Nicolajewsk. Intermediate between *O. lácteus* and *O. lùteus*. Flowers pale yellow or cream-coloured.

Intermediate Bitter-vetch. Fl. May, June. Pl. 1 to 1½ foot.

Tribe V. *Phaseòleæ*, *p.* 341.

88 Canava'lia pube'scens (Gaud. ex Hook. in Beech. voy. part. bot. p. 81.) stem twining; branches and petioles pubescent; leaflets ovate, elliptic, ending in a very short acumen, rather oblique at the base, membranous, glabrous above, but pubescent beneath; peduncles axillary, 3-flowered. ♃. ⌒. S. Native of the Sandwich Islands. Nearly allied to *Dólichos galeàtus*, Gaud. p. 357. no. 4. of the present volume, which is also a species of *Canavàlia*. To follow *C. rútilans*, p. 363. no. 7.

Pubescent Canavalia. Shrub tw.

89 Mucu'na angui'na (Wall. pl. rar. asiat. 3. p. 19. t. 236.) flowers cymose, dense; legumes roundish, transversely wrinkled, hispid, 1-seeded; leaflets glabrous above. ♄. ⌒. S. Native of Chittagong. Flowers large, dark purple, fetid.

Snake-stemmed Cow-itch. Fl. Nov. Shrub tw.

90 Lupi'nus mi'nimus (Dougl. mss. Hook, fl. bor. amer. p. 168.) plant small, herbaceous, and densely clothed with silky hairs; stem furnished with 1-2 leaves; leaflets 7-9, lanceolate, acute, tapering to the base; flowers alternate and verticillate; pedicels bractless; upper lip of calyx bifid at the apex, lower one entire; root small, rather fusiform. ☉. H. Native of North-west America, in mountain valleys near the Kettle Falls, and very abundant towards the Rocky Mountains along the Columbia. To follow *L. micránthus*, Dougl. p. 366. no 15. of the present volume.

Small Lupine. Pl. ¼ foot.

Tribe VI. *Dalbergièæ*, *p.* 373.

91 Ponga'mia elli'ptica (Wall. pl. rar. asiat. 3. p. 20. t. 237.) leaves impari-pinnate, with 3-5 pairs of cuneate-oblong, pubescent leaflets; branchlets, peduncles, and calyxes clothed with ferruginous villi; racemes in fascicles; legumes elliptic-lanceolate. ♄. ⌒. S. Native of Amboyna. Galedùpa ellíptica, Roxb. hort. beng. p. 53. Flowers rose-coloured.

Elliptic Pongamia. Shrub tw.

Tribe VIII. *Mimòseæ*, *p.* 381.

92 I'nga spinifòlia (Hamilt. prod. p. 61.) stem and branches prickly; leaves bipinnate, with 6 pairs of pinnæ, each pinna bearing 3 pairs of ovate-oblique, reticulated, pubescent leaflets, ending each in a spine-like mucrone; legumes twisted, pubescent. ♄. S. Native of the West Indies. Desv. journ. bot. vol. 3. This species should follow *I. Márthæ*, Spreng. p. 395. no. 126.

Spine-leaved Inga. Tree.

93 Aca'cia stenosta'chya (Desv. herb. Hamilt. prod. p. 59.) unarmed; branches angular, brownish, glabrous; leaves with about 10 pairs of pinnæ, each pinna bearing about 20 pairs of linear-rhomboid, rather coriaceous, shining leaflets; rachis complanate, sulcate, pubescent; spikes twin, axillary, filiform, on very long peduncles, cylindrical, loose-flowered; flowers minute. ♄. S. Native of Guiana. This species should follow *A. Guianénsis*, Willd. p. 410. no. 135. of the present volume.

Slender-spiked Acacia. Tree.

94 Aca'cia Hamiltònii (Desv. herb. Hamilt. prod. p. 59.) unarmed; young branches pubescent; leaves with 5 pairs of pinnæ, each pinna bearing many pairs of rather remote, linear, obtuse, ciliated leaflets; peduncles elongated, and are as well as the rachis pilose; spikes subglobose. ♄. S. Native of Jamaica. To follow *A. formòsa*, Kunth, p. 417. no. 223.

Hamilton's Acacia. Tree.

95 Aca'cia linea'ris (Desv. herb. Hamilt. prod. p. 59.) unarmed, shrubby; branches nodose, striated, pubescent at the apex; bracteas rather hardened, permanent; leaves with usually 5 pairs of pinnæ, each pinna bearing about 20 pairs of narrow, linear, crowded, rather ciliated leaflets; peduncles terminal, elongated, fastigiate; spikes subglobose. ♄. S. Native of Jamaica. This plant should follow the last species.

Linear-leafletted Acacia. Shrub.

96 Aca'cia microca'ntha (Desv. herb. Hamilt. prod. p. 60.) stem armed, arborescent; branches pubescent; leaves with usually 10 pairs of pinnæ, each pinna bearing many pairs of minute pubescent leaflets; spikes stipitate, globose, axillary, solitary, on short peduncles, nodding; bracteas rather spinescent. ♄. S. Native of Guiana. This species should follow *A. álbicans*, Kunth, p. 414. no. 185. of the present volume.

Small-spined Acacia. Tree.

97 Aca'cia a'lbida (Lindl. bot. reg. 1317.) spines twin, short; branches, petioles, and peduncles pubescent; leaves with 5-7 pairs of pinnæ, each pinna bearing 8-10 pairs of linear, acute leaflets; heads of flowers pedunculate, twin, axillary. ♄. G. Native of Peru. Flowers yellow. This species should follow *A. álbicans*, Kunth, p. 414. no. 185. of the present volume.

Whitish Acacia. Fl. Oct. Clt.? Shrub.

98 Aca'cia selenoca'rpa (Desv. herb. Hamilt. prod. 2. p. 60.) stem armed; branches whitish, glabrous, spiny; spines scattered; leaves with usually 6 pairs of pinnæ, each pinna bearing about 15 pairs of linear-rhomboid, quite glabrous, glaucescent leaflets; spikes globose, twin, loose-flowered, pedunculate; legumes short, lunate ♄. S. Native of Guiana. This species should follow *A. macrocántha*, Kunth, p. 415. no. 192.

Moon-podded Acacia. Tree.

Tribe X. *Cassièæ*, *p.* 427.

99 Humbòldtia Brunònis (Wall. pl. rar. asiat. 3. p. 17. t. 233.) leaves with 2 pairs of leaflets; hind lobes of stipulas nearly equal-sided, rounded at both extremities; branches equal. ♄. ◡. S. Native of the mountains of Malabar and the peninsula of India. A climbing shrub, with deep orange-coloured flowers.

Brown's Humboldtia. Shrub cl.

Order LXXIX. CHRYSOBALA'NEÆ (shrubs and trees agreeing with *Chrysobálanus* in important characters). R. Br. Congo. p. 14.—Rosàceæ, Tribe I. Chrysobalàneæ, D. C. prod. 2. p. 525.

Flowers more or less irregular (f. 59. *a.* f. 60. *a.* f. 61. *b.*). Sepals 5, joined together into a 5-lobed calyx (f. 59. *a.* f. 60. *a.* f. 61. *a.*), permanent. Petals equal in number to the lobes of the calyx (f. 60. *b.* f. 61. *b.*), and inserted in it, imbricate in æstivation. Stamens inserted in the calyx (f. 60. *c.*) along with the petals, few (f. 61. *c.*) or numerous (f. 59. *c.* f. 60. *d.*), having the filaments incurved when the flower is in æstivation. Anthers 2-celled, bursting by a double chink. Ovary 1 (f. 61. *e.*), free, having the style proceeding from its base (f. 61. *d.*), and containing 2 erect ovula (f. 61. *e.*). The pedicel of the ovary closely cohering to the calyx. Style simple, crowned by a more or less dilated stigma. Seed usually solitary from abortion, exalbuminous in all except *Hirtélla*, in which it is fleshy and the cotyledons foliaceous; in the rest of the genera the cotyledons are fleshy and thick.—This order is composed of trees and shrubs, natives within the tropics, with simple, entire, feather-nerved, glandless, petiolate leaves, and axillary and terminal racemes or panicles of small flowers. The fruit of the greater part of the plants are eatable, though by no means very palatable, being extremely dry and farinaceous: they generally go under the name of plums in the places of their natural growth. The principal distinguishing characters in the fructification of *Chrysobalàneæ* are the style proceeding from the base of the ovarium (f. 61. *d.*), the ovula (which in *Amygdalàceæ* are 2 in number), as well as in the embryo being erect (f. 61. *e.*). The greater part of the *Chrysobalàneæ* have their flowers more or less irregular, this irregularity consisting in the cohesion of the stipe of the ovary with one side of the calyx, and a greater number or greater perfection of stamina, on the same side of the flower.

Synopsis of the genera.

1 **Chrysoba'lanus.** Calyx campanulate, 5-cleft (f. 59. *a.*). Petals 5, unguiculate. Stamens about 20 (f. 59. *c.*) inserted on one side. Drupe plum-formed (f. 59. *d.*), containing an ovate, 5-furrowed, 1-seeded patamen.

2 **Moqui'lea.** Calyx turbinate, acutely 5-toothed. Petals 5, orbicular. Stamens about 40, inserted in the calyx beneath the petals. Ovary hairy. Drupe woody.

3 **Coue'pia.** Calyx tubular, obtusely 5-lobed. Petals 5, nearly orbicular. Stamens about 20, inserted in the top of the calycine tube. Drupe egg-shaped, dry, covered with a thick, fibry, coriaceous rind. Seed 1, inclosed in a fragile testa.

4 **Acio'a.** Calyx tubular, bluntly 5-lobed. Petals 5, oblong, unequal. Stamens 10-12, projecting on one side of the flower, with the filaments joined to the middle. Drupe ovate, coriaceous, containing a 1-celled, 1-seeded nut.

5 **Parina'rium.** Calyx urceolate, 5-cleft. Petals 5. Stamens 15. Ovary villous. Drupe ovate, thick, farinaceous, containing a hard, wrinkled, rough, 2-celled, 2-seeded nut. Seeds clothed with wool.

6 **Grange'ria.** Calyx bluntly 5-cleft (f. 60. *a.*). Petals 5 (f. 60. *b.*), soon falling off. Stamens 15 (f. 60. *d.*), unequal. Ovary woolly. Drupe olive-formed, rather triquetrous (f. 60. *e.*), containing a bony, triquetrous, 1-seeded nut.

7 **Linca'nia.** Calyx bibracteolate on the outside, 5-cleft. Petals wanting. Stamens 5-10, when 5 they are opposite the calycine lobes. Drupe olive-formed, fleshy, containing a 1-seeded nut.

8 **Thely'ra.** Calyx campanulate, ending in a tube, which is adnate to the peduncle, as in *Pelargònium*. Petals 5. Stamens 10, the 6 on one side fertile, the 4 on the other side sterile and tooth-formed. Ovary 2-ovulate. Berry? wrinkled, villous inside, 1-seeded.

9 **Hirte'lla.** Calyx obtusely 5-lobed (f. 61. *a.*). Petals 5, small, deciduous (f. 61. *b.*). Stamens 3-15 (f. 61. *c.*). Drupe furrowed (f. 61. *c.*), containing a 1-celled nut. Albumen fleshy. Cotyledons foliaceous.

† *Genera apparently belonging to the present order.*

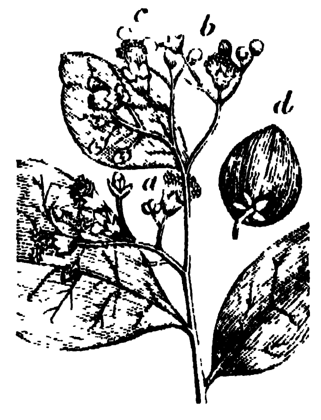
10 **Leuco'stomon.** Calyx 5-parted; lobes acute, coloured, deciduous, with the lower one permanent, glandular, and staminiferous above. Petals wanting. Stamens about 20, inserted in a calycine disk. Ovary free, ovate, pubescent, 5-furrowed, ending in a filiform style. Fruit unknown.

11 **Trilepi'sium.** Calyx 5-lobed, free from the ovary. Petals wanting. Stamens numerous, inserted in the tube of the calyx, and disposed in many series. Tube terminated by 3 ligulæ between the stamens and pistil. Ovary 1-seeded. Style bifid at the apex, crowned by a tomentose stigma.

I. CHRYSOBA'LANUS (from χρυσος, *chrysos*, gold, and βαλανος, *balanos*, an acorn; in reference to the yellow fruit of some of the species). Lin. gen. 621. Lam. ill. t. 428. D. C. prod. 2. p. 525.—Icàco, Plum. gen. 43. t. 5.

Lin. syst. *Icosándria, Monogýnia.* Calyx campanulate, 5-cleft. Petals 5, unguiculate. Stamens about 20, nearly equal in length, disposed in one series. Drupe fleshy, plum-formed, containing an ovate, 5-furrowed, 1-seeded nut.—Trees with simple leaves, and racemes or panicles of insignificant flowers, Fruit of all edible.

FIG. 59.



1 C. **Ica'co** (Lin. spec. 513.) leaves nearly orbicular, or obovate, emarginate; racemes axillary, dichotomous; stamens hairy. ♄. S. Native of South America and the West Indies, by the sea-side, as well as of the southern parts of North America. Jacq. amer. 154. t. 94. Plum. ed. Burm. t. 158.—Catesb. car. 1. t. 25. Panicles axillary, dichotomous. Flowers white. Fruit about the size of a plum, ovate-roundish, varying much in colour, white, yellow, red, but most commonly purple, and usually covered with a kind of bloom; the skin is thin, and the pulp white, adhering firmly to the stone, the taste sweet, with some austerity, but not unpleasant, and is eaten both raw and preserved. The fruit is called *Icaco* or *Cocoa plum*, and is sold in the markets in the West Indies, under these names.

Var. β, pellocárpus (Meyer, prim. esseq. 193.) leaves roundish-ovate or obovate; fruit oval, brown. ♄. S. Native of Guiana. C. purpùreus, Mill. dict. no. 2. Brown. jam. 250. t. 17. f. 5. Perhaps a proper species.

Icaco or Common Cocoa-plum. Clt. 1752. Sh. 3 to 6 feet.

2 C. **elli'pticus** (Smeathm. herb. Hort. trans. 5. p. 453.) leaves elliptic, obtuse, or acute, never emarginate; racemes axillary, dichotomous; stamens hairy. ♄. S. Native of Sierra Leone, on the sea-side. Racemes sometimes disposed in a bracteolate panicle. Fruit the size of a damson plum, with a black thin skin, and the flesh like that of the last species. The fruit is eatable.

Elliptic-leaved Cocoa-plum. Fl. Feb. Mar. Sh. 8 to 10 ft.

3 C. oblongifòlius (Mich. fl. bor. amer. 1. p. 285.) leaves oblong or oblanceolate, a little crenulated; panicles terminal; stamens glabrous. ♄. S. Native of Georgia, in sandy pine forests. Nutt. gen. amer. 1. p. 301. Fruit olive-formed, nearly dry. Leaves sometimes tomentose beneath.

Oblong-leaved Cocoa-plum. Fl. May, Ju. Clt. 1812. Sh. 1 ft.

4 C. ovalifòlius (Schott, in Spreng. syst. append. p. 406.) leaves coriaceous, rather cordate, elliptic, obtusely pointed, clothed with silvery tomentum beneath; flowers hermaphrodite; stamens glabrous. ♄. S. Native of Brazil.

Oval-leaved Cocoa-plum. Shrub.

5 C. macrophy'llus (Schott, l. c. p. 407.) leaves cordate, oblong, obtuse, elongated, coriaceous, shining above, but clothed with white tomentum beneath, having the veins parallel and prominent; flowers hermaphrodite. ♄. S. Native of Brazil. In this and the preceding species 7 of the stamens are wanting or sterile.

Long-leaved Cocoa-plum. Shrub.

Cult. Sandy loam is the best soil for the species of *Cocoa-plum*. Large cuttings, taken off at a joint, without shortening any of their leaves, and planted thinly in a pot filled with sand, with a bell-glass placed over them, in a moist heat, will strike root readily. The best way of increasing the plants is by seeds, when they can be procured.

II. MOQUI'LEA (meaning not explained by the author). Aubl. guian. 1. p. 521. t. 208. D. C. prod. 2. p. 526.

Lin. syst. *Icosándria, Monogýnia.* Calyx tubular or urceolate, acutely 5-parted or 5-toothed. Petals 5, rather unequal, roundish. Stamens about 40, longer than the petals, inserted in the tube of the calyx beneath the petals, distinct or polyadelphous at the base. Ovary hairy. Style lateral, filiform, hairy below. Stigma obtuse. Drupe woody, egg-shaped, with a chinky bark, 1-seeded. Seed amygdalaceous. Trees with simple leaves and axillary and terminal racemes of white flowers.

1 M. Guiane'nsis (Aubl. l. c.) leaves oval, acuminated, quite entire, glabrous; racemes loosely panicled. ♄. S. Native of Guiana, in woods. Stamens about 40, free.

Guiana Moquilea. Tree 30 feet.

2 M. Canome'nsis (Mart. fl. bras. 2. p. 79. t. 166.) young branches, under side of the leaves, buds, and racemes beset with rusty hairs; leaves oblong, acute; berry globose; stamens in 5 bundles, rising from an incomplete orb in the top of the tube of the calyx. ♄. S. Native of Brazil. Hirtélla Canoménsis, Spreng. syst. append. p. 407. Flowers white.

Canom Moquilea. Tree 20 to 30 feet.

Cult. For culture and propagation see *Chrysobálanus.*

III. COUE'PIA (*Coupi* is the name of the tree in Guiana). Aubl. guian. 1. p. 521. t. 207. D. C. prod. 2. p. 526.

Lin. syst. *Icosándria, Monogýnia.* Calyx tubular, bluntly 5-lobed at the apex. Petals 5, nearly orbicular, length of calyx. Stamens about 20, nearly equal, inserted in the top of the calycine tube; filaments distinct. Ovary somewhat stipitate. Drupe egg-shaped, with a dry, thick, coriaceous, fibrous rind. Seed 1, large, inclosed in a thin testa.—Trees with oval, entire, feather-nerved leaves. Flowers few, nearly terminal.

1 C. Guiane'nsis (Aubl. l. c.) leaves with undulated margins; tube of calyx obconical, with rounded lobes. ♄. S. Native of Guiana. A'cia amàra, Willd. spec. 3. p. 717. Petiole clothed with rufous hairs. Flowers small, white. Seed bitter. In Guiana the natives strip the bark from the tree and use it in baking their earthenware.

Guiana Couepia. Tree 60 feet.

2 C. Pari'llo (D. C. prod. 2. p. 526.) leaves flat; tube of calyx cylindrical, with oval-oblong, acuminated lobes. ♄. S. Native of Guiana, where it is called *Parillo.* Flowers small, white.

Parillo Couepia. Tree 20 to 30 feet.

Cult. For culture and propagation see *Chrysobálanus.*

IV. ACIO'A (*Acioua* is the Guiana name of the tree). Aubl. guian. 2. p. 690. D. C. prod. 2. p. 526.—Dulàcia, Neck. elem. no. 1236.

Lin. syst. *Monadélphia, Decándria.* Calyx tubular, bluntly and unequally lobed at the apex. Petals 5, oblong, obtuse, unequal. Stamens 10-12, projecting only on one side of the flower; filaments joined to the middle into a flat ligula, but free at the apex. Ovary or stipe of ovary adnate to the calyx at the base. Drupe ovate, coriaceous, chinky at maturity, containing a 1-celled, 1-seeded nut. Seed large, with a brittle testa.—A tree, with oval, acute, entire leaves, caducous stipulas, and terminal corymbs of violaceous flowers.

1 A. Guiane'nsis (Aubl. l. c.). ♄. S. Native of Guiana, in woods. A'cia dúlcis, Willd. spec. 3. p. 717. Petioles glabrous. Seed eatable. Hardly distinct from *Couèpia.* It is sometimes called *Coupi* by the inhabitants of Guiana. The fruit contains a sweet oil like that of the almond.

Guiana Acioa. Tree 60 feet.

Cult. For culture and propagation see *Chrysobálanus.*

V. PARINA'RIUM (*Parinari* is the name of *P. montànum* in Guiana). Juss. gen. 341. Lam. ill. t. 429. D. C. prod. 2. p. 526.—Parinàri, Aubl. guian. 1. p. 514.—Dugórtia, Neck. elem. no. 797.—Petrocárya, Schreb. gen. no. 629.

Lin. syst. *Icosándria, Monogýnia.* Calyx urceolate, 5-cleft. Petals 5. Stamens about 15, commonly 3 to each petal. Ovary villous, with the stipe adhering to the calyx. Style filiform, glabrous. Drupe ovate, thick, containing a 2-celled, 2-seeded, hard nut, which is rough on the outside. Seeds covered with wool.—Trees with villous branches, and with the leaves glabrous above, but white from pubescence beneath. Flowers small, white, disposed in panicles, corymbs, or racemes. Pulp of fruit eatable, and sometimes the kernel of the nut.

Sect. I. Petroca'rya (from πετρα, *petra*, a stone; and καρυα, *karya*, a nut; in reference to the hard nut contained in the fruit). D. C. prod. 2. p. 527. Flowers disposed in corymbose branched racemes. Stamens 7-8, sterile in one side, and 7 or 8 fertile at the opposite side.—Species native of Guinea.

1 P. monta'num (Aubl. guian. 1. p. 514. t. 204 and 205.) leaves ovate, acuminated, clothed with white down beneath. ♄. S. Native of French Guiana, in woods. Petrocárya montàna, Willd. spec. 2. p. 287.—Petrocárya Brasiliénsis, Schott. The drupe is large, ovate, smooth, and fulvous, has a thick acid rind, and the nut or kernel of the tubercular putamen is sweet and edible.

Mountain Parinarium. Tree 60 to 80 feet.

2 P. campe'stre (Aubl. l. c. p. 516. t. 206.) leaves cordate, acuminated, clothed with white down beneath. ♄. S. Native of French Guiana, in woods. Drupe small, oval, yellow; putamen less echinated than in most of the species, and containing only one single, edible seed. Stipulas broad, many nerved.

Field Parinarium. Clt. 1824. Tree 30 to 40 feet.

Sect. II. Neoca'rya (*Neou*, the Senegal name of *P. Senegalénsis*, and καρυον, *karyon*, a nut; which signifies *Neou-nut*). D. C. prod. 2. p. 527. Flowers disposed in axillary and terminal panicled racemes. Stamens all fertile, disposed in one series, some of them rather concrete at the base.—Species native of Guinea.

3 P. Senegale'nsis (Perr. in litt. D. C. prod. 2. p. 527.) leaves oval, obtuse at both ends, clothed with white down be-

neath. ♄. S. Native of Senegal, where it is called *Neou*. It is therefore referrible to the *Neou Adansònii*, Juss. gen. p. 342. Racemes subspicate, hairy. Calyx ventricose on one side. Fruit unknown.

Senegal Parinarium. Tree 40 to 50 feet.

4 P. exce'lsum (Hort. trans. 5. p. 451.) leaves oblong, coriaceous, deep green above, but clothed with white pubescence beneath; racemes panicled. ♄. S. Native of Sierra Leone, where the fruit is brought to the market at Freetown, under the name of *Rough-skinned* or *Grey plum*. They are eaten by the inhabitants. It is about the size of *Imperatrice plum*, with a coarse skin of a greyish colour; the pulp is dry and farinaceous, and owing to the size of the stone is small in bulk. The negroes are very fond of the fruit. Perhaps *Mampàta Senegalénsium* of Adanson mentioned by Jussieu, in gen. pl. 342. is referrible to this species.

Tall Parinarium. Fl. Feb. Clt. 1822. Tree 50 to 60 feet.

5 P. macrophy'llum (Hort. trans. 5. p. 452.) leaves large, ovate, sessile, and cordate, green above and downy beneath; stems thickly beset with brown hairs; racemes terminal; fruit oblong, twice the size of those of the preceding species. ♄. S. Native of Sierra Leone, by the sea-side about Cape Shilling, where the fruit is called *Gingerbread-plum* by the natives, who eat its pulp; it has much the flavour and appearance of that of the preceding.

Large-leaved Parinarium. Fl. Feb. Mar. Clt. 1822. Shrub 2 to 3 feet.

Cult. For culture and propagation see *Chrysobálanus*, p. 478.

VI. GRANGE'RIA (in honour of N. Granger, a traveller in Egypt and Persia). Comm. in Juss. gen. 349. Lam. ill. t. 427. D. C. prod. 2. p. 527.

Lin. syst. *Icosándria, Monogýnia.* Calyx bluntly 5-cleft (f. 60. *a.*). Petals 5 (f. 60. *b.*), soon falling off. Stamens 15, rather unequal. Ovary woolly (f. 60. *c.*). Style lateral (f. 60. *d.*), filiform, glabrous. Drupe olive-formed, rather triquetrous (f. 60. *e.*), containing a triquetrous, 1-seeded, bony nut. Cotyledons thick and fleshy.—A tree, with stipulaceous, ovate, entire, glabrous leaves, and spicate racemes of white flowers.

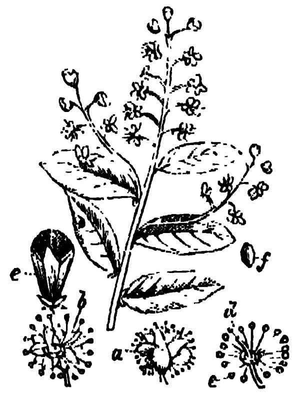
1 G. Borbónica (Lam. dict. 3. p. 21.) ♄. S. Native of the island of Bourbon. Drupe blood-coloured when young. C. buxifòlia, Smith in Rees' cycl. 16. no. 1. (f. 60.)

Bourbon Grangeria. Clt. 1823. Tree 40 to 50 feet.

Cult. For culture and propagation see *Chrysobálanus*; p. 478.

VII. LINCA'NIA (an anagram of Caligni, the Guiana name of the first species). Aubl. guian. 1. p. 119. t. 45. Lam. ill. t. 122. D. C. prod. 2. p. 527.—Hedýcrea, Schreb. gen. no. 409. Rœm. et Schult. syst. 1. p. 345. mant. 252.

FIG. 60.



Lin. syst. *Pentándria, Monogýnia.* Calyx bibracteolate on the outside, with a 5-cleft limb. Petals wanting. Stamens 5-10, opposite the calycine lobes, or only 3 from abortion. Ovary 1, in the bottom of the calyx. Style incurved, lateral? Drupe olive-formed, fleshy, containing a 1-seeded nut. Seed thick.—Small trees, with oblong acuminated leaves, which are hoary beneath, and terminal spicate racemes of small white flowers.

1 L. inca'na (Aubl. l. c.) stamens 5; style incurved; flowers in terminal spikes. ♄. S. Native of Guiana. Hedýcrea incàna, Willd. spec. 1. p. 1210. Vahl. enum. 2. p. 37.

Hairy Lincania. Shrub 4 to 5 feet.

2 L. hu'milis (Cham. in Linnæa. 2. p. 549.) stamens 10, exserted; style pilose; spikes nearly simple. ♄. S. Native of Brazil.

Dwarf Lincania. Shrub.

3 L. Turiu'va (Cham. l. c. p. 550.) stamens 10, exserted; style smooth; spikes branched. ♄. S. Native of Para, in Brazil. Hirtella Octándra, Willd. rel. in Rœm. et Schultes, syst. 5. p. 274.

Turiuva Lincania. Shrub.

Cult. For culture and propagation see *Chrysobálanus*, p. 478.

VIII. THELY'RA (meaning unknown). Pet. Th. gen. mad. no. 72. D. C. prod. 2. p. 527.

Lin. syst. *Decándria, Monogýnia.* Calyx campanulate at the base, ending in a small tube, which is adnate to the peduncle, as in *Pelargònium*. Petals 5. Stamens 10; the 6 on one side fertile, but the 4 on the other side are sterile and tooth-formed. Anthers fixed by the back, and bursting at the sides. Style lateral. Ovary 2-ovulate. Drupe? wrinkled, villous inside. Seed one, thick, exalbuminous. Cotyledons thick, unequal, plicate, the one involving the other. Radicle inferior.—Trees, natives of Madagascar, furnished with glandular bracteas.

1 T. Madagascarie'nsis. ♄. S. Native of Madagascar. None of the species are described.

Madagascar Thelyra. Tree.

Cult. For culture and propagation see *Chrysobálanus*, p. 478.

IX. HIRTE'LLA (a diminutive of *hirtus*, having been so named from the hairyness of the branches). Lin. gen. no. 86. Lam. ill. t. 138. D. C. prod. 2. p. 528.—Caùsea, Scop.—Cosmibuèna, Ruiz et Pav. fl. per. prod.

Lin. syst. *Tri-Icosándria, Monogýnia.* Calyx bluntly 5-lobed (f. 61. *a.*), usually reflexed at length. Petals 5, small (f. 61. *b.*), deciduous. Stamens 3-15 (f. 61. *c.*), many of which are abortive; filaments long, circinnately twisted inwards before the flowers expand. Style rising from the base of the ovary (f. 61. *d.*), opposite the stamens. Drupe furrowed (f. 61. *e.*), 1-celled. Seed stipitate, erect, with fleshy albumen, and a straight embryo, and leafy cotyledons (Gærtn. fruct. 3. p. 40. t. 185.)—American shrubs, with entire stipulaceous leaves, and axillary and terminal simple or compound racemes of flowers.

1 H. tria'ndra (Swartz, fl. ind. occid. 1. p. 508.) flowers triandrous; petals ovate; racemes compound, loose, terminal; rachis pubescent; leaves oblong, acuminated, glabrous. ♄. S. Native of the West Indies and New Spain, in woods. H. Americàna, Jacq. amer. p. 8. t. 8. H. paniculàta, Lam. dict. 3. p. 33. Flowers white.

Triandrous Hirtella. Clt. 1810. Tree 20 feet.

2 H. Cosmibue'na (Lam. ill. 2. p. 114.) flowers triandrous; petals emarginate; racemes compound, pubescent, axillary, and terminal; leaves oblong, acuminated, pubescent beneath. ♄. S. Native of Peru, in woods. Cosmibuèna, Ruiz et Pav. fl. per. prod. p. 10. t. 2. H. Peruviàna, Pers. ench. 1. p. 250. H. racemòsa, Ruiz et Pav. fl. per. 3. t. 227. f. B. Petals lilac.

Cosmibuen's Hirtella. Shrub 5 to 6 feet.

3 H. mollícoma (H. B. et Kunth, nov. gen. amer. 7. p. 263.) flowers triandrous; petals roundish-elliptic; panicles terminal and axillary, usually solitary, elongated, and pilose; leaves oblong, acuminated, somewhat coriaceous, acute at the base, glabrous above, and shining, but beset with soft fuscous pili beneath. ♄. S. Native of New Spain, near El Espinal at the river Magdalena. Flowers white.

Soft-haired Hirtella. Tree 20 feet.

4 H. PE'NDULA (Sol. ex Lam. dict. 3. p. 134.) flowers tetrandrous and pentandrous; racemes compound, loose, elongated, pubescent; leaves oblong-lanceolate, acuminated, cordate at the base, and rather scabrous beneath. ♄. S. Native of South America. Smith in Rees' cycl. 19. no. 3. Flowers white.

Pendulous-branched Hirtella. Shrub.

5 H. CASTA'NEA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 528.) flowers triandrous; petals ovate, length of the calyx; racemes terminal, and are, as well as the branches, very hairy; leaves hairy, oblong-lanceolate, rather cordate at the base, acuminated at the apex. ♄. S. Native of New Spain. Petals of a dirty whitish red colour. Stamens hardly twice the length of the petals.

Chestnut-coloured-flowered Hirtella. Shrub or tree.

6 H. RUGÒSA (Pers. ench. 1. p. 250.) flowers triandrous; petals oblong, longer than the calyx; racemes terminal, and are, as well as the branches, very hairy; leaves ovate-lanceolate, acuminated, shining above, reticulated beneath, and pilose on the nerves. ♄. S. Native of Porto-Rico and St. Thomas. H. Portoricénsis, Willd. rel. in Rœm. et Schultes, syst. 5. p. 274. Flowers white.

Wrinkled Hirtella. Shrub.

7 H. HIRSU'TA (Lam. ill. no. 2754.) flowers tetrandrous or pentandrous; racemes aggregate, compound, axillary, and terminal, and are, as well as the branches, hairy; leaves oval, acute, pilose on the nerves beneath. ♄. S. Native of Cayenne. H. paniculàta, Vahl. symb. 2. p. 13. t. 31. H. aggregàta, Poir. suppl. 2. p. 53. Stamens constantly 6 according to Meyer, nov. act. bonn. 12. p. 802.

Hairy Hirtella. Shrub or tree.

8 H. GLANDULÒSA (Spreng. anl. t. 7. f. 1-4. neuw entd. 1. p. 303.) flowers pentandrous; calyx and pedicels beset with stipitate glands; racemes compound, terminal; leaves ovate-oblong, acutish; the nerves beset with yellow hairs. ♄. S. Native of Brazil.

Glandular Hirtella. Shrub or tree.

9 H. CORYMBÒSA (Cham. in Linnæa. 9. p. 545.) flowers triandrous; corymbs compound, terminal, pubescent; leaves coriaceous, rather cordate, glabrous on both surfaces. ♄. S. Native of Brazil.

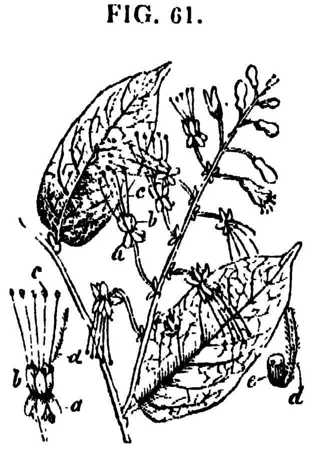
Corymbose-flowered Hirtella. Shrub.

10 H. FLORIBU'NDA (Cham. in Linnæa. 2. p. 548.) flowers octandrous or enneandrous; racemes simple, terminal, and axillary, very hairy; leaves lanceolate-elliptic, coriaceous, glabrous above, except on the nerves, but hairy beneath. ♄. S. Native of Brazil.

Bundle-flowered Hirtella. Shrub or tree.

11 H. RACEMÒSA (Lam. dict. 3. p. 133.) flowers pentandrous; calyx glandless; racemes simple, axillary, solitary; rachis and branchlets villous; leaves oblong, acuminated, glabrous above, but rather pilose or glabrous on the nerves beneath. ♄. S. Native of Guiana and Cayenne. H. Americàna, Aubl. guian. 1. p. 247. t. 98. Flowers purplish. (f. 61.)

FIG. 61.



Racemose-flowered Hirtella. Clt. 1782. Tree 20 to 30 feet.

12 H. OBLONGIFÒLIA (D. C. prod. 2. p. 529.) flowers pentandrous and hexandrous; calyx glandless; racemes simple, axillary, solitary, glabrous; leaves oblong, acuminated, glabrous. ♄. S. Native of New Spain. H. ròsea, Moc. et Sesse, fl. mex. icon. ined. Flowers red. Style glabrous.

Oblong-leaved Hirtella. Shrub or tree.

13 H. HEXA'NDRA (Willd. rel. in Rœm. et Schultes, syst. 5. p. 274.) flowers hexandrous; racemes tern, simple, hairy; leaves oblong, bluntish, glabrous but pubescent on the nerves beneath; petioles and peduncles pubescent. ♄. S. Native of South America, at the river Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 245. Flowers white.

Hexandrous Hirtella. Shrub.

14 H. HEBE'CLADA (Moric. ined. D. C. prod. 2. p. 529.) flowers hexandrous; racemes terminal, simple; branches, petioles, and nerves of leaves velvety; leaves oval, rather puberulous above, and rather hispid beneath. ♄. S. Native of Brazil. Raddi.

Hairy-branched Hirtella. Shrub.

15 H. TOMENTE'LLA (Schott, in Spreng. syst. append. p. 341.) flowers hexandrous and heptandrous; racemes terminal, clothed with ferruginous tomentum; leaves oblong, attenuated at both ends, glabrous above, but rather hairy beneath. ♄. S. Native of Brazil.

Tomentose Hirtella. Shrub.

16 H. ANGUSTIFÒLIA (Schott, in Spreng. syst. append. p. 341.) flowers heptandrous and octandrous; racemes simple, nodding, hairy; leaves cordate, linear-lanceolate, hairy on both surfaces. ♄. S. Native of Brazil.

Narrow-leaved Hirtella. Shrub.

17 H. APE'TALA (Meyer. in nov. act. bonn. 12. p. 803.) flowers enneandrous, apetalous; calyx spreading; leaves ovate-oblong, acuminated, glabrous; racemes compound, terminal. ♄. S. Native of Surinam.

Apetalous Hirtella. Shrub.

18 H. POLYA'NDRA (H. B. et Kunth, nov. gen. amer. 6. p. 246. t. 565.) flowers with 18-20 stamens, 5-petalled; panicles terminal, much branched, clothed with hoary tomentum; leaves oblong or obovate-oblong, ending in a short acumen, acute at the base, shining and glabrous above, but clothed with white tomentum beneath. ♄. S. Native on the shores of the Pacific ocean, near Acapulco. Flowers white.

Polyandrous Hirtella Shrub 10 to 12 feet.

† *Species not sufficiently known.*

19 H. SCA'NDENS (Willd. rel. in Rœm. et Schultes, syst. 5. p. 271.) flowers heptandrous; racemes axillary and terminal; leaves distinct, oblong, rounded at the base, acuminated at the apex, shining and glabrous; stems climbing. ♄. ⌒. S. Native of Brazil.

Climbing Hirtella. Shrub cl.

20 H. NEMORÒSA (Willd. rel. l. c.) flowers heptandrous; racemes terminal; leaves distich, oblong, rounded at the base, acuminated at the apex, shining and glabrous; stem erect. ♄. S. Native of Brazil. Petals yellow. Stamens violaceous.

Grove Hirtella. Shrub.

21 H. ACAYACE'NSIS (Moc. et Sesse, fl. mex. icon. ined. and mss. D. C. prod. 2. p. 529.) flowers octandrous, 4-petalled; racemes simple, villous, axillary; leaves obovate, acuminated, glabrous. ♄. S. Native of Mexico, on the mountains of Acayaca. Flowers purple.

Acayaca Hirtella. Shrub or tree.

22 H. DODECA'NDRA (Moc. et Sesse, l. c.) flowers with 12-15 stamens; racemes terminal, panicled; leaves oval-oblong, acute. ♄. S. Native of Mexico. Petals rose-coloured. Perhaps sufficiently distinct from *H. polyándra*.

Dodecandrous Hirtella. Shrub or tree.

23 H. NÍTIDA (Willd. rel. l. c.) flowers in terminal racemes,

pubescent; leaves oblong, acuminated, shining, narrow at the base. ♄. S. Native of Cuba.

Shining-leaved Hirtella. Shrub or tree.

Cult. For culture and propagation see *Chrysobálanus*, p. 478.

† *Genera which are doubtful whether they belong to the present order.*

X. LEUCO'STOMON (from λευκος, *leucos*, white, and στομα, *stoma*, mouth). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 639.

Lin. syst. *Icosándria, Monogýnia.* Calyx 5-parted; lobes ovate-lanceolate, acute, spreading, coloured, deciduous, the lower part permanent, and bearing a circle of glands above, and stamens. Petals wanting. Stamens about 20, inserted in the calycine disk; filaments very short; anthers long, erect, fixed by the base. Ovary free, ovate, pubescent, 5-furrowed, ending in an acute filiform style. Fruit unknown.—A shrub, with oval, entire, feather-nerved leaves. Stipulas 2, subulate. Peduncles trifid, 3-flowered. Calyx brownish-purple.

1 L. terniflòrum (Moc. et Sesse, l. c.) ♄. S. Native of Mexico.

Tern-flowered Leucostomon. Shrub.

Cult. For culture and propagation see *Chrysobálanus*, p. 478.

XI. TRILEPI'SIUM (from τρεις, *treis*, three, and λεπις, *lepis*, a scale; in reference to the 3 scales situated in the calycine tube between the stamens and pistil). Pet. Th. gen. mad. no. 74. D. C. prod. 2. p. 639.

Lin. syst. *Icosándria, Monogýnia.* Calyx thick, 5-cleft, not adhering to the ovary. Petals wanting. Stamens numerous, inserted by several series in the calyx; filaments filiform. Calycine tube terminating in 3 scales between the stamens and pistil. Ovary in the bottom of the calyx, 1-seeded. Style longer than the tube, bifid at the apex. Stigmas tomentose. Fruit unknown.—A small tree, with alternate lanceolate leaves, when young wrapped round by the stipulas, which are caducous.

1 T. Madagascarie'nsis. ♄. S. Native of Madagascar.

Madagascar Trilepisium. Tree.

Cult. For culture and propagation see *Chrysobálanus*, p. 478.

Order LXXX. AMYGDALA'CEÆ (plants agreeing in important characters with *Amýgdalus*, the almond).—Amygdàleæ, Juss. gen. 340. exclusive of some genera.—Drupàceæ, D. C. fl. fr. 4. p. 479.—Rosàceæ, tribe II. Amygdàleæ, D. C. prod. 2. p. 529.

Calyx 5-toothed (f. 62. *a.* f. 64. *a.*), deciduous, lined with a disk, the fifth lobe next the axis. Petals 5 (f. 62. *a.* f. 63. *b.*), perigynous. Stamens about 20 (f. 62. *b.* f. 63. *b.* f. 64. *a.*), inserted in the throat of the calyx, curved inwards in æstivation. Anthers innate, 1-celled, bursting lengthwise. Ovary superior, solitary, simple, 1-celled. Ovula 2, suspended. Style terminal, with a furrow on one side, terminating in a reniform stigma. Seed usually solitary, suspended. Embryo straight, with the radicle pointing towards the hylum, with thick cotyledons. Albumen none.—Trees or shrubs. Leaves simple, alternate, usually glandular towards the base. Stipulas simple, mostly glandular. Flowers white or pink.—This order is distinguished from *Rosàceæ* and *Pomàceæ* by its fruit being a drupe (f. 63. *b.* f. 64. *d.*), and by the presence of Prussic acid, from *Leguminòsæ* in the equal petals and stamens; and by the fruit.

The plants contained in this order are astringent and febrifugal, as the bark of *Cérasus Virginiàna* is prescribed in the United States, and of the *Cérasus Cápollin* in Mexico. They are, however, better known for yielding an abundance of prussic-acid, a deadly principle residing in the leaves and kernels of the fruit, in consequence of which some of the species are poisonous to cattle which feed upon them, as for example *Cérasus capricìda*, which kills the goats of Nipaul, and the *Cérasus Virginiàna*, which is known in North America to be dangerous. They all of them also yield a gum analogous to Tragacanth. Notwithstanding, however, the poisonous principle that is present in them, their fruit is in many cases a favourite food, as that of *Amýgdalus* the almond, *Armenìaca* the apricot, *Pérsica* the peach and nectarine, *Prùnus* the plum, and *Cérasus* the cherry. The principle in which they abound is the basis of laurel-water, which when taken in small doses acts either as a violent purgative or as an emetic, and in larger doses is said to destroy the irritability without exciting inflammation; these properties, however, although thus dangerous in the distilled water of the laurel and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state of nature. The leaves of *Prùnus spinòsa*, and *Cérasus àvium* have been employed as a substitute for tea. The bark of *Cérasus Cápollin* is used in Mexico against dysentery. The prunes of the shops are chiefly prepared from those sorts of plums called St. Catharine and green-gage, and in Portugal from a sort that derives its name from the village of Guimaraens, where they are principally dried. They contain so large a quantity of sugar, that brandy is distilled from them when fermented. The kernel of *Cérasus Brigantìaca* yields a fixed oil called Huil des Marmottes, which is used instead of olive or almond oil. The *Prùnus Cocomìlia* yields a bark the properties of which are spoken of very highly; according to Tenore it is a specific for the cure of the dangerous intermittent fevers of Calabria, where it grows. A variety of the *Cérasus àvium* is used for the preparation in the Vosges and the Black Forest of the liqueur known under the name of Kirschenwaesser. The kernel of *Cérasus occidentàlis* is used for flavouring the liqueur Noyeau.

Synopsis of the Genera.

1 Amy'gdalus. Drupe clothed with velvety pubescence (f. 62. *c.*), with a fibrous dry rind, separating irregularly, having the putamen pitted or smooth.

2 Pe'rsica. Drupe fleshy (f. 63. *b.*), glabrous or clothed with velvety down, having the putamen irregularly furrowed (f. 63. *c.*).

3 Armeni'aca. Drupe fleshy, clothed with velvety down, having the putamen obtuse at one end, and acute at the other, and surrounded by a furrow, the rest smooth, but never rugged.

4 Pru'nus. Drupe fleshy, quite glabrous, but covered with a kind of grey bloom, having a compressed putamen, which is acute at both ends, and slightly furrowed on the margin, the rest smooth.

5 Ce'rasus. Drupe globose (f. 64. *d.*), fleshy, quite glabrous, containing a smooth flattened putamen (f. 64. *f.*).

6 Polydóntia. Drupe kidney-shaped, dry, containing a 1-seeded nut. Calyx 6-parted.

I. AMY'GDALUS (from *αμυσσω*, *amysso*, to lacerate; in reference to the fissured shell of the putamen). Tourn. inst. t. 402. D. C. fl. fr. 4. p. 486. D. C. prod. 2. p. 530.—Amýgdalus species, Lin. mss.—Amygdalóphora, Neck. elem. no. 717.

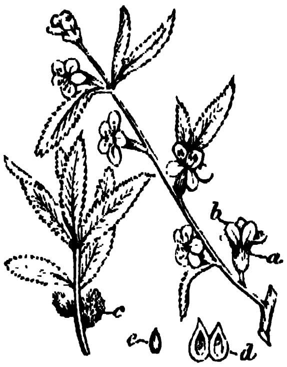
Lin. syst. *Icosándria, Monogýnia.* Drupe clothed with velvety pubescence (f. 62. c.), having a dry rind, which separates irregularly, containing a pitted or smooth putamen or nut.—Trees. Leaves conduplicate when young. Flowers nearly sessile, usually pink or rose-coloured, rising either singly or by pairs from the scaly buds earlier than the leaves. Fruit woolly.

§ 1. *Calyx cylindrically-campanulate.*

1 A. Ara'bica (Oliv. voy. t. 47.) leaves oblong-linear, obtuse, crenated; petioles short; fruit ovate-globose, solitary, ending in a short blunt acumen; putamen ovate. ♄. H. Native of Arabia. Fruit the size of a filbert.

Arabian Almond. Shrub 2 to 3 feet.

FIG. 62.



2 A. na'na (Lin. mant. 396.) leaves oblong-linear, attenuated at the base, serrated, quite glabrous; flowers solitary and rose-coloured. Fruit the form of those of *A. communis*, but much smaller. Root creeping.

Var. α, vulgàris (D. C. prod. 2. p. 530.) calycine lobes ovate, obtuse, wrinkled, shorter than the tube; style thickly clothed with tomentum, exserted. ♄. H. Native of Calmuc Tartary, very frequent on the banks of the Volga, and about Odessa. A. nàna, Pall. ross. p. 12. t. 6. Curt. bot. mag. t. 161. Mill. fig. t. 28. f. 2. Duh. arb. ed. 2. vol. 4. p. 115. t. 30.

Var. β, Geórgica (D. C. l. c.) calycine lobes lanceolate, length of the tube; style inclosed, hardly tomentose at the base. ♄. S. Native of Georgia. A. Geórgica, Desf. arbr. 2. p. 221.

Var. δ, campéstris (Ser. mss. in D. C. prod. 2. p. 530.) leaves broader; calycine lobes length of the tube; petals narrower, longer, and white; style hardly tomentose at the base. ♄. H. Native of the south of Podolia. A. campéstris, Besser. enum. p. 46. no. 1425. A. Besseriàna, Schott, in cat. hort. vind. 1818. The form of the nut is different from the other varieties according to Besser.

Dwarf Almond. Fl. March, April. Clt. 1683. Shrub 2 to 3 feet.

3 A. orienta'lis (Ait. hort. kew. ed. 1. vol. 1. p. 162. ed. 2. vol. 3. p. 195.) leaves lanceolate, quite entire, almost permanent, clothed with silvery tomentum, as well as the branches; fruit mucronate. ♄. H. Native of the Levant. A. argéntea, Lam. dict. 1. p. 103. Duham, arbr. ed. 2. vol. 3. p. 115. Flowers rose-coloured. Hardly larger than *A. nàna*.

Oriental or Silver-leaved Almond. Fl. March, April. Clt. 1756. Shrub 2 to 4 feet.

4 A. inca'na (Pall. ross. 1. p. 13. t. 7. Smith, fl. græc. t. 477.) leaves obovate, serrated, clothed with white tomentum beneath; flowers solitary; drupe compressed, pubescent. ♄. H. Native of Caucasus, and of the Levant between Smyrna and Bursa. Flowers red. Shrub spinose.

Hoary Almond. Fl. March, April. Clt. Shrub 2 feet.

§ 2. *Calyx campanulate.*

5 A. commu'nis (Lin. spec. 677.) leaves oblong-lanceolate, serrulated; flowers solitary; calyx campanulate; fruit compressed, egg-shaped, tomentose. ♄. H. Native of Mauritania, in hedges. Flowers white or rose-coloured.

Var. α, amàra (D. C. fl. fr. 4. p. 486.) style almost the length of the stamens, tomentose below; seeds bitter. Duham. ed. 2. p. 114. Flowers larger. Petals white, but rose-coloured at the base. There are varieties of this *bitter almond*, with hard and brittle shells to the nuts. 1 *Bitter almond*, with a tender shell. 2 *Bitter almond*, with a hard shell. *Amandier amer* (French).

Var. β, dúlcis (D. C. fl. fr. 4. p. 486.) leaves of a greyish green colour; flowers earlier; style much exceeding the stamens; fruit ovate, compressed, acuminated; seeds sweet; shell of putamen hard. Lam. ill. t. 430. f. 2.—Sweet almond, with a hard shell. *Amandier à petits fruits, Amandier douce.*

Var. γ, frágilis (D. C. prod. 2. p. 531.) flowers rising with the leaves; petals broader, deeply emarginate; leaves shorter; petioles thick; fruit acuminated; putamen with a fragile shell; seed sweet. A. frágilis, Hell. fl. wirceb. 1. p. 500. Flowers pale rose-coloured.—Sweet almond, with a tender shell. *Amandier des Dames.* Duham, arb. ed. 2. vol. 4. p. 113. Nois. jard. fruct. p. 7. t. 3. f. 2. Commonly called in France *Coque-molle.*

Var. δ, macrocárpa (D. C. prod. 2. p. 531.) leaves broader, acuminated, hardly cinereous; peduncles shorter, turgid; fruit larger, umbilicate at the base, but acuminated at the apex; putamen hard. Flowers whitish rose-colour, large, rising before the leaves, with broadly obcordate undulated petals.—Sweet almond, with a large fruit. *Amandier à gros fruits.* Duham. arbr. ed. 2. vol. 4. p. 112. Nois. jard. fruit. p. 7. t. 3. There are two other varieties of this. 1 Sweet-almond, with a smaller fruit and tender shell. *Amandier sultane.* 2 Sweet-almond, with a smaller fruit. *Amandier Pistache.*

Var. ε, persicoìdes (D. C. l. c) leaves almost like those of the peach; fruit ovate, obtuse, with the sarcocarp hardly succulent; putamen dark yellow; seeds sweet. Peach-almond. *Amandier pecher.* Duham. arb. ed. 2. vol. 4. p. 114. Nois. jard. fruit. p. 7. t. 3. f. 1. This variety is supposed by Duhamel to have been produced from the impregnation of the almond by the pollen of the peach.

Both the *bitter* and *sweet-almond* rise above 20 feet in height. The leaves resemble those of the peach, but the lower serratures are glandular, which has given rise to the conjecture that glandular leaved peaches have sprung more immediately from the almond than such as are without glands, as is generally the case with nectarines. Their flowers vary in colour from a fine blush to snow white. The chief distinction is in the fruit, which is flatter, with a coriaceous dry covering instead of the rich pulp of the peach and nectarine, opening spontaneously when the kernel is ripe. The *tuberes* of Pliny, Knight considers as swollen almonds, and the same with the *peach-almond*, having raised a similar variety from dusting the stigma of an almond with the pollen of a peach, which produced tolerably good fruit. (Hort. trans. 3. p. 41. t. 1.) It is mentioned by Turner in 1548, and though hardly worth cultivating in England as a fruit tree for profit, yet it is a very satisfactory thing to produce almonds of one's own growing at the dessert. The tree forms an important article in the general culture of many parts of France, Italy, and Spain. In a forward spring the blossoms often appear in February, but in this case frost generally destroys them, and they bear little or no fruit, whereas when the trees do not flower till March they seldom fail to produce fruit in abundance.

Use. The kernel of the nut is the only part used, which is tender and of a fine flavour. The sweet almonds and other varieties are brought to the dessert in a green or imperfectly ripe and also in a ripe state. They are also much used in cookery, confectionery, perfumery, and medicine. Sweet almonds used as food, Professor Martin observes, are difficult of digestion, and afford very little nourishment unless extremely well comminated.

Selection of sorts. The tender shelled is in the greatest esteem, and next the sweet and Jordan.

Propagation. The *almond* is propagated like the peach, by seed for varieties or stocks, and by budding on its own or on a plum stock for continuing varieties. Plum stocks are preferred for strong moist soils, and peach and almond stocks for dry situations.

Final planting. The trees are generally planted as standards in shrubberies, and these will sometimes in good seasons ripen their fruit, but when fruit is the object they should be trained against a west or east wall like the peach.

Mode of bearing and pruning. The *almond* tree bears chiefly on the young wood of the previous year like the apricot and peach, and in part upon small spurs on the two year old and three year old, and older branches; it is therefore pruned like these trees.

Gathering and preserving the crop. A part may be gathered when nearly ripe daily for some weeks before gathering the whole crop. This operation generally falls to be performed in September, when a part may be laid in the fruit room, and a part thoroughly dried and bedded in sand in the fruit cellar for keeping through the winter.

Medicinal properties. Almond-oil is obtained both from bitter and sweet almonds by expression. Bitter almonds have been found poisonous to dogs and smaller animals; and a distilled water from them when made of a certain degree of strength has had the same effects. The essential oil obtained by distillation is one of the most virulent poisons known. Nevertheless bitter almonds are every day used in cookery on account of their agreeable flavour. Almond-oil is supposed to blunt acrimonious humours, and to soften and relax the solids; hence its use internally in tickling coughs, pains, and inflammations, and externally in tensions and rigidity of particular parts. On triturating almonds with water, the oil and water unite together by the mediation of the albuminous matter of the kernel, and form a bland milky liquor called an emulsion, which may be given freely in inflammatory disorders. The sweet almonds alone are employed in making emulsions, as the bitter almonds impart their peculiar taste. Several unctuous and resinous substances, of themselves not mixable with water, may by trituration with almonds be easily mixed into the form of an emulsion; and are thus excellently fitted for medicinal purposes. It is a singular fact that the seeds of the bitter and sweet almonds should differ so essentially in their chemical compositions; the bitter almonds containing a deleterious principle which does not exist in the sweet almond, although found in its bark, leaves, and flowers. The existence of hydrocyanic or prussic acid, as a vegetable principle, was discovered in 1802 by Bohm in the distilled water of bitter almonds. It was also discovered in the leaves of the cherry-laurel by Schrader in the same year; in peach blossoms and leaves by Vauquelin; in cherry-water by Von Ittner, and in the bark of the bird-cherry by Jahn. In all these, and many similar substances, the acid is modified by its ultimate combination with volatile oil. Laurel-water is prepared, according to the Prussian pharmacopœia, by drawing off three pounds of distilled water from two pounds of the fresh leaves. Thomassen Von Thuessink observed it to produce immediately cheerfulness, a lower pulse, and quiet sleep. It has hitherto been chiefly recommended in melancholy with an atrabilious constitution, and in obstructions of the liver, with a viscid state of the blood. Hydrocyanic acid has recently been much used in pulmonary inflammation, asthmas, sympathetic coughs, &c. It is prepared by the apothecaries' company in London from cyanuret of mercury, hydrochloric acid, and water. Dr. Duncan, however, prefers the distilled water of bitter almonds or cherry-laurel water in these diseases, as being more manageable and less liable to decomposition. Bitter almonds consist of 100 parts of fixed oil, 54 albumen, 24 liquid sugar, 6 gum, 3 fibre, 4 pellicles, 5 water, and a little acetate acid.

Common, Sweet, and Bitter Almond. Fl. March, April. Clt. 1548. Tree 10 to 30 feet.

6 A. Cochinchine'nsis (Lour. fl. cochin. p. 316.) leaves oval, quite entire; racemes small, subterminal; calyx campanulate; fruit ovate, ventricose, acute at the apex. ♄. G. Native of Cochin-china, in woods. Corolla white. Kernel like the common almond in form and smell.

Cochin-china Almond. Tree 30 to 40 feet.

8 A. microphy'lla (H. B. et Kunth, nov. gen. amer. 6. p. 245. t. 564.) shrub much branched; leaves oblong, acute, mucronate, crenately serrated, glabrous, small; stipulas twice the length of the petioles; calycine lobes obtuse, mucronate, reflexed; stigma peltate; fruit globose. ♄. S. Native of Mexico between Pachucha and Moran on arid hills at the height of 3900 feet. Flowers small, pink.

Small-leaved Almond. Shrub 3 feet.

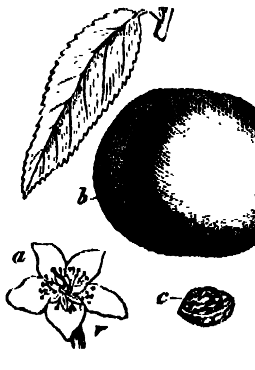
Cult. All the kinds of *almond* are very ornamental when in flower; the larger species are proper trees for the backs of large shrubberies, or to stand singly, as they make a fine appearance in spring, being in blossom before most other trees. The dwarf kinds are well fitted for small shrubberies or the fronts of large ones. All the species are increased by grafting on plum stocks, or on the bitter almond, except some of the dwarfer kinds, which may be easier increased by taking the suckers from the plants at the roots.

II. PE'RSICA (so named from the peach coming originally from Persia). Tourn. inst. t. 400. Mill. dict. D. C. fl. fr. 4. p. 487.—Amýgdalus species of Lin. and Juss.—Trichocárpus, Neck. elem. no. 718.

Lin. syst. *Icosándria, Monogýnia.* Drupe fleshy (f. 63. *b.*), with a glabrous or velvety epicarp, and having the putamen wrinkled from irregular furrows (f. 63. *c.*).—Trees. Leaves conduplicate when young. Flowers almost sessile, solitary or twin, rising from the scaly buds earlier than the leaves.

1 P. vulga'ris (Mill. dict. no. 1. D. C. fl. fr. 4. p. 487.) fruit clothed with velvety tomentum. ♄. H. Native of Persia. Amýgdalus Pérsica, Lin. spec. 677. Lam. dict. 1. p. 99. no. 1-23. and 28-42. Nois. jard. fruit. no. 1-16 and 22-35. with figures. There is a very elegant double flowered variety. The peach tree in its natural state is under the middle-size, with spreading branches, lanceolate, glabrous, serrated leaves. The flowers are sessile, with reddish calyxes, and pale or dark-red corollas; the fruit roundish, generally pointed, with a longitudinal grove; the pulp or sarcocarp large, fleshy, and succulent, white or yellowish, sometimes reddish, abounding in a grateful sweet acid juice; the stone hard, and irregularly furrowed; and the kernel bitter. The tree of quick growth, and not of long duration, blossoms in April, and ripens its fruit in August and September. Dr. Sickler considers Persia as the original country of the peach, which in Media is deemed unwholesome, but when planted in Egypt becomes pulpy, delicious, and salubrious. The peach also, according to Columella, when

FIG. 63.



first brought from Persia into the Roman empire possessed deleterious qualities, which T. A. Knight concludes to have arisen from those peaches being only swollen almonds (the *tuberes* of Pliny), or imperfect peaches, and which are known to contain the prussic acid, which operates unfavourably on many constitutions. The tree has been cultivated time immemorial in most parts of Asia; when it was introduced into Greece is uncertain; the Romans seem to have brought it direct from Persia during the reign of the emperor Claudius. It is first mentioned by Columella, and afterwards described by Pliny. The best peaches in Europe are at present grown in Italy on standards, and next may be cited those of Montreuil, near Paris, trained on lime-white walls. (Mozard sur l'Education du Pecher, &c. 1814.) In England there are but few sorts of peaches that come to tolerable perfection in the open air in ordinary seasons. The best adapted for this purpose are the *free-stones*, but all the sorts ripen well by the aid of hot-walls or glass, and may be forced so as to ripen in May and June. The tree is generally an abundant bearer; one of the *noblesse* kind is at Yokefield in Suffolk, which covers about 600 square feet of trellis under a glass case without flues, and ripens annually from 60 to 70 dozen of peaches. (Hort. trans. 3. p. 17.)

Use. The *peach* is a dessert fruit of the first order, and makes a delicious preserve. In Maryland and Virginia a brandy is made from the fruit. "The manufacture of this liquor, and the feeding of pigs, being (as Braddick observes, Hort. trans. 2. p. 205.) the principal uses to which the *peach* is applied in those countries." The leaves steeped in gin or whisky communicate a flavour resembling that of noyeau.

Criterion of a good peach. A good peach, Miller observes, possesses these qualities, the flesh is firm, the skin is thin, of a deep or bright-red colour next the sun, and yellowish green next the wall, the pulp is of a yellowish colour, full of high flavoured juice, the fleshy part thick, and the stone small.

Varieties. Linnæus divides his *Amýgdalus Pérsica* into two varieties; that with downy fruit or the *peach*, and that with smooth fruit or the *nectarine*, but in the present work the *peach* and *nectarine* have been established into a genus called *Pérsica*, and the *peach* and *nectarine* made distinct species. There are, however, various instances on record (Hort. trans. 1. p. 103.) of both fruits growing on the same tree, and even on the same branch; and one case has occurred of a single fruit partaking of the nature of both. The French consider them as one fruit, arranging them in four divisions, the *pèches* or *free-stone peaches*, the flesh of whose fruit separates readily from the stone and the skin; the *peches lisse* or *free-stone nectarines;* the *pavies* or *clingstone peaches*, whose flesh is firm, and adheres both to the stone and the skin; and the *Brugnons* or *cling-stone nectarines.* Knight (Hort. trans. 3. p. 1.), Robertson (Hort. trans. 3. p. 382.), and many other horticulturists, consider the *peach* and almond as one species. We have, however, in this work followed the established nomenclature, and treated them as distinct fruits. There are many fine varieties of the *peach*. Tusser in 1573 mentions peaches white and red; Parkinson in 1629 enumerates 21 sorts; and Miller in 1750 31 varieties. In the garden of Luxembourg at Paris are 70 varieties, and above double that number of names are to be found in the catalogues of our nurseries. Several attempts have been made to class the varieties of *peaches* and *nectarines* by the leaf and flower, as well as the fruit; the first is by M. Poiteau in the Bon Jardinier; the next by Count Lelieur in his Pomone Française; the next by John Robertson, nurseryman of Kilkenny, whose arrangement is founded on the glands of the leaves; and the fourth by George Lindley (Hort. trans. vol. 5.), also founded on the glands of the leaves; but none of these arrangements have been found sufficiently perfect for the purpose of this work.

List of the varieties of peaches.

Var. a; flesh separating from the stone, called in English *free-stones*, and in French *pèches*.

List of free-stone or melting peaches.

1 *Abricotée, abricotée à noyeau partagé, admirable jaune, grosse jaune, grosse pêche jaune tardive, d'abricot, de Burai, D'Orange, Sandalie hermaphrodite, yellow admirable.* Duham. no. 13. Leaves with reniform glands. Flowers large. Fruit large, yellow and red, ripening in the beginning or middle of October. A second-rate sort.

2 *Acton Scot.* Hort. trans. 2. t. 10. Leaves with globose glands. Flowers large. Fruit middle-sized, pale yellow, and red, ripening about the end of August. A first-rate sort.

3 *Late admirable, royal, la royale, pêche-royale, Bourdine, Boudine, Narbonne, téton de Venus, belle bausse* or *belle bauce* of some, *Judd's melting, Motteux's.* Leaves with globose glands. Flowers small. Fruit large, pale yellow and red, ripening about the end of August. This is one of the very best late peaches, and ought to be in every collection; and is very proper for a peach-house to succeed the early sorts.

4 *Early admirable, admirable, l'admirable,* (Duham. 29.) *belle de Vitry* of Bon Jardinier. Flesh white, red at the stone, ripening end of August.

5 *Yellow alberge, purple alberge, red alberge, golden mignonne, gold-fleshed, alberge-jaune* (Duham. no. 5. t. 5.), *pêche-jaune.* Leaves with globose glands. Flowers small. Fruit middle-sized, yellow and dark red; flesh yellow. Ripening about the end of August. A second-rate sort.

6 *Almond peach.* Leaves without glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening about the middle of September. A second-rate sort, raised from the almond.

7 *Ansley's colonel.* Leaves with globose glands. Flowers large. Fruit large, pale yellow and red, ripening in the middle of September. A first-rate sort, resembling the Barrington.

8 *Barrington, Buckingham mignonne.* Leaves with globose glands. Flowers large. Fruit large, pale yellow and red, ripening in the middle of September. A first-rate sort, but subject to mildew.

9 *Belle Chevreuse* (Duham. t. 13.), *Chevreuse, early Chevreuse.* Leaves with reniform glands. Fruit yellow and red. Flesh yellow, excellent. Much confusion exists with regard to this sort.

10 *Belle de Vitry* (Duham.), *late admirable, bellis, admirable tardive.*

11 *Bellegarde* (Hook. t. 8.), *galand, noire de Montreuil, violette hâtive, early galand* of some, *Brentford mignonne, French royal George* (Hook. t. 41.), *smooth-leaved royal George* of some, *French violette hâtive.* Leaves with globose glands. Flowers small. Fruit large, pale green and dark red, ripening in the beginning and middle of September. A very handsome and excellent peach, succeeds *royal George* and *grosse mignonne.*

12 *Swainson's black.* Leaves with globose glands. Flowers small. Fruit dark red, middle-sized, ripening about the beginning of September.

13 *Braddick's New York* (Hort. trans. 2. t. 13.), *Braddick's South American.* Leaves with reniform glands. Flowers small, Fruit middle-sized, pale green and red, ripening in the beginning of September. A second-rate fruit.

14 *Braddick's red.* Leaves without glands. Flowers large. Fruit large, pale green and dark red, ripening end of August, and beginning of September. A large handsome peach of good quality.

15 *Braddick's summer.* Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A second-rate sort.

16 *Cambray.* Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, resembling the *Malta.*

17 *Cardinal, le cardinal, cardinal de Furstenberg.* Leaves without glands. Flowers large. Fruit large, red, ripening in October. Flesh red, like beet-root, of little merit in this climate.

18 *Green Catharine* of the Americans. Leaves with globose glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the end of September. A worthless kind.

19 *Chancellor, chancellière* var. of Duham. *late chancellor, Noisette.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the middle of September. A first-rate sort.

20 *Yellow chevreuse.* Leaves with globose glands. Flowers small.

21 *Craavcy's.* Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red, ripening about the end of September. A second-rate sort.

22 *Double-blossomed, pêcher à fleurs doubles, pêcher nain à fleurs doubles, pêcher à fleurs semidoubles.* Leaves with reniform glands. Flowers large. Fruit small, pale yellow and red. A worthless sort as regards its fruit.

23 *Double Montagne, Montagne, Montauban.* Lang. t. 28. Leaves without glands. Flowers large. Fruit like that of the *noblesse.*

24 *Early Downton.* Leaves with globose glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening in the middle of August. A first-rate sort.

25 *Dunnington beauty.* Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the beginning of September. A first-rate sort, very like the *noblesse.*

26 *Early Anne* (Duham. t. 10.), *Anne, white avant* of some. Leaves without glands. Flowers large. Fruit middle-sized, white, and red, ripening in the beginning and middle of August. Earliness is the chief recommendation of this sort.

27 *Early red.* Leaves with globose glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening in the end of August. A second-rate sort.

28 *Flat peach* of China (Hort. trans. 4. t. 19.) *Chinese peach, Peen-to peach, Java peach.* Leaves with reniform glands. Flowers large. Fruit small, violet green and red, ripening in the beginning and middle of September, but may be forced in pots pretty early. A worthless sort.

29 *Ford's seedling.* Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. Resembles much the *noblesse.*

30 *Steward's late galande.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the middle of September. A first-rate sort, hardly differing from the *chancellor.*

31 *George the Fourth.* Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red, ripening about the middle of September. A first-rate sort.

32 *Hemskirke.* Leaves without glands. Flowers large. Fruit middle-sized, pale green and red, ripening about the end of August. A first-rate sort.

33 *Hoffmann's favourite.* Leaves with reniform glands. Flowers small. Fruit middle-sized, white and red, ripening about the beginning of September. A second-rate sort.

34 *Hoffmann's white.* Leaves with reniform glands. Flowers small. Fruit middle-sized, white and red, ripening in the beginning and middle of September. A first-rate sort.

35 *Incomparable en Beauté.* Leaves with globose glands. Flowers small. Fruit large, pale yellow greenish and red, ripening in the middle of September. A second-rate sort.

36 *White-blossomed incomparable, white-blossomed.* Leaves with reniform glands. Flowers large. Fruit large, white, ripening about the end of August. Singular on account of its white blossoms and pale fruit.

37 *Pêche D'Ispahan, De Perse.* Leaves without glands. Flowers large. Fruit small, greenish and red, ripening in the middle of September. A worthless kind.

38 *Kew seedling, Kew royal seedling.* Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and dark red, ripening in the beginning of September. A second-rate sort.

39 *Knapp castle seedling.* Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, very like the *noblesse.*

40 *Knight's early, Knight's early seedling.* Leaves with globose glands. Flowers large. Fruit middle-sized, pale green and dark red, ripening in the middle of August. A first-rate sort.

41 *Low's large melting.* Leaves without glands. Flowers small. Fruit large, pale yellow greenish and red, ripening in the beginning of September. Allied to the *royal George,* larger, but not so good.

42 *Madeleine de Bollwiller.* Leaves without glands. Flowers large. Fruit middle-sized, pale green and dark red, ripening in the beginning and middle of September. A first-rate sort.

43 *Madeleine de courson* (Duham. t. 10.), *red Madeleine* of Miller, *Madeleine rouge, rouge Paysanne, French Magdalene.* Leaves without glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening about the beginning of September. A first-rate sort, and a good bearer.

44 *White Magdalen, Madeleine blanche* (Duham. t. 6.), *Montagne blanche.* Leaves without glands. Flowers large. Fruit middle-sized, yellow white and red, ripening in the middle and end of August. A second-rate sort.

45 *Malta, Italian, pêche de Malte, belle de Paris, Malte de Normandie.* Leaves without glands. Flowers large. Fruit middle-sized, pale greenish and red, ripening about the end of August. A first-rate sort, hardy, and keeps well after being gathered, and bears carriage.

46 *American mignonne.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening in the end of September. A second-rate sort; comes near the *chancellor.*

47 *Dorsetshire mignonne.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow and dark red, ripening in the end of September. A second-rate sort.

48 *Grosse mignonne* (Duham. t. 10.), *Grimwood's royal George, large French mignonne, mignonne Vineuse, royal sovereign,* and 50 other names belong to this kind. Leaves with globose glands. Flowers large. Fruit large, yellow and red, ripening from the middle of August to the beginning of September. A first-rate sort, forces well, a good bearer, but does not bear carriage so well as many others.

49 *Lord Fauconberg's mignonne.* Leaves without glands. Flowers small. Fruit large, pale yellow green and red, ripening in the beginning and middle of September. A good peach, resembling the *royal Charlotte.*

50 *Petite mignonne* (Duham. t. 4.), *small mignonne, early mignonne, mignonette, double de Troyes, pêche de Troyes.* Leaves with reniform glands. Flowers small. Fruit small, pale yellow and red, ripening in the beginning and middle of August. A first-rate sort, succeeds the *brown nutmeg,* and is larger than it.

51 *Yellow mignonne.* Leaves with reniform glands. Flowers

small. Fruit small, pale green and pale red. Flesh full yellow. A second-rate sort.

52 *Morrisonia, Morrison's pound, Hoffmann's.* Leaves with globose glands. Flowers small. Fruit large, pale green and red, ripening in the beginning and middle of September. One of the best of the American sorts.

53 *Mountaineer.* Leaves with globose glands. Flowers large. Fruit large, pale yellow and red, ripening in the beginning of September. A first-rate sort. Fruit sometimes partly smooth, in consequence of its having been raised between the *red nutmeg peach* and *violette hâtive nectarine.*

54 *Nain pêcher, pêcher nain d'Orleans, dwarf Orleans, pot peach.* Leaves without glands. Flowers large. Fruit pale green and yellow.

55 *Nivette, nivette veloutée, veloutée tardive, Dorsetshire.* Leaves with globose glands. Flowers small. Fruit large, pale green and red, ripening in the middle of September. A first-rate sort, very like the *late admirable.*

56 *Noblesse* (Hook, t. 2.), *Mellish's favourite, vanguard.* Leaves without glands. Flowers large. Fruit large, pale green and red, ripening end of August and beginning of September. This is one of the very best peaches, either for forcing or the open wall.

57 *Red nutmeg, brown nutmeg, early red nutmeg, avant rouge, avant pêche de Troyes* (Duham. t. 3.), *red avant.* Leaves with reniform glands. Flowers large. Fruit small, pale yellow and dark red, ripening about the end of July. A second-rate sort.

58 *White Nutmeg, early white nutmeg, avant blanche* (Duham. t. 2.), *white avant.* Leaves without glands. Flowers large. Fruit small, white, ripening middle of July. Has little merit, except that of being the earliest.

59 *Ord's peach.* Leaves with reniform glands. Flowers small. Fruit large, yellow green and red, ripening beginning and middle of September. A second-rate sort, allied to the *chancellor.*

60 *Purprée hâtive, early avant* of some. Leaves with reniform glands. Flowers large. Fruit middle-sized yellow white, and red, ripening end of August. A good peach, as large as the *grosse mignonne* and earlier, but more tender.

61 *President.* Leaves with globular glands. Flowers small. Fruit large, pale yellow greenish and red, ripening middle and end of September. Though a good late peach, yet inferior to the *late admirable.*

62 *Early yellow, rare ripe, yellow rare ripe.* Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and red. Flesh yellow. A worthless sort.

63 *White luscious rare ripe.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening middle of September. A second-rate sort.

64 *Rosanne, petite Rosanne, alberge jaune* (Duham. t. 5.), *pêche jaune, Saint Laurent jaune.* Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and dark red, ripening middle of September. A second-rate sort.

65 *Royal Charlotte, early purple of Kew, Madeleine rouge tardive, Madeleine rouge à petites fleurs, Madeleine rouge à moyennes fleurs, Lord Nelson's, new Royal Charlotte, Grimwood's Royal Charlotte.* Leaves without glands. Flowers small. Fruit large, pale green and dark red, ripening beginning of September. An excellent sort. Allied to the *Royal George.*

66 *Royal George* (Hook, t. 41.) *Millet's mignonne, red Magdalen, French chancellor, Lockyer's mignonne, early Royal George.* Leaves without glands. Flowers small. Fruit pale green white and red, large, ripening about the end of August. A first-rate sort, well known and much cultivated, forces and bears well, but subject to mildew.

67 *Royal George mignonne, new Royal George mignonne.* Leaves without glands. Flowers small. Fruit large, pale yellow white and red. A first-rate sort, ripening about the beginning of September.

68 *Melting sanguinole.* Leaves with reniform glands. Flowers loose. Fruit large, ripening about the end of September. A second-rate sort.

69 *Pitmaston sanguinole.* Leaves with reniform glands. Flowers large. Fruit dark red, small, ripening end of September.

70 *Spring-grove.* Leaves with globose glands. Flowers large. Fruit middle-sized, pale green and red, A first-rate sort, ripening about the beginning of September.

71 *Persian spring-grove.* Leaves without glands. Flowers large. Fruit middle-sized, pale green and red. A first-rate sort, ripening about the beginning of September.

72 *Southampton.* Leaves without glands. Flowers large. Fruit large, pale green and red. A first-rate sort, very like the *noblesse*, ripening about the end of August.

73 *Sweet water, early sweet water.* Leaves without glands. Flowers large. Fruit middle-sized, pale green and red. A second-rate sort, ripening about the end of August.

74 *Twyford's, Holmes's, Rickett's.* Leaves without glands. Flowers large. Fruit large, pale green and red. A first-rate sort, ripening about the beginning of August. Resembles the *noblesse* and is probably a seedling from it.

75 *Williams's early purple, Williams's seedling.* Leaves without glands. Flowers small. Fruit pale green and dark red, large. A first-rate sort, ripening in the end of August.

Var. β; flesh adhering to the stone, called in English *clingstones*, and in French *pavies.*

List of Cling-stone peaches.

1 *Blood clingstone, claret cling-stone.* Leaves without glands. Flowers large. Fruit middle-sized, dark red, ripening in October.

2 *Braddick's North American, Braddick's American, Braddick's American yellow, American clingstone.* Leaves with globose glands. Flowers small. Fruit large, yellow and red. Flesh yellow, firm, and coarse. A worthless sort, ripening in September.

3 *Kennedy's Caroline.* Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and red. Flesh yellow. A second-rate sort, ripening about the end of September.

4 *Catharine* (Lang. t. 33.). Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of September. This is one of the best late *clingstone peaches.*

5 *Williams's Catharine.* Leaves with reniform glands. Flowers small. Fruit pale green and red, large, Very like the *Catharine*, but ripening later.

6 *Catline.* Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red, ripening about the end of September. A second-rate sort.

7 *Congress.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red. A second-rate sort, ripening end of September. Resembles the *Catharine.*

8 *Cooper's early.* Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red. A worthless sort, ripening about the end of September.

9 *Golden purple.* Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and dark red. A worthless sort, ripening about the middle of September.

10 *Heath, fine heath, heath clingstone, red heath.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow

and red, ripening in October. In a good season this is one of the very best late *clingstone peaches.*

11 *Incomparable, pavie admirable.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the beginning of October. It is a larger sort than the *Catharine,* but not so good.

12 *Lemon clingstone.* Leaves with reniform glands. Flowers small. Fruit large, yellow and red. Flesh yellow, like that of the two following; all three are esteemed in America for sweetmeats. All ripen about the end of September.

13 *Hoyte's lemon clingstone.* Leaves with globose glands. Flowers small. Fruit large, yellow and dark red. A second-rate sort.

14 *Kennedy's lemon clingstône.* Leaves with reniform glands. Flowers small. Fruit large, yellow and red. *Kennedy's Carolina clingstone, pine-apple clingstone, pine-apple, large yellow pine-apple, red mallacoton.*

15 *Old Newington, Newington.* Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the middle of September. Very good as a *clingstone peach.*

16 *Smith's Newington, early Newington, Newington.* Leaves without glands. Flowers large. Fruit middle-sized, pale green and red. A second-rate sort, ripening about the end of August.

17 *Newington of the Americans.* Leaves with globose glands. Flowers small. Fruit large, pale yellow and dark red, ripening about the end of September. Unworthy of cultivation.

18 *Pavie de Pompone, pavie de Pompone grosse, monstrous pavie of Pompone, gros Persèque rouge, gros melecoton, pavie monstrueux, pavie rouge de Pompone, pavie rouge, pavie camu.* Leaves with reniform glands. Flowers large. Fruit large, yellow and dark red. A second-rate sort, ripening middle and end of October, but will not ripen, unless in a warm season and good situation.

19 *Persique, persèque, gros persèque, persèque allongée.* Leaves with reniform glands. Flowers small. Fruit large, yellow and red, ripening in October. Requires a warm soil and situation. A second-rate sort.

20 *Portugal, Alberge* of some. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red. A white-fleshed late *cling-stone,* ripening about the end of September.

21 *Sanguinole à chair adherente.* Leaves with reniform glands. Flowers large. Fruit middle-sized, dark red, ripening about the end of October.

22 *Tonbridge.* Leaves with globose glands. Flowers small. Fruit middle-sized, yellow and dark red. A hardy sort, ripening about the end of September.

23 *Washington cling-stone.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale yellow, greenish and red. An useless sort, ripening about the middle of September.

† *Peaches not well known, but none of them are probably worth notice.*

1 *Scarlet admirable, dragon.* 2 *Aster's.* 3 *Avant pêche jaune.* 4 *Bear's early, Bear's early avant.* 5 *Belle de Beaucaire.* 6 *Belle chevreuse, chevreuse, early chevreuse.* A *free-stone.* Leaves with reniform glands. 7 *Belle Tellemont.* 8 *Belle de Vitry* of Duhamel. *Late admirable, bellis, admirable tardive.* 9 *Early Bourdine.* Leaves without glands. Flowers small. 10 *Bourdine royale.* 11 *Burchell's early.* 12 *Brevort's seedling,* a free-stone peach. 13 *Large early Burlington.* 14 *Chancellière, veritable chancellière à grandes fleurs.* 15 *Chevreuse d'Italie.* 16 *Late chevreuse, chevreuse tardive, Pourprée.* 17 *Cothelstone's seedling.* 18 *Double swalsh, swalze,* or *swolze, swalch, Dutch.* 19 *Early red cling-stone.* 20 *Early sweetwater.* 21 *Early de Tours.* 22 *Edgar's late melting.* 23 *Emperor of Russia, serrated, unique.* 24 *Favorite large red cling-stone.* 25 *Fuller's galande.* Leaves with globose glands. Flowers small. 26 *New galande.* 27 *De Gloria.* 28 *Grandeville.* Leaves without glands. Flowers large. 29 *Grande monarque.* Leaves with reniform glands. Flowers small. 30 *Grosse de Vitry.* 31 *Langier.* 32 *Large early.* 33 *Late purple, pourprée tardive.* 34 *Gough's late red.* 35 *Largest lemon.* 36 *Limon.* 37 *Mammoth, sachamoona.* 38 *Cobb's mignonne.* Leaves with globose glands. 39 *Earliest mignonne.* Leaves with globose glands. Flowers small. 40 *Mignonne hâtive.* Leaves with globose glands. Flowers small. 41 *Large-fruited mignonne.* Leaves without glands. Flowers large. 42 *Purple mignonne.* 43 *Royal mignonne.* 44 *Woburn early mignonne.* Leaves without glands. Flowers large. 45 *Morris's red free-stone.* 46 *Morris's white free-stone.* 47 *New cut-leaved.* 48 *New York white cling-stone.* 49 *New serrated.* 50 *Early noblesse.* 51 *Noblesse of Oatlands.* Leaves without glands. Flowers large. 52 *Seedling noblesse.* 53 *Pitmaston seedling noblesse.* 54 *Early yellow nutmeg.* 55 *Period's early nutmeg.* 56 *Oldmixon.* 57 *Pavie.* Leaves with globose glands. Flowers large. 58 *Pavie de Jalagnier.* 59 *Pavie jaune.* 60 *Philadelphia free-stone.* 61 *Port Royal.* Leaves without glands. Flowers large. 62 *Pourprée grosse.* 63 *Pourprée hâtive, early avant* of some. 64 *Veritable pourprée hâtive, du vin, early purple, true early purple.* 65 *La pourprée, pourprée tardive* of the French. 66 *Queen Caroline.* 67 *Ramboullet, Rambullion* (Lang. t. 33.) a free-stone peach. 68 *Red rare-ripe.* 69 *White rare-ripe.* 70 *New white rare-ripe.* 71 *Ronde de Vallabreques.* 72 *Saint Fagus.* 73 *Sanguinole, bloody, Batterave, drusette.* Flesh like red beet, used for preserves, as are also other varieties of *sanguinole.* 74 *Scarlet Anne.* Leaves without glands. Flowers large. 75 *De Sernach.* 76 *Superb.* 77 *Tein-doux.* 78 *Transparente ronde.* 79 *Grosse violette hâtive.* Leaves with globose glands. Flowers small. 80 *Washington.* 81 *Wellington.* 82 *Williams's New York.* 83 *Witham's seedling.* Leaves without glands. Flowers large. 84 *Yellow peach.*

* *Culture of the peach in the open air.*

Selection of sorts. Abercrombie says, " except the situation be completely favourable as to climate, aspect, and shelter, forbear to plant very early or extreme late fruit, for frost will almost invariably cut off the former, when blossoming and setting, and the latter will hardly ripen under the declining heat of autumn." The peaches proper for a small garden, according to Forsyth, are; the *early avant, small mignonne, Anne, Royal George, Royal Kensington, noblesse, early Newington, Galande, early purple, chancellor, nivette, Catharine,* and *late Newington.* The peaches in the duke of Buccleuch's garden at Dalkeith, and which ripen in the order in which they are placed, are as follows; those marked † are planted against a hot wall. 1 *Early nutmeg.* 2 *Early Anne.* 3 *Red Magdalene.* 4 *Royal George.* 5 *Grimwood's Royal George.* 6 *Noblesse.* 7 *Galande* †. 8 *Bellegard* †. 9 *Montauban* †. 10 *Miller's mignon* †. 11 *Smith's early Newington* †. 12 *Chancellor* †. 13 *White Magdalene.*

Propagating to procure new varieties.—The peach is raised from the stone; and this mode is pursued in North America, even for procuring trees for common purposes. The peaches called *Acton-Scot* and *Spring-grove* were thus originated; the parent trees were dwarfs planted in large pots; these being brought into a state of vigorous health, the pistils of the blossoms of one sort were impregnated with the pollen of another; only 3 peaches were suffered to remain on each tree; and from sowing the stones of these the above-mentioned peaches and other varieties were produced; the male parent of the latter was the large French mignon, and the female the little red nutmeg, which choice is consistent with the general principle, that the most perfect and vigorous offspring will be obtained of plants as of animals, when the male and female parent are not too closely related to each other. Some excellent papers on this subject will be found in the Hort. Trans. vol. 1. by T. A. Knight.—The *peach* does not, like many other species of fruits, much exercise the patience of the gardener who raises it from the seed; for it may always be made to bear when 3 years old. In prosecuting such experiments, Mr. Knight recommends the seedling *peach* trees to be retained in pots, and buds from them only to be inserted in older trees; for their rapid and luxuriant growth is extremely troublesome on a wall, and pruning is death to them. Mr. Knight, by leaving on the lateral branches near the extremities of the shoots, and by exposing the leaves as much as possible to the sun, in order to promote the growth and ripening of the wood, procured blossom-buds the first year from seed.

Propagation to perpetuate varieties.—The *peach* is generally budded on Damask-plum stocks, and some of the more delicate sorts on apricot stocks, or old apricot trees cut down, or on seedling peaches, almonds, or nectarines. Knight recommends growing almond stocks for the finer nectarines and apricots, as likely to prevent the mildew, and as being allied to the *peach*. He says, "almond stocks should be raised and retained in the nursery in pots, as they do not transplant well." Perform the budding in July and August, in the side of the stock, one bud in each: they should be inserted near the bottom for the principal wall-trees, and at the height of 3 or 4 or 5 feet for riders. The bud will shoot the following spring, and attain the length of 3 or 4 feet in the summer's growth. After the budded trees have ripened the first year's shoot, they may either be planted where they are to remain, or be trained in the nursery for 2, 3, or 4 years, till in a bearing state. Whether the plants be removed into the garden at a year old, or remain longer in the nursery, the first year's shoot from the budding must be headed down, either early in June the same year, to gain a season, or in March following, to 4, 5, or 6 eyes, to produce lateral shoots, with 1 upright leader to begin the formation of the head in a fan-like expansion; the second year's shoot should also be shortened to a few eyes at the return of June or March; and those also of the third year in such degree as may seem expedient.

Soil.—A good soil for *peach* trees, according to Abercrombie, "is composed of 3 parts mellow unexhausted loam, and 1 part drift sand, moderately enriched with vegetable mould. If the soil be lean and poor, and at the same time light, have the borders improved by decomposed dung and fertile mellow earth; if the ground be strong and heavy, add some light earth or dung; if very gravelly, remove the grossest part, excavating to the proper depth, and in the same proportion apply a compost as above. Let the soil be made good to the depth of 30 inches or 3 feet. The nectarine wants the warmer, richer, and deeper soil, if any difference be made. Bad cold ground or an exhausted mould, is often the cause of the trees gumming." Forsyth says, "*Peaches* require a lighter soil than pears and plums, and a light mellow loam is best."

Choice of plants.—Abercrombie, Forsyth, Nicol, and most authors agree in recommending the choice of trees, 2, 3, or 4 years trained. Forsyth says they should be procured in the latter end of October or beginning of November, as soon as the leaf begins to fall.

Final planting.—The *peach* is almost universally planted against walls in Britain; in some few warm situations they have been tried as dwarf standards or as low espaliers, covering with mats in spring to protect their blossoms. Early autumn planting is best on dry soils. Spring planting may be successfully performed in February and March, but the sooner the better, that the trees may take root immediately before the dry warm weather commences.

Mode of bearing.—"All the varieties of the *peach* and *nectarine* bear the fruit upon the young wood of a year old; the blossom-buds arise immediately from the eyes of the shoots. The same shoot seldom bears after the first year, except on some casual small spurs on the two years wood, which is not to be counted upon. Hence the trees are to be pruned as bearing entirely on the shoots of the preceding year, and a full supply of every year's shoots must be trained in for successional bearers the following season."

The summer pruning.—In May and June, and occasionally in the succeeding months, is to regulate the shoots of the same year, and to prevent improper growths by rubbing off the buds. Pinch off fore-right buds or shoots, and pinch off or cut out, ill placed, very weakly, spongy or deformed shoots, and very strong luxuriant growths, retaining a plentiful supply of good lateral shoots in all parts of the tree, and leaving a leader to each branch. Let them mostly be trained in at full length all summer, about 3 inches asunder for next year's bearers, and divest them of any lateral twigs, to prevent a thicket-like intricacy, and to promote a healthy fruitful growth in the shoots left. In the course of the summer regulation, if any partial vacancy occurs, or should a young tree under training want an additional supply of wood, shorten some conveniently placed strong shoot in June to a few eyes, to furnish a supply of laterals the same season.

The winter-pruning may be performed at the fall of the leaf, and thence, according to some professional writers, at any time in mild weather until spring. It should be completed in February, or early in March, before the blossom-buds are considerably advanced, which are distinguishable by being round, plump, and prominent, while the leaf and shoot-buds are oblong and narrow. There is some advantage in pruning when the blossom-buds can be certainly known. Retain in all parts of the tree a competent supply of such regular grown shoots of last year as are apparently fruitful in blossom-buds. Most parts of these should be shortened, not indiscriminately, but according to their strength and situation; the very strong shoots should be left longest, being topped about one-fourth or one-third of their length; shoots of middling vigour reduce one-third or one-half, and prune the very weak to 2 or 3 buds. Always cut at a shoot-bud, to advance for a leader; sometimes a shoot-bud lies between a twin blossom-bud; cut half an inch above the bud. As many new shoots as will lay from 3 to 6 inches asunder may be deemed a competent supply for next year's bearers. Cut out quite close the redundant, irregular, and other improper shoots; remove or reduce some part of the former bearers of the two preceding years; cutting the most naked quite away, and others down to the most eligible younger branch or well-placed shoot. Also take out all diseased and dead wood, retaining young where necessary to fill a vacuity. In cold and late situations, T. A. Knight recommends a mode of pruning adapted to obtain fruit-bearing spurs on the *peach*, and these spurs he finds best calculated in such situations and late seasons to generate well organised and vigorous blossoms. "Instead of taking off so large a portion of the young shoots, and training in a few only, to a considerable length, as is usually done, and as I should myself do, to a great extent in the vicinity of London, and in every favorable situation, I preserve a large number of the young shoots, which are emitted in a proper direction, in early spring by the yearling wood, shortening each where necessary, by pinching off the minute succulent points, generally to the length of 1 or 2 inches. Spurs which lie close to the wall are thus made, upon which numerous blossom-buds form very early in the ensuing summer. It is only in cold and late situations that the mode of management above suggested is recommended. The spurs must not be shortened in the winter or spring till it can be ascertained what parts of them are provided with leaf-buds." In a very cold and elevated situation, C. Harrison (Hort. trans. 2. p. 14.) prunes and nails his *peach* and *nectarine* trees in December and January, taking away two-thirds of the young shoots; and in two hand-dressings in May and July, he leaves the lowest and weakest shoots for a succession in the year following, pinching off the leading and other shoots. The chief rule which he follows, is never to allow the shoots that are left for bearing fruit to run to any length from the strong wood, for which reason, when the trees are pruned in autumn, the bearing branches for the next year are shortened, taking care not to leave more fruiting-buds than he thinks will come to perfection.

Training.—The *peach* is almost universally trained in the fan-manner, either straight-lined or wavy, though some allege that it bears better in rich soils, when two leading branches are encouraged, and the bearing shoots trained outwards from these, so as to form a sort of horizontal training.

Thinning the fruit.—" In favorable seasons the blossoms often set more fruit than the trees can support, or than have room to attain full growth, and if all were to remain it would hurt the trees in their future bearing, therefore they should be timely thinned, when of the size of large peas or half-grown gooseberries. There should be a preparatory thinning before the time of stoning, and a final thinning afterwards, because most plants, especially such as have overborne themselves, drop many fruit at that crisis. Finish the thinning with great regularity, leaving those retained at proper distances, 3, 4, or 5 on strong shoots, 2 or 3 on middling and 1 or 2 on the weaker shoots, and never leaving more than one peach at the same eye. The fruit on weakly trees thin more in proportion."—*Abercrombie.*

Renovating old decaying trees.—Head down, and renew the soil from an old upland pasture, and if the bottom of the border is moist, or if the roots have gone more than 2 feet downwards, pave the bottom, or otherwise render it dry, and impervious to roots at the depth of 20 inches or 2 feet from the surface. This plan will be found almost universally successful, in restoring sufficient vigour to resist insects and diseases, and produce abundance of fruit.

Protecting the blossoms.—This may be done by various modes. Forsyth recommends old netting as the best covering. C. Harrison protects his trees from the frost in the month of January by branches of broom; these are previously steeped in soap-suds mixed with one-third of urine for 48 hours, in order to clear them from insects, and when dry are disposed thinly over the whole tree, letting them remain on only until the trees begin to break into leaf. At the time of the blooming and setting of the fruit, he applies cold water in the following manner, viz. if, upon visiting the trees before the sun is up in the morning after a frosty night, he finds there is any appearance of frost on the bloom or young fruit, he waters the bloom or young fruit thoroughly with cold water from a garden-engine, and he affirms that even if the blossoms or young fruit are discoloured, this operation recovers them, provided it be done before the sun comes upon them. Dr. Noehden remarks, Hort. trans. vol. 2. " that this operation of watering before sun-rise, in counteracting the frost, seems to produce its effect in a manner analogous to the application of cold water to a frozen joint or limb, which is injured by the sudden application of warmth." J. Carr, of St. Ann's, near Leeds, protects his blossoms by retardation; and the means used are, detaching the branches of the trees from the walls in autumn, and not refixing them till late in the spring, when the blossoms are about to expand. In addition to unfastening the trees, a wedge is put in behind the main stem to throw it forward, in order that the tree may receive as little protection from the wall as possible. (*Caled. mem.* 3. *p.* 25.)

Ripening peaches on leafless branches.—Whenever the part of the bearing branch which extends beyond the fruit is without foliage, the fruit itself rarely acquires maturity, and never its proper flavour and excellence. This Knight conjectures to be owing to the want of the returning sap, which would have been furnished by the leaves, and he proved it experimentally by inarching a small branch immediately above the fruit. The fruit in consequence acquired the highest degree of maturity and perfection. (*Hort. trans.* 2. *p.* 25.)

Insects and diseases, &c.—The leaves of the *peach* tree are liable to the attacks of the acarus, its greatest enemy, and also to be devoured by the chermes, aphis, and even a much smaller insect, the thrips. These are to be kept under by the usual means of watering over the leaves, and fumigation with tobacco smoke. The honey-dew, mildew, gum, and canker are chiefly to be kept under by regimen; dusting with sulphur has been found to destroy the mildew, but the only certain way of remedying it is by a renewal of the soil, which will commonly be found old mould long in use and too rich, and by abundance of air. J. Kirk (Caled. hort. mem. 4. p. 159.) has tried renewing the soil for 50 years, and always found it an effectual remedy.

The young wood of the *peach* tree is liable to be covered with black spots or blotches, which Kenment proved to be produced by over rich soil (Caled. hort. mem. 2. p. 79 and 80.). The fruit, when ripe, is very liable to the attacks of the wasp, the large fly, and especially the earwig, &c., the two first may be excluded by nets, or enticed by honied bottles, and the latter caught by the beetle-trap, reeds or bean-stalks laid in behind the leaves, and examined every morning.

Gathering.—Use the peach-gatherer, and gather one day or two before the fruit is to be used, and before it be quite ripe, laying it on clean paper in a dry airy part of the fruit-room.

Use of hot walls.—The ripening of the *peach* may be accelerated in the open air, when planted against a hot wall, by the application of gentle fires in cold moist weather, in August and September. This will ripen the fruit and wood; but no attempt should ever be made to accelerate the blossom early in spring, as without the protection of glass they are almost certain of being cut off.

* * *Culture of the Peach-house.*

Soil.—Abercrombie uses the same soil as for those grown in the open air. The border or bed to be 30 inches or 3 feet deep. The *nectarine* wants the warmer and richer and deeper soil, if any difference be made. The soil for *peaches* that are forced, M'Phail recommends to be, " fine, loamy, well prepared earth, of a medium texture, neither very light nor of a strong binding quality, well mixed with some good manure. The border to be 4 feet deep and so broad that the roots cannot get into a bad soil" (Gard. Rem. 18.). The bottom of the border being made comfortable by draining and paving, if not naturally dry. Nicol directs the breadth of the border to be the width of the house within, and to the extent of 10 or 12 feet without. The average depth 30 inches at the least; but if a yard it would not be too much. The soil to be thus composed: three-fourths strong loam, one-eighth part of light sandy earth, and an eighth part of rotten stable-yard dung, with a competent quantity of lime and marl, all being properly mixed before planting.—*Kal. p.* 291.

Choice of sorts.—Select from the catalogue given, according to quality. The following list is given by Abercrombie as the most proper for forcing:—

* *Cling-stones.*

1 *Late admirable.* *2 *Old Newington.* 3 *Portugal.* 4 *Golden.* 5 *Catharine.* 6 *Pavie de Pompone.*

* * *Free-stones.*

7 *White Nutmeg.* 8 *Grosse Mignonne.* 9 *Belle Chevreuse.* 10 *White Magdalen.* 11 *Red Magdalen.* 12 *Double Montagne.* 13 *Chancellor.* 14 *Early Admirable.* 15 *Malta.* 16 *Royal George.* 17 *Noblesse.* 18 *Late Admirable.* 19 *Late Purple.*

M'Phail says, " The names of the *peach* trees fit for forcing are the *Magdaleine, Double Montagne, Royal George,* and *Noblesse.* Nicol recommends the following:—1 *Red Magdalen.* 2 *White Magdalen.* 3 *Royal George.* 4 *Noblesse.* 5 *Double Montagne.* 6 *Early Admirable.* 7 *Late Admirable.* 8 *Late Purple.* 9 *Grosse Mignonne.* 10 *Smith's Newington.* 11 *Early purple, and orange.*

Choice of plants. " Before a house for forcing *peaches* and *nectarines* be built," M'Phail observes, " trees to plant in it had best be got in readiness, and if they be growing on the premises it will be an advantage. If it can be avoided, no tree should be planted in a forcing-house until the fruit of it has been seen and tasted. The trees should be well trained ones, 4 or 5 feet high; indeed, it is of no consequence what their age be, provided they are healthy, well rooted, and in a bearing state; and if they have been transplanted several times since they were budded, they will be the fitter for transplanting again; and if the work of taking them up and of planting them in the peach-house be carefully and methodically done, the trees, by their removal, will be but little retarded in their growth. When every thing in the forcing-house is got in readiness for the reception of the trees, loosen them from the wall to which they were fastened with nails and shreds, and dig a wide semi-circular trench, 4 feet distant from the stem of each tree, and a little deeper than their spreading roots, then, by little and little, with a pointed stick, work the earth out among their roots, taking care to break as few of them as possible. In this manner the roots of the plants are to be divested of earth in a careful manner, so as to undermine the stem, that the tree may be lifted out of its place without straining the roots of it. Having holes previously prepared, about 8 or 10 inches deep and 4 feet wide, set the trees into them one after another, training their roots out in a regular horizontal manner at full length, and after let the ends of the roots be cut, so as to take the ruggedness off, cover them not deeper than about 6 inches at their extremities, and at the stem of the tree about 4 inches. Clean healthy dwarfs, that have been one or two years trained, Nicol prefers to older plants, and riders three and even four years trained; because, being temporary, it is desirable to have them produce fruit as soon as possible, for if the dwarfs thrive, the former will have to be removed in three or at most in four years. In a house 35 feet long, 3 dwarfs should be planted, and in a house 35 or 40 feet, 4 dwarfs; in both cases with riders between them."—*Kal.* 323.

Situation of the plants in the house.—Permanent occupants, intended to be forced early, Abercrombie plants in a front border, training them on a trellis just under the roof. In late forcing-houses, he trains them to an upright trellis near the back wall. M'Phail plants so as to train under the glass, and Nicol's practice concurs with that recommended by Abercrombie.

For a late peach-house, dwarfs should be planted in front, to be trained about half-way up the roof; and dwarfs, with riders between them, against the back wall, to be trained to the top. In this case, the trees on the back trellis would not be shaded by those in front, provided they are not trained to more than half way up the sloping-glass; and thus the greatest possible extent of unshaded surface, and the greatest quantity of unshaded fruit may be obtained. A house planted in this manner, about 40 or 45 feet in length, may have 4 dwarfs in front, and 4 dwarfs and 5 riders at back, and when in a full bearing state would produce a large quantity of nectarines and peaches. If only 30 or 34 feet in length, 3 dwarfs in front and 3 dwarfs and 4 riders at back, would be trees enough to fill it.—*Pract. gard.*

Season of planting.—Abercrombie recommends November and December as preferable, if not February and March; which practice is also agreeable to that of Nicol.

Training.—All seem agreed in recommending fan-training for *peaches* and *nectarines*, which being the simplest and most natural training, is always to be preferred.

Pruning.—This, according to Abercrombie, may be performed at the fall of the leaf, but should be completed before the blossom-buds are considerably advanced. M'Phail says the best season is in the spring, when the blossom-buds can be distinguished. In the case of a newly-planted house, Nicol heads down the maiden plants, or cuts the trained trees about the end of March or beginning of April. With respect to the dwarfs, the shoots on the lower branches should be cut back to 2 or 3 buds, that the trellis may be furnished from the bottom with young wood. The shoots on the upper or further extended branches may be shortened back to half or one-third of their lengths, according to their strength, provided they have been well ripened, and are free from canker; but if the tree be anyways diseased, let them be cut so far back as to get rid of the cankered or mildewed part, but it would be adviseable that no diseased tree should be planted, unless of a particular kind that cannot be easily obtained. The riders need not be headed so much in as the dwarfs, the object being rather to throw them into a bearing state than to cause them to push very strong shoots, which would not be fruitful. If they make moderately strong shoots, and if these be well ripened in autumn, a good crop may be expected on them next year. Let the young shoots be laid in, as they advance, at the distance of about 9 inches from each other, that is of the dwarfs; those of the riders may be laid in considerably closer, it not being intended they should grow so vigorously as those of the dwarfs. In a bearing-house the winter pruning is supposed to take place in November, and if the summer shoots have been regularly trained and laid in at the distances of 9 inches in the dwarfs, and rather less in the riders, they will not require much pruning at this time. A few of the shoots may be shortened about the lower and middle parts of the tree, for the purpose of providing a supply of young wood in these parts, and thinning out such shoots here and there as have been left too thick; for others should not be shortened, but should be laid in at full length, that is, such as are short, stout, nearly of an equal thickness, and have a bold wood-bud at the extremity, as from these may be expected the best fruit next season. In some parts of the tree, perhaps, or in some particular trees, it may be expedient to cut out such old branches as have but few young shoots on them, provided there be neighbouring branches better furnished, whose shoots may be spread out so as to fill, or nearly to fill, the vacancy occasioned by such lopping. In this case, the shoots borrowed as it were for this purpose, must be shortened more or less, according to the size of the vacancy to be filled up, and according to their strengths, in order that the plant may appear complete in all parts as soon as possible. In summer Nicol pinches off foreright shoots as they appear, and all such as are ill-placed, weakly, watery, deformed, or very luxuriant, leaving a leader to every shoot of last year, and retaining a plentiful supply of good lateral shoots in all parts of the tree. If any blank is to be filled up, some conveniently-placed strong shoot is shortened in June to a few eyes, in order that it may throw out laterals. Sir Joseph Banks, in speaking of the culture of *peaches* at Montreuil, near Paris (Hort. trans. vol. 1. append.) says, " Much advantage is derived from the practice of rubbing off the leaf-buds from the fruit-bearing branches, leaving only as many as are wanted to produce wood for the succeeding year. The *taille d'été* does not only leave the remaining wood to grow stronger and to ripen sooner, but it naturally increases the size of the fruit. The fruit is thinned after the stoning season, as already described for thinning of wall fruit." In a peach-house, in a state of bearing, when the fruit is swelling off, in order that it may attain a greater degree of perfection, such leaves and summer shoots as overhang and shade the fruit are taken off or thinned. The leaves of *peach* trees " may be dressed off," when the wood is ripened, by the use of a withy or small cane, which is more necessary in a house than if the trees were growing in the open air, where the wind or frost may make them tumble down fast. In the newly-planted peach-house the dwarfs must be well cut in, in order to make them push shoots freely for furnishing the trellis next season. Those situated in the lower and middle parts of the tree should be cut back to half their lengths, or to a few buds, less or more according to their strength; and those of the extremities to one-third or to about half their lengths, also according to their strength, and how well they have been ripened. They should be thinned so at this time, as that the shoots which are to issue from them next season may be laid in at the medium distance of about 6 inches. The riders need not be pruned near so much as the dwarfs, as they are wished to produce a crop of fruit the following season, shortening no shoots that are fully ripened, except a few of those at the extremities of the tree, in order to make them throw out others for its full extension upwards next year.

Stirring the soil.—The borders are to be pointed and forked up after pruning, and a little well-rotted dung or compost added where deemed necessary. That part of the border on the outside may in addition be covered with dung, and after forcing is commenced, those in the inside may be occasionally watered with the drainings of the dung-hill.—*Kal.* 324 *and* 438.

Time of beginning to force.—From the rise of the sap, according to Abercrombie, it occupies, in some sorts, about 4 months to make mature fruit; in the later varieties 5 months; and when much of winter is included in the course of forcing, the time is proportionably lengthened. To ripen moderately early kinds by the end of May, begin to force on the 21st of December. Little is gained by commencing sooner. But you may put on the glasses a week before, and make gentle fires, admitting a constant stream of fresh air, to get the house ready. M'Phail says, " Those who wish to have peaches and nectarines ripe in May, should begin to force them about the beginning or middle of December." For a general crop, Nicol, Weeks, and most gardeners recommend forcing to begin in the month of February. He says it is much better to force too slow than too fast.

Temperature.—Abercrombie directs to begin at 42° min. and 45° max. from sun heat, and rise in a fortnight to 45° min. and 50° max. from sun heat; in the progress of the second fortnight augment the temperature from 3 to 8 degrees, so as to have it at the close up to 53° min. and 56° max. from sun heat, admitting air in some degree daily. When the trees are in blossom, let the heat be 55° min. and 60° max. Continue to aim at this till the fruit is set, then raise the minimum to 60° and the artificial maximum to 65°, in order to allow of giving air. When the sun shines do not let the maximum from collected heat pass 70°, rather employ the opportunity to admit a free circulation of air. M'Phail, beginning in February, keeps the thermometer to about 55°, increasing it as the days lengthen; when the fruit is set and swelling, raise it to 60° with fire heat; when the sun shines, let it rise to 65° or 70° with air. A short time before the fruit begins to ripen, from 55° to 70° is not too much with fire heat, and when the sun shines let it rise a little above 75°. In a house, begun to force on the 1st of February, Nicol begins with 45° for the first fortnight, and then increases the heat to 50° or 52°. The times of regulation are supposed to be at 6 or 7 o'clock in the morning and 8 or 9 o'clock at night. At the end of the month the temperature is to be kept as steadily as possible to 55°. In two months keep it to about 65°, seldom allowing it to pass 70°, which if it does, will have the effect of drawing the shoots up weak, and may cause the setting fruit to drop. He recommends 60° by fire heat, mornings and evenings, as proper after the fruit are fairly stoned. T. A. Knight finds that neither peaches nor nectarines acquire perfection either in richness or flavour, unless they be exposed to the full influence of the air and sun during their last swelling, without the intervention of the glass. In consequence, he says, some gardeners take off the lights wholly before the fruit begins to ripen, but he recommends taking them off only in bright sunshine, and putting them on during rain, and at night to protect the fruit from dews, &c.

Air.—A constant stream of fresh air is to be admitted before beginning to force, and plenty of air, when the sun shines, during the whole progress of forcing. M'Phail says, " when the fruit is set and swelling, give the house air every day, whether the sun shine or not. Give plenty of air, and keep the house dry when the fruit begins to ripen." When the intention is to begin to force on the first of February, Nicol shuts up the house from the middle of January, admitting plenty of free air through the day. During the first month of forcing, he admits air freely " every day, even in frosty weather, by the sashes, till the flowers begin to expand, after which time by the ventilators, except in fresh weather, till the season become mild." Air should be admitted all this month to such an extent as to keep down the temperature in sunshine to within 5° of the fire heat medium, and this in order to strengthen the buds as they break, and that the young shoots may spring in a vigorous manner. Admit large portions of air every day when the fruit is swelling off, except in damp weather, from 7 or 8 o'clock in the morning to 5 or 6 o'clock in the evening, opening the sashes to their fullest extent, from 10 to 2 or 3 o'clock in the afternoon, giving and reducing gradually, &c.

Watering and steaming. " While the fruit is in blossom," Abercrombie observes, " steaming the flues must be substituted for watering over the leaves; at the same time you may water the roots now and then gently, avoiding such a copious supply as might risk the dropping of the fruit to be set. Let the water be warmed to the air of the house." M'Phail directs to keep the border moist by watering; and after the fruit are as big as nuts, sprinkle the flues now and then with water, to raise steam, and wash the trees about once a week with clean water, not too cold. It is better not to wash all over the top till the fruit are set. A sunshiny morning is to be preferred, and the water may be about 65°. Do not water after the fruit begins to ripen, but recommence when it is all gathered (Gard. rem. p. 148. and 191.) Newly planted *peach* trees should be freely supplied with water at the roots throughout the season, in order to promote their growth; and the engine must be applied with force to the branches for the suppression of the red spider, and refreshing the foliage, generally once in two or three days (Gard. kal. p. 358). In a fruit-bearing house, after the fruit is set, water should be given pretty freely to the plants at the roots once in two or three days, increasing the quantity as the fruit begins to swell, and as the shoots advance in growth. Also continue the operation of the engine regularly, and do not be afraid to hurt the foliage if the red spider appear upon them, and more particularly towards the top of the house, as it is there the red spider is fostered by the extreme heat. Withhold water from the border, and cease to exercise the engine on the foliage when the fruit are swelling.—*Gard. kal. p.* 401.

Insects and diseases.—The red spider is the great enemy to *peach* and *nectarine* trees, but they are also attacked by blight, mildew, the aphis, thrips, and sometimes even the coccus. The blight, Abercrombie says, is caused by a small insect, very pernicious both to the trees and fruit in their growth; this is apparent by the leaves curling, and often by the ends of the shoots being bunched and clammy. In this case it is advisable to take off the distempered leaves, and cut off the diseased ends of the shoots. Further to check the mischief, if the weather be hot and dry, give the trees a smart watering all over the branches by a garden engine, and repeat it two or three times a week in the afternoon when the power of the sun is declining. These waterings will clear the leaves, branches, and fruit, refresh and revive the whole considerably, and conduce greatly to exterminate the vermin. When the plants have begun to expand their blossoms and leaves, the aphis or green-fly makes its appearance; in which case M'Phail directs to fill the house full of tobacco-smoke once a week or oftener. If there be any appearance of mildew, dust a little sulphur on the infected parts, and if the gum or canker be seen on the shoots, or on any parts of the trees, open the bark and cut out the dying wood. Inspect the trees in every part minutely, and if you perceive the bark dying or the gum oozing out of any part of the stem, cut off the bark as far as it is dead or decaying, and if the branches be strong, that you cannot well effect it with your knife, take a chisel with a semicircular edge and a mallet and cut out the wood as far as you see it is affected; you need not be afraid of hurting the tree, even if the branches or stem are cut half way. This method exposes the old wood to the sun and air, by which it is dried, and the tree is thereby assisted in casting off the unwholesome juices, or those kept in it too long for want of a more dry genial climate (Gard. rem. 131.). J. Michell, of Moncrieff House, Perthshire, hangs on his *peach* trees, when the fruit are ripe, large white glass phials, with a little jam or jelly in them, in order to entice large black flies, which he finds very destructive to peaches. Wasps he destroys by finding out their nests in the day time, and going in the evening with a candle, he introduces a burning stick smeared with wet gunpowder, which stupifies the wasps, and causes them to fall nearly dead, when he crushes them (Caled. hort. mem. 1. p. 194.). Nicol strongly recommends watering for keeping down insects, especially the red spider. If the green fly or thrips make their appearance, recourse must be had to fumigation. Shut the house close at night, and fill it as full of tobacco-smoke as possible. If this be repeated the next evening they will be completely destroyed. Calm cloudy weather is the most favorable for this operation (Gard. kal. p. 340 and 350.). The coccus and chermes, he says, are not so immediately hurtful, and unless very numerous need not be much minded at this season, but they must be more particularly attended to at the time of pruning in November. The males, which have wings and are active, will be dislodged by the operation of the engine, and the females, which are stationary and adhere to the shoots and branches, if very numerous, may readily be crushed by the finger, or by a small flattish stick. In November, the winter pruning being finished, the plants and trellis are to be anointed with the composition recommended for vines, see vol. 1. p. 708.

Gathering of the fruit. M'Phail advises laying moss or some soft material over the borders, to save those from being injured which drop of themselves. Sir Joseph Banks, quoting from a French author, states that peaches are never eaten in perfection if suffered to ripen on the tree; they should be gathered just before they are quite soft, and kept at least 24 hours in the fruit chamber. Hort. trans. vol. 1. append. John Williams of Pitmaston says, "should the season prove wet when the peaches are ripe, they should be gathered, and placed for about two days in a dry airy room before they are eaten." Hort. trans. 2. p. 113.

Ripening of the wood. Abercrombie says, "on account of the fruit of most sort of *peaches* ripening somewhat earlier than grapes, and the growth of the shoots stopping sooner than the runner-wood of vines, it is not so often necessary to assist the plant in September or October by artificial heat; but in some of the late kinds, if, by the time the external air is down to 60°, the shoots have not taken a greenish-brown tint as high as several eyes from the origin, and if the blossom-buds on these, when full swelled, are not distinguishable from the oblong wood-buds, apply a little fire heat, and continue it till the leaves fall." Nicol directs attention to be paid to the ripening of the wood of *peach* trees in September. "A little fire heat may be necessary fully to mature the shoots, especially of young trees. Fire heat should be continued till the growth of the smaller and middle-sized shoots stop, their bottom parts become greenish-brown, and the flower-buds upon them appear turgid, so as to be distinguishable from the wood-buds. The stronger, and more extreme shoots, of the dwarfs in particular, will continue to grow later than the above shoots, which as they are to be considerably shortened back in November for the production of wood to fill the trellis next season, is not very material, provided the bot part be pretty well hardened."

Resting of the wood. The management of the peach-house when at rest, Abercrombie says, "should be nearly the same as for the grape-house, except when there is but one set of frames to serve both an early peach-house and a late grape-house; in which case, as soon as the young wood of the vine is perfectly ripened, the glasses should be brought back to the peach-house; for although the fruit of the grape is to be set and ripened in a higher heat, the *peach* tree as a plant is more tender than the vine, and independently of forcing comes into blossom about two months sooner." M'Phail keeps on the glasses from the time the fruit is gathered till he begins to force, in order to keep the wood dry; but gives them all the air he can. Gard. rem. p. 367. Nicol exposes the house fully day and night, only shutting up in the time of heavy rains. Gard. kal. p. 420.

Forcing the peach tree in pots. "All the varieties of *peaches* and *nectarines*," Abercrombie remarks, "are extremely well suited for forcing in large pots. Small plants intended to come in before or after these in the borders may be excited in the first stage in a distinct house, so as the temperature of that in which they are brought to finish fruiting be suited to their progress." The pots or tubs should be such as not to contain less than a cubic foot of earth, the soil should be lighter and richer than that recommended for the borders, and liquid manure should be plentifully supplied to make up in some degree for the confinement of the roots. They are best forced in a peach-house, but succeed in a vinery or succession stove; best of all, however, in a pit or Dutch frame, where the temperature can be regulated at pleasure, and where they are near the glass. Great care must be taken to supply them regularly with water, for which purpose some place saucers under the pots, others cover their surface with moss, or what is better, fresh cow or rotten horse dung. Casing the pots with ropes made of moss is also a very good method, as it not only preserves an uniform degree of moisture, but also of temperature. Of course the moss must be kept watered. *Peach* trees in pots are sometimes trained to small fan-trellises attached to the pot, but in general they are pruned as dwarf standards, in which form they bear rather better than when trained. When the fruit is nearly ripe, the pots should be removed from the hot-house or vine-house to a cooler and more airy situation, or if in the pits the sashes may be taken off a part of every fine day. In other respects the treatment of *peach* trees in pots is similar to that of the trees in the borders. With respect to the quality of fruit from *peach* trees in pots, J. Williams observes, " by far the best flavoured peaches I have ever tasted were from trees planted in large pots, and kept in a vinery from February till the first week in June, when the trees were removed into the open air, and after being shaded a little from the sun for the first ten days, were placed in the most open part of the garden till the fruit became ripe. Treated in this way the peach is beautifully coloured on the outside, and of a most exquisite flavour." Occasionally in very warm seasons *peach* trees in pots, when forced very early in the season, and afterwards plunged in the open air, will produce a second crop late in the autumn, but this is more a matter of curiosity than utility. It frequently happens with forced cherries and strawberries. Hort. trans. 3. p. 367.

Peach trees as standards. The *peach* bears remarkably well in the standard form, planted in the middle of the house, and the flavour of the fruit is universally acknowledged to be preferable to that grown on the trellis, from the comparatively free circulation of the air. The glass tent or moveable house might be most advantageously applied in this way, and when the fruit begins to ripen, the sashes could be removed, and applied to ripening a late crop of grapes against a common wall, or to cover or houses which had not been forced.

Forcing peaches by dung heat. Sir Thomas Neave (Hort. trans. 5. p. 218.) forces *peaches* and *nectarines* principally by dung heat; about 3 feet and a half of the bottom of the front wall of his peach-house is open brick-work, with a flue on the inside, the top of which is covered with flat tiles. The inside of the house is filled with earth to within 2 feet of the bottom of the lights, and the trees planted as near as possible to the front wall, and trained under the lights or wires like vines; the back wall of the pine-pit is built of the same height as the front of the peach-house, and 3 feet distant from it; this of course forms a space 3 feet wide for the hot dung, and as soon as he wishes to begin forcing, this space is filled with hot dung. The roots being next the flue soon begin to feel the warmth of the dung. He finds great advantage from this method, and it is productive of no ill effects until the leaf buds begin to expand, and if the steam is not then perfectly sweet and moderate, the places left to admit it must be secured. The way in which this dung lining is placed is, that, while it is forcing the *peaches* and *nectarines*, it is assisting to work the pines in the pine-pit at the same time. By this means he has never failed in producing abundant crops of peaches and nectarines.

In medicine peach blossoms are recommended as an anthelmintic purgative. They are given in infusion; half an ounce of the fresh petals or a drachm of the dry for a dose. A syrup made from peach blossoms is officinal in Wirtemberg.

Common Peach. Fl. April, May. Clt. 1562. Tree 10 to 15 feet.

2 P. LÆ'VIS (D. C. fl. fr. 4. p. 487.) fruit smooth, glabrous. ♄. H. Native of Persia. Amýgdalus Pérsica, Lam. dict. 1. p. 100. no. 21-27. Amýgdalus Pérsica necturìna, Ait. hort. kew. ed. 2. vol. 3. p. 194. Noisett. jard. fruct. p. 89-90. no. 17-22. t. 20. f. 23. t. 21. f. 3-4. The *nectarine* is distinguished from the peach by its smooth, and rather firmer, more plump fruit. In other respects the general history of the peach equally applies to the *nectarine*, as well as its culture and uses. Forsyth says, "the fruit is called *nectarine* from *nectar*, the poetical drink of the gods." The varieties of the *nectarine* are as follow.

Var. α; flesh separating from the stone. Called in French *brugnons*, and in English *free-stone nectarines.*

A list of free-stone or melting nectarines.

1 *Aromatic.* Leaves with reniform glands. Flowers small. Fruit pale yellow, red on the exposed side, middle-sized, ripening about the beginning of September. Resembles the *violette hâtive.*

2 *Balgone.* Leaves with reniform glands. Flowers small. Fruit large, pale greenish, but red on the sunny side, ripening in the beginning of September. A first-rate sort.

3 *Boston.* Leaves with globose glands. Flowers small. Fruit middle-sized, orange, but dark red on the sunny side, ripening about the beginning of September. A second-rate kind.

4 *Brinion, brugnon red at the stone, violet red at the stone.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow, red on the sunny side, ripening about the beginning of September. A first-rate sort.

5 *Cérise pêche, cherry nectarine.* Leaves with reniform glands. Flowers small. Fruit small, whitish, but red on the sunny side, ripening about the end of August. More a subject of curiosity than use.

6 *Claremont.* Leaves with reniform glands. Flowers small.

7 *Desprèz, Deprès.* Leaves with reniform glands. Flowers large.

8 *Du Tellier's, duc de Tello, du Tilly's.* Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening in the beginning of September. A first-rate sort.

9 *Downton.* Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A first-rate sort.

10 *Elruge, common elruge, Claremont, Oatlands, Temple's* of some. Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the beginning of September. Flesh almost white to the stone, excellent. A good bearer, and forces very well.

11 *Elruge* of Miller. Leaves without glands. Flowers small.

12 *Fairchild's, Fairchild's early.* Forsyth. Leaves with reniform glands. Flowers small. Fruit small, green, but red on the sunny side, ripening in the beginning and middle of August. Esteemed chiefly for its earliness.

13 *Genoa, late Genoa, Genoese.* Leaves with reniform glands. Flowers small.

14 *Greenshield's late.* Leaves with reniform glands. Flowers small. Fruit middle-sized, greenish on one side, and red on the other, ripening about the end of September.

15 *Hoy's new seedling.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the beginning of September. A first-rate sort, resembling the *Elruge.*

16 *Jaune lisse, lisse jaune, jaune lisse tardive, Rousanne, mofrin.* Leaves with reniform glands. Flowers large. Fruit yellow, small, ripening in October. A second-rate sort.

17 *Murrey, Murry* (Forsyth), *black Mury.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green on one side, and dark red on the other, ripening in the end of August. A first-rate sort.

18 *Large melting.* Leaves with reniform glands. Flowers small.

19 *Ord's new.* Leaves with reniform glands. Flowers small.

20 *Peterborough, late green, vermash,* Forsyth. Leaves with reniform glands. Flowers small. Fruit middle-sized, green, ripening in the middle of October. A second-rate sort.

21 *Pitmaston orange, Williams's orange, Williams's seedling.* Leaves with globose glands. Flowers large. Fruit large, orange and dark red, ripening about the end of August. An excellent, hardy, and good bearer.

22 *Scarlet* of Forsyth. Leaves with reniform glands. Flowers small. Fruit small, fine scarlet and pale red, ripening about the end of August.

23 *Hunt's tawny, Hunt's early tawny.* Leaves without glands. Flowers small. Fruit middle-sized, orange and dark red, ripening from the middle to the end of August. A very distinct sort, worthy of cultivation for its earliness.

24 *Temple's* (Lang. t. 30.), *Temple.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the beginning of September. A first-rate sort.

25 *Vermash, true vermash.* Leaves with reniform glands. Flowers large. Fruit middle-sized, green on one side, and red on the other, ripening about the end of August. A first-rate, but rare sort.

26 *Violette grosse, grosse violette hâtive, violette de courson, le gros brugnon* in some parts of the continent. Leaves with reniform glands. Flowers small. Fruit large, pale greenish and red, ripening in the beginning of September. A first-rate sort, having the flesh very red at the stone.

27 *Violette hâtive* (Hooker, t. 15.), *violet, early violet, lord Selsey's elruge, Hampton Court, large scarlet, new scarlet, vermash* of some, *petite violette hâtive.* Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, forces well.

28 *Violette tardive, violette marbrée, violet panachée.* Leaves with reniform glands. Flowers small.

29 *New white, Neat's white, white, Flanders* (Hook. t. 30.), *Emmerton's new white, Cowdray white, large white.* Leaves with reniform glands. Flowers large. Fruit large, white, ripening about the beginning of September. In a favourable soil and warm exposure both the *new* and *old white* acquire an excellent flavour; under other circumstances only indifferent.

30 *Old white.* Leaves with reniform glands. Flowers large. Fruit large, white, ripening in the beginning of August. A first-rate sort.

Var. β; flesh adhering to the stone. Called in French *pêches-violettes,* and in English *cling-stone nectarines.*

List of cling-stone nectarines.

1 *Aiton's seedling.* Leaves with reniform glands. Flowers small. Fruit large, dark brown, red on the sunny side, ripening in the beginning and middle of September. A second-rate fruit.

2 *Brugnon, Italian.* (Lang. t. 29.) Leaves with reniform glands. Flowers small. Fruit large, greenish, but dark red on the sunny side, ripening in August. A second-rate fruit.

3 *Brugnon hâtif, early brugnon.* Leaves with reniform glands. Flowers small.

4 *Brugnon violet musqué, brugnon musqué* (Duham. 26.), *brugnon, red Roman.* Leaves with reniform glands. Flowers large. Fruit middle-sized, pale yellow, but red on the exposed side. A second-rate fruit. Ripens in September.

5 *Early pavie* (Forsyth, 57.). Leaves without glands. Flowers large.

6 *Golden* (Lang. t. 29.), *fine gold-fleshed, orange.* Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow, but red on the exposed side. Flesh orange-coloured. A second-rate fruit, ripening in the beginning or middle of September.

7 *Pince's golden.* Leaves with reniform glands. Flowers large. Fruit large, orange, but dark red on the exposed side, ripening throughout September. As a cling-stone nectarine very good.

8 *Imperatrice.* Leaves with reniform glands. Flowers small. Fruit large, dark red. A first-rate fruit. Hangs and shrivels like a *Newington.*

9 *Newington, late Newington* (Lang. t. 29.), *scarlet Newington, old Newington, Smith's Newington, French Newington, brugnon de Newington de l'Angleterre, rough Roman, red Roman* of some, *Sion-hill, Anderdon's, Anderson's round.* Leaves without glands. Flowers large. Fruit large, dark, ripening in September. A good bearer, excellent when beginning to shrivel.

10 *Early Newington* (Forsyth, 27.), *early black Newington, black, early black, new early Newington, new dark Newington, Lucombe's seedling, Lucombe's black.* Leaves without glands. Flowers large. Fruit large, dark red, ripening in the end of August. A first-rate sort, larger than the *Newington.*

11 *Tawny Newington.* Leaves without glands. Flowers large. Fruit large, yellowish brown, red on the sunny side, ripening in the beginning and middle of August. A first-rate sort.

12 *West Dean Newington.* Leaves without glands. Flowers large.

13 *Roman, red Roman, old Roman, brugnon musqué* (Duham. no. 26.), *brugnon violet musqué* of some. Leaves with reniform glands. Flowers large. Fruit large, green brown and red, ripening in the beginning and middle of August. A first-rate sort.

14 *Royal Buckfast.* Leaves without glands. Flowers large. Has much resemblance to the *Newington.*

15 *Tawny, late tawny, Murrey* of some. Leaves with reniform glands. Flowers small. Fruit middle-sized, brown, and red, ripening in the middle of September. A second-rate sort.

† *Varieties of nectarines not well known.*

1 *Bright red alberge.*
2 *Argyle.* Leaves with reniform glands. Flowers small.
3 *Bowden.* Leaves with reniform glands. Flowers large.
4 *Brugnon tardif.*
5 *Ford's seedling.* Leaves with reniform glands.
6 *Fox's seedling.*
7 *Freeman's.*
8 *Late French.* Leaves with reniform glands. Flowers small.
9 *Lyndoch.* Leaves with reniform glands. Flowers small.
10 *Pholia.* Leaves with reniform glands. Flowers small.
11 *Please's seedling.* Leaves with reniform glands. Flowers large.
12 *Sands's seedling.* Leaves without glands. Flowers large.
13 *Small orange.* Leaves with globose glands.
14 *Spring-grove.* Leaves with reniform glands. Flowers small.
15 *Veitch's.* Leaves without glands.

Selection of sorts. Forsyth recommends for a small garden; 1 *Fairchild's early.* 2 *Elruge.* 3 *Scarlet.* 4 *Newington.* 5 *Red Roman.* 6 *Temple.*—Those of the Dalkeith garden are as follow. Such as are marked with a † are planted against a hot wall. 1 *Roman* †. 2 *Du Tellier's* †. 3 *Elruge* †. 4 *Brugnon* †. 5 *Temple's* †. 6 *Murrey* †. 7 *Fairchild's.* 8 *Scarlet* †. 9 *Claremont* †. The surest way of having superior kinds is to select according to quality from the catalogue given.

Insects. "On account of the smoothness of the skin of the fruit," Forsyth says, "it suffers more from the wood-louse, earwigs, &c. than the peach; it will therefore be necessary to hang up a greater number of bundles of bean-stalks about these than about any other fruit trees. Wasps are also very destructive to nectarines, and the trees are very liable to be infested with the red spider."

Culture, &c. This is in all respects the same as for the peach. *Smooth*-fruited Peach or Nectarine. Fl. April, May. Tree 10 to 15 feet.

III. ARMENI'ACA (so called from the *apricot* being originally from Armenia). Tourn. inst. t. 399. Juss. gen. 341. D. C. fl. fr. 4. p. 485. prod. 2. p. 531.—Prùnus species of Lin. and others.

Lin. syst. *Icosándria, Monogýnia.* Drupe ovate-globose, fleshy, covered with a velvety skin, containing a nut or stone, which is acute at one end, and blunt at the other, with a furrow on both sides; the rest smooth, not wrinkled.—Small trees. Leaves when young convolute. Flowers rising before the leaves from scaly buds, solitary or few together, almost sessile.

1 A. vulga'ris (Lam. dict. 1. p. 2.) flowers sessile; leaves ovate or cordate, glabrous. ♄. H. Native of Armenia. Prùnus Armeniaca, Lin. spec. 679. *Malus Armeniaca* of the ancients, *Abricot* of the French, *Abricosenbaum* of the Germans, and *Albjcocco* of the Italians. The *apricot* is a low tree, of rather crooked growth, with broad, roundish, cordate or ovate, glandularly-serrated leaves. The flowers are white, tinged with dusky red. The fruit round, yellow both within and without, firmer than plums and most peaches, inclosing a smooth compressed stone, like that of the plum. The flowers appear in April on the shoots of the preceding year, and on spurs of two or more years old, and the fruit ripens in September. It is supposed to have originated in Armenia, but Regnier and Sickler assign it a parallel between the Niger and the Atlas; and Pallas states it to be a native of the whole of the Caucasus, the mountains there to the top being covered with it. It appears from Turner's herbal that the *apricot* was procured out of Italy by Wolfe, a French priest, gardener to Henry VIII. The fruit appears to have been known in Italy in the time of Dioscorides under the name of *præcocia*, probably as Regnier supposes from the Arabic *berkoch*, whence the Tuscan *bacoche* or *albjcocco*, and the English *apricock*, or as professor Martin observes, a tree, when first introduced, might have been called a præcox or early fruit, and gardeners taking the article a for the first syllable of the word, might easily have corrupted it to *apricocks*. The orthography seems to have been finally changed to *apricot* about the end of the last century, as Justice in 1764 writes *apricock*, and Kyle and Moredun in 1782 *apricot*.

Use. The fruit is used in a raw state at the dessert, and is esteemed next to the peach and nectarine; it is also made into marmalades, jellies, and preserves. Grossier says, that lozenges are made by the Chinese from the clarified juice, which, dissolved by water, yield a cool refreshing beverage; oil may be extracted from the nut, and the young shoots yield a fine golden cinnamon colour to wool.

Varieties. Parkinson in 1629 enumerates six; Rea in 1720 seven; the Luxembourg garden catalogue in 1800 fifteen; but the catalogue published by the Horticultural Society in the present year enumerates 41. They are as follow:

I. *Kernels bitter.*

* *Fruit small, round, early. Flowers small.*

1 ***Red masculine apricot*** (Forsyth, treat. p. 2.), *early red masculine* (Hort. soc. cat. no. 9.), *brown masculine* of some collections, *abricot précoce* or *abricotin* (Nois. man. 489.), *fruhe muscateller aprikose* (Baum. tasch. p. 389.), *abricot hatif musqué* (Duham. fruct. 1. p. 133. Mayer, nom. no. 1. t. 2. f. 1. Nois. jard. fr. t. 1.), *musqué hatif*, Hort. Leaves roundish, cordate. Fruit small. Skin dull, honey yellow. Flesh pale yellow, juicy, and tender, parting from the stone. An early and excellent fruit.

2 ***White masculine*** (Hort. trans. 2. ser. 1. p. 59.), *early white masculine* (Hort. soc. cat. no. 8.), *abricot blanc* (Duham. arb. fr. 1. p. 134.), *abricot pêche* (Mayer, pom. fr. 1. p. 30, &c.), *white Algiers* of some gardens. The chief recommendation of this and the former kind is their early time of ripening.

* * *Fruit large.*

† *Channel of the stone closed up.*

‡ *Flesh parting from the stone.*

3 *Large early apricot* (Hort. trans. 2. ser. 1. p. 66. Hort. soc. cat. no. 47. Pom. mag. t. 142.), *abricot gros précoce*, and *abricot de Jaen* (Aud. cat.), *abricot de St. Jaen rouge* in Languedoc, *abricot gros d'Alexandrie* in Provence, *die grosse fruhe apricose*, (Sickler, teutsche 12. t. 12.) Leaves large, broad, oval, tapering to the petiole. Fruit large, oblong, the back nearly straight. Skin downy, bright orange, red next the sun, pale orange on the other side. Flesh orange-coloured, juicy, rich. An excellent early sort, ripening about the middle of July.

4 *Roman apricot* (Langl. pom. p. 89. t. 15. f. 4. Pom. mag. t. 13. Hort. trans. 2. ser. 1. p. 61.), *Roman* or *common* (Switzer, fruit. gard. p. 100.), *common* (Forsyth), *abricot commun* (Duham. arbr. fr. 1. p. 135. t. 2. Nois. jard. fr. p. 2. t. 1.), *gemeine apricose* (Kraft, pom. austr. 1. p. 31. &c.), *grosse gemeine apricose* (Mayer, pom. fr. 1. p. 31. t. 3.), *Brussels apricot* and *Turkey apricot* of some collections. Leaves broad, cordate. Fruit middle-sized, dull straw-coloured, with a little dotting on the sunny side, of an orange red, inclining to oval. Flesh of a dull pale straw-colour, soft, soon becoming mealy, and requiring to be eaten rather before its maturity. This sort bears abundantly, and ripens about the beginning of August; but it is more fit for preserving than for the dessert, the juice being much less highly flavoured than that of many sorts.

5 *Blotched-leaved Roman apricot* (Hort. trans. 2. ser. 1. p. 62.), *blotched Turkey, variegated Turkey, striped Turkey* (Hort. soc. cat. no. 27.), *maculè* of the French, *abricotier à feuilles panachées* (Duham. arb. fr. 1. p. 145.), *abricot commun à feuilles panachées de Jaune* (Noisett. jard. fr. p. 2.), *abricot bunte oder gefleckte apricose*, (Mayer, pom. fr. 1. p. 34. t. 4.) Leaves blotched with a pale yellow or golden colour. Fruit much like that of the *Roman* or *common apricot*.

6 *Royal apricot* (Pom. mag. 1. t. 2. Hort. trans. 2. ser. 1. p. 63.), *abricot royale*, (Bon. jard. 1827. p. 288. Nois. man. 2. p. 490.) Leaves large, roundish cordate or ovate. Fruit about the size of that of the *moorpark*, rather oval, of a dull yellow colour, slightly coloured with red in a small space. Flesh pale orange, very firm, juicy, sweet, and high flavoured, with a slight degree of acidity. This is a very valuable sort, and ripens about 10 days sooner than the *moorpark*.

7 *Brussels apricot*, (Hort. trans. 2. ser. 1. p. 64.) Fruit oval, compressed, of a pale orange colour, acquiring a brown tinge, with deep blood red specks next the sun. The flesh is juicy, rather crisp, and the fruit is most excellent for preserving.

8 *Shipley's apricot* (Hort. soc. cat. no. 24. trans. 2. ser. 1. p. 64.) *Blenheim, Shipley's large, Miss Shipley's*, of various collections. A fine looking fruit, very like the *Roman*, but larger, oval, compressed. Skin clear, yellow, minutely speckled with brown. Flesh of a very bright deep orange, juicy, with a pleasant sweetish acid flavour, without much scent. The fruit is rather more downy than the *Roman*, which it resembles. It ripens about the last week in July.

9 *Almond apricot* (Hort. trans. 2. ser. 1. p. 65.), ***abricot amandier***, (Hort. soc. cat. no. 34.) In form like the *Roman*. Skin pale straw coloured, blotched with pinkish spots next the sun. Flesh pale yellow, dry, with very little flavour. This sort has little or no merit. It ripens about the end of July.

‡ ‡ *Flesh adhering to the stone.*

10 ***Montgamet apricot*** (Hort. trans. 2. ser. 1. p. 65.), *albergier de Montgamet* (Hort. soc. cat. no. 31.) Leaves broad and rounded at the base, and acuminated at the apex. Fruit small, about half as large as the *white masculine*, which it resembles outwardly. Skin pale clear yellow, slightly tinged with red next the sun. Flesh firm, watery, juicy, but without much flavour. This sort is not much esteemed, and is chiefly used for preserving. It ripens at the end of July.

† † *Channel of the stone impervious.*

11 *Moorpark apricot* (Nicol, gard. kal. p. 167. Brookshaw, pom. brit. t. 23.), *Anson's, Dunmore's, Dunmore's Breda, Temple's, imperial Anson, Oldaker's moorpark, Sudlow's moorpark* (Hort. soc. cat.), *peach apricot* (Forsyth, treat. 1. p. 4.), *abricot de Nancy* (Duham. arb. fr. 1. p. 144. t. 6. &c.), *abricot pêche* (Duham. arb. fr. 1. p. 144.), *abricot de Tours* (Hort. soc. cat. no. 51.), *abricot pêche, abricot de Nuremberg ou de Wirtemberg, abricot de Piemont*, Aud. cat. Leaves large, roundish, acuminated. Fruit large, roundish, compressed. Skin of a brownish orange colour. Flesh dull reddish-orange, juicy, and of a high and excellent flavour, peculiar to this sort, never liable to become mealy. This is one of the best of the kinds.

12 *Hemskirke apricot* (Hort. soc. cat. no. 4. Pom. mag. 1. t. 11. Hort. trans. 2. ser. 1. p. 69.). Leaves broad, much like those of the *moorpark*. Fruit rather large, roundish, slightly compressed, very like the *moorpark*. Flesh very bright, deep, clear orange, tender, and juicy, with a particular rich delicate flavour. This sort comes next to *moorpark* for its excellence.

II. *Kernels sweet.*

* *Flesh parting from the stone.*

13 *Breda apricot* (Hort. soc. cat. no. 2. Pom. mag. t. 146.), *Brussels* or *Breda* (Langley, pom. p. 89.), *abricot de Hollande ou Amande Aveline* (Duham. arb. fr. 1. p. 138. t. 4. &c.), *Hollandische Bredäische oder Ananas apricose* (Baumann, tasch. p. 389.) *Holland* (Forsyth, treat. p. 5.), *abricot de Nancy* (Sickler, teutsche, p. 299.) Leaves broadly cordate, acuminated. Fruit rather small, roundish. Skin of a deep brownish colour where exposed to the sun. Flesh deep orange, juicy, rich and high flavoured. Kernel sweet, like a hazel-nut. Ripens from the beginning to the middle of August on walls, and its perfection is considerably prolonged on standards.

14 *Angoumois apricot* (Duham. arb. fr. p. 137. t. 3. Hort. trans. 2. ser. 1. p. 71.), *apricose aus dem Angoumois die rothe abricose* (Mayer, pom. fr. p. 32.), *rothe Angoumois* (Baumann, tasch. p. 388.). Leaves rather small, oval, tapering to both extremities. Fruit about the size of the *Breda*, and like it in shape. Skin yellow where shaded, but of a very deep reddish brown on the exposed side. Flesh reddish orange, juicy, sweet, mixed with a slight acidity, very agreeable. Kernel sweet, like a nut. This sort ripens rather earlier than the *Breda*.

15 *Musch-musch apricot* (Nois. man. p. 410. Hort. trans. 2. ser. 1. p. 72. t. 1.) *Abricot d'Alexandrie*, (Kraft. pom. austr. p. 29. t. 58. f. 1.). Leaves roundish, subcordate, acuminated, doubly serrated. Fruit about the size of the *masculine*, roundish, compressed. Skin straw coloured next the wall, deep orange in the sun, slightly downy. Flesh tender, very sweet, semi-transparent. Kernel very sweet, like a nut. It appears to be a native of the oases of Upper Egypt, where the fruit is gathered and dried in large quantities for sale. It is not sufficiently known to judge how far it may become a valuable variety in this country.

16 *Turkey apricot* (Mill. dict. no. 5. Hort. trans. 2. ser. 1. p. 73.). *Large Turkey* of some nurseries. *Abricot de Nancy, La Bretonnerie* (*Nois jard.* fr. p. 3.) Leaves middle-sized, roundish, acuminated. Fruit rather largish, very handsome, deep yellow, with a number of orange red spots and blotches next the sun, nearly spherical, not compressed. Flesh pale yellow, firm, juicy, sweet, with a little acid, very rich and excellent. Kernel sweet, like that of the almond. Ripens on a south wall about the middle of August, and in other situations may be prolonged to the end of the month. It is an excellent sort.

* * *Flesh adhering to the stone.*

17 *Orange apricot* (Switzer, fruit gard. p. 100. Hort. trans. 2. ser. 1. p. 74.), *early orange, royal orange, royal George, royal Persian* (Hort. soc. cat.), *D'orange* (Knoop, pom. p. 65.), leaves flat, pendulous, tapering. Fruit almost spherical, downy, of a more intense orange colour than other *apricots*, interspersed with some minute specks. Flesh tender, bright orange, in some seasons juicy, but not highly flavoured. Kernel sweet. Generally an abundant bearer, and is chiefly useful for preserving.

The remaining sorts are described in books, upon which no sufficient information has been procured, but none of these are of any importance.

† *List of apricots not sufficiently known, but the greater part of them are not worth notice in this country.*

1 *Albergier ordinaire.* 2 *Albergier à fruit long.* 3 *Albergier à fruit rond.* 4 *Albergier de Tours.* The *albergiers* are of little value in this country; in France they are produced from the stone, and are preferred for stocks. 5 *Algiers.* 6 *Angoumois hatif.* 7 *Angoumois tardif.* 8 *Angoumois rouge.* 9 *Blanc gros.* 10 *Brussels.* 11 *De Carpentras musqué.* 12 *George the Fourth.* 13 *De Luxembourg.* 14 *White masculine, early white masculine, blanc, white Algiers?* 15 *Musqué mi-nain.* 16 *Royal peach apricot.* 17 *Persian.* 18 *Persique.* 19 *De Portugal, male.* 20 *De Provence.* 21 *Russian.* 22 *Saint Cross.* 23 *Transparent.* 24 *Turkey, De Nancy* of some, *large Turkey.*

Choice of sorts. Those grown in the Dalkeith gardens are as follow:—1 *Moorpark.* 2 *Breda early.* 3 *Masculine, early.* 4 *Brussels.* 5 *Orange, early.* The list given should be examined, and the sorts chosen according to their quality.

Propagation.—New varieties are procured from the seed as in the peach, and approved sorts are perpetuated by budding, generally on muscle or plum stocks. The *Brussels* and *Breda*, when intended for standards, are budded on the St. Julian plum, which produces a strong clean stem, but for the rest any stock will do, provided it be free and thriving. Knight (hort. trans. 2. p. 19.) recommends budding the *moorpark* on an *apricot* stock, which he has found prevents the trees from becoming diseased and debilitated, which they generally do on plum stocks. Budding *apricots* is generally performed early in the season, from the middle of June to the end of July. For dwarfs, the bud is inserted 6 or 8 inches from the ground; and the sorts are sometimes twice budded, or one variety budded on another, which is said to keep the trees in a more dwarf state. For riders or standards they are budded on plum stocks, 4 or 5 feet from the ground. Miller prefers half standards, budded 3 or 4 feet from the ground; the trees so produced being less liable to suffer from high winds.

Choice of plants.—Abercrombie prefers trees of 2 or 3 years' growth from the bud, and fit for immediate bearing. Forsyth makes choice of those plants which have the strongest and cleanest stems; and if he can such as have been headed down of 2 or 3 years' growth, as they will bear and fill the walls much sooner than those which have not been so treated. He says, "make choice of trees with one stem, or if they have two, one of them should be cut off; for by planting those with two stems, the middle of the tree is left naked, and, of course, one third of the wall remains uncovered."

Season of planting.—Abercrombie says the best season is from the fall of the leaf until February or March. Forsyth says the best time is in August, when the leaf begins to fall.

Final planting.—The *Breda* and *Brussels* are occasionally planted as standards or espaliers in warm situations; and in these states, in fine seasons, produce more highly flavoured fruit than on walls. The other varieties are generally planted against walls, which Miller and Forsyth say should have an east or west aspect, for if they are planted full south, the heat causes them to be mealy before they are eatable. The borders should not be less than 6 or 8 feet wide, and 2 or 2½ feet deep. The soil a light rich loam, perfectly dry below. Standard *apricots*, according to Abercrombie, do not come into bearing under a considerable number of years, sometimes 10 or 12; but then the fruit, in a congenial situation, is abundant, and of the finest flavour. The training of the plant to a trellis, almost touching the south wall, will improve the flavour of the *apricot*, and render it more succulent than if trained against the wall.

Mode of bearing. The varieties of the *apricot* in general bear upon the young shoots of last year, and casually upon small spurs, rising on the two or three years' old fruit branches. The *Moorpark* bears chiefly on last year's shoots, and on close spurs formed on the two years' old wood. The bearing shoots emit the blossom-buds immediately from the eyes along the sides; and the buds have a round and swelling appearance.

Pruning wall trees.—The general culture of wall *apricots* comprehends a summer and winter course of regulation by pruning and training.

Summer pruning.—Begin the summer pruning in May, or early in June, and continue it occasionally in July and August, &c. This pruning is principally to regulate the young shoots of the same year. In the first place take off close all the foreright shoots, and others that are ill-placed or irregular, or too luxuriant in growth, taking care to retain a competent supply of choice, well-placed, moderately growing side shoots, with a good leader to each mother branch. Continue these mostly at their full length all the summer, regularly trained in close to the wall, to procure a sufficiency to choose from in the general winter pruning for new bearers next year. If the summer regulation commence early, while the shoots are quite young, and, as it were, herbaceous, 1, 2, 3, or 4 inches long, those improper to retain may be detached with the finger and thumb; but when of firmer growth they must be removed with the knife. If any very strong shoot rise in any casually vacant part, it may be topped in June, which will cause it to produce several laterals the same year of more moderate growth, eligible for training in to supply the vacancy.

Thinning the fruit.—Sometimes the fruit are much too numerous, often growing in clusters, in which case thin them in May and the beginning of June in their young green state, leaving the most promising singly at 3 or 4 inches' distance, or from about 3 to 6 on the respective shoots, according to their strength. The apricots so thinned off, and the first principal green crop are esteemed very fine for tarts.

Winter pruning.—This may be performed either at the fall of the leaf, or in mild intervals from that time until the beginning of March. When it is deferred until the buds begin to swell, the promising shoots can be the better distinguished. It comprehends a general regulation, both of the last year's shoots and the older branches. A general supply of the most regular placed young shoots must be every where retained for successional bearers the ensuing year. Cut out some of the most naked part of the two last years' bearers, and naked old branches not furnished with competent supplies of young wood or with fruit-spurs, either to their origin, or to some well-directed lateral, as most expedient, to make room for training a general supply of the new bearers retained, and cut away all the decayed wood and old stumps. Generally observe in this pruning to retain one leading shoot at the end of each branch, either a naturally-placed terminal, or one formed by cutting, where a vacuity is to be furnished with a proper leader. Let the shoots retained for bearers be moderately shortened; strong shoots reduced in the least proportion, cutting off one-fourth or less of their length; from weak shoots take away the third, and sometimes half. This shortening will conduce to the production of a competency of lateral shoots the ensuing summer from the lower and middle placed eyes; whereas without it, the new shoots would proceed mostly from the top, and leave the under part of the mother branches naked, and the lower and middle part of the tree unfurnished with proper supplies of bearing wood. Never prune below all the blossom-buds, except to provide wood, in which case, cut nearer to the origin of the branch, as in these trees, small fruit-spurs, an inch or two long, often appear on some of the two or three years' branches, furnished with blossom-buds; these spurs should generally be retained for bearing; but when any project foreright from the wall, cut them in accordingly, for the spurs projecting above 3 inches, though they may set their fruit, seldom ripen it, unless the season and situation are both favorable. The thick clusters of spurs, which are apt to form on aged trees, ought also to be thinned. As each tree is pruned, nail it, laying in the branches and shoots from 3 to 6 inches' distance, straight, and close to the wall.

Pruning espaliers.—As directed for wall trees.

Pruning standards.—Half standards will require only occasional pruning, to regulate any branches which are too numerous, too extended, or cross placed, and to remove any casually unfruitful parts, and dead wood. At the same time the regular branches forming the head of the tree should not be generally shortened, but permitted to advance in free growth.—*Abercrombie.*

Training the apricot tree.—This is generally done in the fan manner, which is the method of training not only for the *apricot*, but for wall trees generally. Forsyth recommends a mode between the fan and horizontal manner.

Renovating old decaying trees.—Forsyth had the greatest success in this department of fruit tree culture, by cutting down to within a foot or 18 inches, or more occasionally, of the ground, and then renewing the soil of the border.

Gathering.—The apricot is apt to become mealy if left on the tree till over ripe. It should be gathered with the peach-gatherer while moderately firm.

Insects, diseases, &c.—As the fruit ripens early, it is very liable to be attacked by wasps and large flies, which should be kept off by a net, stretched a foot or more apart from the wall or trellis. The other insects, and the diseases of the tree are the same as in the peach tree; but it is not nearly so obnoxious to their attacks, probably owing to the comparatively hard nature of its bark and wood, and coriaceous leaves.

Forcing the apricot.—The *apricot* does not force well; but a few are sometimes tried in pots, and placed in a peach-house and forced in the same manner as peaches and nectarines, see p. 492.

Common Apricot. Fl. Feb. Mar. Clt. 1548. Tr. 10 to 15 ft.

2 A. DASYCA′RPA (Pers. ench. 2. p. 36.) leaves ovate, acuminated, serrated; petioles glandular; flowers pedicellate; pedicels filiform. ♄. H. Native country unknown. A. atropurpúrea, Lois. in Duham. edit. nov. 5. p. 172. t. 15. f. 1. Prùnus dasycárpa, Ehrh. bietr. 6. p. 90. Lodd. bot. cab. 1250. Lindl. bot. reg. 1243.

Prùnus Armenìaca nìgra, Desf. cat. ed. 2. p. 206. In a specimen that flowered in the Botanical Garden at Geneva, the calyx was purple and 6-lobed, the petals 6 in number, and the stamens 24. This species is called *Abricot noir* in French gardens, the fruit black and eatable. It is supposed to be a native of the Levant. The flowers are white.

Thick-fruited Apricot. Fl. Apr. Clt. 1800. Tr. 10 to 15 ft.

3 A. persicifòlia (Lois. in Duham. ed. nov. 5. p. 172. t. 552. f. 1.) leaves ovate, short, or lanceolate, lobulate; petioles glandular; flowers pedicellate. ♄. H. Native country unknown. Flesh of fruit variegated with yellow and red, eatable. Called in France *Abricot noir à feuilles de pêcher*, or *peach-leaved black apricot*. Corolla white.

Peach-leaved Apricot. Fl. Mar. April. Clt. 1800. Tree 10 to 15 feet.

4 A. Sibi'rica (Pers. ench. 2. p. 36.) leaves ovate, acuminated; petiole glandless. ♄. H. Native of the ulterior mountains of Siberia. Amm. ruth. 272. t. 29. Prùnus Sibírica, Lin. spec. p. 679. Pall. ross. 1. p. 15. t. 8. This tree is much like the common *apricot* in appearance, but smaller in all its parts; the petioles are longer and destitute of any gland; the leaves are of the form of those of the birch tree; the fruit is small, juiceless, and sour or acid, and contains a bitter kernel. In transalpîne Dauria, the north side of the mountains in May are clothed with the purple flowers of *Rhododéndron Daúricum* and the south side with the rose-coloured blossoms of this tree.

Siberian Apricot. Fl. Apr. May. Clt. 1788. Sh. 4 to 6 ft.

5 A. Brigantì'aca (Pers. ench. 2. p. 36.) leaves somewhat cordate, acuminated, sharply toothed; the teeth numerous, and lapping over each other; flowers glomerate, almost sessile. ♄. H. Native of Dauphiny, near (Brigantia) Briançon. Prùnus Brigantìaca, Vill. dauph. 3. p. 535. Lois. in Duham. ed. nov. 5. t. 59. Flowers white or pink. From the seeds of this tree a fixed oil, commonly called *huile de marmote* is obtained by expression. It is used instead of olive or almond oil. Perhaps sufficiently distinct from *A. Sibírica*.

Briancon Apricot. Fl. Mar. April. Clt. 1819. Sh. 6 to 8 ft.

Cult. The species are all increased by budding on the same kind of stocks recommended for the common *apricot*. They grow in any kind of soil, and are very ornamental for shrubberies in spring.

IV. **PRU'NUS** (said to be a word of Asiatic origin, the wild plant, according to Galen, being called *προυμνος*, in Asia, from the Greek *προυνη*, which occurs in Theophrastus). Tourn. inst. t. 398. Juss. gen. 341. D. C. fl. fr. 4. p. 483. prod. 2. p. 532.—Prunóphora, Neck. elem. no. 719. Prùnus, species of Lin. and others.

Lin. syst. *Icosándria, Monogýnia.* Drupe ovate, or oblong, fleshy, quite glabrous, covered with a kind of glaucous bloom, containing a compressed nut or putamen, which is acute at both ends, and a little furrowed on the margin, the rest smooth. Trees or shrubs. Leaves convolute when young. Flowers usually disposed in umbellate fascicles, solitary on the pedicels, rising either after or before the leaves.

1 P. spinòsa (Lin. spec. 681.) branches spinose; peduncles solitary; calyx campanulate, with obtuse lobes, which are longer than the tube; leaves obovate-elliptic, or ovate, smooth except when young, sharply and doubly serrated; fruit globose. ♄. H. Native of Europe and America; plentiful in Britain, in hedges and thickets. Vahl. fl. dan. t. 926. Smith, engl. bot. 842. Woodv. med. bot. t. 84. Blackw. icon. t. 494. P. sylvéstris, Bauh. pin. 444. Σπονδιας, Theophrastus. Spìnus, Virgil. Flowers white, rising before or with the leaves. Fruit sour or acid, black, roundish, covered with bluish bloom. The *black thorn* is not so good as the *white thorn* for hedges, because it spreads its roots wide and encroaches upon the pastures; but it is excellent for dead fences, and to lay in covered drains. The fruit, when ripe, makes an excellent preserve; unripe the inspissated juice forms the German acacia, and affords an almost indelible ink, used to mark linens. It is used in home-made wines, to communicate the colour and roughness of red port. The tender leaves, dried, are sometimes used as a substitute for tea, and is the best substitute that has been yet tried, and it is said they have been used in mixing with the Chinese tea. Knight and others consider the *sloe* as the parent of the bullace plum (*P. insitìtia*) and the varieties of the common plum (*P. doméstica*). Sloes have been employed as a styptic medicine from the time of Dioscorides. They have been recommended in diarrhœas and hæmorrhages, and as gargles in the swellings of the tonsils and uvula. Dr. Cullen considers them as the most powerful of acerb fruits, and as agreeable and useful astringents. The flowers with their calyxes, are moderately purgative: the dose is an ounce infused in water. As a shrubbery plant the *sloe* is most ornamental, blossoming before all others of the *Prùnus* tribe.

Var. α, vulgàris (Ser. mss. in D. C. prod. 2. p. 532.) leaves obovate-elliptic; fruit dark purple. P. spinòsa, Lois. in Duham. ed. nov. 5. p. 185. t. 54. f. 1. There is a variegated-leaved kind of this.

Var. β, microcárpa (Wallr. exsic. cent. 1. no. 45.) leaves elliptic, narrow, bluntish; fruit smaller.

Var. γ, macrocárpa (Wallr. exsic. cent. 1. no. 45.) leaves obovate, bluntish; fruit large, dark purple. Native of Germany. Perhaps this is *P. doméstica*, var. ζ, *Juliàna.*

Var. δ, ováta (Ser. mss. in D. C. prod. 2. p. 532.) leaves ovate-roundish.—Blackw. herb. t. 494.

Thorny Plum, Black-thorn, or Sloe. Fl. Mar. Apr. Brit. Shrub 10 to 15 feet.

2 P. insiti'tia (Lin. spec. 680.) branches spiny at the apex; peduncles twin; leaves ovate or ovate-lanceolate, convolute, downy beneath; fruit roundish. ♄. H. Native of Germany and France, as well as of Britain, in hedges. Smith, engl. bot. 841.—Duham. arb. 2. t. 41. Black Bullace tree, Mill. dict. no. 31. The stipulas are fringed. The flowers are white. The fruit is globular, black, or white, of an acid taste, but so tempered by sweetness and roughness as not to be unpleasant, especially after it is mellowed by frost. A conserve is prepared by mixing its pulp with thrice its weight of sugar. The bark of the roots and branches is considerably styptic. An infusion of the flowers, sweetened with sugar, is a mild cathartic. It varies with black and white or wax-coloured fruit.

Grafted or Bullace-plum. Fl. Mar. Apr. Brit. Sh. 10 to 15 ft.

3 P. ca'ndicans (Balb. cat. taur. 1813. p. 62.) peduncles short, twin, or tern, and are as well as the branches pubescent; leaves broadly ovate, white beneath; stipulas very narrow, deeply toothed, length of petioles; calyx campanulate. ♄. H. Native country unknown. Willd. enum. suppl. p. 32. Lindl. bot. reg. 1135. Flowers white.

White-leaved Plum. Fl. Apr. Clt. 1820. Shrub 4 to 6 ft.

4 P. Cocomi'lia (Tenore, prod. suppl. 2. p. 67. cat. 1819. p. 46.) peduncles short, twin; leaves obovate, glabrous on both surfaces, crenulated, with the crenatures glandular; drupe ovate-oblong, mucronulate. ♄. H. Native of Calabria, in hedges. Flowers white. Fruit yellow, bitter, or sour. The bark of this shrub is febrifugal, and is spoken very highly of by Tenore: it is a specific for the cure of the dangerous fevers of Calabria, where it grows.

Cocomilia or Calabrian Plum. Fl. April. Clt. 1824. Sh. 2 to 3 feet.

5 P. tomentòsa (Thunb. fl. jap. 203.) branches unarmed;

peduncles solitary; leaves ovate, acute, serrated, villous above, tomentose beneath as well as the petioles. ♄. F. Native of Japan. Flowers white. Drupe the size of a pea.

Tomentose Plum-tree. Shrub 6 to 8 feet.

6 P. MARI'TIMA (Wangh. amer. 103. ex Willd. enum. 519.) peduncles twin; leaves ovate-lanceolate, serrated; fruit small, round, sweet, dark blue. ♄. H. Native of North America, in sand by the sea-side. Flowers white. Fruit size of a pigeon's egg, dark purple, good to eat.

Sea-side Plum. Fl. Apr. May. Clt. 1818. Sh. 5 to 8 feet.

7 P. ACUMINA'TA (Michx. fl. bor. amer. 284.) flowers? calyx glabrous; leaves oblong-oval, ending in a long, acute acumen; drupe ovate, acuminated, on a long peduncle. ♄. H. Native of Virginia. Perhaps the same as *P. maritima.*

Acuminated-leaved Plum. Shrub 6 to 10 feet.

8 P. PUBE'SCENS (Poir. suppl. 4. p. 584. but not of Pursh) flowers usually solitary, almost sessile; leaves ovate, thickish, and roundish, or ending in a short acumen, hardly pubescent, unequally toothed; petioles pubescent, short; fruit oval. ♄. H. Native country unknown. Flowers white.

Pubescent Plum. Fl. May. Clt. 1818. Shrub 2 to 3 feet.

9 P. DOME'STICA (Lin. spec. 680.) flowers usually solitary; leaves ovate-lanceolate, convolute; branches unarmed. ♄. H. Native of the south of Europe, in elevated places. Smith, engl. bot. 1783. Flowers white. Fruit variable, both in shape and colour. All the varieties of garden plums belong to this species. The *plum* is called *prune*, in French, *prugno* in Italian, and *pflaunzen-baum* in German. It rises usually to the height of 15 feet, branching into a moderately spreading head. The natural colour of the fruit is generally considered to be black, but the varieties in cultivation, yellow, blue, and green, and of different shapes and flavours. It is a native of or naturalized in Britain, very frequently found in hedges; but its original country is supposed to be Asia Minor; and according to Pliny it was brought from Syria into Greece, and thence into Italy.

Use.—The best varieties are esteemed a delicious dessert fruit, and the others are used in pies, tarts, conserves, and sweetmeats. A wholesome wine is also occasionally made from them, with or without other fruits or ingredients. Plums, Professor Martin observes, when sufficiently ripe and taken in moderate quantity, are not unwholesome, but in an immature state they are more liable to produce diarrhœa and similar diseases than any other fruit of the class. Considered medicinally, they are emollient, cooling, and laxative, especially the French prunes, which are peculiarly useful in costive habits. The wood of the *plum* is used in turnery, cabinet work, and in making musical instruments.

Varieties.—Tusser enumerates 10, Parkinson 60. In the Luxembourg Catalogue are 68, but in the Horticultural Catalogue for the present year there are 274, which are here disposed according to the colour and shape of the fruit.

Var. α, *armenioïdes* (Ser. ex D. C. prod. 2. p. 533.) fruit oval or roundish, yellow or greenish yellow; stone blunt. To this belong the following varieties of *plum.*

1 *Apricot, abricotée* (Duham. arb. fr. 2. p. 93. no. 20. t. 13.). Wood smooth. Fruit yellow, oval, middle-sized; flesh adhering to the stone. A bad kitchen fruit, ripening in the end of August.

2 *Abricotée hâtive*, Lois. in Duham. ed. nov. 5. p. 195. no. 23.

3 *Bonne deux fois l'an.* Wood downy. Fruit small, greenish-yellow, oblong; flesh adhering to the stone. An useless fruit, ripening in August and September.

4 *Bryanston-gage.* Wood smooth. Fruit roundish, greenish-yellow, middle-sized; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of October.

5 *White bullace.* Wood downy. Fruit round, yellow, small; flesh adhering to the stone. A kitchen and preserving fruit, ripening in October. An abundant bearer.

6 *Yellow Roman bullace.*

7 *Coe's golden drop, Coe's imperial golden. Golden drop, new golden drop, Burry seedling, Fair's golden drop, golden gage.* Wood smooth. Fruit oval, large; flesh adhering to the stone. One of the most valuable plums either for the table or for preserving, and a good bearer. Ripens in the end of September.

8 *White damson, small round damson.* Wood downy. Fruit oval, yellow; flesh adhering to the stone. A second-rate kitchen fruit, ripening about the end of September.

9 *Dennison's Albany.* Fruit yellow.

10 *Dennison's late.* Fruit oval, yellow, middle-sized. A good preserving fruit, ripening in October.

11 *Drap d'Or, mirabelle double* (Duham. arb. fr. 2. p. 96.), *mirabelle grosse, abricotée hâtive* (Lois. in Duham. ed. nov. 5. p. 195. no. 23.). Wood downy. Fruit small, round, yellow; flesh separating from the stone. An excellent dessert fruit, precedes the *green-gage* in ripening, and resembles it in quality.

12 *Chancellor gage.* Wood smooth. Fruit middle-sized, round, yellow. A second-rate dessert fruit.

13 *Gisborn's, Gisborn's early, Paterson's.* Wood downy. Fruit oblong, middle-sized, yellow; flesh separating from the stone. A second-rate kitchen fruit, ripening in the middle of August. A great bearer.

14 *Superior green-gage.* Wood downy. Fruit oval, yellow, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning of September.

15 *Guimaraen.* Wood downy. Fruit middle-sized; flesh adhering to the stone. A first-rate preserving fruit, ripening in the beginning of September.

16 *Mirabelle, mirabelle petite, mirabelle jaune.* Wood downy. Fruit small, roundish-ovate, yellow; flesh separating from the stone. A first-rate dessert fruit, and good for preserving. Ripens in the middle of August.

17 *Yellow Orleans.*

18 *Peter's large yellow.* Wood downy. Fruit middle-sized, oval; flesh adhering to the stone. A good dessert fruit, ripening in August. Bears considerable resemblance to the *green-gage*, but is not so good.

19 *Washington, new Washington, Franklin, Bolmar, Bolmar's Washington.* Wood downy. Fruit large, roundish-oval, yellow. Tree vigorous, bears well as a standard. A first-rate dessert fruit, ripening in September.

Var. β, *Claudiàna* (Pers. ench. 2. p. 35.) fruit roundish, rather depressed, green, and usually spotted with purple, rarely purple; flesh greenish yellow, more or less sugary; umbilicus hardly depressed; putamen or stone ending in a short mucrone. To this variety belong the following sorts of plums.

1 *Green-gage, brugnon green-gage, Reine Claude, abricot vert, vert bonne, Dauphine, Reine Claude blanche, grosse reine, grosse reine Claude* (Duham. arbr. fr. 2. p. 89. no. 25. t. 11.), *Damas vert, Sucrin vert, Drap d'Or* of some. Wood smooth. Fruit middle-sized, round, greenish yellow; flesh separating from the stone, ripening about the middle of August. Allowed by all to be one of the very best plums both for the dessert and for preserving.

2 *Aston green-gage.*

3 *Cowperthwait's green-gage.*

4 *Derbyshire green-gage.*

5 *Gonne's green-gage.*

6 *Hoo green-gage.*

7 *Isleworth green-gage, Wilmot's green-gage, Wilmot's new green-gage, Wilmot's late green-gage.*

8 *Late green-gage.*

9 *New green-gage.*

10 *Isle vert, de Savoye, Grüne inselpflaume.*

11 *Luscombe's nonsuch.* Wood smooth. Fruit large, greenish-yellow, round; flesh adhering to the stone. A second-rate dessert fruit, ripening in the end of August.

12 *White Orleans.* Wood smooth. Fruit round, greenish white; flesh adhering to the stone. A kitchen fruit, ripening in the middle and end of August.

13 *Reine Claude blanche, petite espèce, petite reine Claude.* Duham. arb. fr. 2. p. 91. no. 26.

14 *Reine Claude à fleur semidouble, reine Claude à fleurs demidoubles.* Flowers semidouble.

15 *Reine Claude violette* (Lois. in Duham. ed. nov. vol. 5. p. 195. no. 22. t. 57. f. 2.), *purple gage.* Wood smooth. Fruit middle-sized, purple; flesh separating from the stone. A first-rate dessert fruit, ripening in October. Succeeds as a standard, and is a good bearer.

Var. γ, Catherínea (Ser. mss. in D. C. prod. 2. p. 534.) fruit roundish-obovate or roundish, wax-coloured or yellow; umbilicus exserted; flesh sweet, hardly sapid; stone bluntish, usually rather prominent at the base, and truncate. Prùnus doméstica cèrea, Lin. spec. 680. To this variety belong the following sorts of plums.

1 *Abricotée blanche.* Lois. in Duham. ed. nov. 5. p. 205. t. 60. f. 10.

2 *Abricotée blanche à longue queue grosse.*

3 *Bingham's.* Wood downy. Fruit large, yellow, oblong; flesh adhering to the stone. A second-rate dessert kind, ripening in September.

4 *Bricette.* Duham. arb. fr. 2. p. 97. no. 31. t. 29. t. 5.

5 *Damas ambre.*

6 *Damas ballon.*

7 *Damas ballon jaune et vert.*

8 *Damas ballon rouge et jaune.*

9 *Gros damas blanc* (Duham. arb. fr. 2. p. 72. no. 7. t. 3. f. 2.), *gros damas blanc hâtif, damas blanc très hâtif.* Wood smooth. Fruit yellow, oval, middle-sized; flesh separating from the stone. A second-rate kitchen fruit, ripening in the middle of September.

10 *Petit damas blanc* (Duham. arb. fr. 2. p. 71. no. 6. t. 3.). Fruit small, yellow, oval. Wood smooth. Flesh separating from the stone. A second-rate kitchen fruit, ripening in the beginning and middle of September.

11 *Damas dronet.* Wood smooth. Fruit oval, middle-sized, yellow; flesh separating from the stone. Ripens in August.

12 *Damas d'Espagne.*

13 *White damask.*

14 *Downton impératrice.* Wood smooth. Fruit obovate, middle-sized; flesh separating from the stone. A first-rate dessert and preserving fruit, ripening in October.

15 *White imperatrice, impératrice blanche* (Duham. arb. fr. 2. p. 106. t. 18. f. 2.). Wood smooth. Fruit white, obovate, middle-sized; flesh separating from the stone. A second-rate dessert and preserving fruit, ripening in the beginning and middle of August.

16 *Jaune hâtive* (Duham. arb. fr. 2. p. 66. f. 1.), *jaune de Catalogne, Catalonian, white primordian, amber primordian, St. Barnabé, D'Avoine.* Wood downy. Fruit oval, yellow, middle-sized; flesh separating from the stone. A dessert fruit, ripening in the end of July. Only to be recommended for its earliness.

17 *Mirabelle tardive.* Fruit oval, purple and yellow, small; flesh separating from the stone. A preserving fruit, ripening in the beginning of September.

18 *White perdrigon, perdrigon blanc* (Duham. arb. fr. 2. p. 84. no. 2. t. 8.), *brignole* (Calv. pep. 2. p. 187.). Wood downy. Fruit middle-sized, yellow, oval; flesh adhering to the stone. A first-rate preserving fruit, ripening in the end of August. This and the *blue perdrigon* furnish the brignole prunes of the shops.

19 *Yellow perdrigon.*

20 *Gros perdrigon de brignole.*

21 *Saint Catharine* (Duham. arb. fr. 2. p. 109. t. 19.). Wood smooth. Fruit oblong, middle-sized, yellow; flesh adhering to the stone. A first-rate dessert and preserving fruit, ripening in the middle of September. It is a good bearer.

22 *Saint Julien.* Like the last. Used chiefly for stocks for peaches.

23 *Grosse virginale blanche.* Lois. in Duham. ed. nov. 5. p. 206. no. 62. t. 62. f. 1.

24 *White pear.* Fruit pale yellow, obovate, middle-sized; flesh adhering to the stone. A worthless kitchen fruit, ripening in the end of August. Bears abundantly. Grown chiefly for stocks for peaches.

Var. δ, Aubertiàna (Ser. mss. in D. C. prod. 2. p. 534.) fruit ovate, obtuse, yellow on all sides; umbilicus depressed; stone hardly prominent at the base. To this variety belong the following kinds of plums.

1 *White magnum bonum, yellow magnum bonum, dame Aubert* (Duham. arbr. 2. p. 107. no. 41. t. 2.), *dame Aubert blanche, dame Aubert jaune, grosse luisante, impériale blanche* (Nois. jard. fr. 143. no. 37. t. 57. and t. 58. f. 4.), *impératrice jaune* (Calv. pep. 2. p. 196. ex Lois. l. c.), *egg plum, Wentworth, white Holland, white Mogul.* Wood smooth. Fruit large, oval, yellow, and white; flesh adhering to the stone. A second-rate ki[illegible] fruit, ripening in September.

2 *New magnum bonum.*

3 *Prune datte* (Duham. arb. fr. 2. p. 202.). Fruit yellow, oval, middle-sized. A preserving fruit, ripening in September.

4 *Rognon d'ane.* Calv. pep. 2. p. 202.

5 *Prune moyenne de Bourgogne.* Calv. pep. 2. p. 202. ex Lois. l. c. p. 206. no. 61.

Var. ε, Myrobálana (Lin. spec. 680.) fruit globose, depressed at the base, red; umbilicus depressed; stone mucronulate; sepals narrow. Prùnus cerasífera, Ehrh. beitr. 4. p. 17. Prùnus Myrobálana, Lois. l. c. 5. p. 184. t. 57. f. 11. To this variety belong the following garden plums.

1 *Cerisette.* Lois. l. c. p. 190. no. 58. t. 5.

2 *Cherry plum, Virginian cherry, Myrobálan* (Duham. arb. fr. 2. p. 111. no. 46. t. 2. f. 15.), *De Virginie, early scarlet, D'Amérique rouge.* Wood smooth. Fruit middle-sized, cordate, red. A second-rate dessert and kitchen fruit, ripening in the beginning and middle of August.

Var. ζ, Damascèna (Lin. spec. 680.) fruit globose, depressed, violaceous; stone short; keel prominent, blunt at the apex. To this variety belong the following garden plums.

1 *Azure hâtive.* Wood downy. Fruit round, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning of August.

2 *De chypre* (Duham. arb. fr. 2. p. 82. no. 18.). Wood smooth. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of August.

3 *Coe's fine late red.* Wood downy. Fruit middle-sized, purple, round; flesh separating from the stone. A first-rate dessert fruit, ripening in October. Valuable for its lateness.

4 *Damas de Maugeron* (Duham. arb. fr. 2. p. 76. no. 18. t.

5.). Wood smooth. Fruit middle-sized; flesh adhering to the stone. A worthless fruit.

5 *Damas musqué* (Duham. arb. fr. 2. p. 74. no. 10. t. 20. f. 3.), *prunier des Vacances* (Lois. l. c. 5. p. 192. no. 10. t. 55. f. 3. but not of Duham.). A worthless sort.

6 *Damas noir hâtive.* Lois. l. c. but not of Duham.

7 *Damas violette gros.*

8 *Damas rouge, gros damas rouge tardif.* Lois. l. c. 5. p. 198. no. 33. t. 58. f. 1.

9 *Damas rouge de Christ.*

10 *Petit damas rouge.* Lois. l. c. 5. p. 198. no. 32. t. 56. f. 8.

11 *Monsieur* (Duham. arb. fr. 2. p. 78. no. 15. t. 7.), *monsieur ordinaire.* Wood downy. Fruit middle-sized, purple, round; flesh separating from the stone. A second-rate dessert and kitchen fruit, ripening in the middle of August. Differs very little from the *Orleans.*

12 *Royale.* Duham. arb. fr. 2. p. 88. no. 24. t. 10.

13 *Kirke's.* Wood smooth. Fruit middle-sized, purple, round; flesh separating from the stone. A first-rate dessert fruit, ripening in the beginning and middle of August.

Var. η, *Turonénsis* (Ser. mss. in D. C. prod. 2. p. 533.) fruit obovate or globose; stone blunt at the apex or mucronulate. To this variety belong the following kinds of plums.

* *Fruit obovate.*

1 *D'Agen.* Fruit purple, obovate, middle-sized; flesh separating from the stone. A good bearer, and a first-rate table and preserving fruit. Ripening in the end of September.

2 *Cornemuse.* Wood downy. Fruit middle-sized, obovate, purple; flesh separating from the stone. A second-rate preserving fruit, ripening in the beginning of September.

3 *Figue grosse rouge.* Wood downy. Fruit oblong-obovate, large; flesh separating from the stone. A second-rate fruit, ripening in September.

4 *Blue impératrice, impératrice violette, véritable impératrice, violette.* Wood smooth. Fruit large, purple, obovate; flesh adhering to the stone. A first-rate dessert and preserving fruit, ripening in October. A good bearer.

5 *Imperial diadem, Mimms.* Wood smooth. Fruit obovate, large, purple; flesh separating from the stone. A first-rate dessert and kitchen fruit, ripening in the beginning of September.

* * *Fruit oval or oblong.*

6 *D'Autriche, prune datte, prune datte violette.* Fruit middle-sized, purple, oblong; flesh separating from the stone. A preserving fruit, ripening in the end of July.

7 *Bifère.* Fruit purple, oblong.

8 *Chesnut.* Wood smooth. Fruit middle-sized, purple, oblong; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of September.

9 *Cooper's large, Cooper's large red, Cooper's large American, La délicieuse.* Wood smooth. Fruit oval, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of September.

10 *Fotheringham.* Wood smooth. Fruit middle-sized, oblong, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle and end of August.

11 *Goliath, Caledonian, nectarine* of some, *Wilmot's late Orleans, Saint Cloud.* Wood downy. Fruit large, purple, oblong; flesh adhering to the stone. A second-rate kitchen fruit, ripening in the middle of August. The tree bears well.

12 *Gwalsh.* Wood smooth. Fruit large, oval, purple. A second-rate dessert fruit, ripening in September, resembling the *red magnum bonum.*

13 *Red magnum bonum, impériale, red imperial, impériale rouge.* Wood smooth. Fruit large, oval; flesh separating from the stone. A second-rate kitchen fruit, ripening in September.

14 *Orleans, red damask.* Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate kitchen and dessert fruit, ripening in the middle and end of August. A good bearer.

15 *Coul Orleans.*

16 *Early Orleans, Grimwood's early Orleans, monsieur hâtif, monsieur hâtif de Montmorency, new early Orleans, new Orleans, Hampton Court.* Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate kitchen and table fruit, ripening in the beginning and middle of August.

17 *Late or black Orleans.*

18 *Knevett's late Orleans.*

19 *Smith's Orleans.*

20 *Wilmot's new early Orleans, Wilmot's Orleans, Wilmot's early Orleans, Wilmot's large Orleans.* Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A dessert and kitchen fruit, very like the *early Orleans.*

21 *Perdrigon des Alpes.* Fruit small, purple, oval; flesh separating from the stone. A worthless sort.

22 *Blue perdrigon, perdrigon violette* (Duham. arb. fr. 2. p. 82. no. 21. t. 9.?), *perdrigon de brignole.* Wood downy. Fruit oval, middle-sized, purple; flesh adhering to the stone. A first-rate dessert and preserving fruit, furnishing the brignole prunes of the shops.

23 *Perdrigon Normand.* Duham.

24 *Perdrigon rouge* (Duham. arb. fr. 2. p. 86. no. 22. t. 20. f. 6.?). Wood downy. Fruit middle-sized, purple, oval; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning and middle of September.

25 *Perdrigon tardif.*

26 *Perdrigon violet des Alpes.* Wood downy. Fruit middle-sized, oval, purple; flesh separating from the stone. A second-rate dessert and preserving fruit, ripening in the middle of August.

27 *Perdrigon violette hâtif.*

28 *Pigeon's heart.* Wood smooth. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate sort, ripening in the beginning of September.

29 *Précoce de Tours, Noire hâtive, early violet, perdrigon violet* of some, *blue perdrigon.* Wood downy. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate dessert and kitchen fruit, ripening in the beginning of August.

30 *Rodney, Rodney gage.* Wood downy. Fruit large, purple, oval; flesh adhering to the stone. A second-rate dessert fruit, ripening in August.

31 *Royal Dauphin.* Wood smooth. Fruit large, red, and oval; flesh separating from the stone. A second-rate sort, ripening in the beginning of September.

32 *Royale de Tours* (Duham. arb. fr. 2. p. 81. no. 17. t. 20. f. 8.). Wood downy. Fruit large, round, purple; flesh adhering to the stone. A first-rate dessert and kitchen fruit, equal to the *Orleans,* if not better.

33 *Saint Martin rouge, Saint Martin* (Lois. l. c. 5. p. 193. no. 12. t. 58. f. 7.). Wood downy. Fruit middle-sized, purple, oval; flesh adhering to the stone, ripening in October. A very good kind, considering its lateness.

34 *Sharp's emperor.* Wood downy. Fruit oblong, purple, large; flesh adhering to the stone. A second-rate dessert fruit, ripening in the end of September.

35 *Valance, Saint Loo.* Wood smooth. Fruit oblong, large, purple; flesh adhering to the stone, ripening in the middle and end of September. Seems only fit for drying.

36 *Suisse*, *prunier Suisse* (Duham. arb. fr. 2. p. 82. no. 19. t. 20. f. 7.), *Altesse*, *monsieur tardive*, *Simiana*.

37 *Gros damas de Tours* (Duham. arb. fr. 2. p. 69. no. 4.). Wood downy. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate table fruit, ripening in the beginning of August.

38 *Damas de Tours*.

39 *Damas d'Italie* (Duham. arb. fr. 2. p. 65. no. 12. f. 4.). Wood smooth. Fruit middle-sized, purple; flesh separating from the stone. A second-rate table and preserving fruit, ripening in the beginning of September.

40 *Jerusalem*, *prunier de Jerusalem* (Lois. l. c. 5. p. 194. no. 16. t. 56. f. 2.), *Œil de Bœuf*, *de Bordeaux*. Wood downy. Fruit large, purple, round; flesh adhering to the stone. A second-rate table fruit, ripening in the middle of September.

41 *Tardive de châlons*. Lois. l. c. 5. p. 193. no. 13. t. 58. f. 6.

Var. ϑ, *Juliàna* (Lin. spec. 580.) fruit ovate-globose, round, oblong or oval, small, blue or purple; umbilicus not depressed, the suture hardly evident; stone mucronulate. Prùnus damascèna, Black. herb. t. 305.? To this variety belong the following garden plums.

1 *Aston*. Fruit small, round, purple; flesh adhering to the stone. A second-rate preserving fruit, ripening in September.

2 *Auchtertyre*. Wood downy. Fruit small, purple, oval; flesh separating from the stone. A second-rate sort, ripening in August.

3 *Black bullace*. Wood downy. Fruit small, round, purple; flesh adhering to the stone. A worthless fruit, ripening in October.

4 *New large bullace*.

5 *Damas d'Espagne*. Lois. l. c. 5. p. 196. no. 25. t. 56. f. 4.

6 *Damas noir de Septembre*. Duham. arb. fr. 2. p. 77. no. 14. t. 6.

7 *Damas noir tardif* (Duham. arb. fr. 2. p. 73. no. 9. t. 20. f. 4.). Wood downy. Fruit middle-sized, purple, roundish; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of September.

8 *Damas petit tardif*. Wood downy. Fruit small, roundish, purple. A worthless sort, ripening in the end of September.

9 *Damas de Provence*.

10 *Damas de Provence hâtif*. Lois. l. c. 5. p. 197. no. 27.

11 *Damas Quiné*.

12 *Damas de Septembre* (Duham. arb. fr. 5. p. 77. no. 14. t. 6.), *prune de Vacance*. Wood downy. Fruit small, purple, oval; flesh adhering to the stone. A second-rate sort, ripening in the end of September.

13 *Damas de Valence*.

14 *Damas violet* (Duham. arb. fr. 2. p. 192. no. 11. t. 56. f. 5. ?). Wood downy. Fruit small, oval, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of August.

15 *Damas violet tardif*.

16 *Blue damask*.

17 *Domine Dull's*. Wood smooth. Fruit oval, purple, middle-sized; flesh adhering to the stone. A second-rate kitchen fruit, ripening in the beginning of September.

18 *Morocco*, *black Morocco*, *black damask*, *early Morocco*, *early black Morocco*, *early damask*. Wood downy. Fruit middle-sized, round, purple; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of August.

19 *Moyeu de Bourgogne*. Wood downy. Fruit middle-sized, round, purple; flesh adhering to the stone. A second-rate kitchen fruit, ripening in the middle of August.

20 *Nelson's victory*. Wood smooth. Fruit round, purple, middle-sized; flesh adhering to the stone. A worthless kind, ripening in the middle of August.

21 *Muscle*. Wood downy. Fruit purple, oval, middle-sized; flesh adhering to the stone. A third-rate kitchen fruit.

22 *Perdrigon hâtif*. Wood downy. Fruit round, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle and end of August.

23 *Saint Julien* (Lois. in Duham. ed. nov. 5. p. 189. t. 54. f. 2. and 56. f. 9.). Used chiefly for stocks for peaches.

24 *Petit Saint Julien*.

25 *Gros Saint Julien*. Lois. l. c. p. 190. no. 2. t. 58. f. 3.

26 *Stonewood*. Fruit purple, roundish, middle-sized; flesh separating from the stone. A second-rate table fruit, ripening in the beginning of September.

27 *Virgin*, *prunier de Virginie* (Duham. arb. fr. 2. p. 111. no. 45.). Wood smooth. Fruit roundish, middle-sized, purple; flesh separating from the stone. A first-rate dessert fruit, resembling the *reine Claude violette*, ripening in the beginning of September.

28 *Virginale rouge*. Lois. l. c. p. 192. no. 11. t. 56. f. 5.

29 *Prunier noir de Montreuil*. Duham. arb. fr. 2. p. 68. no. 3.

30 *Gros noir de Montreuil*.

Var. ι, *pruneauliàna* (Ser. in D. C. prod. 2. p. 534.) branches pyramidal; fruit ovate, more or less obtuse or elongated, violaceous, rarely green; umbilicus exserted; nut very much compressed, elongated, prominent at the base, more or less acute at the apex. Prùnus pyramidàlis, D. C. fl. fr. 4. p. 485. Perhaps not distinct from var. *Juliàna*. To this variety belong the following garden plums.

1 *Abricotée rouge*. Lois. l. c. p. 196. no. 24. t. 46. f. 11.

2 *Ashridge black*.

3 *D'Amérique noire*.

4 *Black ball*, *black hill*.

5 *Bonne rouge*.

6 *Damas rouge*.

7 *Damatie rouge*.

8 *Damson*, *common damson*, *round damson*, *small round damson*. Wood downy. Fruit small, purple, roundish, obovate; flesh separating from the stone. A kitchen fruit, ripening in September. *Damsons* are all raised from the stone.

9 *Black damson*.

10 *Round black damson*.

11 *Early damson*.

12 *Long damson*.

13 *Shailer's white damson*.

14 *Shropshire damson*, *prune damson*.

15 *Sweet damson*.

16 *Violet damson*.

17 *White damson*.

18 *Diaprée blanche*. Duham. arb. fr. 2. p. 104. no. 38. t. 20. f. 11.

19 *Diaprée blanche longue*.

20 *Diaprée rouge* (Duham. arb. fr. 2. p. 102. no. 37. t. 20. f. 12.), *roche corbon*. Wood smooth. Fruit middle-sized, oval, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle of September.

21 *Cheston*, *matchless*, *Diaprée violette* (Duham. arb. fr. 2. p. 111. no. 36. t. 17.). Wood smooth. Fruit oval, purple, middle-sized; flesh separating from the stone. A second-rate table and preserving fruit.

22 *French prune*.

23 *Elfreth's prune*.

24 *Hungarian prune*. Fruit oblong, purple, middle-sized; flesh adhering to the stone. A preserving fruit, ripening in the end of September. A sort of *quetsche*.

25 *Horse plum, Irish horse plum.*

26 *Impériale de Milan.*

27 *Impériale Ottoman.*

28 *Impériale violette.* Duham. arb. fr. 2. p. 98. no. 32. t. 15.

29 *Impériale violette à feuilles panachées.* Duham. arb. fr. 2. p. 99. no. 33.

30 *Isabella.* Wood downy. Fruit oval, red, middle-sized; flesh adhering to the stone. A first-rate dessert and kitchen fruit, ripening in the end of August.

31 *Jacinthe.* Duham. arb. fr. 2. p. 100. no. 34. t. 16.

32 *Prunallier.*

33 *Prunallier petit.*

34 *Quetsche* (Nois. jard. fr. 144. no. 42.), *common quetsche, Zwetschen* (Lois. l. c. p. 203. t. 55. f. 6.), *Zwetsche, Zwetschke, grosse quetsche, prune d'Allemagne, prunier Allemand* (Lois. l. c. p. 202. no. 45.), *gros quetsche d'Allemagne, German prune, Leipzig, impératrice violette* of many, *grosse impératrice violette, damask, gros damas, damas violette* of some, *gros damas violette.* Wood smooth. Fruit oval, middle-sized, purple; flesh separating from the stone. A second-rate kitchen and preserving fruit. Bears well in this country. In Germany it is much cultivated for the purpose of drying. It is the German prune of the shops.

35 *Austrian quetsche.* Wood smooth. Fruit oval, purple, middle-sized; flesh separating from the stone. A second-rate preserving and kitchen fruit, ripening in the end of September.

36 *Quetsche de Brême.* Wood smooth. Fruit oblong, middle-sized, purple; flesh separating from the stone. A first-rate preserving fruit, ripening in September.

37 *Hungarian quetsche.* Wood smooth. Fruit purple, oblong, middle-sized; flesh separating from the stone. A preserving fruit, ripening in September.

38 *Quetsche d'Italie.*

39 *Early Leipzig quetsche.* Wood smooth. Fruit middle-sized, oblong, purple; flesh separating from the stone. A preserving fruit, ripening in the beginning of September.

40 *Long green quetsche.*

41 *Saint James's quetsche.* Fruit oblong, purple; flesh adhering to the stone. A preserving fruit, ripening in September.

42 *Saint Martin's quetsche.*

43 *Quetsche précoce.*

44 *Quetsche Rognon de Coq.*

45 *Turkish quetsche.*

46 *Quetsche verte.*

47 *Wetherell's sweet.* Fruit round, purple, small; flesh separating from the stone. A preserving fruit, ripening in the end of September. A sort of *damson.*

48 *Wheat, wheaten, whitton, great whitton, nutmeg.* Wood smooth. Fruit roundish-oblong, middle-sized, red; flesh adhering to the stone. A second-rate dessert fruit, ripening in the middle and end of August. Remarkable for its bright fiery red-colour.

49 *Wine sour, Rotherham.* Wood downy. Fruit small, purple, roundish-oblong; flesh adhering to the stone. A first-rate preserving fruit, ripening in the middle of September.

50 *New wine sour.*

51 *Prunier haricot.* Ser. ined.

† *A list of plums not sufficiently known, but none of them are probably worth notice.*

1 *Belle de Riom.* 2 *Brompton.* 3 *Brussels.* 4 *Buchanan.* 5 *Burnet.* 6 *De Canada.* 7 *Court royal.* 8 *Cydmarine.* 9 *Dame Aubert rouge.* 10 *Dame Aubert violette.* 11 *Winter damson.* 12 *Davies's seedling.* 13 *Deron's.* 14 *Dittisham.* 15 *Double blossomed, à fleurs doubles.* 16 *Duke of Devonshire.* 17 *Dumferline.* 18 *Elfry's.* 19 *Elton.* 20 *Emperor.* 21 *Prùnier à fleur semidouble.* 22 *Fall copper.* 23 *French copper.* 24 *Blucher's gage.* 25 *Banker's gage.* 26 *Flushing gage.* 27 *Schuyler's gage.* 28 *White gage.* 29 *Garlick's early.* 30 *Goldsmith's Vienna.* 31 *Green plum of Tours.* 32 *Grove-house purple.* 33 *Honey Julien.* 34 *Horse jag.* 35 *Jean morceau.* 36 *Julien gros à feuilles panachées.* 37 *Kenellan.* 38 *Lammas.* 39 *Large green drying.* 40 *Luscombe's seedling.* 41 *Maitre Claude.* 42 *Mignonne.* 43 *Mirabelle de Lory.* 44 *Mirabelle rouge.* 45 *Miviam.* 46 *Monsieur d'Agen.* 47 *Wild Oakley park.* 48 *Oddy's.* 49 *Orange.* 50 *Panachée.* 51 *Blue primordian.* 52 *Pseudo Mirabelle.* 53 *Queen mother.* 54 *Raisin.* 55 *Roi d'Agen.* 56 *Saint Antonio.* 57 *Saint Maurin.* 58 *Saint Rême.* 59 *Scaldatello.* 60 *Scaldatone.* 61 *Small green drying.* 62 *Steer's emperor.* 63 *Svedske Ungersk.* 64 *Tidlig Leipziger Svedske.* 65 *Sweet prune.* 66 *Triancon.* 67 *La Victorine.* 68 *Violet gage.* 69 *Violet de Tours.* 70 *White corn.* 71 *Yellow gage.* 72 *Yellow Jack.*

Cultivation of the plum in orchards appears to be deserving of more encouragement than it generally meets with. Not only does the fruit make excellent pies and tarts, but it may be kept in large quantities, so as to be ready for that purpose at any period of the year. They also make a good wine, and with other fruits and ingredients form one of the substitutes for port. The *damson, bullace,* and some other kinds will grow and bear high flavoured fruit in hedges, where the soil is dry below, and not too thin. The fruit of the *sloe* is for wine-making superior to that of the plum, and nearly as good for tarts.

Selection of sorts. The following are recommended by Forsyth for a small garden: 1 *Jaune hâtive.* 2 *Morocco.* 3 *Orleans.* 4 *Royal.* 5 *Green-gage,* different sorts. 6 *Drap d'Or.* 7 *Saint Catharine and imperatrice.* 8 *Magnum bonum,* for baking. 9 *Wine-sour,* for preserving.—The table fruit in the Dalkeith garden are as under, placed in the order of their ripening, all of them being planted against walls. 1 *Violet de hâtive.* 2 *Early hâtive.* 3 *New Orleans.* 4 *Early Morocco.* 5 *Green-gage.* 6 *Blue-gage.* 7 *Blue perdrigon.* 8 *Apricot plum.* 9 *Fotheringham.* 10 *White magnum bonum.* 11 *Imperial.*

Propagation. Most of the varieties are propagated by grafting or budding on the *muscle, St. Julien, magnum bonum,* or any free growing *plums,* raised from seed or from suckers, but seedlings are preferable to stocks for a permanent plantation. The common baking plums, as the *damson, bullace, Wentworth,* &c. are generally propagated by suckers, without being either budded or grafted. *Plum* grafting is performed in February or March; budding in July or August. Miller prefers budding, because plums are very apt to gum wherever large wounds are made on them. New varieties are procured by propagating from seeds on the general principles already stated. T. A. Knight (Hort. trans. 3. p. 214.) in an attempt to combine the bulk of the *yellow magnum bonum* with the richness and flavour of the *green-gage,* produced a fruit which partook of both parents; and a good variety of the *Orleans plum* has been raised from seed by J. Wilmot, Hort. trans. 3. p. 392.

Soil. Plums, according to Miller, should have a middling soil, neither too wet and heavy, nor over light and dry, in either of which extremes they seldom do well. Abercrombie recommends any mellow fertile garden or orchard ground; and where a soil is to be made, "one-half fresh loam, one-fourth sharp sand, one-sixth road stuff, and one-twelfth vegetable remains or decomposed dung, or animal matter."

Site. The *plum* is cultivated like other indigenous fruit-trees, the hardier sorts as standards, and the finer varieties against walls. It is sometimes forced; but the blossom, like that of the cherry, is difficult to set, and on the whole it is a fruit not well adapted for forcing. The finer varieties are almost always planted against walls, which, Miller says, should have an east south-east aspect, which is more kindly to these fruits than a full south aspect, on which they are subject to shrivel and be very dry, and many sorts will be extremely mealy if exposed too much to the heat of the sun; but most sorts will ripen extremely well as espaliers if rightly managed. Some, he adds, plant *plums* for standards, in which method some of the ordinary sorts will bear very well, but then the fruit will not be near so fair as those produced on espaliers, and will be more in danger of being bruised or blown down by strong winds. Abercrombie says, "have some choice sorts against south walls for earlier and superior fruit; others on east and west walls, and espaliers to ripen in succession, with full and half standards in the orchard."

Choice of plants. Miller recommends trees of not more than one year's growth from the bud, for if they are older they are very subject to canker, or if they take well to the ground commonly produce only two or three luxuriant branches. Abercrombie and Nicol take plants from one to five years old. Forsyth chooses "clean straight plants, with single stems, and of two or three years' growth."

Final planting. Miller says it is common to see *plum* trees planted at the distance of 14 or 16 feet, so that the walls are in a few years covered with branches, and then all the shoots are cut and mangled with the knife, so as to appear like a stumped hedge, and produce little fruit; therefore the only way to have *plum* trees in good order is to give them room, and extend their branches at full length. Abercrombie directs full and half standards to be planted at 40, 30, 25, and 20 feet distance; dwarfs generally 20 feet apart, and wall trees or espaliers 15, 20, or 25 feet from stem to stem. Forsyth says *plums* and cherries thrive best by themselves, and he prefers a wall for each, placing *plums* on walls 10 feet high, 8 yards apart, and at 7 yards distance on 12 feet walls.

Mode of bearing. All the sorts produce their fruit on small natural spurs, rising at the ends and along the sides of the bearing shoots, on one, two, or three years' growth. In most sorts new fruit branches are 2 years old before the spurs bear. The same branches and spurs continue fruitful in proportion to the time which they take to come into bearing. After the formation of the head is begun, it takes from 2 to 6 years before the different sorts come into bearing. Miller trains horizontally, and is against shortening the branches of *plum* trees, since the more these trees are pruned, the more luxuriant they grow, until the strength of them is exhausted, and then they gum and spoil; therefore the safest method to manage these trees, is to lay in their shoots horizontally, as they are produced at equal distances, in proportion to the length of their leaves, pinching off the points of young shoots, where lateral branches are desired, and displacing foreright and irregular shoots, or such as shade the fruit. With thus carefully going over these trees in the growing season, there will be but little work to do to them in the winter. Abercrombie agrees with Miller in not shortening the fruitful branches. Standards, he says, must be allowed to "expand in free growth, occasionally pruning long, rambling, and cross-placed or other irregular branches. Thin crowded parts, cut away worn out bearers, also decayed and cankery wood." Forsyth says, "never cut the stems of young *plum* trees when first planted, but leave them till the buds begin to break, then you may head them down to 5 or more eyes, always observing to leave an odd one for the leading shoot; remember to cut sloping towards the wall, and as near to an eye as possible: thus managed, the shoots will soon fill the wall with fine wood. If you find that some of the shoots are too luxuriant, you may pinch the tops off with your finger and thumb about the beginning of June, in the first year after planting; by doing which you will obtain plenty of wood to fill the bottom of the wall. A great deal depends on the first and second years' management of your trees."

Renovating decaying trees.—Proceed as directed for the peach, but observe that the *plum* tree, when cut down, is very apt to run to wood, therefore the new soil must neither be very rich nor laid on in a very deep stratum.

Protecting blossoms.—This is sometimes done with the tenderer sorts, in the same way as for peaches and apricots.

Taking the crop.—The different sorts of the *plum* ripen in succession for about 3 months in summer and autumn. Some early sorts begin to ripen in July; the main varieties reach full maturity in August and September; late sorts continue ripening till the end of October or beginning of November. Each kind should be brought to table presently after being gathered, as they will not keep long in a natural state.

Insects and diseases.—See peach. The gum and canker are the most common diseases, and, as in almost every other case, the acarus is the most noxious insect. As a remedy for the former, Abercrombie directs to head down.. The insects are destroyed by the common means. The *gages*, or *reine Claudes*, when nearly ripe, are very apt to be eaten by wasps.

Forcing plums. Mr. J. Aiton (Hort. trans. 4. p. 531.) says, when an early crop of plums is desired, they are best forced in large tubs or pots, as this method admits of their being removed at pleasure into different temperatures; but for a general crop to ripen by the end of May or beginning of June, he prefers having the trees planted in the forcing house. The temperature required for cherries answers well for plums, and plenty of air must be admitted. He prefers, for forcing, the *Précoce de Tours*, *green gage*, *azure hâtive*, *white perdrigon*, *Orleans*, *new Orleans*, and *Morocco*.

Domestic or Garden-plum. Fl. April, May. Britain. Tree 10 to 20 feet.

10 P. DIVARICA'TA (Led. fl. ros. alt. ill. t. 13. fl. alt. 2. p. 211.) branches unarmed; petioles glandless; leaves oblong-elliptic, attenuated at both ends, convolute, serrated, glabrous, having the middle rib beneath bearded longitudinally; peduncles solitary; calyx reflexed; fruit elliptic, yellow. ♄. H. Native of Caucasus. Flowers white, very numerous.

Divaricate Plum. Fl. April. Clt. 1820. Shrub 8 to 10 ft.

11 P. MICROCA'RPA (Meyer, verz. pfl. p. 166.) unarmed; leaves quite glabrous, conduplicate, ovate-elliptic, or oblong, obtuse, sharply serrated; serratures immarginate and glandless; umbels many-flowered; calyx tubular; drupe and nut oblong. ♄. H. Native of Caucasus, on mount Bechvarmak.

Small-fruited Plum. Shrub.

12 P. CHINE'NSIS (Blum. bijdr. p. 1104.) leaves oblong, acuminated, furnished with 2 glands at the base, and unequally and glandularly serrulated, glabrous, except in the axils of the veins beneath, where they are pubescent; flowers rising from the buds in umbellate fascicles; sepals glandularly serrulated; fruit round, yellowish red. ♄. G. Native of China.

China Plum. Tree.

Cult. All the species grow in any kind of soil, and are either increased by seeds, by suckers from the roots, or by grafting or budding for to continue rare sorts.

V. CE'RASUS (said to have been first brought from Cerasus, a town in Pontus, in Asia). Juss. gen. 340. D. C. fl. fr. 4. p. 479. D. C. prod. 2. p. 535.—Cérasus and Lauro-cérasus, Tourn.—Prùnus species of Lin.

LIN. SYST. *Icosándria, Monogýnia.*. Drupe globose or umbilicate at the base (f. 64. *d.*), fleshy, quite glabrous, destitute of bloom, containing a smooth, rather globose, compressed stone (f. 64. *f.*).—Trees. Leaves when young conduplicate. Flowers white. Pedicels 1-flowered, rising before the leaves in fascicled umbels (f. 64.) from scaly buds, but sometimes rising after the evolution of the leaves in racemes from the tops of the branches.

Sect. I. Cerasóphora (κερασος, *kerasos*, the cherry, and *φορεω*, *phoreo*, to bear ; bearing cherries). D. C. prod. 2. p. 535. Cerasóphora, Neck. elem. no. 720.—Cérasus, Tourn. 431. exclusive of the species wherein the flowers are disposed in racemes. Flowers umbellate (f. 63.). Pedicels 1-flowered, rising from the buds (f. 64.).

1 C. Phóshia (Hamilt. ex. D. Don, fl. nep. p. 239.) leaves elliptic-oblong, acuminated, doubly serrated, pilose beneath; stipulas pectinated, bearing glands ; umbels few-flowered, sessile. ♄ . H. Native of Nipaul, at Narainhetty. Prùnus cerasoìdes, D. Don, prod. fl. nep. 289. Flowers of a pale rose colour. *Phoshia* is the name of the tree in Nipaul.

Phoshia Cherry. Tree 15 to 20 feet.

2 C. A'vium (Mœnch. meth. 672. D. C. fl. 4. p. 482. Lois. in Duham. ed. nov. 5. p. 10. no. 16. var. 1-4.) flowers rising with the leaves ; fruit roundish-ovate, depressed ; peduncles slender ; flesh of fruit very succulent and sugary, with the juice usually coloured ; epicarp adhering to the flesh ; leaves white beneath, rather pubescent ; branches strong, divaricate ; flower-bud oblong, acute. ♄ . H. Native of Europe, in woods. Prùnus Cérasus àvium, Lin. spec. 679. Prùnus nìgra, Mill. dict. no. 2. but not of Aiton. Fruit black.

Var. α, sylvéstris (Ser. in D. C. prod. 2. p. 535.) fruit small, blackish purple, having the suture hardly depressed ; flesh tender, hardly sweet. Prùnus àvium, *α* and *β*, Willd. baum. ed. 2. p. 308. Prùnus nígricans, and P. vària, Ehrh. beitr. 7. pp. 126. and 127. Merísier à petits fruits, Duh. arb. fr. 1. p. 156. To this variety belong the small *Merisier* cherries, which are not better than the wild cherries.

1 *Merise petite ronde.*

2 *Merise petite rouge.*

3 *Black Mazzard; wild black-fruited ; small wild black ; Whixley's black. Merisier à petit fruit noir.* Very like the *Black heart* cherry.

Var. β, macrocárpa (Ser. in D. C. prod. 2. p. 535.) tree middle-sized ; nerves of leaves red ; peduncles longer ; fruit large, blackish-purple, containing a red stone. This kind is cultivated in Switzerland, under the name of *Kirschwasser*, where the inhabitants distil a spirit from the fruit. To this variety belong the cherries known under the following names :

1 *Merisier à gros fruit noir*, Duham. abr. fr. 1. p. 180. and Lois. in Duham. ed. nov. 1. p. 12. t. 4. f. D.

2 *Merise rouge.*

3 *Merise grosse noire.*

4 *Merise grosse rose oblongue.*

5 *Corone ; large wild black ; Hertfordshire black.* Fruit roundish. Flesh tender. Ripens in July and bears abundantly. Does best as a standard. A second-rate sort of cherry.

Var. γ, pállida (Ser. mss. in D. C. prod. 2. p. 535.) fruit of a pale wax colour ; leaves bearing twin glands at the base. To this variety belong the following sorts of cherry.

1 *Merisier à fruit blanc.* Lois. in Duham. abr. fr. ed. nov. 5. p. 12. no. 3. t. 4. f. B.

2 *Merisier à fruit jaune.* Lois. l. c. 5. p. 12. no. 4. t. 4. f. A.

Var. δ, múltiplex (Ser. l. c.) smaller ; leaves ovate, small, bearing 2 or 3 glands at the base. This variety is frequently cultivated in gardens, under the names of *double-flowering cherry, merisier à fleurs doubles, merise à fleur double.* Only fit for ornament.

Bird's Corone, Merise, or Merisier Cherry. Fl. April, May. Britain. Tree 20 to 40 feet.

3 C. Dura'cina (D. C. fl. fr. 4. p. 483.) tree large ; branches ascending when young, but in the adult state hardly spreading ; flowers rising with the leaves ; fruit heart-shaped ; peduncles long, slender ; suture of the fruit much depressed, rarely almost obsolete ; flesh hard and brittle ; epicarp adhering firmly to the flesh ; stone of fruit ovate. ♄ . H. Native of the south of Europe. Prùnus Cérasus, var. bigarélla and durácina. Lin. spec. 679. Flowers white. To this species the *bigarreautiers, bigarreau*, and *heart cherries* belong.

Var. α, cordígera (Ser. in D. C. prod. 2. p. 353.) fruit ovate, more or less heart-shaped or 2-lobed at the apex, with the suture much depressed. To this variety belong the *cherries* known under the following names :

1 *Bigarreau belle de Rockmond, cœur de pigeon* (Lois in Duham. arb. fr. ed. nov. 5. p. 15. no. 20. t. 18.), *bigarreau commun.*

2 *Black bigarreau, black heart.*

3 *Bigarreau blanc.*

4 *Bigarreau blanc tardif de Heldesheiner.* Fruit pale yellow and red, small. A worthless fruit, ripening in August.

5 *Bigarreau couleur de chair* (Lois. in Duham. ed. nov. 5. p. 16. no. 24.), fruit pale yellow and red, large, ripening in the beginning of July. A second-rate table fruit. Does best as a standard.

6 *Bigarreau cœuret, cœur de poulet.*

7 *Bigarreau dur.*

8 *Bigarreau à fruit jaune.*

9 *Bigarreau gros cœuret.*

10 *Bigarreau gros commun.*

11 *Bigarreau à gros fruit blanc* (Duham.), Fruit pale yellow and red, tender, ripening in July. A first-rate table fruit, having the flesh more tender than that of the *bigarreau.* Does best as a standard.

12 *Bigarreau à gros fruit rouge*, Duham. 1. t. 2.

13 *Bigarreau à gros fruit rouge tardif.*

14 *Bigarreau gros monstrueux.* Fruit long, heart-shaped, dark red, firm, ripening in the beginning of July. A first-rate table fruit. Does best against a south wall.

15 *Knevett's late bigarreau.*

16 *Bigarreau de Mai.*

17 *Bigarreau monstrueux.*

18 *Bigarreau à petit fruit blanc.* Fruit small, pale yellow, ripening in July. A fruit of little value. Does best as a standard.

19 *Bigarreau à petit fruit rouge hâtif.*

20 *Bigarreau princesse ambré.*

21 *Turkey bigarreau.*

22 *White bigarreau.*

23 *Black American.*

24 *Black bud of Buckinghamshire.*

25 *Belcher's black heart.*

26 *Black heart of Buckinghamshire.*

27 *Goldsmith's black heart.*

28 *Jenkins's black heart.*

29 *Black Tartarian, Ronalds's black heart, black Russian.*

30 *Spanish black heart.*

31 *Amber heart.*

32 *Early amber heart.*

33 *American heart.*

34 *Tradescant's black heart, Elkhorn.*

35 *Elton.* Fruit pale red and yellow, large. Flesh half tender, ripening beginning of July. An excellent table fruit. Does best against a south wall.

36 *Taversham heart.*

37 *Florence.* Fruit pale yellow and red, large, ripening about

the end of July. Flesh firm. A first-rate table fruit. Does best against a south wall.

38 *Churchill's heart.* Fruit large, pale yellow and red. Flesh firm. A first-rate table fruit. Does well as a standard.

39 *Guigne grosse blanche.* Fruit pale yellow and red. Flesh firm. A second-rate table fruit, ripening about the middle of July. Does best against a south wall.

40 *Guigne grosse rouge hâtive.* Fruit red. Flesh firm. A second-rate table fruit, ripening about the beginning of July. Does best as a standard.

41 *Kruger's herz Kersche zu Frankfort.* Fruit red and pale yellow; flesh firm. Ripening in July. Does best against a south wall.

42 *Lady Southampton's yellow.* Fruit yellow. Flesh firm. A second-rate table fruit, ripening in July and August. Does best as a standard. *Lady Southampton's duke cherry, Lady Southampton's golden-drop, yellow* or *golden cherry.*

43 *Large heart cherry.*

44 *Late* or *Spanish heart.*

45 *Lukeward's heart.* Fruit blush. Flesh half tender. A second-rate table fruit, ripening in July. A bad bearer. Does well as a standard.

46 *Maple heart.* Fruit red. Flesh firm. A bad fruit.

47 *Red heart.* Fruit red. Flesh firm, ripening in July. A second-rate sort and a shy bearer.

48 *Remington heart.*

49 *Shailer's new grizzly.* Fruit yellow and red. Flesh hard. An useless sort, ripening in July. Does as a standard.

50 *Guigne grosse blanche, guigne à gros fruit blanc* (Duh. arb. fr. 1. p. 161. t. 1. f. 3.). Fruit pale yellow and red, heart-shaped. Flesh firm. A worthless fruit, ripening middle of July.

Var. β, *obtusàta* (Ser. mss.) fruit ovate, obtuse, or 2-lobed at the apex, with the suture hardly depressed. To this variety belong the following kinds of *cherries:*

1 *Bigarreau, graffion, bigarreau gros, bigarreau d'Hollande, Italian heart, Harrison's heart, West's white heart.* Fruit pale yellow and red, obtuse, heart-shaped, large, ripening in July and August. Flesh firm. A first-rate table fruit. Does best as a standard.

2 *Bigarreau Napoléon, bigarreau Lauermann, Lauermann's grosse Kirsche.* Fruit large, pale yellow and red, obtuse, heart-shaped. Flesh firm. A first rate dessert fruit. Does best on a south wall.

3 *Bigarreau rouge.* Fruit large, pale yellow and red, obtuse, heart-shaped. Flesh firm. Hardly different from the *bigarreau.* A good dessert fruit.

4 *Guigne grosse noir luisante.* Fruit middle-sized, blood-coloured, obtuse, heart-shaped. Flesh firm. A second-rate dessert fruit, ripening in the beginning of July. Does well as a standard; the branches are pendulous. A good bearer.

5 *Black Tartarian, Tartarian, Fraser's black, Fraser's Tartarian, Fraser's black heart, Ronald's black heart, Circassian, black Russian.* Fruit blood-coloured, large, obtuse, heart-shaped. Flesh half tender. A first-rate table fruit, ripening about the end of June. In appearance it is the finest. Does best against a wall.

6 *White Tartarian, Fraser's white Tartarian, Fraser's white transparent.* Fruit middle-sized, pale yellow, obtuse, heart-shaped. Flesh half tender. A second-rate dessert fruit, ripening beginning of July. Does well as a standard.

7 *Bigarreau noir, cerise de Norwège,* Lois. in Duham. ed. nov. 5. p. 17. no. 36. t. 18. f. B.

8 *Bigarreau noir tardif,* Lois. in Duham. ed. nov. p. 17. no. 27. t. 18. f. A.

Var. γ, *mamillàris* (Ser. mss.) fruit ovate, ending in a drop-like process at end, with the suture more profound at the base. To this variety belong the following sorts of *cherries:*

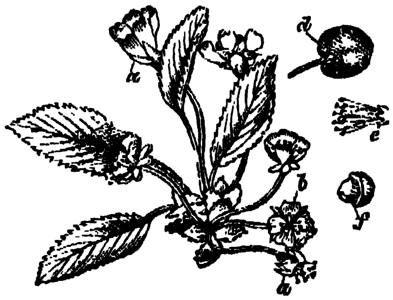
1 *Four to the pound, bigarreau à grandes feuilles* (Nois. jard. fr. p. 17. no. 6.), *cerisier de quatre à la livre, guigne à feuilles de tabac, Prùnus macrophýlla* (Poir. suppl. 5. p. 584.), *Cérasus nicotianæfòlia* (Hortul.), *Cérasus decumàna* (Delauny). Leaves large. Fruit middle-sized, heart-shaped. Flesh firm. A worthless fruit, ripening about the end of July.

2 *Gascoigne's heart, red heart* of some, *bleeding heart, Herefordshire heart, guigne rouge hâtive.* Fruit middle-sized, dark red, heart-shaped, the apex terminating in the form of a drop. Flesh half tender. A second-rate fruit, ripening in July.

3 *Bigarreau piquant, guigne piquante, guigne à piquet,* Lois. in Duham. ed. nov. 5. p. 13. no. 12. t. 16. f. A.

Hard or Bigarreau Cherry. Fl. April, May. Tr. 10 to 20 ft.

FIG. 64.



4 C. Julia'na (D. C. fl. fr. 4. p. 482.) branches ascending when young, but when in an adult state hardly spreading; flowers rising with the leaves; fruit ovate, depressed, heart-formed; flesh of fruit sweet, rather soft, epicarp adhering to the flesh; leaves glabrous. ♄. H. Native of Europe. The varieties of this species of *cherry* are commonly called *guigniers, geans,* or *heaumiers.* The sorts are as follow:

1 *Black eagle.* Fruit middle-sized, black, obtuse, heart-shaped; flesh tender. A first-rate dessert fruit, ripening beginning of July. A good bearer. Does either as a standard or wall tree.

2 *Bowyer's early heart.* Fruit obtuse, heart-shaped, middle-sized. Flesh tender. A good bearer and excellent middle-sized cherry, ripening about the end of June.

3 *Amber gean.* Fruit pale red, obtuse, heart-shaped, small. Flesh tender. A first-rate table fruit, ripening end of July. Does well as a standard. An abundant bearer.

4 *Black gean.* Useless fruit.

5 *Black caroon gean.*

6 *Early gean.*

7 *Flemish gean.* Fruit small, red, obtuse, heart-shaped. Flesh half tender. A second-rate dessert fruit, ripening end of July. Does well as a standard.

8 *Hungarian gean.* Fruit middle-sized, amber-coloured, obtuse, heart-shaped. Flesh half tender. A second-rate dessert fruit, ripening in July. Does best as a standard.

9 *Black Hungarian gean.* Fruit middle-sized, black, round. Flesh tender. A second-rate dessert fruit, ripening in July.

10 *White Hungarian gean.* Fruit middle-sized, amber-coloured, obtuse, heart-shaped. Flesh tender, transparent. A second-rate dessert-fruit, ripening in July. Does best as a standard.

11 *Late gean.* Fruit black, heart-shaped, small. A worthless fruit, ripening about the end of July.

12 *Large black gean.* Fruit black, middle-sized, heart-shaped. Flesh firm. A worthless kind, ripening end of July.

13 *Lundie gean.* Fruit black, heart-shaped, middle-sized.

A second-rate dessert fruit, ripening in July. Does well as a standard.

14 *Polton gean.*

15 *White gean.*

16 *Guigne d'Argovie, Tokeli seiler.*

17 *Guigne ecarlate.* Fruit red, oval, middle-sized. Flesh firm. A worthless sort, ripening in July.

18 *Guigne blanche,* Lois, in Duham. ed. nov. 5. p. 13. no. 7.

19 *Guigne noir, guigne à petit fruit noir,* Duham. arb. fr. 1. p. 166. t. 1. f. 2.

20 *Guigne rose hâtive.*

21 *Guigne rouge hâtive,* Lois. in Duham. ed. nov. 5. p. 12. no. 6.

22 *Guigne grosse noire.*

23 *Guigne grosse rouge tardive, guigne à fruit rouge tardif,* Duham. arb. fr. 1. p. 162.

24 *Guigne jaune.*

25 *Guigne noir.* Resembles the *black heart.*

26 *Guigne petite blanche.*

27 *Guigne petite rouge.* Worthless.

28 *Guigne de Russie à fruit blanc.*

29 *Guigne précoce, guigne de Pentecôte,* Lois. in Duham. ed. nov. 5. p. 12. no. 5. f. 15.

30 *Guigne de dure peau,* Lois. l. c. p. 14. no. 13. t. 16. f. D.

31 *Guigne à petit fruit noir,* Duham. arb. 1. p. 160. t. 1. f. 2.

32 *Guigne bigandelle,* Le Berr. trait. jard. 1. p. 231. ex. Lois. l. c.

33 *Guigne ou cerise cœur de poule,* Calv. pepin. 2. p. 139. ex Lois. l. c.

34 *Hertfordshire black.* Fruit black, obtuse, heart-shaped. Flesh tender. A second-rate dessert fruit, ripening about the middle of July. Does well as a standard.

Var. β? Heaumiàna (Ser. mss.) taller trees; leaves thin, large, elongated, finely serrulated; flesh of fruit not brittle. To this variety belong the following sorts of *cherry:*

1 *Heaumier blanc,* Lois. in Duham. ed. nov. 5. p. 17. no. 28.

2 *Heaumier rouge,* Lois. l. c. p. 17. no. 29. t. 19. B.

3 *Heaumier noir,* Lois. l. c. p. 17. no. 30. t. 19. f. A.

Var. γ, pèndula (Ser. mss. in D. C. prod. 2. p. 536.) branches pendulous.—*Allsaints, weeping cherry, cerise de la Tout-saint, cerise tardive, cerise de St. Martin, guignier à rameaux pendans* (Lois. in Duham. ed. nov. 5. p. 15. no. 16.). Fruit round, red, small, watery, ripening in July and October. This sort is of little value as a fruit, being more curious than useful.

St. Julian, Guigniers, or Gean-cherry. Tree 20 to 40 feet.

5 C. Caproniàna (D. C. fl. fr. 4. p. 482.) small trees, with spreading branches; flowers rising with the leaves; calyx large, campanulate; peduncles usually thick, stiffish, not long; fruit globose, depressed, with the suture hardly depressed; flesh soft, more or less acid and styptic; epicarp not adhering to the flesh; stone roundish. ♄. H. Native of Europe. C. vulgàris, Mill. dict. no. 1. Lois. in Duham. ed. nov. 5. p. 18. var. 1-3. Prùnus austèra and P. ácida, Ehrh. beitr. 7. p. 129. Commonly called *round cherries, Morellos, May-dukes,* and in France *cerises de Paris, cerises à fruits ronds,* and *griottiers.* In consequence of this species containing a greater number of the best *cherries* than any of the other species, we have given the history and cultivation of all kinds of *cherries* under it. The *cherry* is a middle-sized tree, with ash-coloured, shining, roundish branches, ovate, serrated leaves, and white flowers, produced in umbellate fascicles, and succeeded by a red drupe with an acid pulp. The leaf and flower-buds are distinct, the former terminal, the latter produced from the sides of the 2 or more years' old branches. The cultivated *cherry* was brought to Italy by the Roman general Lucullus in 73 A.C. from a town in Pontus in Asia, called Cerasus, whence the generic name, and was introduced to Britain 120 years afterwards. Many suppose that the *cherries* introduced by the Romans into Britain were lost, and that they were re-introduced in the time of Henry VIII. by Richard Haines, the fruiterer to that king. But though we have no proof that *cherries* were in England at the time of the Norman Conquest, or for some centuries after it, yet Warton has proved by a quotation from Lidgate, a poet who wrote about or before 1415, that the hawkers in London were wont to expose cherries for sale, in the same manner as is now done, early in the season. The tree is now very generally cultivated, both as a wall and standard fruit, and has been forced for upwards of two centuries.

Use.—The cherry is a refreshing summer fruit, highly grateful at the dessert, and affording pies, tarts, and other useful and elegant preparations in cookery and confectionery. Steeping cherries in brandy qualifies and improves its strength and flavour; a fine wine is made from the juice, and a spirit is distilled from the fermented pulp. The gum which exudes from the tree is equal to gum arabic; and Hasselquist relates, that more than 100 men, during a siege, were kept alive for nearly two months without any other sustenance than a little of this gum taken sometimes into the mouth and suffered gradually to dissolve. Cherry wood is hard and tough, and is used by the turner, flute-maker, and cabinet-maker.

Varieties.—The Romans had 8 sorts: red, black, tender fleshed, hard fleshed, small, bitter flavoured, and a dwarf sort. Tusser, in 1573, mentions cherries red and black. Parkinson mentions 34 sorts, Ray 24, and Miller has 18 sorts, to which he says others are continually adding,' differing little from those he has described. The catalogue of the Luxembourg contains 42, and the catalogue of the London Horticultural Society, published last February, 219 sorts, the greater part of which are not well known.

The French divide their *cherries* into *griottes,* or those belonging to the present species; *bigarreau,* or hard-fruited *cherries,* the *Cérasus duràcina; Merisiers,* or wild *cherries;* the *Cérasus àvium,* and *guignes* or *geans,* the *Cérasus Juliàna.*

The varieties of the present species are as follow:

Var. α, Montmorencyàna (Ser. mss. in D. C. prod. 2. p. 536.) fruit globose, depressed, pale red, generally hardly depressed at the suture; flesh white, more or less acid; peduncles rather long; leaves ovate, acuminated. To this variety appertain the following sorts of *cherry:*

1 *Adam's crown.* Fruit pale red, round, heart-shaped, middle-sized. Flesh tender. A first-rate dessert fruit, worthy of cultivation for its earliness, being ripe about the beginning of July.

2 *Arch-duke, late arch-duke, late duke.*

3 *D'Aremberg.* Fruit middle-sized, dark red, roundish. Flesh tender. A first-rate dessert fruit, ripening beginning of July, allied to the *May-duke.* Does either as a standard or wall fruit.

4 *Belle de Choisy, ambrée de Choisy, cerise de La Palembre, cerise doucette, griottier de Palembre* (Lois. in Duham. ed. nov. p. 25. no. 20. t. 11.). Fruit very handsome and good, large, red, round. Flesh tender and sweet. A first-rate dessert fruit, ripening beginning and middle of August. Answers well either as a wall or standard fruit.

5 *Carnation, English bearer* of some, *cerise nouvelle d'Angleterre, cerise de Portugal, griotte de Villenes, Guindoux rouge* (Lois. in Duham. ed. nov. 5. p. 22. no. 14. t. 7.), *grosse cerise rouge pâle* (Nois. jard. fr. p. 20. no. 17. t. 5.), *griottier rouge pâle, cerise à gros fruit pale* (Duham. arbr. fr. 1. p. 182. t. 9.). Fruit large, round, pale red; flesh tender. A first-rate sort, ripening in July.

6 *English bearer.* Fruit large, dark red, round. Flesh

tender. A first-rate kitchen fruit, ripening in July. Does well as a standard. It is a variety of the *Kentish cherry*.

7 *English cherry, cerise d'Angleterre.* Fruit middle-sized, round, red. Flesh tender. A first-rate kitchen fruit, ripening in July. It is a variety of the *Kentish*. Does well as a standard.

8 *English preserve.* Fruit round, red, middle-sized. Flesh tender. A first-rate kitchen fruit, ripening about the beginning of July. It is a sort of *Kentish*, and good for drying.

9 *Large honey cherry.* Fruit roundish, red, small. Flesh sweet. A second-rate table fruit, but too small for cultivation.

10 *Jeffries' duke.* Fruit middle-sized, round, red. Flesh tender. A first-rate dessert fruit, ripening about the beginning of July. Answers either as a wall or standard fruit.

11 *D'Ostheim.* Fruit round, dark red. Flesh tender. A first-rate table and kitchen fruit. Answers best as a dwarf standard.

12 *De Soissons.* Fruit round, dark red. Flesh tender. A second-rate dessert fruit, ripening middle of July. Answers best as a standard.

13 *Cerise de Montmorency*, Duham. arb. fr. 1. p. 181.

14 *May-duke, early duke, early May-duke, large May-duke, Morris's duke, Benham's fine early duke, Thomson's duke, Portugal duke, Buchanan's early duke, Anglaise, royale hâtive, De Hollande, Courlande, De Hollande à larges feuilles, d'Espagne, griotte d'Espagne, griotte precoce* of some, *cerise nain à fruit rond précoce* (Duham. arb. fr. 1. p. 168. t. 3.). Fruit middle-sized, obtuse, heart-shaped. Flesh tender. This is certainly one of the best dessert cherries, when all its properties are taken into consideration. It answers either as a wall or standard fruit.

15 *Cerise griot marasquin*, Lois. in Duham. 5. p. 21. no. 7.

16 *Cerise à crochet*, Duham. arb. fr. 1. p. 175.

17 *Cerise à noyeau tendre*, Duham. l. c. p. 174.

18 *Cerise d'Italie, cerise du pape goix*, Lois. in Duham. ed. nov. 5. p. 27. no. 35.

Var. β, pallèscens (Ser. in D. C. prod. 2. p. 536.) fruit globose, depressed, or ovate-globose, amber-coloured. To this variety belong the following *cherries:*

1 *Blanche, cerise à fruit blanc, cerise ambre* (Duham. arb. fr. 1. p. 185. no. 18. t. 11.). Fruit small, pale yellow. Flesh tender. Not worthy of cultivation.

2 *Downton.* Fruit roundish, heart-shaped, pale yellow and red. Flesh tender. A good bearing and excellent dessert cherry, ripening about the beginning of July. Does well either as a wall or standard fruit.

3 *White heart.* Fruit heart-shaped, pale yellow and red. Flesh tender. A second-rate dessert fruit, ripening end of July.

Var. γ, gobbétta (Ser. in D. C. prod. 2. p. 536.) fruit red, depressed, the suture also depressed; flesh white; peduncles short; leaves tapering to both ends. To this variety belong the following sorts of *cherry:*

1 *Early May, griotte naine précoce.* Fruit red, round, small. Flesh watery. A poor fruit, owing to its smallness and acidity, ripening in the middle of June.

2 *Flemish, Kentish* of many, *yellow Ramonde, cerise de Kent* (Lois. in Duham. 5. t. 12.), *cerise de Montmorency à gros fruit* (Duham. arb. f. 1. p. 180. t. 8.), *Montmorency à courte queue, cerise à courte queue, gros gobet, gobet à courte queue, double volgers* of the Dutch. Fruit round, red, middle-sized. Flesh watery. A first-rate kitchen fruit, ripening in July. Does best as a standard.

3 *Kentish, common red, Flemish* of many, *Virginian May, early Richmond, Kentish red* or *pie cherry, Sussex, de Montmorency, Montmorency à longue queue, commune à Trochet* of some. Fruit middle-sized, round, red. Flesh watery. A good bearer and a first-rate kitchen fruit, ripening end of July. Does best as a standard.

4 *Kentish drier.* Fruit round, red, middle-sized. Flesh watery. A first-rate kitchen fruit, ripening in July. Does best as a standard.

5 *Wild Rosshire.* Fruit small, red, round. Flesh watery. A wild *cherry*, allied to the *Kentish*.

Var. δ, polýgyna (Ser. mss. in D. C. prod. 2. p. 537.) flowers numerous, usually polygynous; fruit numerous, on the same peduncle; flesh white? leaves glandular at the base. C. polýgyna, D. C. herb.—Cerise à bouquet, Duham. arb. fr. 1. p. 173. t. 53.—*Cluster cherry, chevreuse.* Fruit round, red, small. Flesh watery. A cluster of fruit is formed from several styles in the same flower. A kitchen fruit. Does best as a standard.

Var. ε, múltiplex (Ser. in D. C. prod. 2. p. 537.) flowers semi-double or double; pistils simple, fertile, or petaloid; fruit pale red; flesh thin and very acid.—*Double-flowering cherry, cerise à fleurs doubles, semi-double-flowering cherry, cerise à fleurs semi-doubles.* Only cultivated for ornament.

Var. ϑ, persiflòra (Ser. in D. C. prod. 2. p. 537.) flowers double, red.—*Cerise à fleur de pêcher, peach-flowered cherry.*

Var. η, persifòlia; leaves narrow, like those of the peach or willow.—*Willow-leaved May-duke cherry, fern-leaved cherry, cerise à feuilles de pécher, cerise à feuilles de saul de balsamine* (Lois. in Duham. ed. nov. 5. p. 25.), *cerise de Hollande à feuilles de saul.* This kind of *cherry* bears but an inferior fruit.

Var. θ, variegàta (Ser. l. c.) leaves variegated with white.—*Cerise à feuilles panachées* (Lois. in Duham. ed. nov. 5. p. 20. no. 4.), *variegated-leaved cherry.*

Var. ι, griòtta (Ser. l. c.) fruit globose, depressed, dark purple; flesh red. To this variety belong the following sorts of *cherries:*

1 *Griotte de chaux, griotte d'Allemagne* (Duham. arb. fr. 1. p. 192. t. 141.), *grosse cerise de M. le Compte de Maur.*

2 *Griotte commune, griottier*, Duham. arb. fr. 1. p. 187. t. 12.

3 *Early purple griotte.* Fruit dark red, heart-shaped, middle-sized. Flesh tender. A first-rate dessert fruit, ripening about the beginning of June. A valuable *cherry*, particularly on account of its earliness. Does well either as a standard or wall fruit.

4 *Griotte de Kleparow, la bonne Polonaise.* Fruit middle-sized, round, red. Flesh tender. A second-rate dessert fruit, ripening in July. Does best as a standard.

5 *Griotte à petit fruit, griotte à petit fruit noir*, Duham. abr. fr. 1. p. 190.

6 *Griotte de Portugal* (Duham. arb. fr. 1. p. 190. no. 18. t. 13.), *arch-duke* of some. A kind of *May-duke.*

7 *Griotte de Ratafia, griotte à Ratafia, cerise à tres petit fruit noir* (Duham. arb. fr. 1. p. 189. no. 16.), *cerise* or *griotte du nord tardive, de St. Martin, wild Russian, brune de Bruxelles, gros griotte noire tardive* (Lois. in Duham. ed. nov. 5. p. 26. no. 21. t. 14.), *cerise du nord* (Lois. l. c. p. 26. no. 22. t. 5.). Fruit roundish, dark red. Flesh watery. A good bearer, but inferior in size to the *Morello*, which it closely resembles; ripens in August. It is a kitchen fruit.

8 *Griotte de Turquie.* Fruit round, red, large. Flesh tender. A first-rate dessert fruit, ripening end of July. Like the *belle de Choisy*. Does well either as a wall or standard fruit.

9 *Griotte ou cerise de Prusse*, Lois. in Duham. ed. nov. 5. p. 29. t. 33. t. 13. f. A.

10 *Griotte ou guindoux de Poitou*, Le Berr. trait. jard. 1. p. 252. ex. Lois. l. c. p. 27. no. 29. t. 12. f. C.

11 *Morella extra noir.*

12 *Morellen dobbeete.*

13 *Sweet Morello.*

14 *Langstilkede sode Moreller.*

15 *Morello, small Morello* of some, *Dutch Morello, large Morello, black Morello, late Morello, Ronald's large Morello, du nord, griotte ordinaire du nord.* Fruit dark red, round, heart-shaped, large. Flesh tender. A first-rate kitchen fruit, ripening in July and August. For north walls and for preserving the *Morello* is well known to be most valuable.

16 *Wild Morello.*

Var. κ, cordígera (Ser. in D.C. prod. 2. p. 537.) fruit ovate-globose; flesh red. To this variety belong the following sorts of *cherry:*

1 *Cerise guigne,* Duham. arb. fr. 1. p. 195. t. 16. f. 1.

2 *Griotte guigne, cerise d'Angleterre,* Lois. in Duham. ed. nov. 5. p. 28. no. 32. t. 14. f. B.

3 *Griotte ou cerise cœur,* Le Berr. trait. jard. 1. p. 257. ex Lois. l. c.

4 *Plumstone Morello.* Fruit red, round, heart-shaped. Flesh watery, inferior to the *Morello.*

Capronian, Griotte, Duke, and Morello Cherry. Fl. April. May. Tree 20 feet.

† *Names of cherries not so well known as to be placed in either species or varieties.*

1 *Adlington.* 2 *Affane.* 3 *Ambrée à gros fruit.* 4 *Ambrée à petit fruit.* 5 *American heart.* 6 *Ansell's fine black.* 7 *Belle Bosc.* 8 *Black American.* 9 *Black Orleans.* 10 *Black Spanish.* 11 *Broughton's early black duke.* 12 *Bount's Dantzic cherry.* 13 *Buttner's herz kirsche.* 14 *Buttner's October zucker weichsel.* 15 *Buttner's sehrspate.* 16 *Denner's black.* 17 *Double Natte.* 18 *Franche.* 19 *Grosse blanche carrée.* 20 *Grosse blanche.* 21 *Hartlib.* 22 *Hâtive ou précoce.* 23 *Hâtive de St. Jean.* 24 *De Jacap.* 25 *Læder kirsebær.* 26 *Lamper's knorpel-kirsche.* 27 *Millet's late heart-duke.* 28 *Monstrueuse Hennequine.* 29 *Muscat de Prague.* 30 *New Royal.* 31 *Nouvelle d'Angleterre, cerise guigne.* 32 *Noyau tendre.* 33 *Cerise à petit fruit blanc.* 34 *Précoce.* 35 *Prince's duke.* 36 *Black prolific.* 37 *De Prusse.* 38 *Rainer's French cherry.* 39 *Remington heart.* 40 *Rothmelirt Bernstein kirsche.* 41 *Rouge pale tardive.* 42 *Royal tardive, duke cherry.* 43 *Russie à fruit blanc.* 44 *Thramer's Muscateller aus Minorka.* 45 *Tilger's Weisse herz kirsche.* 46 *Robertson's Tradescant's.* 47 *Turkine.* 48 *Transparent.* 49 *White transparent.* 50 *Cerise à trochet, commune à trochet, très fertile.* 51 *Unique novelle, early unique, early unique novelle.* 52 *De Varenne.* 53 *Wellington.* 54 *White Spanish.* 55 *Winter's schwarze knorpel kirsche.*

Selection of sorts.—Forsyth recommends for a small garden: 1 *May-duke.* 2 *Morello.* 3 *Archduke.* 4 *Black heart.* 5 *Bigarreau.* 6 *Graffion.* 7 *Turkey heart.* 8 *Kensington duke cherry.*

Those in the Dalkeith garden are:—1 *May-duke, two sorts.* 2 *Harrison's heart.* 3 *Black heart.* 4 *White heart.* 5 *Amber heart.* 6 *Morello.* All against walls.

Miller says the best sorts for an orchard are: *the common red* or *Kentish, the duke cherry,* and *the Lukeward's heart;* all of which are plentiful bearers.

Propagation.—Varieties of the *cherry* are continued by grafting or budding on stocks of the *black* or *wild red cherries,* which are strong growers and of a longer duration than any of the garden kinds. The *hearts,* which are all ill bearers, are sometimes grafted on *bird cherry* stocks, which are said to have the same effect on the *cherry* that the paradise stock has on the apple, that of dwarfing the tree and rendering it more prolific. Some graft on the *Morello* for the same purpose. The stones of the cultivated *cherries* are sometimes, but improperly, substituted for those of the wild sort, as being more easily procured. New varieties are produced by propagating from seed.

The *cherry,* Mr. T. A. Knight observes, (Hort. trans. 2. p. 38.) "sports more extensively in variety when propagated from seeds, than any other fruit which I have hitherto subjected to experiments; and this species is therefore probably capable of acquiring a higher state of perfection than it has ever yet attained. New varieties are also much wanted; for the trees of the best old kinds are every where in a state of decay in the cherry orchards; and I am quite confident that neither healthy nor productive trees will ever be obtained from grafts of old and expended varieties of this or any other species of fruit tree."

Cherry stones, whether for stocks or new varieties, are sown in light sandy earth in autumn, or are preserved in sand till spring and then sown. They will come up the same season, and should not be removed till the second autumn after sowing. They may then be planted out in rows, 3 feet apart, and the plants about 1 foot asunder in the rows. The succeeding summer they will be fit to bud, if intended for dwarfs; but if for standards they will require to stand one or more seasons, generally till four years old. They should be budded or grafted near 6 feet from the ground; the usual way is to bud in summer, and graft those which do not succeed the following spring.

Soil.—The *cherry* delights in dry sandy soil and elevated situations; but some sorts, as the *May-duke,* will thrive in all soils and aspects, and all the varieties may be planted in a common mellow garden or orchard ground. In Kent, this tree prospers in the deep loam lying on rock. Miller says, the soil which *cherries* thrive best in, is a fresh hazel loam; if it be a dry gravel they will not live many years, and will be perpetually blighted in the spring.

Site.—To obtain fruit early, some sorts, as the *May-duke,* are planted against walls; but all the varieties will do well as dwarfs or espaliers in general situations, and most of them as standards. The *May-duke,* Nicol observes, does well as a standard; but against a south wall the fruit becomes considerably larger, and contrary to what happens in other fruits, it seems to acquire flavour. The *Morello* is much improved in flavour when planted against a wall of good aspect. Abercrombie says, "allot to the finest of the early kinds south walls for fruit in May and June, train others against west and east walls, for supplies in succession, and some on north walls for the latest ripeners, particularly the *Morello,* which, so situated, will continue in perfection till September and October; but it is also proper to plant some trees of this sort on south walls, to have the fruit ripen earlier, with an improved flavour."

Final planting.—Plant full standards from 20 to 30 feet apart; small standards 15, 18, or 20 feet apart. The proper season for planting is from the middle or end of October, or any time in November or December, if open weather, till February or March. Miller says, never plant standard or rider *cherry* trees over other fruits; for there is no sort of fruit that will prosper under the drip of *cherries.* He allows 40 feet square for standards in orchards for the same reason.

Mode of bearing.—*Cherry* trees in general produce the fruit upon small spurs or studs, from half an inch to 2 inches in length, which proceed from the side and ends of the two year or 3 year and older branches; and as new spurs continue shooting from the extreme parts, it is a maxim in pruning both standard and wall trees, not to shorten the bearing branches where there is room for their regular extension. The *Morello* is, in some degree, an exception.

Pruning cherry trees in general. To standards give only an occasional pruning to reform or remove any casual irregularity from cross-placed or very crowded branches, and take away all cankery and decayed wood. To wall trees a summer pruning should commence in May or June, in order to regulate the shoots of the same year. Disbud the superfluous or foreright shoots, or if they have been suffered to spring, pinch or cut them off with such as are disorderly. Retain a competent supply of the best well placed side and terminal shoots, to remain for selection at the winter pruning. Nail or lay in the reserve close to the wall at their full length, and so train them all summer. The winter pruning may be performed at the fall of the leaf, or at any time in moderate weather till February or March. It comprises a regulation both of the old and young wood. Carefully preserve the sound and productive branches and bearers in their full expansion, and reduce or remove such only as are irregular in growth, too crowded, unfruitful, decayed, or cankery. Any branches extending out of bounds prune into some good lateral shoot or fruit-bud. According to the time the bearers have already lasted, look to some promising shoots for successors to those which may first wear out. To fill immediate vacancies retain select shoots of the last year and the year before, with uniformly a leader to the advancing branch where there is room, and with lateral shoots in any open or unproductive space nearer the origin of the branches, to be trained as bearers between the main branches. Some cut superfluous fruit-shoots clean away; others leave a sprinkling of short stubs cut very short if foreright. The new laterals and terminals are to be trained in at full length as far as room will permit. They will come into bearing the first and second year. In pruning *cherry* trees in general be careful to preserve the small clustering fruit spurs, except where on wall trees any old spurs project considerably, and assume a rugged disorderly appearance; cut such clean out smoothly.

Pruning the Morello cherry. "The *Morello cherry* bears principally on the shoots of last year, the fruit proceeding immediately from the eyes of the shoots, and bears but casually, and in a small degree, on close spurs formed on the two year old wood, and hardly ever on wood of the third year. Therefore both in the summer and winter pruning leave a supply of last year's shoots on all the branches, from the origin to the extremity of the tree, for next year's bearers, cutting out past bearers to make room. It is plain that the *Morello* ought to have no stubs left with a view to spurs, and all foreright shoots ought to be disbudded while young. To leave a convenient space for young wood train the present bearers 6 inches apart; lay in between each of these one young shoot for bearing next year, which will make the promiscuous distance 3 inches." Underwood (Caled. hort. mem. 1. p. 427.) has often observed, when the branches of *cherry* trees are laid in too near to one another, or are crossed by branches of the same kind, or by plum-tree branches, as is sometimes the case, that although there be abundance of blossom, yet there is no crop even in good seasons. On examining the blossoms produced on such crowded shoots he found that in 50 flowers there were not above two styles, of course no fruit could be expected. By not laying in the branches so close, and by removing all superfluous summer shoots, more light and air was admitted, and he had in consequence plentiful crops.

Renovating old or *decayed trees.* Proceed as in the renovating the plum, see p. 504.

Growing cherry trees in orchards. Near large towns cherries might be cultivated in orchards to a certain extent. In Kent and Hertfordshire are the cherry orchards which afford the chief supply for the London market. The sorts are chiefly the *caroon, small black* or *Kentish*, the *May-duke*, and the *Morello;* but *Holman's duke*, the *black heart*, and *large black gean* will do well in orchards.

Protecting from birds. "As cherries in the ripening state are frequently attacked by birds, it is advisable to have choice wall-trees or espaliers defended with large nets in due time. Old fishing nets may also be spread over the branches of dwarf standards. To protect other standard trees let scare-crows and clap-boards be put up."

Gathering the fruit. Use the hand, taking hold of the fruit-stalk in gathering from the wall, and the cherry gatherer, in gathering from the distant branches of high standards.

Insects and diseases, &c. Wall *cherry* trees are often infested with the red-spider, but standards are generally not much injured by insects. Nasmith says, "our *cherry* trees both in the open air, and on the natural walls, particularly the tops of young shoots, are much attacked with a small black insect, provincially called the black beetle. The remedy I have found most effectual for their destruction is a mixture of pitch with one-sixteenth part of powdered orpiment, one-sixteenth part of sulphur, dissolved over a slow fire in an earthen pipkin, until they be well incorporated; when cold, divide it into small pieces about the size of a hen's egg, and burn it under the trees with damp straw, directing the smoke as much as possible where the insects are most numerous. In an hour afterwards, if the state of the fruit will admit, give the trees a good washing with a garden engine, which generally clears off the half dead beetles, and prevents the spreading of the red-spider." Caled. hort. mem. 2. p. 90.

Of the culture of the cherry-house.

Though the *cherry* be a native of Britain no fruit is more difficult to force. M'Phail observes, "no tree forced for obtaining fruit early is more liable to fail of a good crop than the *cherry;* the blossoms are apt to fall off before the fruit is set, and the fruit will keep falling off before and after they are as large as peas. This is occasioned by a kind of stagnation of air about them, which affects the tender blossoms and young shoots."

Soil. M'Phail says, "take light, sandy, rich, mellow earth, and make a border of it the whole width of the house, and 4 feet deep." According to Nicol, "the border should be from 24 to 30 inches deep; the bottom, if not naturally mild and dry, to be drained and paved. The soil should be a sandy loam or light hale garden earth, made moderately rich with stable-yard dung well reduced, or with other light compost. If a small portion of lime, or a moderate quantity of marl, were mixed with it so much the better. The soil for *cherries* to be forced in pots or tubs should be considerably richer than the above." Torbron (Hort. trans. 4. p. 116.) uses fresh virgin soil and rotten dung.

Choice of sorts. M'Phail, Nicol, and all gardeners agree in giving the preference to the *May-duke*. Nicol says, "none of the other kinds set so well, except the *Morello*, which I do not hesitate to say well deserves a place; it is a good bearer, and the fruit when forced acquires superior size and flavour." Nicol, kal. p. 295.

Choice of plants. M'Phail takes standards of different heights in a bearing state; Nicol clean, healthy, young plants, that have been one or two years in training against a wall; Torbron trees 8 or 10 years from the bud, and selected of such various heights as best suits the size of the house.

Choice of situation. M'Phail and Torbron plant in rows, beginning with the tallest in the back side, reserving the shortest for the front, letting them slope to the south gradually, somewhat in the form in which plants are set in the green-house." (Gard. rémem. 146. and Hort. trans. 4. p. 116.) Nicol has a trellis against the back wall for wall-trained trees, and a border in front in which he plants dwarf-standards. The dwarfs against the back trellis he plants 8 or 10 feet apart. Riders that have been 3 or 4 years trained, and are well furnished with fruit-spurs, may be planted between the dwarfs. They may probably yield a few fruit the first season, and will hardly fail to produce plentifully in that following. In the border may be planted, as dwarf standards, to be kept under 5 feet in height, some well furnished plants that have been kept in large pots or tubs for a year or two; such being more fruitful, and less apt to go to wood, than plants that have grown in the open ground. In planting these the ball of earth should not be much reduced, only a few of the under roots should be spread out, for if the ball were reduced, and the whole roots spread out as in the ordinary way of planting, when it is wished that the plant may push freely, the intention here would be thwarted, which is to have the plant dwarf and fruitful, growing little to wood. Along with these may be planted in the same way an apricot or two, or figs, or both, that have been dwarfed in pots or tubs as above. If they succeed it would give a pleasant variety, of which there need be little doubt, as the temperature, soil, and general treatment for cherries will suit apricots, and not far disagree with figs. These little standards may be allowed a space of about 4 feet square each, which is sufficient, as they must not be suffered to rise high or spread far, on account of shading the trees on the trellis. In planting of the principal dwarfs and riders, let the work be carefully performed. They should be raised with as good roots, and be kept as short time out of the ground as possible, placing them just as deep as they have been before, spreading out their roots and fibres, and filling in with fine earth. The whole should have a moderate quantity of water, and have air freely admitted every day, defending them, however, from snow or much rain. The house should not be forced the first year; and it will be better to defer heading in the plants till the middle or end of March than to prune them now. I shall, therefore, take no further notice of them till then, supposing they are to be attended to with respect to air and moderate waterings. It is necessary, however, to remark, that the plants should be carefully anointed with the liquor recommended for vines, see vol. 1. p. 708. either just now or sometime in the course of the month.

Time of planting. According to Nicol and M'Phail January and February; to Torbron early in the autumn.

Pruning. Trees planted in January may be pruned about the middle or end of March. The dwarfs planted against the trellis should be well cut in, that is, each shoot of last year should be shortened back to three or four buds, that the plants may throw out a sufficiency of young shoots to fill the rail from the bottom. The dwarfs planted in the border as little standards need not be headed in so much, as the intention is to have the fruit full, and that they may grow little to wood from the beginning. Their short shrubby shoots need not be touched, unless bruised or hurt in transplanting, shortening back the longer and weaker ones a few inches, according to their strength. The riders planted against the back trellis may be treated very much in the same manner, the sole intention being to obtain a few crops of them while the dwarfs are making wood, and filling their spaces. In November following the trees may be pruned for the succeeding season. In order to produce wood to fill the trellis as soon as possible, the dwarfs should be pretty much headed in. The shoots may be pruned very much in the manner of the trees in the early house, shortening no shoots that are fully ripened, except a few of those at the extremities of the tree, in order to make them throw out others for its full extension upwards next year. November is also the proper time for pruning an established cherry-house preparatory to forcing for the next year. As *cherry* trees which have been forced make very little wood, the pruning required is probably nothing further than moderately to thin out the spurs, and to prune off any accidental breast-wood or water-shoots that may have risen since the crop was gathered. "The leading shoots, except for the purpose of producing wood to fill up any blank or vacancy, need not be shortened; nor need those in the lower parts of the tree, except for the same reason. But if it be necessary to shorten these, let them be cut pretty well in, as otherwise they will push very weakly. Shoots on the extreme parts of the tree that should be shortened for the above purpose, need not however be cut so closely in. If they be headed back one-third or to half their lengths, it will generally be found sufficient."

Summer pruning. Very little of this is requisite, such water-shoots or breast-wood as arise among the spurs are to be pinched off as they appear, laying in such shoots only of this description as may be wanted to fill an occasional vacancy. Train in the summer shoots of the dwarfs as they advance at the distance of about 8 or 9 inches from each other; and otherwise observe the general rules for pruning *cherries* on walls and espaliers.

Stirring the soil. After pruning, the borders are to be forked up, and a little well-rotted dung mixed with sand worked in if thought necessary. In summer they may be slightly stirred on the surface, and weeded to keep them fresh, clean, and neat, and where a part of the border is outside the house cover with horse-dung or litter in the early part of the season.

The time of beginning to force is sometimes December, but more generally January and February. "Newly planted trees," Nicol observes, "will bear gentle forcing next spring, from the first or middle of March, which ought to be considered merely as preparatory to forcing them fully, till about the first of February the third year." Torbron, if the trees have been removed with good balls, admits of gentle forcing the first spring, but prefers deferring it till the third year. He says, "I have had an abundant crop of fine cherries from trees which had been planted only a few months before forcing, but would not recommend the risking of a whole crop, unless the trees have been longer established." Where cherries are to be ripened early in the season he "shuts in about the beginning of December, and lights the fires about the third or last week of that month." Hort. trans. 4. p. 116.

Temperature. Abercrombie begins at 40°, "and throughout the first week lets the minimum be 40°, and the maximum 42°, giving plenty of air. By gradual advances in the second, third, and fourth week, raise the course to 42° min. and 45° max. In strong sunshine admit air freely rather than have the temperature above 52°, by collecting the warm air. In the fifth and sixth week the artificial minimum may be gradually elevated to 45°, but the maximum should be restrained to 48° from fire heat, and to 55° from sun heat, until the plants are in flower. After the blossoms are shown, and until the fruit is set, aim to have the heat from the flues at 48° min. and 52° max. At this stage maintain as free an interchange of air as the weather will permit, and when the sun heat is strong do not let the temperature within exceed 60°. As the fruit is to be swelled and ripened, the requisite heat is 60° min. and 65° max." In January M'Phail does not let the cherry-house rise higher than 50°. In February "if the thermometer in the morning is as low as 35° there is no danger, but it should rise in the course of the day to imitate nature as near as possible. In the month of March the thermometer in the open air in the shade seldom rises above 55°. In the month of April it seldom rises above 65°. But it is observed that when the sun shines on a *cherry* tree or other trees in the open air, the heat on them is higher than in the shade. The *cherry* tree is of such a delicate nature to force, that it is impossible for any person to write down the exact temperature of the air, which would insure a crop from it in the forcing way." When the fruit is beginning to colour and swell off for ripening, the temperature may be raised 4 or 5 degrees. Torbron (Hort. trans. 4. p. 119.) says, "for the first three, four, or five weeks of lighting fires, if the weather be so severe as to depress the thermometer in the open air from 22° to 12° degrees; then let the thermometer inside the house be kept from 35° to 40°, or just sufficient to exclude the frost. If the weather be not severe during the above period the thermometer may be kept to 45° inside the house. As the season advances and becomes more mild, and the days longer, probably about the first or middle of February, the thermometer may be raised to 50°, and then it is expedient to give gentle sprinklings by an engine or syringe two or three times a week in the evening. Whilst the trees are in bloom no sprinkling must be used, but the flues when only moderately hot are to be steamed morning and evening, and every day and hour of sunshine, and in calm and mild weather fresh air must be copiously admitted. When the petals begin to drop, and when the fruit is set, the temperature may be raised to 55°, the house being engined three or four times a week in the evening, but never till the bloom is all down. When the cherries are completely stoned the thermometer may be raised to 60° by fire heat, sprinkling every evening by the engine till the fruit is nearly ripe; the house may be kept higher by day as well as by night after stoning.

Watering. M'Phail waters occasionally at the root and over the top till the trees are in blossom; but when the stones in the fruit are become hard, the trees may be washed all over occasionally with clean water, not too cold. Let this be done in a fine sunny morning. In April, when the cherries are grown large, give the border a good watering now and then, which will enable the trees to swell their fruit to a good size; by keeping them in a healthy growing state the fruit will be fine flavoured, and the trees will make strong flower-buds for the ensuing season. If the fruit is not ripening, wash the trees occasionally, in a sunshiny morning, with sweet clean water. According to Torbron, "from the time the flower begins to open till the fruit is completely stoned, the soil should be but sparingly watered; but when the stoning is effected water may be applied to the roots freely till the fruit is nearly ripe, when he desists." (Hort. trans. 4. p. 119.) Before the fruit begins to colour the engine should be exercised with force, and often for a week or two, to subdue the red spider. After the crop is gathered the watering must be resumed, and continued till the foliage begins to drop. The border may be kept in a moderately moist state until the leaves begin to fall, or till the house be exposed or be uncovered.

Air. In forcing the *cherry* it is essential to continue a free circulation of air; always sustaining the minimum heat in the different stages. The blossoms will sometimes fall abortive, or the young fruit drop off after setting, from no other cause than a stagnant atmosphere. At first beginning to force M'Phail gives plenty of air night and day. In February, when the trees are in blossom, "let the house have air day and night, and as much as you can when the fruit are swelling off." Nicol says, "the airing of the cherry-house may be performed by the sashes with every safety till the buds begin to expand, and after that in frosty or bad weather air may be admitted by the ventilators. In February nothing is more conducive to the health of the plants, and the setting of the fruit, than a regular and free circulation of air. A day should never pass without less or more air being admitted. As the fruit begins to ripen give as large and regular portions of air as possible, opening the sashes by 8 or 9 o'clock in the morning, giving full air about 10 o'clock, reducing about 2 or 3, and shutting up about 4 or 5, sooner or later according to the state of the atmosphere. In conducting this matter, however, regard must be had to the temperature, but air may be admitted in sunshine to such an extent as to keep down the mercury or spirits in the thermometer to 65°, and at other times to 60°." Gard. kal. p. 339. Torbron says, "the *cherry* in forcing requiring more fresh air than most other fruits, particular attention must be paid to its admission, by the gardener having it in his power occasionally to make as many inlets or openings as convenient. It will be conducive to this end that the roof and the upright or front sashes, if any, be moveable, and all with little difficulty, because in changeable weather the current of air may be required to be augmented or reduced many times in one day. Air must be admitted freely and copiously when the weather is mild and calm, and accompanied with sunshine, during the time the cherries are in bloom, and also near the time of their ripening." Hort. trans. 4. p. 119.

Insects and diseases. "The *cherry* is liable to be infested by a small grub-worm, which rolls itself up in the leaves, and extends its ravages to the fruit. As soon as the insect is perceived the trees should be searched daily, that it may be destroyed by the hand, and prevented from spreading. It usually shows itself first about the time of flowering." Pract. gard. p. 661. The cherry-house, as the season advances, may be smoked once a week or ten days, which will prevent the trees from being infested with a blackish kind of insect, frequently very pernicious. Birds are apt to get into the house and eat the fruit, therefore narrow nets should be employed, which will prevent birds as well as wasps and flies from getting to the fruit. Torbron fumigates for the black fly, and picks off the grub.

Gathering and keeping the fruit. If it be found necessary cherries will keep some time on the trees, provided the birds can be kept from them. Keep the house for the purpose dry, cool, and well aired. Gard. rem. p. 246.

Exposing the wood. This, according to all the authors quoted, may be done from the time the fruit is gathered till within a week or ten days of the recommencement of forcing. The glass should be entirely taken off, unless the cherry-house is in part used for some other purpose, to which this practice would be injurious.

Forcing cherry trees in pots. M'Phail and Nicol concur in approving the very general practice of planting *cherry* trees in pots; in which, or in tubs of a foot or 15 inches in diameter, they may be successfully forced. Three or four dozen good plants managed in this way would give a great deal of fruit, which might be had in succession for a considerable length of time by dividing the plants into 3 or 4 classes or divisions, and shifting them from one compartment to another. In January the first 12 trees may be placed in the green-house or conservatory, if there be one, or in a peach-house now at work, placing them in the coolest part of the house, but in the full light, and where they may have plenty of air. They must be duly attended to with water at the roots, and be frequently syringed at top, generally once in two days. The pots being occasionally watered with the drainings of the dung-hill would add much to the vigour of the plants; there is no method of manuring more effectual or so readily accomplished. The plants may remain here till the fruit be fairly set, the stoning over, and all danger of dropping past. They may then be placed in a vinery or stove to ripen off, where they would come in early, and be very high flavoured, if placed near the light, and so as that they may have free air daily. In February a second and third dozen should be taken in, and a fourth in the beginning of March, and each similarly treated. Gard. kal. It is very common with early forced *cherry* trees to bear a second crop late in the same season. Hort. trans. 3. p. 367. Mr. B. Law (Hort. trans. series 2. vol. 1.) finds the following method of forcing *cherries* attended with greater success than any other he is acquainted with. He puts the *cherry* trees into his houses, giving them but very little water at the close of the year, by which he finds them better prepared for blooming in the spring. Their pots have a capacity of from two quarts to two gallons, according to the size of the plants, but the soil in which they are planted is by no means rich, for he finds that highly manured soil makes the shoots too luxuriant, and causes them to gum. When he begins to force he waters but sparingly, and admits air both by night and by day as much as the weather will permit; for he finds alternate ventillation by day and confinement by night to be very injurious. He opens his back lights in any kind of weather close to the trees. In frosty weather he increases his fires, to enable him to give constant air without actually allowing the temperature to fall to 32°. In this manner he proceeds very slowly until the blossoms are all set. He subsequently raises the temperature to 65°, and afterwards gradually to 70°, increasing the moisture of the atmosphere at the same time, and always taking care to keep the ventillation as abundant as he possibly can. By which means he finds the crop certain and abundant without the use of any kind of bottom heat, as tan leaves, &c.

Forcing by a temporary structure. Torborn observes, that "where a portion of wall (especially with a southern aspect) already well furnished with *may-dukes* perfectly established, and in a bearing state, can be spared for forcing, a temporary glass case may be put up against it; the flue may be built on the surface of the border without digging or sinking for a foundation; neither will any upright or front wall be requisite, the wooden plate on which the lower end of the rafters are to rest may be supported by piles sunk or driven into the soil of the border, one pile under every or every alternate rafter. The place between the surface and the soil should be filled by boards nailed against the piles to exclude the external air, for the plate must be elevated above the level of the surface from 18 to 30 inches, or whatever height may be sufficient to let the sashes slip down, in order to admit fresh air. I believe this to be an uncommon structure, and it may perhaps be objected to; but I am confident it will suit well for cherries, for I have constructed such places even for forcing peaches with good success, as well as for maturing and preserving a late crop of grapes." Hort. trans. 4. p. 117.

6 C. SEMPERFLÒRENS (D. C. fl. fr. 4. p. 481. Lois. in Duham. ed. nov. p. 30. no. 18. t. 5. f. A.) branches drooping; leaves ovate, serrated; flowers late, axillary, solitary; calyxes serrated; fruit globose, red. ♄. H. Native country unknown. Prùnus semperflòrens, Ehrh. beitr. 7. p. 132. Prùnus serótina, Roth. cat. 1. p. 58. Flowers white. This is the *All-saints* or *weeping-cherry*, the *cerise de la toussaint, cerise tardive, cerise de Saint Martin*, and *Guignier à rameaux pendans* of the French. The fruit is small, round, red, watery, but it is of little value.

Var. β, *sessiliflòra* (Ser. mss. in D. C. prod. 2. p. 537.) This is a monstrosity, bearing earlier sessile flowers, and foliaceous styles.

Ever-flowering Weeping or All Saints' Cherry. Fl. May. Tree 10 to 20 feet.

7 C. CHAMÆCE'RASUS (Lois. in Duham. ed. nov. 5. p. 29. t. 5. f. A.) flowers umbellate; umbels usually sessile; peduncles longer than the leaves when in fruit; fruit round, reddish purple, very acid; leaves obovate, shining, crenated, bluntish, quite glabrous, rather coriaceous, hardly glandular. ♄. H. Native of Siberia and Germany. C. intermèdia, Lois. l. c. p. 30. Prùnus intermèdia, Poir. dict. 5. p. 674. Prùnus fruticòsa, Pall. fl. ross. 1. p. 19. t. 8. B. Chamæcérasus fruticòsa, Pers. ench. 2. p. 34. Lower serratures of leaves glandular. Flowers white.

Ground-cherry or Siberian-cherry. Fl. May. Clt. 1597. Tree 2 to 4 feet.

8 C. PERSICIFÒLIA (Lois. l. c. p. 9.) flowers umbellate, numerous; peduncles rather capillary; leaves ovate-lanceolate, acuminated, unequally-serrulated; petioles biglandular. ♄. H. Native of North America? Prùnus persicifòlia, Desf. arbr. 2. p. 205. This kind of *cherry* was raised from seeds sent by Michaux from North America.

Peach-leaved Cherry. Fl. May. Tree 8 to 10 feet.

9 C. PU'DDUM (Roxb. Wall. pl. rar. asiat. 2. p. 37. t. 143.) leaves ovate, lanceolate, acuminated, sharply serrulated; flowers umbellate; umbels on short peduncles; bracteas ciliated; calyx tubular, length of the peduncle; limb of calyx reflexed; fruit roundish, red. ♄. H. Native of Nipaul, between Hurdwar and Sirinaghur. Flowers rose-coloured. The wood is reckoned very useful in Nipaul. The fruit is like that of a common *cherry;* it is refreshing, but not very sweet. The tree is found in the south of Hindostan, Nipaul, Kamaon, Deyra, Sirmore, and elsewhere in great abundance. *Puddum* is the vernacular name of the tree.

Puddum Cherry. Fl. Oct. Nov. Tree 20 to 30 feet.

10 C. PU'MILA (Michx. fl. bor. amer. 2. p. 286.) striated; branches twiggy; flowers subumbellate, pedunculate; calyx short, campanulate; leaves obovate-oblong, erect, glaucous beneath, glabrous, hardly serrulated; fruit ovate, red. ♄. H. Native of Canada. Lois. in Duham. ed. nov. 5. p. 31. Prùnus pùmila, Lin. mant. 73. Mill. fig. t. 89. f. 2. Cérasus glaùca, Mœnch. meth. 672. Stature of Amýgdalus nàna. In Canada it is commonly called *Ragouminier*. Flowers white. Fruit red, acid.

Dwarf Canadian-cherry. Fl. May. Clt. 1756. Sh. 3 to 4 ft.

11 C. PYGMÆ'A (Lois. in Duham. ed. nov. 5. p. 32. no. 21.) unarmed; umbels sessile, few-flowered; leaves ovate-elliptic, acutish, glabrous on both surfaces, tapering to the base, sharply serrated, bearing 2 glands at the base; fruit black, hardly succulent, about the size of a large pea. ♄. H. Native of North America. Prùnus pygmæ'a, Willd. spec. 2. p. 993. Flowers white, size of those of *Prùnus spinòsa*.

Pigmy Cherry. Fl. May. Clt. 1823. Shrub 3 to 4 feet.

12 C. NÌGRA (Lois. l. c. p. 32. no. 22.) unarmed; umbels sessile, few-flowered; lobes of calyx obtuse; leaves ovate, acuminated; petioles biglandular. ♄. H. Native of Canada, and from Fort William in lat. 48 deg. to the Saskatchawan, Lake Huron, and Newfoundland. Sims, bot. mag. 1117. Prùnus nìgra, Ait. hort. kew. ed. 1. vol. 2. p. 165. ed. 2. vol. 3. p. 198. Calyx purple, with obtuse segments, having glandular margins.

Black Canadian-cherry. Fl. April, May. Clt. 1773. Shrub.

13 C. BOREA'LIS (Michx. fl. bor. amer. 1. p. 286. Lois. l. c. 5. p. 32. no. 23.) flowers sub-corymbous; pedicels longish; leaves oval-oblong, acuminated, membranous, glabrous, erosely denticulated; fruit small, egg-shaped, red, with sweet flesh. ♄. H. Native of North America, on the high mountains of New England. Prùnus boreàlis, Poir. dict. 5. p. 674. Leaves like those of the common almond, with the serratures inflexed, and tipped by glands at the apex.

Northern Cherry or Choke-cherry. Fl. May. Clt. 1822. Sh.

14 C. GLANDULÒSA (Lois. in Duham. ed. nov. 5. p. 33. no. 26.) flowers solitary; peduncles pendulous; leaves oblong, acute, with glandular serratures, glabrous, of the same colour on both surfaces; branches unarmed. ♄. H. Native of Japan. Prùnus glandulòsa, Thunb. fl. jap. 203. Corolla flesh-coloured.

Glandular-leaved Cherry. Shrub 5 to 8 feet.

15 C. A'SPERA (Lois. l. c. 5. p. 33. no. 24.) branches dotted; flowers solitary, terminal, pedunculate; leaves ovate, acuminated, serrated, scabrous on both surfaces. ♄. H. Native of Japan. Prùnus áspera, Thunb. fl. jap. 201. Poir. dict. 5. p. 675. Drupe the size of pepper, blue, glabrous, edible, containing a hard acutish stone. The upper surface of the leaf is so hard that it is used for polishing in Japan.

Rough-leaved Cherry. Shrub 5 to 6 feet.

16 C. INCÌSA (Lois. l. c. 5. p. 33. no. 27.) branches unarmed; flowers solitary; peduncles capillary, twice the length of the leaves; leaves ovate, deeply serrated, villous; calyx cylindrical, ferruginous. ♄. H. Native of Japan. Prùnus incìsa, Thunb. fl. jap. 202. Petals rose-coloured.

Cut-leaved Cherry. Shrub 6 feet.

17 C. DEPRE'SSA (Pursh. fl. amer. sept. 1. p. 331.) branches angular, depressed, prostrate; umbels few-flowered, sessile, aggregate; leaves lanceolate-cuneated, a little serrated, glabrous, glaucous beneath; fruit ovate. ♄. H. Native of North America, from Canada to Virginia, throughout Canada, and as far as the Saskatchawan. Cérasus pùmila, Michx. fl. bor. amer. 1. p. 286. but not the Prùnus pùmila of Lin. Prùnus Susquehànæ, Willd. enum. 519. baumz. ed. 2. p. 286. Flowers white.

Depressed or Sand-cherry. Fl. May. Clt. 1805. Shrub prostrate.

18 C. HYEMA'LIS (Michx. fl. bor. amer. 1. p. 284.) umbels sessile, aggregate; segments of the calyx lanceolate; leaves oval-oblong or obovate, abruptly acuminated; fruit subovate. ♄. H. Native of Canada, Virginia, and in the shady woods of Carolina. Lois. in Duham. ed. nov. 5. p. 194. Flowers white. Fruit black and astringent, eatable only in the winter.

Winter or Black Choke-cherry. Fl. May. Clt. 1805. Shrub 3 to 4 feet.

19 C. PROSTRA'TA (Ser. in D. C. prod. 2. p. 538.) decumbent; flowers usually solitary, almost sessile; calyx tubular; leaves ovate, deeply-serrated, glandless, clothed with hoary tomentum beneath; fruit ovate, red, with tender flesh, and with the sutures of the stone very blunt. ♄. H. Native of the mountains of Candia, and on mount Lebanon, and of Siberia. Prùnus prostràta, Labill. syr. dec. 1. p. 15. Lois. in Duham. ed. nov. 5. p. 182. t. 53. f. 2. good. Curt. bot. mag. 136. Prùnus incàna, Steven in mem. soc. mosq. 3. p. 263. Petals ovate, retuse, rose-coloured.

Prostrate Cherry. Fl. April, May. Clt. 1802. Sh. pros.

20 C. HU'MILIS (Moris, elench. sard. p. 17.) stems depressed; flowers usually solitary, pedicellate; calyx tubular; leaves oblong or ovate, unequally serrated, glabrous, and green on both surfaces, reticulately veined beneath; fruit ovate. ♄. H. Native of Sardinia. Habit of *C. prostràta*, but differs from it in the nerves being hoary. Petals ovate, of a pale rose colour.

Humble Cherry. Fl. June, July. Shrub depressed.

21 C. CHI'CASA (Michx. fl. bor. amer. 1. p. 284.) branches rather spinescent, quite glabrous; flowers usually twin; pedicels very short; calyx glabrous, with very short segments; leaves oval-oblong, acute or acuminated; fruit nearly globose, small, yellow. ♄. H. Native of Carolina, to which country it has been introduced by the Indians, and by them called *Chicasaw*.

Chicasaw Cherry or Plum. Fl. April, May. Clt. 1806. Shrub 6 feet.

22 C. PUBE'SCENS (Ser. in D. C. prod. 2. p. 538.) umbels sessile, few-flowered; peduncles and calyxes pubescent; leaves short, oval, serrulated, for the most part biglandular at the base; fruit globose. ♄. H. Native of New England and Pennsylvania. Prùnus pubéscens, Pursh. fl. bor. amer. 1. p. 331. Prùnus sphærocárpa, Michx. fl. amer. sept. 1. p. 284. but not of Swartz. Young branches pubescent. Fruit on short pedicels, of a brownish purple-colour, and astringent.

Pubescent Cherry. Fl. April, May. Clt. 1820. Shrub.

23 C. JAPO'NICA (Lois. in Duham. ed. nov. 5. p. 33.) leaves ovate, acuminated, glabrous, shining; peduncles solitary; lobes of calyx shorter than the tube. ♄. G. Native of Japan. Prùnus Japónica, Thunb. fl. jap. p. 201. Prùnus Sinénsis, Pers. ench. 2. p. 36. Flowers red. Drupe the size of a pea.

Var. β, múltiplex (Ser.) flowers semidouble, with the petals white on the upper side, and red on the under. Prùnus Japónica, Ker. bot. reg. 27.

Japan Cherry. Fl. March, May. Clt. 1810. Sh. 2 to 4 feet.

24 C. CHINE'NSIS; leaves ovate-lanceolate, doubly serrated, wrinkled from veins beneath; peduncles sub-aggregate. ♄. H. Native of China. Amýgdalus pùmila, Lin. mant. 74. Sims, bot. mag. 2176. exclusive of the synonyme of Pluck. Flowers semidouble, red.

China Cherry. Fl. March, May. Clt. 1810. Sh. 2 to 3 ft.

25 C. SERRULA'TA (G. Don, in Loud. hort. brit. p. 480.) leaves obovate, acuminated, setaceously serrulated, quite glabrous; petioles glandular; flowers in fascicles. ♄. G. Native of China, where it is called *Yung-to*. Prùnus serrulàta, Lindl. hort. trans. 7. p. 238. This species is generally known by the name of *double Chinese-cherry*. The flowers are pale white, and very ornamental.

Serrulated-leaved Cherry. Fl. April. Clt. 1822. Shrub 4 to 6 feet.

26 C. SALÍCINA (G. Don, in Loud. hort. brit. p. 480.) flowers usually solitary, shorter than the leaves; leaves obovate, acuminated, glandularly serrated, glabrous; stipulas subulate, glandular, length of the petiole; petiole glandless. ♄. F. Native of China, where it is called *Ching-cho-lee* or *Tung-chok-lee plum*. Prùnus salícina, Lindl. hort. trans. Flowers small, white. Fruit about the size of those of the Myrobalan plum. It seems to come nearest to *C. glandulòsa*.

Willow Cherry. Fl. April, May. Clt. 1822. Shrub 4 to 6 feet.

SECT. II. LAUROCE'RASUS (the name indicates it is a cherry in fruit, and laurel in leaves). Laurocérasus and Cérasus species, Tourn. inst. t. 493. Flowers disposed in racemes, rising from the branches.

§ 1. *Pàdus* (from παδος, *pados*, a name given by Theophrastus to a tree analogous to the *cherry*). *Leaves caducous.*

27 C. PENNSYLVA'NICA (Lois. in Duham. ed. nov. 5. p. 9.) umbels almost sessile, aggregate, sometimes in the form of panicles; leaves oblong-lanceolate, acuminated, glabrous, biglandular at the base. ♄. H. Native of North America, Canada as far as the Saskatchawan, and from Newfoundland to the Rocky Mountains. Prùnus Pennsylvánica, Lin. fil. suppl. 252. Prùnus lanceolàta, Willd. arb. 240. t. 3. f. 3. Flowers white. Fruit smaller than those of the *cherry*, agreeable to eat.

Pennsylvanian Bird-cherry. Fl. May. Clt. 1773. Shrub 6 to 8 feet.

28 C. PANICULA'TA (Lois. l. c. 5. p. 9. Ker. bot. reg. t. 80.) flowers panicled, spreading; leaves ovate. ♄. G. Native of Japan. Prùnus paniculàta, Thunb. fl. jap. 200. Flowers large, white. Very like *C. Mahàleb*, but differs in the panicle of flowers being larger and more spreading, in the flowers being smaller, in the leaves being more oblong and attenuated at the base, and acutely serrated.

Panicled-flowered Bird-cherry. Fl. May. Shrub.

29 C. PSEU'DO-CE'RASUS (G. Don, in Loud. hort. brit. 200.) leaves obovate, acuminated, flat, serrated; flowers racemose; branches and peduncles pubescent; fruit small, pale red, of a pleasant subacid flavour, with a small smooth stone. ♄. H. Native of China, where it is called *Yung-to*. Prùnus pseudocérasus, Lindl. hort. trans. 6. p. 90. Prùnus paniculàta, Ker. bot. reg. 800. but not of Thunb. Flowers white. This species of *cherry* forces well.

False-cherry. Fl. April, May. Clt. 1821. Sh. 6 to 10 feet.

30 C. MAHA'LEB (Mill. dict. no. 4. D. C. fl. fr. 4. p. 480.) racemes somewhat corymbose, leafy; leaves broad, roundish-cordate, denticulated, glandular, folded together; fruit ovate-roundish, black. ♄. H. Native of the south of Europe. Lois. in Duham. ed. nov. 5. p. 6. t. 2. Prùnus Mahàleb, Lin. spec. 678. Jacq. fl. austr. t. 227. Resembling the apricot in foliage. Flowers white. The wood is red, very hard, and sweet-scented, and on that account is greatly esteemed by the French for making cabinets and other furniture, under the name of *bois de Sainte*

Lucie. The fruit is black, yielding a bitter purple juice, the stain of which is not easily effaced. A fragrant and pleasant distilled water is made from both leaves and flowers.

Mahaleb Bird-cherry. Fl. Ap. May. Clt. 1714. Tree 10 ft.

31 C. Pa'dus (D. C. fl. fr. 4. p. 580.) racemes elongated, leafy, drooping; petals obovate; leaves ovate-lanceolate, rather acuminated; fruit round, black, astringent. ♄. H. Native of Europe and Siberia, in hedges and in woods; plentiful in some parts of Britain. Prùnus Pàdus, Lin. spec. 677. Smith, engl. bot. t. 1383. Flowers white. Fruit black, called *bird-cherry*, *fowl-cherry*, *cluster-cherry*, and in Scotland *hag-berry*. A strong decoction of the bark is used by the Finlanders to cure venereal complaints. The fruit is nauseous to most palates, but infused in gin or whiskey it greatly improves these spirits, and is only surpassed by an infusion of peach leaves.

Var. α, vulgàris (Ser. in D. C. prod. 2. p. 539.) flowers large, loose, on long peduncles; fruit black. Prùnus pàdus α, D. C. fl. fr. 4. p. 580. Lois. in Duham. ed. nov. 5. p. 2. t. 1.

Var. β, parviflòra (Ser. l. c.) flowers smaller; peduncles shorter and denser; fruit black. Oed. fl. dan. t. 205.

Var. γ, rùbra (Ser. in D. C. prod. 2. p. 539.) fruit red. C. Pàdus fructu rubro, D. C. fl. fr. 4. p. 580. Lois. l. c. Prùnus rùbra, Willd. arbr. 237. t. 4. f. 2. ex Ait. hort. kew. ed. 2. p. 299. This is the *Cornish* or *red-bird cherry*.

Var. δ, bracteòsa (Ser. mss. in D. C. prod. 2. p. 539.) flowers very numerous; pedicels furnished with long bracteas. C. Pàdus δ, D. C. herb.

Common *Padus* or Bird-cherry. Fl. April, May. Britain. Tree 10 to 30 feet.

32 C. acumina'ta (Wall. pl. rar. asiat. 2. p. 78. t. 181.) leaves lanceolate, acuminated, remotely serrated, and are, as well as the flowers, glabrous, sometimes with a few glands beneath; racemes axillary, solitary, or in fascicles, a little shorter than the leaves. ♄. G. Native of the mountains of Nipaul. Flowers white. Racemes nodding. *Aroa* is the Nipaul name of the tree.

Acuminated-leaved Bird-cherry. Tree 20 to 30 feet.

33 C. Virginia'na (Michx. fl. bor. amer. 1. p. 285.) racemes erect, elongated; petals orbicular; leaves oblong, acuminated, doubly-toothed, smooth; petioles usually bearing about 4 glands; fruit red. ♄. H. Native of Virginia, Carolina, and Canada. Prùnus rùbra, Ait. hort. kew. ed. 1. vol. 2. p. 162. Willd. arb. 238. t. 5. f. 1. Prùnus argùta, Bigelow in litt.—Catesb. car. 2. t. 19. —Park. par. 599. t. 597. f. 6. Flowers white. Fruit globose. Wood beautifully veined with black and white. The tree retains its foliage late in autumn.

Virginian Bird-cherry. Fl. May, June. Clt. 1724. Tree 20 to 80 feet.

34 C. Canade'nsis (Lois. in Duham. ed. nov. 5. p. 3.) leaves without glands, broad-lanceolate, wrinkled, pubescent on both surfaces, and green, drawn down into the petiole. ♄. H. Native of Canada. Prùnus Canadénsis, Willd. spec. 2. p. 986.—Pluk. alm. t. 158. f. 4. Flowers white.

Canada Bird-cherry. Fl. May, June. Clt. 1820. Tree 20 to 30 feet.

35 C. móllis (Dougl. mss. Hook. fl. bor. amer. 169.) racemes short, pubescently tomentose, as well as the calyxes; calycine segments reflexed; leaves obovate-oblong, crenated, pubescent beneath; fruit ovate. ♄. H. Native of the north-west coast of America, near the mouth of the Columbia, and on subalpine hills near the source of the river. Like *C. pubéscens* in habit. Young branches dark brown and downy. Flowers white.

Soft Bird-cherry. Tree 12 to 24 feet.

36 C. emargina'ta (Dougl. mss. Hook. fl. bor. amer. p. 169.) racemes corymbose; pedicels elongated, glabrous; calyx glabrous, with ovate, obtuse, reflexed segments; leaves oval, denticulately serrulated, glabrous, acute at the base, and biglandular, but obtuse at the apex, and usually emarginate; fruit globose. ♄. H. Native of north-west America, on the upper part of the Columbia river, especially about the Kettle Falls. Flowers white. Fruit astringent. Wood red spotted with white. Leaves 2 inches long.

Emarginate-leaved Bird-cherry. Shrub 4 to 8 feet.

37 C. Capo'llin (D. C. prod. 2. p. 539.) racemes rather compound, lateral, and terminal; leaves lanceolate, serrated, glabrous; fruit globose. ♄. G. Native of Mexico, in cold and temperate places. Prùnus Virginiàna, Moc. et Sesse, fl. mex. icon. ined. Prùnus Canadénsis, pl. mex. ined.—Hern. mex. 95. with a figure. The leaves are about the size and form of those of *Sàlix fràgilis*. The fruit is the colour and form of that of *C. àrium*. The bark of this tree is employed in Mexico as a febrifuge.

Capollin Bird-cherry. Shrub.

38 C. Nipaule'nsis (Ser. in D. C. prod. 2. p. 540.) leaves long, lanceolate, acuminated, bluntly serrated, glabrous, conspicuously and reticulately veined beneath, and whitish, pilose in the axils of the nerves; peduncles short, rather villous, as well as the rachis; calyx glabrous; fruit*?* ♄. H. Native of Nipaul. The leaves are almost the form of those of *Sàlix fràgilis*.

Nipaul Bird-cherry. Clt. 1820. Shrub.

39 C. caprícida; leaves elliptic, acuminated, coriaceous, glabrous, quite entire, with undulately curled margins; petioles glandless; racemes either solitary or aggregate by threes, many-flowered, glabrous, shorter than the leaves. ♄. G. Native of Nipaul, at Narainhetty. Prùnus caprícida, Wall. in litt. Prùnus undulàta, Hamilt. ex D. Don, prod. p. 239. Cérasus undulàta, Ser. in D. C. prod. 2. p. 540. The leaves of this shrub contain so large a quantity of prussic-acid as to kill the goats of Nipaul. This shrub is probably evergreen.

Goat-killing Bird-cherry. Sh.

40 C. ellı'ptica (Lois. in Duham. ed. nov. 5. p. 4.) leaves elliptic, serrated, bluntish, veiny, glabrous. ♄. H. Native of Japan. Prùnus ellíptica, Thunb. fl. jap. 199. Drupe oblong, about the size of a small grape.

Elliptic-leaved Bird-cherry. Tree.

41 C. serótina (Lois. in Duham. ed. nov. 5. p. 3.) racemes loose, at length pendulous; leaves oval or obovate, acuminated, simply serrated, opaque, shining above, naked on both surfaces, bearded in the axils of the veins beneath; petioles biglandular; fruit dark purple, globose. ♄. H. Native of North America, in Canada and Newfoundland. Prùnus serótina, Willd. arbr. 239. t. 5. f. 2. Prùnus Virginiàna, Mill. dict. no. 2. Leaves rather coriaceous, shining, the floral ones very narrow at the base. Flowers white. This is the *Tawquoy-meen-ahtik* of the Cree Indians. Its fruit is termed *Tawqawy-mena* or *Choke-cherry;* it is not very edible in a fresh state, but when dried and bruised it forms an esteemed addition to pemmican. Dr. Richardson says it is the *C. Virginiàna*.

Var. β, retùsa (Ser. mss. in D. C. prod. 2. p. 540.) leaves roundish, obovate, rather villous beneath, very blunt, and rather retuse at the apex; the middle nerve pilose on both sides. ♄. S. Native of South America.

Late Bird-cherry, or Choke-cherry. Fl. May, June. Clt. 1629. Tree 20 feet.

§ 2. *Laurocérasus* (*laurus*, the laurel, and *cérasus*, the cherry; the trees are cherries in fruit but laurels in the leaves). *Leaves coriaceous, permanent, evergreen.*

42 C. occidenta'lis (Lois. in Duham. ed. nov. 5. p. 4.) racemes lateral; leaves glandless, oblong, acuminated, quite entire, glabrous on both surfaces. ♄. S. Native of the West

Indies. Prùnus occidentàlis, Swartz, fl. ind. occ. 2. p. 925.—Catesb. car. 2. p. 94. t. 94.? Flowers white.

Occidental Bird-cherry. Fl. year. Clt. 1784. Tree 20 ft.

43 C. Lusita'nica (Lois. in Duham. ed. nov. 5. p. 5.) racemes erect, axillary, longer than the leaves; leaves ovate-lanceolate, serrated, glandless. ♄. H. Native of Portugal and Pennsylvania. Prùnus Lusitánica, Lin. spec. 678. Mill. fig. 131. t. 196. f. 1.—Dill. hort. elth. 193. t. 159. f. 193. Fruit ovate, red when ripe. The *Portugal laurel* is one of the most elegant shrubs which we have in our plantations, especially when planted in a proper situation and soil. The evergreen shining leaves and the long racemes of white flowers make altogether a very striking appearance. It was brought to England from Portugal, but whether it is a native of that country is doubtful.

Var. β, Híxa (Ser. in D. C. prod. 2. p. 540.) leaves larger; racemes more elongated; flowers looser. ♄. H. Native of Teneriffe, the Grand Canary, and Palma. Prùnus Híxa, Brouss. ex Willd. enum. 517. Prùnus multiglandulòsa, Cav. ann. sci. nat. 3. p. 59. The lower serratures of the leaves are glandular, according to Willdenow.

Portugal Laurel. Fl. June. Clt. 1648. Tree 10 to 20 feet.

44 C. lauro-ce'rasus (Lois. in Duham. ed. nov. 5. p. 6.) racemes shorter than the leaves; leaves ovate-lanceolate, remotely serrated, furnished with 2 or 4 glands beneath; fruit ovate, acute. ♄. H. Native of the Levant, Caucasus, the mountains of Persia, and the Crimea. Prùnus Laurocérasus, Lin. spec. 678. Clusius received it in 1576 from David Ungand, then ambassador from the Emperor of Germany at Constantinople, with some other rare trees and shrubs, all of which perished except the common *laurel* and horse-chestnut. It was sent by the name of *Trabison Cumasi* or *Date of Trebisond*. The leaves have a bitter styptic taste, accompanied with a flavour resembling that of the bitter almond; this flavour has caused them to be used for culinary purposes in custards, puddings, blanc-mange, &c., and as the proportion of the sapid matter of the leaf to the quantity of milk is inconsiderable, no bad effects are produced. Laurel-water is prepared, according to the Prussian pharmacopœia, by drawing off 3 pounds of distilled water from 2 pounds of the fresh leaves. See *Amýgdalus*.

Cherry-laurel or Common Laurel. Fl. April, May. Clt. 1629. Shrub 6 to 10 feet.

45 C. sphæroca'rpa (Lois. l. c. 5. p. 4.) racemes axillary, erect, small, shorter than the leaves; leaves glandless, quite entire, shining; flowers distant; fruit nearly globose. ♄. S. Native of Jamaica, St. Domingo, Hispaniola, and Brazil, in woods. Prùnus sphærocárpa, Swartz, fl. ind. occ. 2. p. 927. but not of Michx.—Sloane, hist. 2. p. 9. t. 193. f. 1. Wood very hard and white. Leaves 2 inches long and about an inch and a half broad, nearly round. Fruit purple when ripe.

Round-fruited Evergreen Bird-cherry. Fl. June, July. Clt. 1820. Tree 10 to 12 feet.

46 C. Brasilie'nsis (Cham. et Schlecht. Linnæa. 2. p. 542.) racemes axillary, shorter than the leaves, erect; leaves elliptic, acuminated at both ends, quite entire, with revolute edges, furnished with a gland on both sides of the middle nerve at the base beneath. ♄. S. Native of Brazil. Drupe black.

Brasilian Evergreen Bird-cherry. Tree.

47 C. Carolinia'na (Michx. fl. bor. amer. 1. p. 285.) leaves on short petioles, oblong-lanceolate, mucronate, smooth, rather coriaceous, almost entire; racemes axillary, dense, shorter than the leaves; flowers rather large; fruit nearly globose, mucronate. ♄. H. Native of North America, from Carolina to Florida. Lois. in Duham. ed. nov. 5. p. 5. Prùnus Caroliniàna, Ait. hort. kew. 2. p. 163. Leaves about 2 inches long, ¾ of an inch broad, with a few indentures on their edges. Flowers white.

Carolina Evergreen Bird-cherry. Fl. May. Clt. 1759. Tree 20 to 30 feet.

48 C. salicifòlia (D. C. prod. 2. p. 540.) quite glabrous; leaves oblong-lanceolate, ending in a very long acumen, sharply serrulated, smooth, permanent; calyx permanent, with the lobes denticulated; petioles furnished with 1 or 2 glands; style curved. ♄. S. Native of New Granada. Prùnus salicifòlia, H. B. et Kunth, nov. gen. amer. 4. p. 241. t. 563. Leaves like those of *Sàlix fràgilis*. Flowers white.

Willow-leaved Evergreen Bird-cherry. Tree 20 to 30 feet.

49 C. ferrugínea (D. C. prod. 2. p. 540.) leaves obovate, permanent, on short petioles, retuse; petioles and branches clothed with rusty velvety down; racemes length of leaves. ♄. S. Native of Mexico. Fruit unknown.

Rusty Evergreen Bird-cherry. Shrub.

50 C. Capu'li (Ser. mss. in D. C. prod. 2. p. 541.) leaves lanceolate, sharply serrated, glandless, glabrous. ♄. S. Native of Peru. Prùnus Capùli, Cav. ex Spreng. syst. 2. p. 477. Perhaps the same as *C. Capóllin* of Mexico.

Capuli Evergreen Bird-cherry. Tree.

Cult. All the hardy kinds of this genus are well adapted for shrubberies; they are generally increased by cuttings or layers, which should be planted in September, in as sheltered a border as possible; some of them are raised more readily by seeds, as the *Portugal laurel*. Ripened cuttings of the stove and greenhouse kinds root freely if planted in a pot of sand, with a hand-glass placed over them; those of the stove species require bottom heat to make them strike root.

VI. POLYDO'NTIA (from *πολυ*, *poly*, many, and *οδους οδοντος*, *odous odontos*, a tooth; calyx having more teeth than other genera in the order). Blum. bijdr. 1104.

Lin. syst. *Icosándria, Monogýnia.* Calyx inferior, campanulate, with a 6-cleft deciduous limb. Petals 6, very minute, inserted in the limb of the calyx. Stamens 12-18, nearly equal, inserted with the petals. Ovary free, 1-celled. Stigma peltate. Drupe kidney-shaped, dry, 1-seeded. Embryo exalbuminous, inverted.—A tree 30 to 50 feet high, with alternate, oblong, quite entire, exstipulate leaves, for the most part biglandular at the base. Racemes axillary and lateral, solitary or crowded, tomentose. Flowers small, furnished with 1 bractea each. This genus is hardly distinct from *Amýgdalus*.

1 P. arbòrea (Blum. bijdr. p. 1105.). ♄. S. Native of Java, in mountain woods.

Tree Polydontia. Tree 30 to 50 feet.

Cult. A mixture of loam, peat, and sand will suit this tree; and ripened cuttings will strike root, if planted in sand, under a hand-glass, in heat.

LXXXI. SPIRÆA'CEÆ (plants agreeing with *Spiræ'a* in important characters). Ulmàriæ, Vent. t. 3. p. 351.—Rosàceæ, Tribe III. Spiræacèæ, D. C. prod. 2. p. 541.

Calyx 5-cleft (f. 65. *a.* f. 66. *a.* f. 67. *a.*), imbricate in æstivation, with a disk either lining the tube (f. 67. *b.*), or surrounding the orifice, the fifth lobe next the axis. Petals 5 (f. 65. *b.* f. 66. *b.* f. 67. *c.*), perigynous, equal. Stamens from 20-50, arising from the calyx or the disk, with the petals curved inwards in æstivation; anthers innate, 2-celled, bursting lengthwise. Ovaries superior, several together (f. 65. *d.*), free from the calyx. Follicles or carpels several (f. 65. *d.*), distinct, disposed in a whorl, around an imaginary axis of the flower, usually 5 (f. 65. *d.*) in number, but sometimes fewer from abortion, apiculate by the styles, they at length become capsular, and open inwardly, somewhat 2-valved. Seeds 2-4, rarely solitary from abortion, rising from the margin of the inner suture, at the middle or near the base, suspended, without aril and without albumen. Embryo straight, inverted in *Spiræ'a*, but probably erect in the other genera. Cotyledons flat, thickish. This order is composed of shrubs or herbs, with simple, trifoliate, or pinnate leaves. The roots of all the plants contained in it are so astringent as to be sometimes used for tanning. The *Gillènia trifoliàta* is remarkable in having, in addition to its astringency, an emetic property, on which account it is employed in North America as Ipecacuanha. It is said a similar power exists in other plants of this order.

This order is distinguished from *Chrysobalàneæ* by the numerous follicular dehiscent carpels, and from *Rosàceæ* in the carpels, and in the styles being terminal, not lateral, as in that order.

Synopsis of the genera.

1 **Pu'rshia.** Lobes of calyx all obtuse. Stamens about 25, rising from the calyx. Carpels 1-2, ovate, oblong, containing 1 seed, which is inserted at the base of the carpel. Leaves cuneated, deeply toothed at the apex.

2 **Ke'rria.** Lobes of calyx 5, 3 of which are obtuse, and the other 2 mucronate. Stamens about 20, arising from the calyx. Carpels 5-8, globose, containing 1 seed each, which adheres to the side.

3 **Spiræ'a.** Calyx 5-cleft (f. 65. *a.* f. 66. *a.*). Stamens 20-50, inserted with the petals in the torus, which adheres to the calyx. Carpels 2-5 (f. 65. *d.*), rarely solitary, free, rarely joined, containing 2-6 seeds in each, fixed to the inner suture.

4 **Gille'nia.** Calyx 5-cleft (f. 67. *a.*). Petals linear, contracted at the base (f. 67. *c.*), rising from the top of the tube. Stamens 10-15, inclosed (f. 67. *b.*). Carpels 5, somewhat connate into a 5-celled fruit; cells 2-seeded.

† *A genus doubtful whether it belongs to the present order.*

5 **Adenile'ma.** Calyx glandular, 5-cleft. Stamens numerous, inserted with the petals in the calyx. Ovary simple. Style 1. Capsule inclosed in the calyx, 1-celled, dehiscent, many-seeded. Seeds albuminous.

I. PU'RSHIA (in honour of Frederick Pursh, author of Flora Americæ Septentrionalis, 2 vols. 8vo. London, 1817). D. C. in Lin. trans. 12. p. 154. prod. 2. p. 541.—Tigàrea, Pursh, fl. amer. sept. 1. p. 33. t. 15. but not of Aublet.

Lin. syst. *Icosándria, Mono-Digýnia.* Calyx 5-cleft; lobes ovate, obtuse. Petals 5, obovate. Stamens about 25, rising with the petals from the calyx. Carpels 1-2, ovate-oblong, pubescent, tapering into the style at the apex, at length opening by a longitudinal chink. Seed 1, inserted in the base of the carpel. —A much-branched shrub, with scaly buds. Leaves crowded, wedge-shaped, deeply 3-toothed at the apex, smoothish above, but clothed with hoary tomentum beneath. Stipulas very small. Flowers yellow.

1 P. **tridenta'ta** (D. C. l. c.). ♄. H. Native of North America, on the banks of the Columbia river, and in the prairies of the Rocky Mountains, &c. Hook. fl. bor. amer. t. 8. Tigàrea tridentàta, Pursh, fl. amer. sept. 1. p. 33.

Tridentate-leaved Purshia. Clt. 1826. Shrub 1 to 2 feet.

Cult. A dry light sandy soil will answer this shrub best. Cuttings may be rooted under a hand-glass, but the shrub is easier increased by seeds.

II. KE'RRIA (in honour of — Kerr, sometime superintendant of the botanic garden in Ceylon). D. C. in Lin. trans. 12. p. 156. prod. 2. p. 541.

Lin. syst. *Icosándria, Pentagýnia.* Calyx 5-cleft; lobes ovate, 3 of which are obtuse, and the other 2 callosely mucronate at the apex, imbricate in æstivation. Petals 5, orbicular. Stamens about 20, arising from the calyx with the petals, exserted. Carpels 5-8, globose, free, glabrous, each ending in a filiform style. Seed solitary in the carpels, adhering laterally.—An evergreen shrub, with smooth green bark, twiggy branches, ovate-lanceolate, coarsely and unequally serrated, feather-nerved, conduplicate leaves, linear-subulate stipulas, and large yellow flowers, which are usually double in the gardens.

1 K. **Japónica** (D. C. l. c.). ♄. H. Native of Japan. Rùbus Japónicus, Lin. mant. 245. Córchorus Japónicus, Thunb. fl. jap. p. 227. Andr. bot. rep. 587. Sims, bot. mag. 1296. Spiræ'a Japónica, Cambess. ann. sc. nat. 1. p. 389. Flowers yellow. The single-flowered *Kerria* has not yet been introduced to the gardens, but the double-flowering variety is very common.

Japan Kerria. Fl. all the year. Clt. 1700. Sh. 4 to 10 ft.

Cult. *Kérria* is an elegant shrub when in blossom, being clothed with double yellow flowers all the summer. It is hardy enough to stand the winter in the open air, if planted against a south wall. Cuttings, taken off at a joint when in a young state, root readily, if planted under a hand-glass.

III. SPIRÆ'A (said to be from σπειραω, *speirao*, to become spiral; in allusion to the fitness of the plants to be twisted into garlands). Lin. gen. 630. Gærtn. fruct. 1. p. 337. t. 69. D. C. prod. 2. p. 541.—Spiræ'a, Ulmària, and Filipéndula, Tourn. inst. —Spiræ'a species, Cambéssedes, mon. spir. in ann. sc. nat. 1. p. 227.

Lin. syst. *Icosándria, Di-Pentagýnia.* Calyx 5-cleft (f. 65. *a.* f. 66. *a.*), permanent. Stamens 10-50, inserted in the torus, lining the calyx along with the petals. Carpels solitary, or several together (f. 65. *d.*), rarely connected at the base, ending in short points, sessile, rarely stipitate. Seeds 2-6, fixed to the inner suture of the carpel. Embryo inverted. Cotyledons thickish. —Unarmed shrubs or perennial herbs, with alternate branches. Leaves usually simple, but sometimes pinnately cut, as in Section *Ulmària,* having pinnate or palmately ternate nerves. Flowers white or reddish, never yellow.

Sect. I. Physoca'rpos (φυσα, *physa*, a bladder, and καρπος, *karpos*, a fruit; in reference to the bladdery carpels). Cambess. in ann. sc. nat. 1. p. 385. D. C. prod. 2. p. 542. Ovaries connected at the base. Torus lining the calycine tube. Carpels bladdery, rather membranous. Ovula 2-3, fixed to the seminiferous margin of the carpel, ovoid, at first horizontal, but at length suspended. Flowers hermaphrodite, disposed in umbels; pedicels 1-flowered. Leaves toothed or somewhat lobed, usually stipulate.

1 S. **opulifòlia** (Lin. spec. 702.) leaves cordate, 3-lobed, biserrated, stalked; corymbs pedunculate, hemispherical; flowers numerous; pedicels slender, glabrous; sepals spreading; carpels large, diverging; seeds obovate, shining, yellow. ♄. H. Native of North America, from Canada to Carolina, on the mountains. Cambess. in ann. sc. nat. 1. p. 386. Lois. in Duham. ed. nov. 6. p. 61. t. 14.—Comm. hort. 1. p. 169. t. 87. Flowers white. Carpels 3.

Var. β, tomentélla (Ser. in D. C. prod. 2. p. 542.) peduncles and calyxes tomentose. Native at the grand rapids of the Columbia river.

Guelder-rose-leaved Spiræa. Fl. June, July. Clt. 1690. Sh. 5 to 6 feet.

2 S. MONO'GYNA (Torrey, in ann. lyc. 2. p. 194.) leaves broad-ovate, slightly 3-lobed, deeply serrated, glabrous; corymbs umbellate; flowers monogynous; lobes of calyx erectly spreading; ovaries villous. ♄. H. Native of North America, on the Rocky Mountains. Flowers white. Carpel solitary.

Monogynous Spiræa. Shrub 3 to 4 feet.

3 S. CAPITA'TA (Pursh, fl. amer. sept. 1. p. 342.) leaves ovate, a little lobed, doubly serrated, tomentose, and reticulated beneath; corymbs terminal, crowded, somewhat capitate, on long peduncles. ♄. H. Native of North America, on the eastern coast, and at the river Columbia. Cambess. l. c. 1. p. 365. Flowers white. Carpels 2. Said by Hooker to be a variety of *S. opulifòlia.*

Capitate-flowered Spiræa. Shrub 3 to 4 feet.

SECT. II. CHAMÆ'DRYON (*Chamædrys*, the name of the germander; form of leaves). Ser. mss. in D. C. prod. 2. p. 542.—Spiræa species, Cambess. mon. spir. in ann. sc. nat. 1. p. 384. Ovaries free. Torus free at the apex, but adhering to the calycine tube at the base. Shrubs, with hermaphrodite flowers, disposed in umbels or corymbs; pedicels undivided, 1-flowered. Leaves entire or toothed, exstipulate.

4 S. ULMIFÒLIA (Scop. fl. carn. ed. 2. vol. 1. p. 349. t. 22.) leaves ovate-lanceolate, acute, flat, sharply serrated, glabrous; flowers disposed in sub-hemispherical, terminal corymbs; sepals reflexed. ♄. H. Native of Carinthia and Siberia. Cambess. l. c. 1. p. 367. Lois. in Duham. ed. nov. 6. p. 40. t. 13. S. chamædrifòlia, Jacq. hort. vind. t. 140. Lindl. bot. reg. t. 1222. Lodd. bot. cab. 1042. Flowers white.

Var. β, phyllántha (Ser. mss. in D. C. prod. 2. p. 542.) sepals distinct, stipitate, transformed into verticillate, lanceolate, sharply serrated leaves; petals and stamens wanting, or if present more or less deformed. S. foliòsa, Poir. dict. 7. p. 353.

Elm-leaved Spiræa. Fl. June, Jul. Clt. 1790. Sh. 3 to 5 ft.

5 S. FLEXUÒSA (Fisch. in litt. and Cambess. l. c. p. 365. t. 26.) leaves lanceolate, glabrous, dentately serrated from the apex to the middle; flowers disposed in corymbs. ♄. H. Native country unknown. S. alpìna, Hort. par. ex Cambess. and Fisch. in litt. Perhaps only a variety of *S. ulmifòlia.* Flowers white.

Flexuous Spiræa. Fl. Ju. Jul. Clt. 1820. Sh. 4 to 6 feet.

6 S. CRATÆGIFÒLIA (Link. enum. 2. p. 40.) leaves obovate, obtuse, doubly serrated in front, glabrous; corymbs terminal, compound, subcapitate. ♄. H. Native country unknown. Flowers white.

Hawthorn-leaved Spiræa. Fl. June, July. Clt. 1823. Sh. 4 to 6 feet.

7 S. BE'LLA (Sims, bot. mag. 2426.) stems glabrous, rufous; leaves ovate, glabrous, serrated, petiolate, glaucous beneath; lobes of calyx deflexed; cymes terminal, spreading, and are as well as the branches pubescent. ♄. H. Native of Nipaul. Shrub erect, branched, with the habit of *S. chamædrifòlia.* Flowers beautiful red. Carpels 5, shining.

Pretty Spiræa. Fl. July, Aug. Clt. 1820. Sh. 2 to 3 feet.

8 S. CHAMÆDRIFÒLIA (Lin. spec. 701.) leaves ovate, deeply serrated at the apex, pubescent; flowers disposed in hemispherical corymbs; pedicels slender, elongated; sepals veiny, reflexed. ♄. H. Native of Siberia, Kamtschatka, Dahuria, and north-west coast of America. Cambess. l. c. 1. p. 362. Pall. fl. ross. 1. p. 32. t. 15. Flowers white.

Germander-leaved Spiræa. Fl. June, July. Clt. 1789. Sh. 1 to 2 feet.

9 S. BLU'MEI; leaves obovate, obtuse, deeply toothed at the apex, smoothish; cymes pedunculate, terminal, and are as well as the calyxes glabrous. ♄. G. Native of Java and Japan. S. chamædrifòlia Japónica, Blum. bijdr. 1114. Flowers white.

Blume's Spiræa. Shrub 3 to 6 feet.

10 S. ME'DIA (Pursh, fl. amer. sept. 1. p. 342.) leaves obovate, few-toothed at the apex, rather villous; corymbs pedunculate. ♄. H. Native of Canada. S. chamædrifòlia β, mèdia, Ser. in D. C. prod. 2. p. 542. Flowers white.

Intermediate Spiræa. Fl. June, Jul. Clt.? Sh. 1 to 2 feet.

11 S. OBLONGIFÒLIA (Waldst. et Kit. pl. hung. 3. p. 261. t. 235.) leaves oblong-lanceolate, narrowed at the base, deeply serrated at the apex, or entire, pubescent, ciliated; corymbs pedunculate. ♄. H. Native of Hungary. Flowers white. Like *S. chamædrifòlia* in the form of the leaves, but sufficiently distinct.

Oblong-leaved Spiræa. Fl. May, Ju. Clt. 1816. Sh. 3 to 6 ft.

12 S. LANCEOLA'TA (Poir. dict. 7. p. 354.) leaves lanceolate, deeply serrated, glabrous, paler beneath; umbels few-flowered, axillary, pedunculate. ♄. G. Native of the Mauritius and China. S. Cantonénsis, Lour. coch. p. 322. ex Cambess. l. c. p. 366. t. 25. Leaves like those of *S. salicifòlia.* Flowers white. Leaves deeply serrated only at the apex.

Lanceolate-leaved Spiræa. Shrub 2 to 4 feet.

13 S. CA'NA (Waldst. et Kit. pl. hung. 3. p. 252. t. 227.) leaves ovate, acute, quite entire, or a little toothed, clothed with hoary villi; corymbs somewhat spicate, lateral, pedunculate, few-flowered, loose; sepals spreading; styles thick; carpels diverging, and rather villous. ♄. H. Native of Croatia on high rocks. Cambess. l. c. 1. p. 364. Leaves about the size of those of *Sàlix rèpens*, var. *argéntea.* Flowers white.

Hoary Spiræa. Fl. June, July. Clt. 1825. Sh. 1 to 2 ft.

14 S. VACCINIFÒLIA (D. Don, prod. fl. nep. p. 227.) leaves elliptic, acute, glabrous, glaucous beneath, serrated at the apex; branches hairy; cymes terminal, few-flowered, tomentose. ♄. H. Native of Nipaul. Lodd. bot. cab. 1403. Shrub small, erect. Flowers white.

Whortle-berry-leaved Spiræa. Fl. July, Aug. Clt. 1820. Shrub 2 feet.

15 S. INCÌSA (Thunb. fl. jap. 213.) leaves ovate, deeply 5-parted, serrated, pale and villous beneath; cymes terminal. ♄. H. Native of Japan. Cambess. l. c. p. 262. Flowers small, white.

Cut-leaved Spiræa. Shrub 2 to 3 feet.

16 S. TRI'LOBA (Lin. mant. 244.) leaves roundish, 3-lobed, crenated, glabrous, glaucous beneath and reticulately veined; flowers disposed in corymbous umbels; sepals ascending; carpels glabrous. ♄. H. Native of the Altaian mountains. Cambess. l. c. p. 361. Wats. dent. brit. 68. Pall. ross. 1. p. 33. t. 17. Flowers white. Carpels glabrous.

Three-lobed-leaved Spiræa. Fl. May. Clt. 1801. Sh. 2 to 4 ft.

17 S. ALPI'NA (Pall. fl. ross. 1. p. 35. t. 20.) leaves lanceolate, sessile, serrulated, glabrous, with the middle nerve pinnate; corymbs terminal, pedunculate, nearly leafless; sepals ascending. ♄. H. Native on the alps of Siberia, in woods. Flowers white.

Alpine Spiræa. Fl. June. Clt. 1806. Shrub 4 to 6 feet.

18 S. THALICTROÌDES (Pall. fl. ross. 1. pp. 34. and 78. t. 18.) leaves obovate, obtuse, somewhat 3-lobed; umbels lateral, sessile. ♄. H. Native of Dahuria, on the alps. S. aquilegifòlia, Pall. itin. 3. append. 734. no. 94. t. P. f. 3. Leaves glaucous beneath, finely 3-nerved. Flowers white.

Meadow-rue-like Spiræa. Fl. May, June. Clt. 1816. Sh. 2 to 3 feet.

19 S. ARGE'NTEA (Mutis, in Lin. fil. suppl. 261.) plant clothed with silky silvery down; leaves crowded, obovate, or oblong, serrated towards the apex, fan-nerved: racemes axillary and terminal, panicled; ovaries silky, biovulate. ♄. S. Native

of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 235. t. 562. Flowers white.

Silvery Spiræa. Shrub 4 to 6 feet.

20 S. Pikowie'nsis (Besser, enum. pl. pod. p. 46. no. 1428.) leaves lanceolate-cuneate, obtuse, rarely cuspidate, triple-nerved, unequally serrated at the apex; corymbs pedunculate. ♄. H. Native of Podolia, about Pikow. Flowers white.

Pikow Spiræa. Fl. June, July. Clt. 1827. Sh. 3 to 4 feet.

21 S. hypericifòlia (Lin. spec. 701.) leaves obovate, 3-4-nerved, quite entire, glabrous; corymbs sessile; pedicels glabrous; sepals ascending. ♄. H. Native of Canada. S. hypericifòlia, var. β, Plukenetiàna, Ser. in D. C. prod. 2. p. 543.—Pluk. phyt. t. 218. f. 5. Leaves full of dots. Flowers white.

St. John's-wort-leaved Spiræa. Fl. June, July. Clt. 1640. Shrub 4 to 6 feet.

22 S. acutifòlia (Willd. enum. p. 540.) leaves ovate-cuneated, acute, quite entire, rarely a little toothed, puberulous; corymbs sessile. ♄. H. Native of Siberia. S. Sibírica, Hort. par. ex Cambess. l. c. p. 356. S. hypericifòlia, var. δ, acùta, Ser. in D. C. prod. 2. p. 543. S. ambígua, Pall. Flowers white.

Acute-leaved Spiræa. Fl. May, Ju. Clt. 1817. Sh. 3 to 4 ft.

23 S. crena'ta (Lin. spec. 701.) leaves obovate, rather pubescent, crenulated at the apex; corymbs stalked; pedicels puberulous. ♄. H. Native of Spain, Hungary, and other parts of Europe. S. obovàta, Walds. et Kit. in Willd. enum. p. 541. Cambess. l. c. p. 359.—Barr. icon. rar. no. 1376. t. 564. S. hypericifòlia γ, D. C. fl. fr. 5. p. 645. S. hypericifòlia, var. δ, crenàta, Ser. in D. C. prod. 2. p. 543. Led. fl. ross. alt. ill. t. 428. S. hypericifòlia var. α Uralénsis, Ser. in D. C. prod. 2. p. 215. Flowers small, white.

Crenate-leaved Spiræa. Fl. May, June. Clt. 1739. Shrub 4 to 6 feet.

24 S. Savra'nica (Bess. in litt.) plant clothed with pubescence in every part; leaves obovate, entire, elongated; corymbs terminal, dense. ♄. S. Native of Siberia, about Barnaoul, and of Podolia. S. crenàta, Pall. fl. ross. 1. p. 35. t. 19. S. hypericifòlia, var. ε, Savránica, Ser. in D. C. prod. 2. p. 543. S. hypericifòlia var. β longifòlia, Led. fl. ross. alt. ill. t. 429. Flowers small, white.

Var. β, *Besseriàna* (Ser.) smoothish; leaves usually entire, glabrous? corymbs terminal, loose. ♄. H. Native of Podolia and Caucasus. Lodd. bot. cab. 1252. S. crenàta, Besser, in litt.

Savranic Spiræa. Fl. May, June. Clt. 1819. Sh. 3 to 6 ft.

25 S. Thunbe'rgii (Blum. bijdr. 1115.) leaves linear-lanceolate, acuminated at both ends, smoothish, sharply serrated towards the apex; fascicles of flowers sessile, lateral, racemose in consequence of the leaves falling off; calyx glabrous. ♄. G. Native of Java and Japan. Thunb. fl. jap. p. 210. Flowers white.

Thunberg's Spiræa. Shrub 3 to 6 feet.

26 S. cane'scens (D. Don, fl. nep. p. 227.) leaves oval or obovate, obtuse, stalked, quite entire, villous; corymbs crowded, and are as well as the branches tomentose. ♄. G. Native of Sirinagur. S. cuneàta, Wall. Shrub erect, branched, canescent, with the habit of *S. hypericifòlia*. Flowers apparently red. Carpels 5, connivent.

Canescent Spiræa. Shrub.

27 S. ceanothifòlia (Horn. hort. hafn. 2. p. 466.) leaves ovate, rounded at the base, sharply and unequally serrated from the middle to the apex; corymbs terminal, on short peduncles. ♄. H. Native country unknown. Flowers white.

Ceanothus-leaved Spiræa. Fl. June, July. Clt. 1823. Sh. 3 to 4 feet.

28 S. corymbòsa (Rafin. prec. som. 36. and Desv. journ. bot. 1814. p. 168.) leaves oval-oblong, unequally serrated, glabrous, discoloured; corymbs terminal; flowers trigynous. ♄. H. Native of Virginia. Lodd. bot. cab. 671. Flowers white.

Corymbous Spiræa. Fl. June, Jul. Clt. 1819. Sh. 2 to 3 ft.

Sect. III. Spira'ria (an alteration of the generic name). Ser. in D. C. prod. 2. p. 544.—Spiræ'a species, Cambess. mon. spir. in ann. sc. nat. 1. p. 354. Ovaries free (f. 65. *d.*). Torus free at the base, but lining the bottom of the calycine tube. Carpels not inflated.—Shrubs with hermaphrodite, paniculate flowers, and serrated exstipulate leaves.

29 S. betulifòlia (Pall. fl. ross. 1. p. 33. t. 16.) leaves broadly oval, serrated, on short petioles, glabrous; flowers disposed in fastigiate panicles; carpels 5, erect, glabrous. ♄. S. Native of Siberia and North-west America, and in valleys of the Rocky Mountains. Camb. l. c. p. 368. t. 27. Flowers pink. Wats. dend. brit. 67. Perhaps the same as *S. cratægifòlia* of Link. enum. 2. p. 40.?

Birch-leaved Spiræa. Fl. Ju. Jul. Clt. 1812. Sh. 2 to 4 ft.

30 S. læviga'ta (Lin. mant. p. 244.) leaves obovate-oblong, smooth, glaucous, quite entire, sessile, mucronate; branches of panicles cylindrical; bracteas linear, hardly the length of the calyx; calycine segments triangular, ascending. ♄. H. Native of Siberia. Camb. l. c. p. 369. S. Altaiénsis, Laxm. nov. act. petrop. 15. p. 555. t. 29. f. 2. S. Altàica, Pall. fl. ross. 1. p. 272. t. 23. Flowers white, disposed in thyrsoid racemose panicles. The leaves being gently astringent, may serve as a substitute for tea.

Smooth-leaved Spiræa. Fl. May, June. Clt. 1774. Shrub 4 to 6 feet.

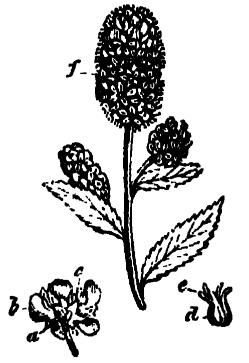
31 S. Magella'nica (Poir. dict. 7. p. 350.) leaves petiolate, lanceolate, unequally serrated, nerved; racemes terminal, almost simple. ♄. H. Native of the Straits of Magellan. Flowers white.

Magellan Spiræa. Shrub.

32 S. Japónica (Siebold, ex Blum. bijdr. 1114.) leaves rhomboid-lanceolate, acutish, deeply serrated from the middle to the apex, smooth, grey beneath; corymbs terminal, simple, and are as well as the calyxes glabrous. ♄. G. Native of Japan. Said to be like *S. Magellánica*.

Japan Spiræa. Shrub.

FIG. 65.



33 S. salicifòlia (Lin. spec. 700.) stem and peduncles glabrous; leaves lanceolate, glabrous, somewhat doubly serrated; racemes rather spicate; calycine lobes triangular, spreading; carpels 5, glabrous. ♄. H. Native of Siberia, Tartary, Bohemia, and Silesia. It is to be found in England, although perhaps not truly indigenous; in many parts of Westmoreland; in many places on the borders of Winandermere, and also between Poolbridge and Colthouse, near Hakshead, Cumberland, and in a wood at Hafod, Cardiganshire. Smith, engl. bot. 1468. Gmel. fl. sib. 3. t. 49. Pall. fl. ross. 1. p. 36. t. 21. Duham. arb. 2. t. 75. Flowers red or rose-coloured, disposed in thyrsoid racemes.

Willow-leaved Spiræa. Fl. Ju. Aug. Brit. Sh. 4 to 6 ft.

34 S. alpe'stris (Pall. fl. ross. 1. p. 36, t. 22.) leaves lanceolate, acute, deeply serrated almost to the base, canescent; racemes loose, thyrsoid. ♄. H. Native of Siberia, on rocks about the rivers Oby and Yenessee. Amman, ruth. 188. t. 28. Flowers pale red.

Alp Spirœa. Fl. June, Aug. Clt. 1800. Sh. 2 to 3 feet.

35 S. PANICULA'TA (Willd. spec. 2. p. 1055.) leaves lanceolate, acute, sharply serrated; racemes panicled, divaricate; bark of branches red. ♄. H. Native of North America, Canada, and Newfoundland. S. álba, Ehrh. beitr. 7. p. 137. S. salicifòlia, var. γ, paniculàta, D. C. prod. 2. p. 544.—Mill. fig. 171. t. 257. f. 2. Flowers white, disposed in terminal thyrsoid panicles.

Panicled Spiræa. Fl. June, Aug. Clt. 1663. Sh. 4 to 5 ft.

36 S. TOMENTÒSA (Lin. spec. p. 701.) stem and peduncles clothed with rufous tomentum; leaves ovate, somewhat doubly serrated, densely clothed with tomentum beneath; calycine lobes tomentose on the outside, triangular, deflexed; carpels 5, tomentose, divaricate. ♄. H. Native of Canada, and in many places of North-west America on mountains. Camb. l. c. p. 373.—Mill. fig. 257. f. 1. Schmidt, arb. 1. t. 51.—Pluk. phyt. t. 321. f. 5. Flowers small, of a beautiful red colour, disposed in dense compound, terminal racemes.

Tomentose Spiræa. Fl. July, Sept. Clt. 1736. Sh. 4 to 6 ft.

37 S. MENZIE'SII (Hook, fl. bor. amer. p. 173.) branches pubescent at the apex, as well as the peduncles and calyxes; sepals reflexed; leaves elliptic, coarsely and unequally serrated towards the apex, glabrous, the same colour on both surfaces; panicle crowded with flowers, oblong, obtuse; flowers small, stamens twice the length of the corolla; ovaries 5, glabrous. ♄. H. Native of North America, on the west coast. Flowers rose-coloured.

Menzies's Spiræa. Shrub.

38 S. DOUGLA'SII (Hook, fl. bor. amer. p. 172.) branches and peduncles pubescent; leaves elliptic, coarsely and unequally serrated towards the apex, clothed with hoary tomentum beneath; panicle crowded with flowers, oblong, obtuse; flowers small; stamens twice the length of the corolla; calycine lobes triangular, reflexed; carpels 5, glabrous, shining. ♄. H. Native of the north-west coast of America, about the Columbia and the Straits of Fuca.

Douglas's Spiræa. Shrub 4 to 5 feet.

39 S. CARPINIFÒLIA (Willd. enum. p. 540. Wats. dend. brit. t. 66.) leaves ovate-elliptic, acute at both ends, glabrous, coarsely serrated; racemes divaricate, panicled. ♄. H. Native of North America. Spiræ'a salicifòlia δ, latifòlia, Willd. spec. 2. p. 1056. S. obovàta, Rafin. but not of Walds. et Kit. Flowers white.

Hornbeam-leaved Spiræa. Fl. Ju. Aug. Clt. ? Sh. 3 to 6 ft.

40 S. ARIÆFÒLIA (Smith, in Rees' cycl. vol. 33.) leaves elliptic-oblong, toothed, pale, somewhat lobed, villous beneath; panicle large, branched, villous; pedicels bracteate; lobes of calyx acute, spreading; carpels 5, compressed, hairy. ♄. H. Native of North America, principally on the north-west coast. Flowers rose-coloured.

Aria-leaved Spiræa. Shrub.

41 S. CALLÒSA (Thunb. fl. jap. 209.) leaves lanceolate, acutely serrated, tapering to both ends, glaucous, smoothish beneath; corymbs terminal, compound, fastigiate, and are as well as the calyxes villous; stem and peduncles villous. ♄. G. Native of Japan and Nepaul. S. expánsa, Wall. Differs from *S. salicifòlia*, in the leaves being stalked. Flowers red.

Callous-leaved Spiræa. Shrub 4 feet.

42 S. CŒRULE'SCENS (Poir. dict. 7. p. 350.) leaves almost sessile, lanceolate-oblong, entire, bluish; panicles axillary, branched; sepals obtuse, shorter than the corolla. ♄. G. Native of India. Cambess. l. c. p. 374. Flowers white.

Bluish-leaved Spirœa. Shrub.

43 S. DÍSCOLOR (Pursh, fl. amer. sept. 1. p. 342.) leaves ovate, lobed; lobules toothed, and somewhat plicate, clothed with white tomentum beneath; panicle pedunculate, much branched. ♄. H. Native of North America, on the banks of the river Kooskoosky.

Discoloured-leaved Spiræa. Shrub.

SECT. IV. SORBA'RIA (so named from the leaves being pinnate, resembling those of the mountain ash, *Sórbus*). Ser. in D. C. prod. 2. p. 545.—Spiræ'a, spec. Lin. Camb. l. c. 1. p. 375. Ovaries 5, joined. Torus wholly lining the tube of the calyx. Flowers hermaphrodite, disposed in thyrsoid panicles.

44 S. SORBIFÒLIA (Lin. spec. 702.) leaves pinnate; leaflets sessile, lanceolate, opposite, doubly and sharply serrated; panicles thyrsoid. ♄. H. Native of Siberia, in bogs. Pall. fl. ross. 1. t. 88. t. 24.—Gmel. fl. sib. 3. p. 190. t. 46. Flowers white, sweet scented. The hollow shoots are used for tobacco-pipes in Siberia. S. pinnàta, Mœnch. meth. 663.

Sorbus-leaved Spiræa. Fl. July, Aug. Clt. 1759. Shrub 3 to 4 feet.

45 S. PALLA'SII; leaves pinnate; leaflets sessile, ovate-lanceolate, deeply serrated, almost pinnatifid, opposite; flowers corymbous. ♄. S. Native of Siberia, on the high mountains about Lake Baikle. S. sorbifòlia, var. β, alpina, Pall. fl. ross. 1. p. 34. t. 25. Flowers white, larger than those of the preceding species.

Pallas's Spirœa. Fl. July, Aug. Clt. ? Shrub.

SECT. V. ARU'NCUS (from *αρογγος*, *aroggos*, a goat's beard). Ser. in D. C. prod. 2. p. 545. Spiræ'a species, Cambess. l. c. 1. p. 376. Carpels 5, free, pendulous. Torus very thick, free at the apex.—Herbs, with tripinnate leaves, without stipulas, and dioecious flowers.

46 S. ARU'NCUS (Lin. spec. p. 702.) leaflets acuminated, terminal ones ovate, lateral ones oblong; flowers very numerous; carpels glabrous. ♃. H. Native of Europe, in woods, as in Germany, Carniola, Piedmont, Siberia, Kamtschatka, &c. Camb. l. c. p. 376. Pall. fl. ross. 1. p. 39. t. 26.—Cam. hort. 26. t. 9. Flowers white, disposed in long spikes, forming a terminal panicle.

Var. β, Americàna (Michx. fl. bor. amer. 1. p. 294.) leaves more shining; flowers more loose on the spikes. ♃. H. Native of North America.

Goat's-beard Spiræa. Fl. Ju. Jul. Clt. 1633. Pl. 4 to 6 ft.

SECT. VI. ULMA'RIA (from *ulmus*, the elm; form of leaflets of most of the species). Cambess. l. c. 1. p. 378.—Ulmària, Mœnch. meth. p. 663. Torus obsolete. Style clavate, retroflexed. Ovula 2, about the middle of each ovary, fixed to the suture, and pendulous. Carpels hardly double the size of the ovaries, erect, rarely twisted.—Herbs with pinnate, stipulate leaves and cymose umbels of hermaphrodite flowers.

47 S. ULMA'RIA (Lin. spec. 702.) leaves interruptedly pinnate, white from tomentum beneath; leaflets coarsely serrated, terminal one the largest and 3-lobed; sepals reflexed; styles elongated; carpels glabrous, twisted. ♃. H. Native of Europe and Siberia, in meadows and bogs; plentiful in Britain. Smith, engl. bot. 960. Curt. fl. lond. 5. t. 33. Ulmària palústris, Mœnch. meth. 663. Stem and peduncles puberulous. Stipulas roundish, joined to the petiole. Flowers white, in large compound cymes. The *Meadow-sweet* abounds in moist meadows, about the banks of rivers, brooks, and ditches, perfuming the air with the sweet hawthorn-like scent of its numerous blossoms, from June to August. The green parts of the herb partake of a similar aromatic flavour when rubbed or chewed. The flowers, infused in boiling water give it a very fine flavour, which rises in distillation. The leaves and tops have been used in medicine.

Var. α, variegàta; leaves variegated with white or yellow.

Var. β, múltiplex; flowers double. Cultivated in gardens.

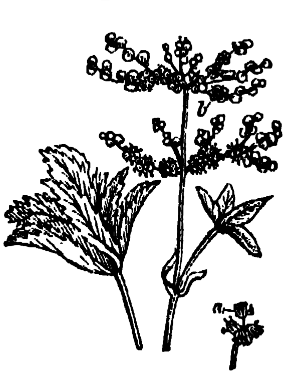
Meadow-sweet. Fl. June, Aug. Britain. Pl. 2 to 3 feet.

49 S. DENUDA'TA (Presl. fl. cech. 101.) leaves interruptedly pinnate, green, and glabrous on both surfaces; leaflets coarsely serrated, terminal one the largest and 3-lobed; sepals reflexed; carpels glabrous, twisted. ♃. H. Native of Sicily and the south of Europe. S. ulmarioìdes, Bory, voy. sout. p. 124. S. ulmària β, denudàta, Cambess. l. c. p. 380. Stem and peduncles smoothish. Flowers white, sweet scented, disposed in compound cymes.

Naked-leaved Meadow-sweet. Fl. June, Aug. Clt.? Pl. 2 to 3 feet.

50 S. LOBA'TA (Murr. syst. ed. 14. p. 472.) leaves palmately pinnate, glabrous beneath; lower leaves palmately bipinnate; stipulas reniform; styles short; sepals reflexed; carpels glabrous, parallel, not curved. ♃. H. Native of North America. Jacq. hort. vind. 1. p. 38. t. 88. S. palmàta, Lin. fil. but not of Thunb. nor Pall. Leaflets lobed, terminal ones 5-lobed, lateral ones 3-lobed. Flowers red, disposed in compound cymes.

FIG. 66.



Lobed-leaved Meadow-sweet. Fl. July, Aug. Clt. 1765. Pl. 2 feet.

51 S. PALMA'TA (Thunb. fl. jap. 212. but not of Lin. nor Pall.) leaves 5-7-lobed; lobes oblong, acuminated, acutely and doubly serrated. ♃. H. Native of Japan. Cambess. l. c. p. 384. Flowers white or red. Panicle cymose, decompound. It comes nearest to *S. opulifòlia*, according to Thunberg.

Palmate-leaved Meadow-sweet. Fl. June, Aug. Clt. 1823. Pl. 1 to 2 feet.

52 S. KAMTSCHA'TICA (Pall. fl. ross. 1. p. 41. t. 28.) leaves palmately lobed, upper stem leaves somewhat hastate or lanceolate; petioles appendiculate; flowers corymbose; sepals pilose, reflexed; carpels very hairy, parallel; styles subcapitate. ♃. H. Native of Kamtschatka and Behring's Island. Cambess, l. c. 385. Root leaves often a foot wide and 8 inches long, white, with hairs beneath, 5-lobed; lobes acute, doubly serrated, lower stem leaves 3-lobed. Flowers white, sweet-scented, larger than those of *S. Ulmària*, disposed in branched cymes.

Kamtschatka Meadow-sweet. Pl. 6 to 9 feet.

53 S. VESTI'TA (Wall. mss.) leaves cordate, 5-lobed, tomentose beneath, sharply and unequally serrated; petioles furnished with numerous unequal leaflets, generally the 2 in the centre very large; flowers corymbose, terminal. ♃. H. Native of Kamaon. Flowers white. Like *S. Kamtschática* and *S. Ulmària.*

Clothed Meadow-sweet. Pl. 2 to 3 feet.

54 S. QUINQUE'LOBA (Baumg. ex Spreng. syst. 2. p. 503.) leaves pinnately ternate, clothed with white tomentum beneath; lateral leaflets 5-cleft, outer one 7-cleft; segments acute, serrated; panicle corymbose. ♃. H. Native of Transylvania.

Five-lobed-leaved Meadow-sweet. Pl. 1 to 2 feet.

55 S. DIGITA'TA (Willd. spec. 2. p. 1061.) leaves pinnate, clothed with tomentum beneath; terminal leaflet largest and 7-lobed, lateral ones 5-lobed; corymbs branched, contracted; carpels parallel, villous; styles thickish, capitate. ♃. H. Native of Eastern Siberia, in meadows and moist valleys in the subalpine regions beyond the Baikal, especially in Dauria. S. palmàta, Pall. fl. ross. 1. p. 40. t. 27. itin. 3. append. 735. no. 95. t. 2. f. 1. but not of Thunberg nor Lin. Flowers white. Allied to *S. lobàta.*

Digitate-leaved Meadow-sweet. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 feet.

56 S. FILIPE'NDULA (Lin. spec. 702.) root tuberous; leaves interruptedly pinnate; leaflets uniform, oblong-linear, acutely toothed; stipulas somewhat reniform, clasping the stem, toothed; corymbs loose; sepals reflexed; carpels parallel, villous, numerous; stigmas thick. ♃. H. Native of Europe, in meadows, and very common in high pastures on a calcareous soil. Smith, engl. bot. 284. Oed. fl. dan. 635.—Black. herb. 647. Root consisting of tubers hanging by threads, hence called *Filipéndula* or *Dropwort.* Flowers white inside and red on the outside, sweet-scented, disposed in loose terminal corymbs. The whole herb is astringent, and was formerly used in medicine, but it is now altogether neglected.

Var. α, *vulgàris* (Cambess. l. c. p. 379.) stems tall, and are as well as the leaves glabrous; leaves with scabrous margins; teeth usually piliferous at the apex.

Var. β, *múltiplex* (Ser. in D. C. prod. 2. p. 546.) flowers double. Cultivated in gardens.

Var. γ, *minor* (Cambess. l. c. p. 380.) stem humble; leaves much smaller.

Var, δ, *pubéscens* (Cambess. l. c. p. 379.) leaves clothed with hairy pubescence. ♃. H. Native of Provence, about Fonchateau. S. pubéscens, D. C. fl. fr. 5. p. 546.

Dropwort. Fl. June, Oct. Britain. Pl. 1 to 1½ foot.

Cult. The hardy shrubby species of *Spiræ'a* are very pretty when in flower, and are therefore well adapted for shrubberies; they thrive well in any soil, and are easily increased by cuttings or layers. The greenhouse species are also of easy cultivation. The hardy herbaceous kinds will grow in any kind of soil, but prefer a moist situation; they are well fitted for flower borders, and are increased by dividing the plants at the root.

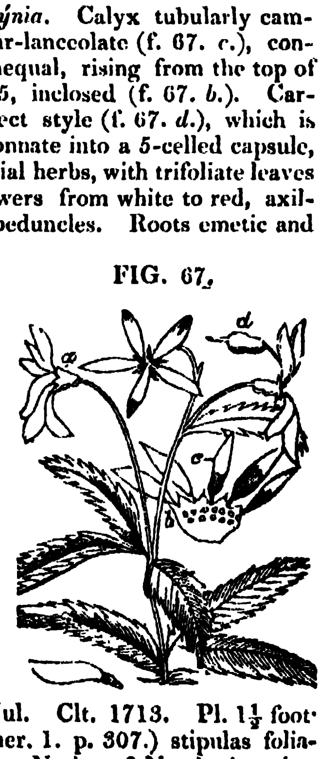
◆

IV. GILLE'NIA (probably from Gillen, the name of some obscure botanist). Mœnch. suppl. 286. Nutt. gen. amer. 1. p. 307. D. C. prod. 2. p. 546.—Spiræ'a species of Lin. Cambess. and others.

LIN. SYST. *Icosándria, Pentagýnia.* Calyx tubularly campanulate, 5-cleft. Petals 5, linear-lanceolate (f. 67. *c.*), contracted near the claws, rather unequal, rising from the top of the calycine tube. Stamens 10-15, inclosed (f. 67. *b.*). Carpels 5, terminated by a filiform erect style (f. 67. *d.*), which is capitate at the apex, somewhat connate into a 5-celled capsule, with 2 seeds in each cell.—Perennial herbs, with trifoliate leaves and stalked serrated leaflets. Flowers from white to red, axillary and terminal, on very long peduncles. Roots emetic and cathartic.

1 G. TRIFOLIA'TA (Mœnch. suppl. p. 286.) stipulas linear, acuminated, entire. ♃. H. Native of North America, in shady humid woods, from Florida to Canada. Spiræ'a trifoliàta, Lin. spec. 702. Curt. bot. mag. 486. Bigel. med. bot. t. 41. Mill. fig. 171. t. 256. Flowers in panicles. The roots of this plant possess properties analogous to Ipecacuanha. It requires, however, a larger dose, and then it is not so certain in its effects. Some authors have attributed a tonic power to the roots of *Gillènia* in small doses.

FIG. 67.



Trifoliate Gillenia. Fl. June, Jul. Clt. 1713. Pl. 1½ foot.

2 G. STIPULA'CEA (Nutt. gen. amer. 1. p. 307.) stipulas foliaceous, ovate, deeply cut. ♃. H. Native of North America, in humid woods from Tennessee to Kentucky. Spiræ'a stipu-

làta, Willd. enum. 542. Pursh, fl. amer. sept. 1. p. 343. Bart. med. bot. p. 71. t. 6. Cambess. l. c. t. 28. Radical leaves pinnatifid. Flowers from white to rose colour.

Stipulaceous Gillenia. Fl. Ju. Aug. Clt. 1805. Pl. 1 to 1½ ft.

Cult. The species of *Gillènia* are elegant plants, and therefore are worth cultivating in every collection of hardy herbaceous plants. They grow best in a peat border, and are readily increased by dividing the plants at the root, in spring.

† *A genus doubtful whether it belongs to the present order.*

V. ADENILE'MA (from ἀδὴν, *aden*, a gland, and ἴλημι, *hilemi*, to be near; glands on calyx). Blum. bijdr. 1120.

Lin. syst. *Icosándria, Monogýnia.* Calyx campanulate, 5-cleft, clothed with glandular pili on the outside. Petals 5, small, inserted in the calyx. Stamens numerous, inserted with the petals. Ovary 1. Style 1, crowned by a subpeltate stigma. Capsule inclosed in the calyx, beaked by the permanent style, 1-celled, opening at the side, containing 8-12 seeds, which are 1-ribbed, and fixed in a twin order on the sides of the opening suture. Spermaderm testaceous. Embryo albuminous, with leafy cotyledons and a short centripetal radicle.—A sarmentose, unarmed shrub, with the habit of *Rùbus*, with alternate, cordate, acuminated, 3-lobed, deeply serrated, bistipulate leaves. Flowers unibracteate, disposed in terminal racemose panicles. This genus apparently approaches the *Neìllia*.

1 A. fa'llax (Blum. l. c. 1121.). ♄. S. Native of Java, on mount Gede.

Fallaceous Adenilema. Shrub rambling.

Cult. For culture and propagation, see *Kagenèckia*.

Order LXXXII. QUILLA'JEÆ (plants agreeing with *Quillàja* in important characters). D. Don, in edinb. phil. journ. for Jan. 1831.

Calyx 5-cleft (f. 68. *a.*), valvate in æstivation (f. 68. *d.*). Petals 5 (f. 68. *b.*), alternating with the calycine segments, but sometimes wanting. Stamens definite in number from 10-15, inserted in the calyx; anthers bilocular. Ovaries 5 (f. 68. *c.*), connate at the base, 1-celled, containing numerous erect ovula. Styles 5 (f. 68. *f.*). Stigmas unilateral, papillous. Follicles 5 (f. 68. *e.*), disposed in a circle, connate at the base. Seeds disposed in 2 rows, inserted on the inner suture of the follicles, ascending, winged at the apex, with the umbilicus at the base; the testa simple and membranous. Albumen wanting. Embryo erect, with foliaceous convolute cotyledons, and a terete radicle, which is shorter than the cotyledons, pointing to the umbilicus.—South American trees, with alternate undivided leaves, small caducous stipulas, and terminal dioecious flowers. This order differs essentially both from *Rosàceæ* and *Spiræàceæ* in the erect ovula, and from the latter also in the valvular æstivation of the calyx. The habit of the plants composing this order is likewise abundantly different.

Synopsis of the genera.

1 Kagene'ckia. Calyx saucer-shaped, furnished with a ring a little elevated on the inside, girding the ovaries. Petals wanting? Stamens 15, 5 of which alternate with the lobes of the calyx, the rest by pairs opposite the lobes.

2 Quilla'ja. Calyx 5-cleft (f. 68. *a.*). Disk 5-lobed (f. 68. *c.*), stellate, fleshy. Petals 5 (f. 68. *b.*), spatulate, unguiculate. Stamens 10, disposed in 2 series, 5 of which are inserted in the middle of the calycine lobes, and the other 5 in the throat of the calyx.

3 Vauqueli'nia. Calyx 5-cleft. Petals 5. Stamens 15-20, exserted with the petals from the throat of the calyx.

4 Lindle'ya. Calyx 5-cleft. Petals 5. Stamens 15-20, inserted in the disk in the throat of the calyx. Carpels 5, connate their whole length. Styles 5, concrete.

I. KAGENE'CKIA (the authors of the Flora Peruviana have dedicated this genus to Frederick de Kageneck, ambassador from the king of Holland to the king of Spain). Ruiz et Pav. fl. per. prod. t. 37. H. B. et Kunth, nov. gen. amer. 6. p. 236. D. C. prod. 2. p. 547. D. Don, in edinb. phil. journ. Jan. 1831.

Lin. syst. *Icosándria, Pentagýnia.* Calyx saucer-shaped, 10-ribbed on the outside, permanent; limb 5-cleft, furnished on the inside with an elevated hardly membranous ring girding the ovaries; lobes recurved, acuminated or obtuse. Petals wanting? or 5, orbicular? Stamens 15, 5 of which alternate with the calycine lobes; the rest by pairs opposite the calycine lobes; filaments dilated at the base. Anthers cordate, oblong. Stigmas with cucullate disks. Carpels 5, follicular.—Trees, with dotless, glandularly serrulated leaves. Stipulas small, gland-formed. Flowers terminal, polygamous.

1 K. oblónga (Ruiz et Pav. fl. per. syst. 1. p. 289.) leaves oblong, obtuse, coriaceous, serrulated; glands of teeth deciduous; flowers solitary. ♄. G. Native of Chili, on mountains about Conception. Lydæ'a Lyday, Mol. chil. ed. 2. p. 300. In its native country it is commonly called *guayo colorado*, but according to Molino, *Lyday*. The wood is used to build houses in Chili. The leaves being very bitter are used by the inhabitants of Chili to cure intermittent fevers, as also those of the following species.

Oblong-leaved Kageneckia. Fl. Aug. Dec. Tree 30 feet.

2 K. lanceola'ta (Ruiz et Pav. fl. per. syst. p. 290. gen. p. 145. t. 37.) leaves lanceolate or obovate, membranous, serrulated; glands of teeth permanent; flowers corymbose. ♄. G. Native of Peru, on hills in the province of Canta.

Lanceolate-leaved Kageneckia. Fl. Nov. Dec. Tree 20 ft.

3 K. glutinòsa (H. B. et Kunth, nov. gen. amer. 6. p. 237.) leaves oblong and oblong-lanceolate, acute, narrow at the base, sharply crenately serrated; branches clammy. ♄. G. Native of South America, on the Andes in the province of Jaen de Bracamoros.

Clammy-branched Kageneckia. Tree 12 to 20 feet.

Cult. These trees will grow well in a mixture of loam, peat, and sand, and ripened cuttings will probably root if planted in a pot of sand, with a hand-glass placed over them in a little bottom heat.

II. QUILLA'JA (*Quillai* or *Cullay* is the name of *Q. saponària* in Chili). Mol. Juss. gen. 444. Kunth, nov. gen. amer. 6. p. 236. in a note. D. C. prod. 2. p. 547. D. Don, in edinb. phil. journ. Jan. 1831. Smegmadérmos, Ruiz et Pav. fl. per. prod. 2. t. 31.

Lin. syst. *Decándria, Pentagýnia.* Calyx 5-cleft (f. 68. *a.*); segments ovate, bluntish, thick, tomentose, with truncate margins. Disk concrete, with the calyx 5-lobed (f. 68. *c.*), stellate, fleshy, smooth, nectariferous; lobes elevated from the calyx, roundish, emarginate. Petals 5 (f. 68. *b.*), spatulate, unguiculate, alternating with the segments of the calyx. Stamens 10 (f. 68.), disposed in a double order, 5 of which are inserted in the middle of the calycine lobes, rising from the notches of the lobes of the disk (f. 68. *a.*), the other 5 inserted in the throat of the calyx, and opposite the petals (f. 68. *b.*); filaments subulate. Carpels 5 (f. 68. *e.*), connate, spreading. Styles 5 (f. 68. *f.*), terminal, permanent. Stigmas unilateral.—Evergreen trees, with undivided leaves. Stipulas 2, petiolar, caducous. Flowers corymbose, polygamous.

1 Q. saponaʹria (Mol. chil. p. 182. ed. 2. p. 298.) leaves oval, for the most part toothed. ♄. G. Native of Chili, very plentiful in the woods of the provinces of Rire d Richacay. Q. Molìnæ, D. C. prod. 2. p. 547. Q. Smegmadérmos, D. C. prod. 2. p. 547. Smegmadérmos emarginàtus, Ruiz et Pav. fl. per. syst. 1. p. 288. Smegmària emarginàta, Willd. spec. 4. p. 1123. In Chili the bark is used as a substitute for soap.

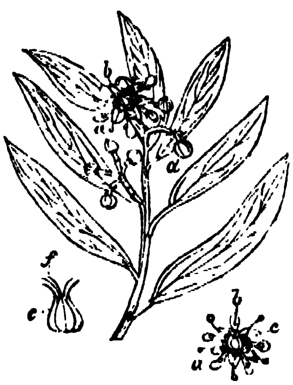
Soap Quillaja. Fl. Dec. Feb. Tree 60 feet.

2 Q. lanceolaʹta (D. Don, in edinb. phil. journ. Jan. 1831.) leaves lanceolate, acute, entire. ♄. S. Native of Brazil. (f. 68.)

Lanceolate - leaved Quillaja. Tree.

Cult. See *Kagenèckia* for culture and propagation, p. 522.

FIG. 68.



III. VAUQUELI'NIA (in honour of M. Vauquelin, the celebrated French chemist, whose discoveries have been extended to the vegetable kingdom). Corr. in Humb. et Bonpl. pl. æquin. 1. p. 140. t. 40. D. C. prod. 2. p. 547.

Lin. syst. *Icosándria, Pentagýnia.* Calyx 5-cleft, permanent. Petals 5, permanent. Stamens 15-20, permanent, exserted with the petals from the calyx. Anthers oblong. Carpels 5, joined into a 5-celled, 5-styled ovarium. Styles 5. Stigmas capitate. Capsule ovate, 5-celled; cells 2-valved, dehiscent, 2-seeded. Seeds ending in a membranous wing, as in the rest of the genera, erect.—A tree, with alternate, lanceolate, unequally toothed, exstipulate? leaves, and terminal corymbs of white flowers. Flowers probably dioecious.

1 V. corymbòsa (Corr. l. c.) ♄. S. Native of Mexico, in temperate parts near Actopan. H. B. et Kunth, nov. gen. amer. 6. p. 238.

Corymbose-flowered Vauquelinia. Tree 50 feet.

Cult. See *Kagenèckia* for culture and propagation, p. 522.

IV. LINDLE'YA (in honour of John Lindley, F.R.S. F.L.S. professor of botany in the London university). H. B. et Kunth, nov. gen. amer. 6. p. 239. D. C. prod. 2. p. 548.

Lin. syst. *Icosándria, Pentagýnia.* Calyx 5-cleft, permanent. Petals 5. Stamens 15-20, inserted in the disk in the throat of the calyx. Anthers lanceolate, uncinately reflexed at the base. Carpels 5, connected into a 5-celled, 5-styled ovarium, containing 2 pendulous? ovula each. Capsule 5-celled, propped by the calyx, woody, 5-angled. Seeds with winged margins.—A smooth tree, with scattered simple crenulated bistipulate leaves, and axillary solitary white bracteate flowers. This genus approaches very near *Vauquelinia.*

1 L. mespiloiʹdes (H. B. et Kunth, nov. gen. amer. 6. p. 239. t. 562.) ♄. S. Native of Mexico, very common about the village of Magdalena. Habit of *Pỳrus màlus,* or the apple-tree.

Mespilus-like Lindleya. Tree 20 to 30 feet.

Cult. See *Kagenèckia* for culture and propagation, p. 522.

Order LXXXIII. ROSA'CEÆ (plants agreeing with *Rosa* in important characters). Juss. gen. 334. part.

Calyx 4-5-lobed, valvate in æstivation, with the disk surrounding the orifice (f. 74. *g.* f. 75. *e.*), having the fifth lobe next the axis. Petals 5 (f. 71. *b.* f. 72. *b.* f. 75. *c,* &c.), perigynous, equal. Stamens indefinite (f. 69. *c.* f. 71. *c.*), arising from the calyx, just within the petals; they are curved inwards in æstivation; anthers innate, 2-celled, bursting lengthwise. Ovaries superior (f. 71. *d.*), several, 1-celled, 1-seeded. Ovula usually suspended, rarely erect. Styles lateral, near the apex of the ovaries. Stigmas simple and emarginate on one side. Fruit either 1-seeded nuts or akenia (f. 71. *d.* f. 72. *c.*). Seeds erect or inverted. Embryo straight, with a taper short radicle, pointing to the hylum, and flat cotyledons. Albumen wanting.—This order is composed of herbaceous plants or shrubs, but never trees. Leaves simple or compound, with 2 stipulas at the base. *Rosàceæ* are distinguished from *Pomàceæ* by their superior fruit, and usually suspended seeds; from *Leguminòsæ* by their regular petals and stamens, and especially by the odd segment of the 5-lobed calyx of that order, which is anterior, not posterior, as in *Rosàceæ;* from *Chrysobalàneæ* in their styles proceeding from the side of the ovarium near the apex, and not from the base, as in that order, by their more regular petals and stamens, and by their fruit not being a drupe; *Amygdalàceæ* differ from *Rosàceæ* by their terminal styles, drupaceous fruit, and presence of prussic-acid, along with the formation of gum; *Sanguisórbeæ* differ from *Rosàceæ* in their apetalous flowers and definite stamens, alternating with the segments of the calyx; *Spiræàceæ* and *Quillàjeæ* differ from *Rosàceæ* by their follicular fruit, and in the æstivation of the calyx.

Rosaceous plants are always wholesome; they are chiefly remarkable from the presence of an astringent principle, which has caused several of them to be reckoned febrifugal. The root of *Tormentílla rèpens* is used for tanning in the Feroe Islands; *Potentílla ansérina* has been used by tanners; *Potentílla rèpens* as a febrifuge. *Gèum urbànum* and *rivàle* have been compared for efficacy to *Cinchòna.* The fruit of many species of *Fragària* or strawberry, and *Rùbus* or raspberry and cloudberry, are valuable articles for the dessert. The leaves of *Rùbus árcticus* and *Ròsa rubiginòsa* have been employed as a substitute for tea. *Agrimònia eupatòria* yields a decoction useful as a gargle. The root of *Rùbus villòsus* is a popular astringent in North America in cholera infantum. One of the most powerful anthelmintics in the world belongs to this family, an Abyssinian plant, *Brayèra anthelmíntica.* Upon the authority of Dr. Brayer two or three doses of the infusion are sufficient to cure the most obstinate case of tænia. The various species of roses form some of the greatest beauties of the garden. The fruit of *Ròsa canìna,* and other allied species, is astringent, and is employed against chronic diarrhœa and other maladies. The petals of *Ròsa damascèna* yield a highly fragrant essential oil, called attar of roses; those of *Ròsa gállica* are astringent when dried with rapidity, and are sometimes found useful in cases of debility, such as leucorrhœa and diarrhœa, &c.

Synopsis of the genera.

Tribe I.

Drya'deæ. *Calyx* 8-10-*cleft* (f. 70. *b.*), *rarely many parted*

(f. 69. *a.*), *valvate in æstivation, the outer lobes accessory* (f. 70. *b.*), *and alternating with the inner lobes. Petals* 4-5, *rarely more* (f. 69. *b.* f. 70. *c.*). *Carpels numerous* (f. 70. *d.*), *free, inserted in a dry or fleshy polyphore, dry* (f. 70. *d.*) *or baccate* (f. 71. *d.*), 1-*seeded. Herbs or shrubs, usually with compound leaves, with* 2 *stipulas adnate to the sides of the petiole.*

1 Dry'as. Calyx 8-9-parted (f. 69. *a.*). Petals 8-9 (f. 69. *b.*). Stamens numerous (f. 69. *c*). Carpels dry, numerous, ending each in the feathery style (f. 69. *e.*). Seed ascending.

2 Ge'um. Calyx 10-cleft, the 5 outer segments accessory. Petals 5. Stamens numerous. Carpels numerous, dry, ending each in a kneed style.

3 Sieve'rsia. All as in *Geum*, but differs in the carpels ending in a feathery (f. 70. *d.*) jointless style or awn.

4 Colu'ria. Calyx 10-parted, the 5 outer lobes accessory. Petals 5. Stamens numerous. Carpels numerous, scrobiculate, tailless.

5 Cowa'nia. Calyx 5-cleft. Petals 5. Stamens numerous. Carpels awned by the feathery styles.

6 Waldstei'nia. Tube of calyx turbinate, crowned by a crenulated ring under the stamens, bearing bracteas on the outside. Petals 5. Stamens numerous. Carpels 2-4, globose, naked at the apex, coriaceous. Seed erect.

7 Comaròpsis. Calyx 5-cleft. Petals 5. Stamens numerous. Carpels few, dry, ending in filiform styles. Seeds erect.

8 Ru'bus. Calyx 5-cleft. Petals 5. Stamens numerous. Carpels fleshy, inserted on an elevated torus. Seed inverted.

9 Daliba'rda. Calyx 5-6-cleft; lobes toothed. Petals 5. Stamens numerous, deciduous. Carpels 5-10, ending in short styles, subdrupaceous. Seed pendulous.

10 Fraga'ria. Calyx 10-cleft (f. 71. *a.*) the outer segments accessory (f. 71. *c.*). Petals 5 (f. 71. *b.*). Stamens numerous. Carpels dry, seated on an elevated fleshy torus (f. 71. *d.*). Styles lateral. Seed pendulous (f. 71. *d.*).

11 Duche'snea. Calyx 10-parted, the outer segments accessory, foliaceous, and tridentate. Petals 5. Stamens numerous. Carpels numerous, seated on a fleshy, succulent, elevated torus.

12 Potenti'lla. Calyx 10-cleft (f. 72. *a.*), the outer segments accessory. Petals 5 (f. 71. *d.* f. 72. *b.*). Stamens numerous. Carpels numerous, dry (f. 72. *c.*), seated on an elevated torus. Styles lateral.

13 Tormenti'lla. Calyx 8-parted, the 4 outer segments accessory. Petals 4. Stamens 16. Akenia dry, naked, numerous, wrinkled, seated on a depressed receptacle. Styles lateral.

14 Co'marum. Calyx 10-parted, the 5 outer segments accessory. Petals 5, small. Stamens numerous. Akenia numerous, seated on an elevated spongy receptacle.

15 Horke'lia. Calyx 10-cleft, the outer segments accessory. Petals 5. Stamens 10. Akenia inserted on a conical receptacle, inclosed in the calyx.

16 Sibba'ldia. All as in *Potentilla*, but the petals are very minute, and the carpels and stamens are usually 5. Seed inverted. Polyphore dry.

17 Chamærhòdos. Calyx campanulate, 5-cleft. Petals 5, obovate. Stamens 5. Styles lateral, 10, rarely 5. Carpels 5-10 or more, seated on a villous receptacle. Plants beset with glandular hairs.

18 Agrimònia. Calyx turbinate, 5-cleft (f. 73. *a. d.*), involucrated by bristles (f. 73.). Petals 5. Stamens 15. Carpels 2, with terminal styles. Seed pendulous.

19 Aremònia. Calyx 5-cleft, surrounded by a 10-12-cleft involucrum. Petals 5. Stamens 5-10. Carpels 2, with terminal styles. Seed pendulous.

20 Braye'ra. Calyx double, both 5-cleft; lobes of the outer large and oblong, of the inner spatulate and shorter. Petals 5, small, linear. Stamens 15-20. Carpels 2, ending in exserted styles. Seed pendulous.

Tribe II.

Neura'deæ. *Calyx 5-cleft* (f. 76. *b.*), *with a short tube adhering to the ovary, valvate in æstivation. Petals* 5. *Carpels* 10. *connected into a* 10-*celled capsule* (f. 76. *c.*), *which is depressed at the apex. Seed bony, obliquely pendulous.—A decumbent suffruticose herb.*

21 Neura'da. Petals 5, inserted in the base of the calycine lobes (f. 76. *a.*). Stamens 10. Styles 10.

Tribe III.

Ròseæ. *Tube of calyx contracted at the mouth* (f. 76. *a. e.*), *with a 5-parted limb* (f. 76. *d.* f. 75. *b.*); *lobes somewhat spirally imbricated in æstivation, usually pinnatifid* (f. 75. *b.* f. 76. *d.*). *Petals* 5 (f. 75. *c.* f. 76. *c.*). *Stamens numerous. Carpels numerous, inserted inside the tube of the calyx, which at length becomes baccate and incloses them* (f. 75. *f.* f. 76. *a.*). *Seeds inverted.—Shrubs, with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole.*

22 Ròsa. Character the same as that of the tribe.

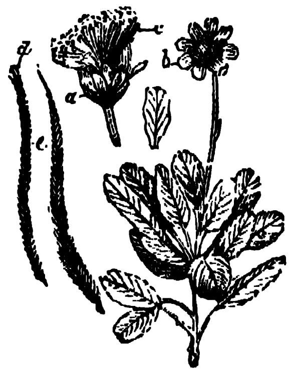
Tribe I.

DRYA'DEÆ (plants agreeing in important characters with *Dryas*). Vent. tabl. 3. p. 349.—Fragariàceæ, Rich. in Nestl. pot. p. 14. Calyx 10-cleft, rarely 8-cleft or many parted, valvate in æstivation, the outer segments accessory, and alternating with the inner ones. Petals 4-5, rarely more, alternating with the inner segments of the calyx. Stamens numerous, rarely few, inserted in the apex of the calycine tube. Carpels or akenia numerous, rarely few, crowded, inserted in the torus, distinct from each other, and free from the calyx, bearing the styles at the side near the apex. Styles with a furrow on the inside, and expanded into an oblique stigma at the apex. Akenia 1-ovulate, free from each other, dry or baccate. Seeds solitary, erect or inverted, exalbuminous. Embryo erect, with flattish cotyledons.—Herbs or subshrubs, with usually compound bistipulate leaves, the stipulas adnate to the sides of the petioles.

I. DRY'AS (so named by Linnæus from the dryades or nymphs of the oaks, in consequence of the leaves bearing some resemblance to those of the oak). Lin. gen. no. 637. Lam. ill. f. 443. Nestl. pot. 16. D. C. prod. 2. p. 549.

Lin. syst. *Icosándria, Polygýnia.* Calyx 8-9-parted (f. 69. *a.*), with a somewhat concave tube (f. 79. *a.*). Petals 8-9 (f. 69. *b.*). Stamens numerous. Carpels numerous, each terminated by a style, which at length becomes a feathery tail (f. 69. e.). Seed ascending.—Humble suffruticose herbs, with simple permanent leaves, which are clothed with white tomentum beneath. Flowers white, or yellow.

FIG. 69.



1 D. octope'tala (Lin. spec. 717.) leaves ovate or subcordate, crenately serrated. ♄. H. Native of Europe on the Alps, and of Siberia. In Scotland, as in Breadalbane, Isle of Sky, Perthshire, Rosshire, Sutherland, and Argyleshire; in Ireland, between Gort and Gallaway, and near Sligo; in England, on Amdifclowder, in Littendale, and near Settle in Yorkshire. Smith, eng. bot. 451. Oed. fl. dan. t. 31. This delicate evergreen plant, with its white flowers and germander-like leaves, is a great ornament to alpine heights.

Eight-petalled Dryas. Fl. Ju. Aug. Britain. Shrub prostrate.

2 D. Drummóndi (Richards, mss. Hook. in bot. mag. t. 2972.) leaves elliptic, rather attenuated at the base, deeply crenated, clothed with white tomentum beneath, and on the scapes; calycine segments ovate. ♄. H. Native of North America, Canada, and the Rocky Mountains as far as Slave Lake. D. octopétala, Pursh, fl. amer. sept. 1. p. 350. D. chamædrifòlia, Richards in Frankl. journ. append. p. 740. Flowers yellow. An elegant plant when in flower.

Drummond's Dryas. Fl. June, July. Clt. 1800. Sh. pros.

3 D. integrifòlia (Vahl. act. soc. hafn. 4. p. 2. p. 151.) leaves quite entire, acute, cordate at the base. ♄. H. Native of Greenland. Oed. fl. dan. 1216. Flowers white, very like those of the first species.

Entire-leaved Dryas. Fl. June, Aug. Clt. 1810. Sh. pros.

4 D. tene'lla (Pursh, fl. amer. sept. 1. p. 350.) leaves small, ovate, acute, quite entire, cordate at the base, flat, clothed with white tomentum beneath. ♄. H. Native of North America, in New Hampshire, Rocky Mountains, &c. D. integrifòlia, Hook. exot. fl. t. 220. but not of Vahl. D. integrifòlia var. *β*, tenélla, D. C. prod. 2. p. 550. Flowers white, one-half smaller than those of the last species. An elegant plant when in flower.

Slender Dryas. Fl. June, Aug. Clt. 1820. Sh. proc.

Cult. *Dryas* is a genus of elegant little evergreen, prostrate plants; they thrive best in a border of peat soil, and sometimes they are grown in pots in the same kind of soil, and placed among other alpine plants. They are usually increased by dividing the plants at the root, and sometimes by seed.

II. GE'UM (from *γευω*, *geuo*, to give a relish; roots of *G. urbànum*). Lin. gen. 864. Lam. ill. 443. Nestl. pot. p. 16.

Lin. syst. *Icosándria*, *Polygýnia*. Calyx with a concave tube, and a 10-cleft limb, the 5 outer segments accessory. Stamens numerous. Carpels dry, disposed in a head, ending each in a style, which at length becomes kneed. Seed ascending.—Herbs, with variously dissected leaves, the terminal lobe or leaflet always large. Flowers usually yellow or copper-coloured, red or white.

Sect. I. Caryophylla'strum (*Caryophýllus*, the name of the clove pink; the roots of *G. urbànum* have a taste like cloves). Ser. in mem. soc. gen. 2. p. 138. D. C. prod. 2. p. 550. Flowers ascending. Calyx reflexed. Styles deflexed, kneed. Appendages for the most part shorter than the styles.

1 G. Canade'nse (Murr. comm. gœt. 5. p. 33. t. 4. but not of Jacq.) stem erect, rough, dichotomous; radical leaves interruptedly pinnate, the terminal leaflet large, nearly orbicular, 3-5-lobed, and crenated; cauline leaves quinately and ternately pinnate, with the leaflets lobulate and toothed; stipulas ovate, 3-5-lobed; peduncles elongated; petals orbicular, retuse, length of the calyx; head of carpels obovate; ovaries pilose, very numerous; styles glabrous, but with the appendages pilose. ♃. H. Native of North America. G. stríctum, Ait. hort. kew. ed. 1. vol. 2. p. 217. Petals yellow.

Canadian Avens. Fl. May, June. Clt. 1778. Pl. 1½ foot.

2 G. stri'ctum (Pursh, fl. amer. sept. 1. p. 351.) hairy; leaves all interruptedly pinnate, the terminal leaflet the largest; leaflets ovate, toothed; stipulas cut; the 5 outer calycine segments linear and short; petals nearly orbicular, longer than the calyx; awns of carpel naked and hooked. ♃. H. Native of North America, from Canada to New York, in dry wet meadows and bogs. G. Allépicum, Jacq. icon. rar. 1. t. 93. Flowers large, yellow and striped.

Straight Avens. Fl. May, July. Clt. 1778. Pl. 2 feet.

3 G. macrophy'llum (Willd. enum. 557.) stem erect, rough, pilose, dichotomous; radical leaves interruptedly pinnate; leaflets nearly orbicular, terminal one cordate, large, and biserrated; cauline leaves bluntly 3-lobed and serrated; stipulas ovate, 3-5-toothed or nearly entire; peduncles when bearing the flowers very short, but when bearing the fruit they are much elongated; petals obcordate, longer than the calyx; heads of carpels ovate-orbicular; ovaries very pilose; styles smoothish, but with the appendages pilose at the base. ♃. H. Native of Kamtschatka. Flowers yellow.

Large-leaved Avens. Fl. June, July. Clt. 1804. Pl. 1½ ft.

4 G. heterophy'llum (Desf. hort. par. D. C. prod. 2. p. 550.) stem erect, flexuous, beset with spreading pili, dichotomous; radical leaves bluntly 3-lobed; cauline ones somewhat pinnate; the leaflets cuneiform, lobulate, and toothed; stipulas oval, profoundly toothed; peduncles short and stiff; petals obovate, about equal in length to the calyx; heads of carpels spherical, quite glabrous; styles with short appendages. ♃. H. Native country unknown. Flowers white?

Var. β, elongàtum (Ser. in D. C. prod. 2. p. 550.) peduncles elongated; appendages of styles longer and rather pilose; lobes of leaves more acute.

Variable-leaved Avens. Fl. May, July. Clt. 1816. Pl. 1½ foot.

5 G. interme'dium (Besser, cat. hort. crem. ex D. C. prod. 2. p. 550. but not of Willd.) stem erect, beset with spreading pili; radical leaves interruptedly pinnate; leaflets ovate-oblong, coarsely biserrated, terminal one large and 3-5-lobed; cauline leaves somewhat interruptedly pinnate or ternate; leaflets of the upper leaves rhomboid-lanceolate, and coarsely toothed; stipulas ovate, deeply toothed; peduncles when bearing the fruit much elongated; petals orbicular, length of the calyx; heads of carpels obovate-globose; ovaries very pilose; styles glabrous, but with the appendages pilose. ♃. H. Native of Volhynia and Altaia, in shady places. Flowers yellow.

Intermediate Avens. Fl. June, July. Clt. 1820. Pl. 1½ ft.

6 G. Virginia'num (*Lin.* spec. 716.) stem branched, pilose; radical leaves quinately pinnate, cauline ones ternate; leaflets lanceolate-cuneiform, toothed, the uppermost leaves 1-lobed, and very acute; stipulas ovate, toothed; peduncles when in fruit much elongated, filiform, and divaricate; petals obovate, shorter than the calyx; heads of carpels spherical; carpels few, pilose; styles elongated, and are, as well as the appendages, pilose. ♃. H. Native of Virginia and Carolina. This species comes very near *G. urbànum*, and differs from it principally in the small white flowers, and in the leaflets and stipulas being narrower.

Virginian Avens. Fl. July, Aug. Clt. 1739. Pl. 1 to 2 feet.

7 G. a'lbum (Gmel. syst. nat. 2. p. 861. Willd. enum. 556.) radical leaves pinnate, cauline ones ternate, uppermost cauline ones simple, and somewhat trifid; petals about equal in length to the calyx; styles glabrous, with pilose appendages. ♃. H. Native of Canada and Pennsylvania. G. Canadénse, Jacq. hort. vind. 2. t. 175. ex Willd. l. c. Flowers small, white.

White-flowered Avens. Fl. June, July. Clt. 1730. Pl. 1 to 1½ foot.

8 G. Portenschlagia'num (Tratt. ros. 3. p. 116.) stem terete, pubescent; branches straight, dichotomous; radical leaves pinnate, middle cauline ones dilately 3-lobed, but the upper cauline ones are lanceolate and coarsely toothed, pubescent; peduncles elongated, erect; petals about equal to the calyx; ovaries hispid; awns of carpels glabrous, glochidate at the apex. ♃. H. Native country unknown. According to Trattineck it is allied to *G. álbum*. Flowers smaller than those of *G. urbànum*.

Portenschlag's Avens. Fl. June, July. Clt. 1820. Pl. 1½ ft.

9 G. rubifòlium (Lejeune. rev. fl. spa. 103.) flowers erect; petals length of the calyx; radical leaves lyrately pinnate; leaflets of upper leaves cuneiform, acute, auricled at the base; awns of carpels at first geniculately twisted, but at length hooked. ♃. H. Native about Spa. Flowers yellow.

Bramble-leaved Avens. Pl. 1½ foot.

10 G. urba'num (Lin. spec. 716.) stem erect, branched, pilose; radical leaves pinnate, with 5 leaflets, cauline leaves ternate, 3-lobed or 3-parted; leaflets ovate, broad, dentately crenate; upper cauline leaves ovate, 1-lobed; stipulas large, nearly orbicular; petals obovate, length of the calyx; heads of carpels spherical; ovaries pilose, numerous; styles glabrous, with pilose appendages. ♃. H. Native of Europe, in woods and hedges; plentiful in all parts of Britain. Smith, engl. bot. 1400. Sturm, deutsch. fl. fasc. 5. Woodv. med. bot. 5. p. 33. t. 4. A. Fl. dan. 672. Flowers erect, small, yellow. The roots have a mildly astringent aromatic taste, somewhat like cloves, whence this plant has the name of *Caryophyllàta*. They have much more virtue in a dry warm situation. Gathered in the spring, and put fresh into ale, they give it a pleasant flavour, and prevent its turning sour. Infused in wine it is esteemed a good stomachic.

Var. β, *opulifòlium* (Ser. in D. C. prod. 2. p. 551.) cauline leaves usually 3-lobed at the apex, small, toothed; stipulas ovate-orbicular. Native about Bern and Geneva.

City or Common Avens or Herb Bennet. Fl. May, Aug. Britain. Pl. 1 to 2 feet.

11 G. cocci'neum (Smith, fl. græc. t. 485.) leaves lyrately pinnate; lower leaflets small, terminal one very large, roundish, cordate, all deeply crenated; cauline leaves 3-lobed, cut; stipulas deeply toothed; flowers panicled, erect; plant villous or pilose. ♃. H. Native of Bithynia, on Mount Olympus. Flowers large, scarlet.

Scarlet-flowered Avens. Pl. ½ to 1 foot.

12 G. Chiloe'nse (Balb. in litt. Loud. hort. brit. p. 214.) plant villous; stem glandular; radical leaves interruptedly pinnate; leaflets crenate-serrated, the terminal one large, roundish, cordate, lobed, and crenated; cauline leaves 3-parted, deeply cut; stipulas large, roundish, toothed; flowers panicled, erect. ♃. H. Native of Chiloe. G. coccíneum, Lindl. bot. reg. 1088. G. Quèllyon, Sweet, fl. gard. 2. ser. vol. 2. with a figure. Flowers scarlet, sometimes copper-coloured.

Chiloe Avens. Fl. May, July. Clt. 1826. Pl. 1 to 2 feet.

13 G. hederæfòlium (Gmel. fl. bad. 2. p. 460.) leaves simple, somewhat 3-lobed, clothed with pilose tomentum; stem erect; carpels pilose, with feathery awns. ♃. H. Native country unknown. Caryophyllàta foliis hederæ terrestris. Bauh. pin. 322. Perhaps a variety of *G. urbànum*.

Ivy-leaved Avens. Pl. 1 to 2 feet.

14 G. ela'tum (Wall. cat. 711.) stem erect, pubescent; 1-2-flowered; leaves interruptedly pinnate; leaflets obtuse, crenately lobed, outer ones the largest, rather hairy and ciliated; cauline leaves pinnatifid; flowers large, erect; stipulas large, deeply lobed. ♃. H. Native of the Himalaya.

Tall Avens. Pl. 2 to 3 feet.

15 G. ranunculoìdes (Ser. in mem. soc. phys. gen. 2. p. 138.) stem erect, branched; radical leaves interruptedly pinnate; leaflets bifid, dentate; cauline leaves somewhat interruptedly pinnate, or palmate; leaflets obovate-cuneated, toothed; stipulas ovate, large, lobed, or coarsely serrated; peduncles very long, filiform; petals roundish, nearly twice the length of the calyx; heads of carpels spherical; carpels numerous, pilose; styles glabrous, with the appendages ascending and glabrous, nearly the length of the styles. ♃. H. Native country unknown. G. heterophýllum, Hortul. but not of Desf. Flowers golden yellow, about the size of those of *Ranúnculus àcris*.

Crowfoot-like Avens. Fl. June, July. Clt. 1823. Pl. 1 foot.

Sect. II. Caryophylla'ta (the same as last section). Ser. in mem. soc. gen. 2. p. 139. D. C. prod. 2. p. 551.—Cariophyllàta, Tourn. inst. t. 151. Flowers erect or drooping. Calyxes erect. Styles deflexed, jointed, with the appendages about equal in length to the style.

16 G. riva'le (Lin. spec. 717.) plant pilose; stems erect, simple, 1-4-flowered; leaves interruptedly and lyrately pinnate; leaflets obovate, biserrate; cauline leaves 3-lobed; lobes acute; stipulas ovate, toothed; peduncles pilose, elongated; flowers nodding; petals obcordate, on long claws, length of calyx; heads of carpels spherical, at length stipitate; ovaries very pilose; styles elongated, bent, pilose. ♃. H. Native of Europe, Siberia, and North America, in moist pastures and woods, indicating, according to Linnæus, a barren soil, not fit for corn; plentiful in many parts of Britain. Smith, engl. bot. 106. Sturm, deutschl. fl. fasc. 8. with a figure. Oed. fl. dan. 722. Caryophyllàta nùtans, Mœnch. meth. 661. G. nùtans, Rafin. in litt. Flowers nodding, of a coppery red colour. The powder is beneficial in diarrhœas and hæmorrhages, and is much used by the Canadians in tertian agues.

Var. β, *intermèdium* (Ser. in D. C. prod. 2. p. 551.) plant less pilose; lobes of upper leaves narrower; peduncles slenderer. ♃. H. Native about Berlin, in groves. G. intermèdium, Willd. hort. berl. t. 69. Tratt. ros. 3. p. 122.

Var. γ, *proliferum* (Ser. l. c.) flowers semi-double; segments of the calyx tridentate; carpels transformed into leaves.

River or Water Avens. Fl. June, Jul. Britain. Pl. 1 foot.

17 G. hy'bridum (Jacq. pl. rar. t. 94.) pilose; stems few-flowered; radical leaves interruptedly pinnate; terminal leaflets broad, rounded, and cordate, lobed and serrated; cauline leaves 3-lobed; lobes rounded; stipulas large, lobed; flowers erect; petals obcordate; carpels pilose, with hooked, pilose awns. ♃. H. Native of Europe, in woods. G. rivàle, var. β, luxùrians, Tratt. ros. 3. p. 121. Flowers erect, reddish.

Hybrid Avens. Fl. June, July. Clt.? Pl. 1 foot.

18 G. Pyrena'icum (Ram. bull. phil. no. 42. t. 10. f. 3.) plant pilose; stems erect, simple, 1-4-flowered; leaves interruptedly pinnate; lower leaflets ovate, dentate, small, terminal one large, cordate-reniform, biserrate; stipulas ovate, bluntly toothed; flowers nodding; petals roundish, obcordate, on short claws, longer than the calyx; heads of carpels spherical, depressed; styles deflexed, stiff, length of carpels; carpels very pilose, with the appendages also pilose. ♃. H. Native of the Pyrenees. D. C. fl. fr. 4. no. 3765. G. Tournefórtii, Lapeyr. abreg. p. 292. G. inclinàtum, Schleich. cat. 1815. Flowers yellow.

Pyrenean Avens. Fl. June, July. Clt. 1804. Pl. 1½ foot.

19 G. BRACHYPE′TALUM (Ser. in mem. soc. phys. gen. 2. p. 139.) plant rather pilose; stems erect, simple, 1-3-flowered; lower leaves interruptedly pinnate, ultimate ones approximate, 1-lobed, lanceolate, all biserrated; lower stipulas large, and nearly orbicular, coarsely serrated; flowers axillary, drooping; petals obovate, loose, much shorter than the calyx; heads of carpels roundish. ♃. H. Native country unknown, but cultivated in the garden at Geneva. Flowers pale yellow, marked with rose-coloured lines.

Short-petalled Avens. Fl. June, Aug. Clt. 1818. Pl. 1½ ft.

20 G. THOMASIA′NUM (Ser. in mem. soc. phys. gen. 2. p. 140.) plant pilose; stems erect, 1-3-flowered; radical leaves somewhat interruptedly pinnate; leaflets nearly equal, obovate, somewhat doubly serrated; cauline leaves ternate; the terminal leaflets 3-lobed or lanceolate; stipulas ovate, doubly serrated; flowers ascending; calycine lobes ovate, short; petals obovate, hardly longer than the calyx; heads of carpels nearly spherical; styles appendiculate. ♃. H. Native of the eastern Pyrenees, about Mount Louis. Flowers small, yellow.

Thomas's Avens. Fl. May, Aug. Pl. 1 foot.

21 G. PARVIFLÒRUM (Commers, ex Smith in Rees's cycl. vol. 16. no. 12.) stem few-flowered, tomentose; radical leaves pinnate, crenated, longer than the stem; stipulas dissected; flowers almost sessile, nodding; calycine segments longer than the corolla; carpels villous. ♃. H. Native of the Straits of Magellan. Flowers small, white. Allied to *G. rivàle*, according to Smith.

Small-flowered Avens. Pl. ½ foot.

22 G. CALTHIFÒLIUM (Menzies, ex Smith, in Rees's cycl. vol. 16.) stem erect, few-flowered; radical leaves pinnate; leaflets acutely-toothed, pilose, terminal one large, roundish-reniform; cauline leaves round, profoundly-toothed; calyx erect; petals ovate-roundish, about equal in length to the calyx; carpels pilose; styles straight? ♃. H. Native of north-west America. Flowers yellow. Perhaps the same as *Sievèrsia radiàta*.

Caltha-leaved Avens. Pl. ½ foot.

23 G. MAGELLA′NICUM (Comm. ex Pers. ench. 2. p. 57.) scape elongated; leaves interruptedly pinnate; terminal leaflet large and lobed, lower ones small. ♃. H. Native of the Straits of Magellan. Probably a species of *Sievèrsia*.

Magellan Avens. Pl. ½ foot.

24 G. INVOLUCRA′TUM (Juss. herb. ex Pers. ench. 2. p. 57.) stem 5-flowered; leaves pinnate; terminal leaflet roundish and crenated; flower involucrated by the leaves; petals white, smaller than the calyx. ♃. H. Native of the Straits of Magellan. Perhaps the same as *G. parviflòrum*.

Involucrated-flowered Avens. Pl. 1 foot.

25 G. HI′SPIDUM (Fries, fl. hall. p. 90. ex Tratt. ros. 3. p. 140.) plant hairy; flowers erect; petals longer than the calyx; awns of carpels kneed above the middle, hispid, glabrous above; stigma clavate; radical leaves almost equally pinnate; cauline leaves pinnatifid. ♃. H. Native of Sweden. Reichb. icon. rar. cent. 5. t. 3. ex Tratt. Flowers yellow, 2 terminal on long peduncles.

Hispid Avens. Fl. June, July. Pl. 1 foot.

26 G. CAPE′NSE (Thunb. prod. fl. cap. p. 91.) stem erect; radical leaves pinnate; terminal leaflet large; cauline leaves tripartite or pinnatifid; petals roundish, obovate, longer than the calyx; awns of carpels naked, twisted and kneed in the middle. ♃. G. Native of the Cape of Good Hope. Wicks. in acad. handl. 1822.

Cape Avens. Pl. 1 foot.

27 G. JAPÓNICUM (Thunb. fl. jap. 220.) stem flexuous, hairy; leaves 3-5-lobed, hairy; stipulas ovate, cut; flowers erect; petals length of calyx; fruit hairy, ending in naked recurved awns. ♃. H. Native of Japan. Flowers yellow.

Japan Avens. Pl. 1 foot.

† *A species not well known.*

28 G. OBLÍQUUM (Steud. nom. phan. 366.) stem oblique, simple, hairy; radical leaves pinnate; outer leaflet very large, ovate, 5-parted, crenated; cauline leaves 3-lobed; stipulas oblong, toothed; carpels awnless. ♃. H. Native country unknown. Caryophyllàta oblíqua, Mœnch, suppl. 280. Waldsteìnia Mœ′nchii, Tratt. ros. 3. p. 106. Perhaps a true species of *Waldsteìnia* on account of the want of awns to the carpels.

Oblique Avens. Pl. ½ to 1 foot.

Cult. The plants will grow in any common soil, and are easily increased by dividing the plants at the root or by seeds.

III. SIEVE′RSIA (in honour of M. Sievers, a Russian botanist and traveller). Willd. berl. mag. 1811. p. 397. R. Brown, in Parry, voy. append. p. 276. Adàmia, Fisch. in litt. Gèum sect. 3. Oreògeum, Ser. in mem. soc. phys. gen. p. 139.

LIN. SYST. *Icosándria, Polygýnia.* Calyx 10-cleft (f. 70. *b.*), the outer alternate segments accessory. Petals 5 (f. 70. *c.*). Stamens numerous. Ovaries indefinite; ovula ascending. Styles terminal, continuous. Carpels or akenia awned by the whole style (f. 70. *d.*). Awns feathery (f. 70. *d.*), articulated. Embryo erect. Habit nearly of *Gèum*, but differs in the styles being jointed, the superior joint dissimilar to the lower joint, and usually deciduous. Flowers and calyxes erect, never reflexed.

1 S. ATLA′NTICA; plant pilose; stems erect, simple; leaves interruptedly pinnate; lower leaflets ovate, toothed, terminal one large, somewhat cordate, biserrated, cauline leaves simple, deeply toothed; stipulas lanceolate, a little toothed; flowers ascending; petals obcordate, longer than the calyx; heads of carpels spherical, depressed; styles deflexed, stiff, length of ovaries, which are pilose; tails villous. ♃. H. Native of the south of Europe and north of Africa, in woods. Gèum Atlánticum, Desf. fl. atl. 1. p. 401. G. sylváticum, Pourr. act. toul. ex D. C. fl. fr. 5. p. 544. G. biflòrum, Brot. fl. lus. 2. p. 533. Flowers large, yellow.

Atlantic Sieversia. Fl. June, Aug. Clt. 1810. Pl. 1 foot.

2 S. RE′PTANS (Spreng. syst. 2. p. 553.) sterile stems creeping, but the floriferous ones are erect, and undivided; radical leaves interruptedly pinnatifid, larger lobes obovate, profoundly toothed at the apex, smaller ones ovate, entire or tridentate at the apex; cauline leaves 3-lobed; flower large, solitary on the top of the stem; calycine segments elongated, usually trifid at the apex; petals obcordate, longer than the calyx; styles spreading, very pilose. ♃. H. Native on the higher Alps of France, Switzerland, and Germany. Gèum réptans, Lin. spec. 717. Jacq. austr. 5. append. t. 22. Adàmia réptans, Fisch. Mor. hist. 2. p. 431. sect. 4. t. 26. f. 5.—Barrel. icon. t. 400.—Bocc. mus. t. 128. Flowers large, yellow.

Var. β, macrophýlla (Ser. in D. C. prod. 2. p. 553.) leaves and stolons large; leaflets coarsely and doubly serrated. ♃. H. Native of Vallais, at Gallenstock.

Creeping Sieversia. Fl. May, Sept. Clt. 1597. Pl. ½ foot.

3 S. ANEMONOÌDES (Willd. berl. mag. 5. p. 398.) stems 1-flowered; stolons creeping; leaves pinnate, glabrous; leaflets cuneiform, toothed at the apex; stipulas filiform; petals longer than the calyx; styles bearded. ♃. H. Native of Siberia and Kamtschatka. Dryas pentapétala, Lin. amœn. 2. p. 353. Caryophyllàta, Kamtschática, Lam. dict. 1. p. 400. Gèum anemonoìdes, Willd. spec. 2. p. 1117.—Pall. itin. 3. p. 733. t. E. c. f. 4. Flowers large, white.

Anemone-like Sieversia. Fl. June, Aug. Clt. 1775. Pl. ½ ft.

4 S. ADNA′TA; stem 1-flowered, downy; radicle leaves long, interruptedly pinnate; leaflets crenately lobed, villous above, and glabrous beneath, ciliated; cauline leaves small, lower ones rather

pinnatifid, uppermost ones trifid. ♃. H. Native of Gosaingsthan. Gèum adnàtum, Wall. cat. no. 712. Like *S. rèptans.*

Adnate Sieversia. Pl. ½ foot.

5 S. RÓSSII (R. Br. in chl. melv. p. 18. t. C.) radical leaves interruptedly pinnate, glabrous; leaflets 3-lobed, but the accessory and lower ones are small and undivided; stem 1-flowered, usually 2-leaved; awns of carpels naked. ♃. H. Native of Melville Island. Gèum Róssii, Ser. in D. C. prod. 2. p. 553. Flowers large, yellow, distinctly veined.

Ross's Sieversia. Pl. ½ foot.

6 S. GLACIA'LIS (Spreng. syst. 2. p. 543.) whole plant densely clothed with yellowish villi; leaves interruptedly pinnate; leaflets ovate-oblong, upper and lower ones small, middle ones large and usually unidentate; flowers large, terminal, solitary. ♃. H. Native of Siberia, on the Alps at the mouth of the river Lena. Adàmia glaciàlis, Fisch. ex Steud. nom. Gèum glaciàle, Adams, act. mosk. 5. p. 96. Flowers large, yellow. Allied to *S. rèptans* according to Adam.

Icy Sieversia. Fl. May, Aug. Clt. 1819. Pl. ½ foot.

7 S. MONTA'NA (Spreng. syst. 2. p. 543.) stem erect, 1-flowered; stolons none; radical leaves interruptedly pinnatifid, terminal leaflet ovate, large, oblong, obtuse, and bluntly biserrate, lateral leaflets smaller and toothed; cauline leaves 1-lobed, and are as well as the stipulas deeply toothed; calycine segments undivided; petals obcordate, longer than the calyx; styles spreading, very pilose. ♃. H. Native of the Alps of Europe, Switzerland, Austria, Silesia, Dauphiny, &c. Gèum montànum, Lin. spec. 717. The leaflets becoming gradually smaller from the apex. Flowers large, yellow. Jacq. austr. 4. t. 373. Sturm. deutsch. fl. fasc. 14. with a figure.

Var. β, mìnus (Pers. ench. 2. p. 57.) stems and leaves smaller than those of the species. ♃. H. Native on the higher Alps of Europe. G. alpìnum, Mill. dict. no. 5.—Barr. icon. t. 399.

Mountain Sieversia. Fl. May, Sept. Clt. 1597. Pl. ½ foot.

8 S. TRIFLÒRA (R. Br. in chl. melv. p. 18.) plant pilose; stems simple, usually 3-flowered; radical leaves interruptedly pinnate, leaflets cuneated, and deeply toothed; petals oblong, length of the calyx; awns of carpels long, and villous. ♃. H. Native of Upper Louisiana. Hook. bot. mag. t. 2858. Gèum triflòrum, Pursh. fl. amer. sept. 2. p. 736. Leaves connate at the base. Stipulas divaricate, adnate to the petiole. Petals reddish?

Three-flowered Sieversia. Fl. June. Clt. 1826. Pl. ½ foot.

9 S. PE'CKII (R. Br. in chl. melv. p. 18.) plant smoothish; stem 1-5-flowered; radical leaves pinnate; lateral leaflets small, ovate, and toothed, terminal one reniform-cordate, lobed, large, doubly toothed; cauline leaves almost wanting; petals obovate, longer than the calyx. ♃. H. Native of North America, on the white hills in New Hampshire. Hook. bot. mag. t. 2863. Gèum Péckii, Pursh. fl. amer. sept. 2. p. 554.

Peck's Sieversia. Fl. June, Aug. Clt. 1826. Pl. ¾ foot.

10 S. CILIA'TA; plant pubescent; stem simple; leaves smoothish, pinnate, with ciliated margins; upper leaves palmate, with linear-cut leaflets; flowers corymbose. ♃. H. Native of North America, on the banks of the river Kooskoosky. Gèum ciliàtum, Pursh. fl. amer. sept. 1. p. 352. Flowers yellow.

Ciliated-leafletted Sieversia. Fl. Ju. July. Clt. 1818. Pl. 1 ft.

11 S. RADIA'TA; plant very hairy; stem simple; radical leaves pinnate; the terminal leaflet very large, radiantly nerved; cauline leaves stem-clàsping, and deeply jagged; petals obcordate, cuneated; awns of carpels glabrous. ♃. H. Native of the high mountains of Carolina, and on the west coast of America. Gèum radiàtum, Michx. fl. bor. amer. 1. p. 300. Flowers yellow.

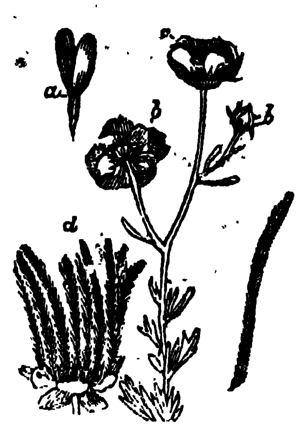
Ray-leaved Sieversia. Fl. June, July. Clt. 1815. Pl. 1 ft.

12 S. CAROLINIA'NA; stems decumbent, a little branched; radical leaves obtuse, serrated, sub-pinnate; terminal lobe large, lateral ones small; cauline leaves ovate-lanceolate, serrated, hairy, on short petioles; flowers erect; petals ovate. ♃. H. Native of Carolina. Gèum Caroliniànum, Walt. fl. carl. 150. Flowers white.

Carolina Sieversia. Pl. ½ foot.

13 S. PARADÓXA (D. Don, in Lin. trans. 14. p. 576. t. 22. f. 2.) leaves in fascicles, linear, obtuse, sessile, entire or 3 or 5-cleft; flowers sub-corymbose; styles plumose; stem shrubby. ♄. G. Native of Mexico. Gèum cercocarpoìdes, D. C. prod. 2. p. 554. A branched stiff shrub, with large yellow flowers. (f. 70.)

FIG. 70.



Paradoxical Sieversia. Shrub 1 to 3 feet.

Cult. For culture and propagation see *Gèum. S. paradóxa* should be treated in the way recommended for *Cowània.*

IV. COLU'RIA (from κολουρος, *kolouros*, deprived of a tail; the seed is without the tail so conspicuous in the three preceding genera). R. Brown, chl. melv. 1. p. 392. Led. fl. alt. 2. p. 262.

LIN. SYST. *Icosándria, Polygýnia.* Calyx campanulate, 10-cleft, the 5 outer segments accessory. Petals 5, cordate, orbicular. Filaments inserted in the throat of the calyx, permanent. Ovaries numerous. Styles straight, thickened at the base, and articulated with the ovary. Carpels tailless, scrobiculately wrinkled, inclosed in the calyx.—A small plant, with interruptedly pinnate leaves, the terminal leaflets large, the lateral ones unequal in size and shape, all canescent beneath, cauline leaves trifid or entire. Stipulas connate, entire. Stem 1-3-flowered. Flowers yellow.

1 C. GEOÌDES (R. Br. l. c.) ♃. H. Native of Siberia, on rocks in the less elevated mountains. Drỳas Geoìdes, Pall. itin. 3. append. 732. t. Y. f. 1. Gèum Laxmánni, Gærtn. fruct. 1. p. 352. t. 74. f. 1. Gèum potentilloìdes, Ait. hort. kew. ed. 1. vol. 2. p. 219. Caryophyllàta potentilloìdes, Lam. ency. 1. p. 395. Laxmánnia geoides, Fisch. mss. Laxmánnia potentilloìdes, Fisch. ex Steud. nom.

Geum-like Coluria. Fl. May, Ju. Clt. 1780. Pl. ¼ to ½ foot.

Cult. A light soil suits this plant best, and it is easily propagated by dividing at the root, or by seed.

V. COWA'NIA (in honour of James Cowan, who, as a merchant, had several times visited Mexico and Peru, from whence he has introduced a great many plants, now common in our gardens). D. Don, in Lin. trans. 14. p. 574.

LIN. SYST. *Icosándria, Polygýnia.* Calyx 5-cleft. Petals 5. Stàmens indefinite. Ovaries 5-11, densely villous, adnate to the bottom of the calyx. Ovula erect. Styles terminal, continuous. Carpels or akenia awned by the plumose permanent styles. Embryo erect.—A much branched shrub, with alternate small linear coriaceous leaves, with entire revolute edges, glandular above, and clothed with white wool beneath, dilated and tripartite at the apex; segments linear, blunt, with revolute edges. Stipulas twin, membranous, dilated, entire, silky, adnate by the base to the petiole, but free and acuminated at the apex. Flowers yellow, numerous, sessile, solitary on the tops of the branches, about the size of those of *Potentílla fruticòsa.*

1 C. MEXICA'NA (D. Don, l. c. t. 22. f. 1.) ♄. G. Native of Mexico. Gèum dryadoìdes, D. C. prod. 2. p. 554.

Mexican Cowania. Shrub 1 to 2 feet.

Cult. This shrub will do well in a mixture of sand, peat, and a little loam; and cuttings will root if planted in a pot of sand with a bell-glass placed over them, or the plant may be increased by seeds.

VI. **WALDSTEI'NIA** (in honour of Francis Von Waldstein, a German botanist, author of Descriptiones et Icones plantarum rariorum Hungariæ, 3 vols. fol. Vienna, 1802. 1812. in conjunction with Paul Kitaibél). Willd. nov. act. nat. cur. ber. 2. p. 103. Nestl. pot. 17. t. 1. D. C. prod. 2. p. 555.

Lin. syst. *Icosándria, Di-Pentagýnia.* Calyx with a turbinate tube, crowned with a crenulated ring under the stamens, bearing bracteas on the outside. Petals 5. Stamens numerous. Carpels 2-4, fixed to the bottom of the calyx, connate at the base. Styles terminal. Akenia 1-4, globose, naked, and somewhat umbilicate at the apex, rather fleshy. Seeds erect.

1 W. **geoïdes** (Willd. l. c. p. 105. t. 4. f. 1.) ♃. H. Native of Hungary, in shady woods. Leaves petiolate, palmately 5-lobed, having the lobes acutely toothed. Flowers yellow, smaller than those of Potentílla vérna. Waldst. et Kit. pl. rar. hung. 1. t. 77. Lodd. bot. cab. 492.

Geum-like Waldsteinia. Fl. June, July. Clt. 1804. Pl. ¾ ft.

Cult. See *Gèum* for culture and propagation, p. 527.

VII. **COMARO'PSIS** (*κομαρον, komaron*, the Cómarum, and *οψις, opsis*, resemblance). Rich. in Nestl. pot. p. 16. t. 1. D. C. prod. 2. p. 555.—Waldstèinia species, Tratt. ros.

Lin. syst. *Icosándria, Polygýnia.* Calyx with a turbinate tube and a 5-cleft limb, destitute of bracteas. Petals 5, unguiculate. Stamens numerous. Carpels few, ending each in the filiform elongated style. Akenia dry, not coarctate at the base. Seed erect.—Herbs, with the habit of *Waldsteinia*, but differs from it in the calyx being without bracteas. Leaves trifoliate.

* *Lobes of calyx entire.*

1 **fragarioìdes** (D. C. prod. 2. p. 555.) carpels smoothish; peduncles branched, 3-flowered; petals 3 times the length of the calyx; leaflets cuneiform, sessile, terminal one stalked. ♃. H. Native of Canada, in shady beech woods, and on the Alleghany mountains. Dalibárda fragarioìdes, Michx. fl. bor. amer. t. 300. t. 28. Sims, bot. mag. 1567. Waldsteínia fragarioìdes, Trat. ros. Dryas trifoliàta, Pall. ined. Comarópsis Doniàna, D. C. prod. 2. p. 555.—Waldsteínia Doniàna, Tratt. ros. Leaves petiolate, trifoliate. Leaflets cuneated, deeply serrated. Flowers yellow. There is a variety of this with petals shorter than the calyx.

Strawberry-like Comaropsis. Fl. May, June. Clt. 1800. Pl. ½ foot.

2 C. **Sibírica** (D. C. prod. 2. p. 555.) carpels hairy; peduncles branched, 3-flowered; petals 3 times larger than the calyx; leaflets cuneiform, sessile. ♃. H. Native of Siberia, beyond the Baikal. Dalibárda ternàta, Steph. mem. soc. mosc. 1. p. 92. t. 10. Waldsteínia Sibírica, Tratt. ros. Very like the preceding species, but the petals are said to be white.

Siberian Comaropsis. Pl. ½ foot.

* * *Lobes of calyx serrated.*

3 C. **peda'ta** (D. C. prod. 2. p. 555.) carpels glabrous; peduncles simple, glabrous, bracteate, 1-flowered; stems unarmed. ♃. H. Native of North America, on the western coast. Rùbus pedàtus, Smith, icon. ined. t. 63. Dalibárda pedàta, Steph. mem. soc. mosc. t. 92. Spreng. grundz. 510. Leaves petiolate, trifoliate; lateral segments bipartite. Flowers white.

Pedate-leaved Comaropsis. Pl. 1 foot.

4 C. **radi'cans** (D. C. prod. 2. p. 555.) carpels glabrous; peduncles simple, pilose, bractless, 1-flowered; stems prickly, rooting. ♃. G. Native of Chili, in woods. Rùbus radìcans, Cav. icon. 5. p. 7. t. 413. Spreng. grundz. p. 514. Leaves petiolate, trifoliate; terminal leaflet large; lateral ones undivided. Flowers pale red.

Rooting Comaropsis. Pl. creeping.

Cult. See *Gèum* for culture and propagation, p. 527.

VIII. **RU'BUS** (from *rub*, red in Celtic; in reference to the colour of the fruit in some species). Lin. gen. 864. Lam. ill. t. 441. Nestl. pot. 16. Weih. et Nees, rub. germ. p. 11. Wallr. sched. crit. p. 223. D. C. prod. 2. p. 556.

Lin. syst. *Icosándria, Polygýnia.* Calyx flattish at the bottom, 5-cleft. Petals 5. Stamens numerous, inserted in the calyx along with the petals. Carpels or akenia numerous, fleshy, disposed in a head upon an elevated torus. Styles lateral, near the apex of the carpels. Seeds inverted.—Shrubs, rarely herbs, with the stems sometimes unarmed, but usually prickly. Leaves stalked, pinnate or palmate, with the leaflets usually stalked, sometimes the leaves are simple lobed or undivided. Fruit of all edible.

§ 1. *Leaves pinnate or ternately pinnate.*

* *Leaflets glabrous beneath.*

1 R. **rosæfòlius** (Smith, icon. ined. 3. p. 60. t. 60.) stems rather terete, pilose; prickles spreading, a little recurved; leaves pinnate, rather pilose; leaflets ovate-lanceolate, somewhat doubly serrated, full of glandular dots; stipulas linear-setaceous; peduncles usually 1-flowered; calycine segments lanceolate, acuminated, hardly longer than the corolla; carpels glabrous, very numerous, small, wrinkled from lacunæ when dry. ♄. G. Native of the Mauritius. Flowers white. Fruit size of those of the common raspberry.

Var. β, coronàrius (Sims, bot. mag. 1783.) petals very numerous, much longer than the calyx. R. Commersònii, Poir. dict. 6. p. 240. R. Sinénsis, Hortul. Flowers large, semidouble, white.

Var. γ, trìlobus (D. C. prod. 2. p. 556.) petals numerous, much longer than the calyx; leaves 3-lobed, large, glabrous. Flowers large, semidouble, white.

Rose-leaved Bramble. Fl. April, Oct. Clt. 1811. Shrub 2 to 6 feet.

2 R. **eglante'ria** (Tratt. ros. 3. p. 9.) stems shrubby, terete, glabrous, prickly; leaves pinnate; leaflets cordate-oblong, doubly serrated, glandular, pubescent; flowers solitary, axillary. ♄. G. Native of New Holland. Like *R. rosæfòlius*, but differs in the leaflets being cordate-oblong, and in the flowers being axillary. Flowers white.

Eglantine Bramble. Fl. April, July. Clt. 1825. Shrub 3 to 6 feet.

3 R. **fraxinifòlius** (Poir. dict. 6. p. 242.) branches glabrous, rather terete; prickles few, straightish; lower leaves with 3-5 pairs of leaflets, upper ones ternate, rarely simple; leaflets ovate-lanceolate, nearly sessile, glabrous, doubly serrated; flowers panicled, numerous; branches of panicle filiform; bracteas subulate, cut; calycine segments oval, acuminated, glabrous on the outside, hardly shorter than the petals; fruit large, globose; carpels numerous. ♄. S. Native of Java. Flowers white.

Ash-leaved Bramble. Shrub 2 to 4 feet.

4 R. **pinna'tus** (Willd. spec. 2. p. 1081.) branches villous; prickles hooked, obtuse; leaves pinnate; leaflets ovate-lanceolate, glabrous on both surfaces, sharply and doubly serrated, wrinkling from veins, having the middle nerve prickly; flowers

racemose; peduncles villous and prickly; calycine segments longer than the petals. ♄. G. Native of St. Helena. Flowers pink.

Pinnate-leaved Bramble. Fl. Ju. July. Clt. 1789. Sh. 3 to 6 ft.

5 R. AUSTRA'LIS (Forst. prod. no. 224.) stem glabrous, terete; prickles of branches secund, recurved; leaves ternate and pinnate; leaflets oval, sharply toothed, rather coriaceous, glabrous on both surfaces; flowers racemose, dioecious; calycine segments blunt, spreading. ♄. G. Native of New Zealand.

Southern Bramble. Shrub 3 to 4 feet.

6 R. CHINE'NSIS (Ser. in D. C. prod. 2. p. 557.) stems terete, glabrous; prickles spreading, erect; leaves pinnate; petioles pilose; leaflets lanceolate, obsoletely serrated, glandular, glabrous; flowers terminal, solitary; calycine segments ovate, glandular, pilose, ending in long taper points, which are longer than the corolla; petals obovate, very blunt. ♄. G. Native of China. Flowers white.

China Bramble. Shrub.

* * *Leaflets clothed with white tomentum or pubescence beneath.*

7 R. RI'GIDUS (Smith in Rees's cyclop. vol. 30.) stem villous; prickles slender, numerous; leaves of sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, doubly and unequally serrated, rather villous beneath, and on the petioles; stipulas lanceolate; flowers racemose, terminal, numerous, small; calycine segments ending in a short acumen; petals very narrow; fruit small. ♄. G. Native of the Cape of Good Hope.

Stiff Bramble. Shrub.

8 R. TAGA'LLUS (Cham. et Schlecht. Linnæa. 2. p. 9.) shrubby; branches terete, tomentose; prickles hooked, scattered; leaves pinnate, with 2-3 pairs of doubly serrated leaflets, which are pubescent on both surfaces, and glandless; stipulas setaceous; flowers usually solitary, terminal on the branches; calycine segments lanceolate, acuminated, equal in length to the petals, reflexed when in fruit. ♄. G. Native of the Island of Lucon, on the burning mount called Taal. Fruit eatable, red.

Taal Bramble. Shrub.

9 R. CHRYSOCA'RPUS (Mundt. in litt. Cham. et Schlecht. in Linnæa. 2. p. 17.) branches tomentose and glandular; prickles hooked, small; leaves of fertile branches trifoliate and pinnate; leaflets ovate, densely crenate-toothed, and curled on the margins, glabrous above, but clothed with yellowish tomentum beneath and on the petioles, and glandular; stipulas lanceolate-linear; panicle terminal, short, coarctate; calycine segments lanceolate; petals obovate, equal in length to the calyx. ♄. G. Native of the Cape of Good Hope, at Hex river. Resembles *R. rigidus* of Smith.

Golden-fruited Bramble. Shrub.

10 R. MU'NDTII (Cham. et Schlecht. in Linnæa. 2. p. 18.) branches tomentose; prickles hooked, strong, numerous; leaves of fertile branches trifoliate and pinnate; leaflets ovate, unequally and doubly serrated, pilose above, but clothed with hoary tomentum beneath, and glandless; stipulas lanceolate-linear; panicle terminal, coarctate; calycine segments ovate-lanceolate, acuminated; acumen foliaceous; petals obovate, shorter than the calyx. ♄. G. Native of the Cape of Good Hope, at Hanglip.

Mundt's Bramble. Shrub.

11 R. CELE'BICUS (Blum. bijdr. 1107.) lower leaves with 3-5 pairs of leaflets, floral ones simple; leaflets ovate-elliptic, acute, doubly serrated, smooth above, prickly on the middle nerve beneath, and pubescent on the veins; rameal prickles scattered, straight; stipulas wedge-shaped, jagged; panicle racemose; calycine segments ovate, cuspidate. ♄. S. Native of Java.

Celebes Bramble. Shrub.

12 R. JAVA'NICUS (Blum. bijdr. 1107.) leaves ternate or pinnate, with 2 pairs of leaflets; leaflets ovate-lanceolate, acuminated, deeply serrated, pubescent on both surfaces; rameal prickles straight; stipulas subulate; peduncles axillary and terminal, 1-flowered; calycine segments ovate, acuminated. ♄. S. Native of Java, in the province of Cheribon. Like *R. biflòrus*, Hamilt.

Java Bramble. Shrub 4 to 6 feet.

13 R. GRA'CILIS (Roxb. ex herb. Lamb. D. C. prod. 2. p. 557.) stems finely puberulous; prickles numerous, reflexed; lower leaves pinnate, upper ones trifoliate; leaflets ovate, obtuse, obsoletely crenate, rather villous beneath, with the nerves pilose; stipulas subulate, pilose; flowers few, subracemose, and axillary; peduncles short, hairy; calycine segments linear-spatulate, elongated, woolly, denticulated at the apex. ♄. S. Native of the East Indies.

Slender Bramble. Shrub 2 to 4 feet.

14 R. BORBÓNICUS (Pers. ench. 2. p. 51.) stems hoary; leaves pinnate; leaflets ovate-oblong, clothed with white tomentum beneath, acutely serrated; petioles tomentose, prickly. ♄. S. Native of the Island of Bourbon. R. tomentosus, Bory. voy. 2. p. 375. but not of Willd. Fruit like that of *R. cæ'sius*.

Bourbon Bramble. Shrub.

15 R. MICRA'NTHUS (D. Don, prod. fl. nep. 235.) leaves pinnate, with usually 7 or 9 leaflets, lanceolate, acuminated, deeply serrated, green above, but shining and glaucous beneath; petioles and rachis furnished with a few hooked prickles; corymbs panicled; petals unguiculate, shorter than the calyx; stem erect, furnished with inflexed prickles. ♄. H. Native of Nipaul. R. pauciflòrus, Lindl. bot. reg. 854. An erect, branched shrub, armed with subulate prickles, which are inflexed at the apex. Young branches clothed with a kind of glaucous bloom at the apex. Stipulas lanceolate, acuminated, membranous. Flowers small, reddish purple.

Small-flowered Bramble. Fl. May, Aug. Clt. 1822. Shrub 4 to 6 feet.

16 R. NÌVEUS (Wall. mss. in Lin. soc. herb.) stem trailing, terete, pubescent, prickly as well as the petioles and midrib of the leaves; prickles hooked; leaves pinnately trifoliate; leaflets elliptic, doubly serrated, acuminated, middle one slightly lobed, pilose above, but clothed with white tomentum beneath; calyx tomentose; the segments ending in a long acumen each, longer than the petals. ♄. H. Native of Nipaul.

Snowy Bramble. Shrub trailing.

17 R. MYSORE'NSIS (Heyne in Roth, nov. spec. 235.) stems nearly terete; prickles straight; leaves pinnate, with 5 or 7 leaflets, which are connate above, and somewhat plicate, rugulose, pubescent, ovate, acuminated, deeply and acutely doubly serrated, clothed with white tomentum beneath, the terminal leaflet trifid; racemes corymbose; peduncles 4-flowered; bracteas linear; calyx clothed with white tomentum; the segments terminating in a cartilaginous mucrone, and hardly longer than the petals. ♄. G. Native of Mysore.

Mysore Bramble. Shrub.

18 R. DÍSTANS (D. Don, prod. fl. nep. 256.) stems terete; prickles strong, compressed, recurved; leaves pinnate, with 7-9 leaflets, clothed with white tomentum beneath; leaflets ovate, lanceolate, acuminated, sharply serrated, distant, with numerous nerves; stipulas linear; racemes corymbose; peduncles short; calyx tomentose, with ovate hardly pointed segments, which are the length of the petals. ♄. H. Native of Nipaul. R. pinnàtus, D. Don, prod. fl. nep. p. 254. Leaves resembling those of hemp.

Distant-leafletted Bramble. Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

19 R. APE'TALUS (Poir. dict. 6. p. 242.) branches nearly

terete, pubescent; prickles scattered; leaves pinnate, with usually 7 oval serrulated leaflets, which are white beneath from tomentum; racemes axillary; flowers apetalous; calycine segments nearly linear, acute; carpels few. ♄. S. Native of the Isle of France.

Apetalous Bramble. Fl. June, July. Clt. 1823. Sh. 6 feet.

20 R. MACRÓPODUS (Ser. in D. C. prod. 2. p. 557.) branches tomentose; prickles numerous on the peduncles, slender, and recurved; leaves of the fertile branches pinnately trifoliate, clothed with hoary tomentum beneath, and rather pilose above; leaflets crenated, terminal one large and deeply 3-lobed; flowers axillary, solitary; peduncles longer than the leaves; calycine segments linear-lanceolate, 5-nerved, acuminated, rather woolly, prickly, rather foliaceous at the apex, twice the length of the corolla. ♄. G. Native of New South Wales.

Long-petioled Bramble. Shrub.

21 R. STRIGÒSUS (Michx. fl. bor. amer. 1. p. 297.) stem terete, very hispid; leaves of the sterile branches quinately pinnate, of the fertile branches 3-lobed; leaflets ovate, unequally serrated, obtuse at the base, lined beneath, and clothed with white tomentum, the terminal lobe or leaflet usually subcordate; peduncles usually 3-flowered, and are as well as the calyxes hispid. ♄. H. Native of Pennsylvania and Canada, on the mountains. R. Pennsylvánicus, Poir. dict. 6. p. 246. Petals white, longer than the calyx.

Strigose Bramble. Shrub.

22 R. BIFLÒRUS (Hamilt. ex Smith in Rees' cycl. vol. 30.) stem prickly at the base; leaves of the sterile branches with 5 leaflets, of the fertile branches trifoliate; leaflets ovate or elliptic, unequally serrated, cuneated at the base, clothed with white tomentum beneath, but villous above; petioles and branches tomentose and prickly; stipulas linear; peduncles elongated, twin or tern; calycine segments broad, oval, acuminated, length of the petals. ♄. H. Native of Upper Nipaul, on the banks of rivers, and in the vicinity of Chitlong. R. pedunculòsus, D. Don, prod. fl. nep. 234. where the stem is said to be unarmed.

Two-flowered Bramble. Fl. April, June. Shrub 4 to 6 feet.

23 R. OCCIDENTA'LIS (Lin. spec. 706.) stems terete, pruinose; prickles recurved; leaves of the sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, deeply serrated, clothed with white tomentum beneath; stipulas very narrow, setaceous; peduncles umbellate, prickly; calycine segments lanceolate-linear, tomentose, pointed at the apex; petals obovate-cuneated, 2-lobed, spreading, shorter than the calyx; carpels numerous, smoothish, when dry wrinkled from lacunæ. ♄. H. Native of Canada and the West Indies.—Sloan. jam. t. 213. f. 1.—Dill. hort. elth. t. 287. f. 319. Stems covered with bloom. Fruit black, resembling that of the common raspberry.

Western Bramble or Virginian Raspberry. Fl. May, June. Clt. 1696. Shrub 4 to 6 feet.

24 R. A'SPER (D. Don, prod. fl. nep. p. 234.) leaves pinnate, with usually 7 elliptic, acuminated, sharply serrated leaflets, which are green above, and rather pilose beneath; petioles and branches beset with gland-bearing bristles and prickles; stipulas lanceolate, cuspidate; peduncles terminal, usually tern. ♄. H. Native of Nipaul. Flowers white.

Rough Bramble. Fl. May, June. Clt. 1821. Sh. 4 to 6 feet.

25 R. LASIOCA'RPUS (Smith in Rees' cycl. vol. 30.) stems smooth; prickles strong, recurved; leaves pinnate, with 7 leaflets, clothed with white tomentum beneath, the terminal leaflet usually 3-lobed; nerves pilosé; stipulas setaceous; flowers racemose, terminal; carpels tomentose, reticulated. ♄. S. Native of Mysore.

Woolly-fruited Bramble. Shrub.

26 R. IDÆ'US (Lin. spec. 706.) villous; stems terete; prickles slender, straight; leaves of the sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, deeply serrated, clothed with white tomentum beneath; stipulas setaceous; peduncles sub-corymbose; calyx clothed with white tomentum, with ovate-lanceolate segments; petals obovate, cuneated, entire, connivent, shorter than the calyx; carpels numerous, pubescent. ♄. H. Native of Europe, in woods and hedges; plentiful in some parts of Wales and Scotland. Smith, engl. bot. 2442. Woodv. med. bot. t. 138. Oed. fl. dan. 788.—Blackw. herb. 289. R. frambæsiànus, Lam. fl. fr. 3. p. 135.—Framboisier, Duham. arbr. fr. 2. t. 255. f. 260. The *raspberry* is called *framboisier* in French, *himbeerestrauch* in German, and *rovo ideo* in Italian. The stems of the *raspberry* are biennial, upright, but the root is perennial. The flowers come out in panicles from the extremity of the year's shoots; they are white, and appear in May and June. It is a native of Britain, and not uncommon in woods in low situations.

Use. The fruit is grateful to most palates as nature presents it, but sugar improves the flavour; accordingly it is much esteemed when made into sweetmeats, and for jams, tarts, and sauces. It is fragrant, subacid, and cooling, allays heat and thirst. It is much used in distilling, to make the cordial spirituous liquor, from which it has its name. Raspberry syrup is next to the strawberry in dissolving the tartar of the teeth, as like that fruit it does not undergo the acetous fermentation in the stomach; it is recommended to gouty and rheumatic patients.

The varieties of *raspberry* are as follow.

* *Red raspberries.*

1 *Red Antwerp, Burley, late-bearing Antwerp, Knevett's Antwerp, framboisier rouge à gros fruit.* A red fruit of the first quality.

2 *Barnet, Cornwall's prolific, Cornwall's seedling, Cornwall's red, large red, lord Exmouth's.* A very fine large red fruit, of the first quality, but does not bear carriage so well as the *red Antwerp.*

3 *Bromley-hill.* A red fruit of the first quality.

4 *Brentford cane.* A second-rate red fruit.

5 *Red cane.* A red fruit, of a second-rate quality.

6 *Rough cane.* A second-rate red fruit.

7 *Smooth cane.* A second-rate red fruit.

8 *Common red, old red, wild red.* A worthless red fruit.

9 *Cornish.* A red fruit, of the first-rate quality.

10 *Double bearing, red double bearing, perpetual bearing, Siberian, late cane.* A red fruit, having the merit of bearing late in the season.

11 *Williams's double bearing red.* Resembles the preceding, but seems rather more tender.

12 *Jilliards's seedling.* A second rate red fruit.

13 *Early prolific.* A second-rate red kind.

14 *Red malta.*

15 *Spring-grove.* A second-rate red sort, but an abundant bearer.

16 *Superb.* A second-rate red kind.

17 *Taylor's paragon, scarlet paragon.* A second-rate red fruit.

18 *Wilmot's early red.* A second-rate red fruit.

19 *Woodward's red globe.* A second-rate red kind.

* * *White and yellow raspberries.*

20 *Yellow Antwerp, white Antwerp, double bearing yellow.* A pale yellow fruit, of the first-rate quality.

21 *Old white.* A white fruit, of very inferior quality.

22 *Large white.*

Estimate of sorts. The *red* and *yellow Antwerp* may be said to hold the similar rank in this class of fruits as the red and the white Dutch among currants; and although some may be found nearly to equal them, yet it is doubtful whether they are yet exceeded by any.

Propagation. The varieties can be perpetuated by the young suckers, which spring from the root in spring and summer; when these have completed one year's growth they are proper to detach with roots for planting, either in the autumn or the next spring in February or March, but never later than the middle of April. These new plants will bear some fruit the same year, and furnish a succession of strong bottom shoots for full bearing the second season. New varieties are easily raised from seed, and they will come into bearing the second year.

Soil and site. All the varieties will succeed in any common mould, trenched about 2 feet deep, and sufficiently manured; but the soil in which the *raspberry* bush prospers most and bears the finest fruit, is in a light rich loam. Allot the main crop a free exposure to the sun, that the berries may ripen in perfection. Be careful to favour the double bearers with a dry soil, and a sheltered sunny situation, to give the second crop every aid in coming to maturity. When *raspberries* are cultivated on a large scale it is best to keep them in plantations by themselves. Set them in rows from 4 to 6 feet asunder, as the bushes are of the smaller or larger kinds, and by 3 or 4 feet in the row. Scattered bushes may either occupy a small row lengthwise along the back part of a border, or stand in detached stools, at 10 or 15 feet distance. Select sorts are frequently trained against walls, stakes, or espaliers, from the most sunny to the most shady aspect, for early and late fruit of improved growth and flavour. Neill says "the *raspberry* bush grows freely in any good garden soil; but it is the better for being slightly moist. Although the place be inclosed by trees, and even slightly shaded, the plant succeeds. In an inclosed and well sheltered quarter, with rather a damp soil, containing a proportion of peat moss, we have seen very great crops of large and well flavoured berries produced; for example at Melville-house, the seat of the earl of Leven, in Fifeshire." Haynes also recommends well manured bog-earth, and a situation naturally or artificially shaded.

New plantations. Raspberry bushes are in their prime about the third and fourth year, and, if well managed, continue in perfection 5 or 6 years; after which they are apt to decline in growth, and the fruit to become small, so that a successive plantation should be provided in time. Select new plants from vigorous shoots, in full perfection as to bearing.

Summer culture. Keep them free from weeds during the summer by hoeing between the rows, at the same time loosen the earth about the plants; under this management the plants, if tolerably strong, will both yield a moderate crop the first season, and supply young stems for bearing in greater plenty and perfection the following season, and so from year to year the summer culture should be repeated. As the plants get established let all straggling suckers between the rows, or from the extreme roots of single shoots, be cleared out by hoeing, or twisted off to admit the air and sun freely to the fruit. The fruit of the *raspberry* may be obtained of a very large size, other circumstances being favourable, by destroying all the suckers; but in this way, the plant being destroyed, a double plantation is wanted, one to grow only suckers, and the other fruit.

Pruning and winter dressing. It is requisite every winter or spring to cut out the dead stems, and to thin and regulate the successional young shoots. This annual pruning may be performed any time during open weather from November till the beginning of April. When kitchen garden crops are cultivated between the rows it is most convenient to do this as soon as the old bearers begin to decay. As to pruning indiscriminately in the open weather of winter, it sometimes happens that severe frosts immediately follow, and partially kill the plants; therefore it is safer to shorten the tender young shoots early in the spring, but let it not be deferred till the buds are making new shoots, as that would weaken the root. Cut out all the old dead stems close to the bottom, and having selected from the strongest young shoots on each main stool 3-4 or 5 to be preserved for a succession of bearers, cut away the superabundant shoots close to the ground. Let each of the shoots retained be pruned at the top below the weak bending part, cutting them in smaller plants to about 3 or 4 feet in length, and in the large sorts to the length of 5 or 6 feet. If any of the stems diverge irregularly, or straggle much asunder, they may be tied together at the top, and thus the strong ones will support the weaker, or the taller varieties may have the support of stakes. Prune plants against a wall or trellis in the same manner as directed above, and train the shoots to rise a little diagonally. After pruning, having cleared away the cuttings, dig the ground between and about the plants. To turn in a little rich compost will conduce to plentiful and fine returns; lay it at the extremities of the roots, and deeper as the plantation gets older. Eradicate all straggling suckers.

Taking the crop. "The fruit of the different varieties comes in from the end of June or July till October or later. As it ripens it should be timely gathered for immediate use, because when fully ripe it will not keep above 2 or 3 days before it moulds or becomes maggoty, and unfit to be used." Abercrombie.

Var. β, *microphýllus* (Wallr. sched. p. 226.) leaves all ternate; stems suffruticose, bushy, humble.

Raspberry. Fl. May, June. Britain. Shrub 4 to 6 feet.

27 R. MENZIE′SII (Hook, fl. bor. amer. p. 179.) stems procumbent, terete, prickly, glabrous; branches short, pubescently tomentose, prickly; leaves pinnately trifoliate; leaflets broad, ovate, slightly lobed, unequally serrated, on short petioles, hairy above, paler and very hairy beneath; panicle terminal, few-flowered; pedicels and calyxes prickly; calycine segments ovate, acute, mucronate, tomentose, shorter than the corolla. ♄. H. Native of North-west America. Flowers red.

Menzies's Bramble. Shrub procumbent.

28 R. MACROPE′TALUS (Doug. mss. in Hook, fl. bor. amer. p. 178. t. 59.) hairy; stem tall, shrubby; branches angular, slender, elongated; petioles, peduncles, calyxes, and ribs of leaves beneath beset with bristly prickles; leaflets 3, ovate, acute, deeply-lobed, serrated, membranous, terminal one on a long petiole, but the lateral ones are on short petioles; stipulas lanceolate; peduncles 2-flowered; calycine segments long-acuminated, about equal in length to the petals, which are oblong and white. ♄. H. Native of North-west America, on the banks of rivers and in low woods in the valley of the Columbia. Flowers white. Habit of *R. spectábilis.*

Var. β, *myriacánthus* (Doug. mss.) leaflets obtuse.

Long-petalled Bramble. Shrub.

§ 2. *Leaves with 3-5 leaflets, disposed in a palmate manner.*

* *Shrubby. Stipulas petiolar, linear.*

29 R. LACINIA′TUS (Willd. hort. berol. t. 82,) stem nearly terete; prickles dilated at the base, compressed, recurved, strong; leaves with 3-5 leaflets; leaflets dissected and sharply serrated, puberulous beneath; flowers in loose panicles; calycine segments lanceolate, tomentose, and prickly, somewhat foliaceous and reflexed at the apex; petals obovate-cuneated, 3-lobed at the apex; akenia roundish, black. ♃. H. Native country unknown. Wats. dend. brit. 69. Flowers white or rose-coloured.

Jagged-leaved Bramble. Fl. June, Sept. Clt.? Sh. straggling.

30 R. CÆ'SIUS (Lin. spec. 706.) stems prostrate, terete, usually covered with glaucous, pruinose bloom; prickles slender, a little recurved; leaves with 3-5 ovate, doubly serrated leaflets, which are downy beneath; panicle simple; calycine segments ovate, acuminated; akenia thick, few, greyish. ♄. H. Native of Europe, about way sides and on the hedges of fields; plentiful in Britain. Smith, engl. bot. 826. and Weih. ex Ern. Meyer. Fl. dan. 1213. Panicle corymbose; petals blush-coloured. Fruit sweet, black, with a dew tinge or bloom.

Var. β, arvénsis (Wallr. sched. p. 228.) leaflets tomentose beneath; branches puberulous. R. pseùdo-cæ'sius, Weih. ex Ern. Meyer in litt.

Var. γ, grandiflòrus (Ser. in D. C. prod. 2. p. 559.) pubescent; petals and calycine segments elongated. Schleich. in litt.

Var. δ, parvifòlius (Wallr. sched. p. 228.) stems ascending, purplish, at length naked; leaflets small, deeply lobed; peduncles 1-3-flowered.

Grey Bramble or Dewberry. Fl. June, July. Britain. Sh. prostrate.

31 R. DUMETÒRUM (Weih. et Nees, rub. germ. ex Lindl. syn. brit. fl. p. 95.) stem procumbent, rather angular, rather hairy, with a slight coat of bloom; bristles and glands very few; prickles unequal, recurved; leaflets generally 5, the lateral ones sessile; flowers in corymbs; fruit black. ♄. H. Native of Germany and Britain, in hedges. R. nemoròsus, Willd.

Hedge Bramble. Fl. July, Aug. Britain. Sh. procumbent.

32 R. HI'RTUS (Waldst. et Kit. pl. hung. 2. p. 150. t. 141.) stem procumbent, tapering, densely hairy, covered with purple glands and setæ; prickles long, numerous, straight, spreading; leaflets 3-5, pedate, cordate, ovate, covered with shining hairs beneath; stipulas leafy; panicle corymbose, with red setæ; bracteas long, trifid. ♄. H. Native of Hungary and Britain, in hedges and woods.

Hairy Bramble. Fl. July, Aug. Britain. Sh. procumbent.

33 R. ELLI'PTICUS (Smith in Rees' cycl. vol. 30.) leaves trifoliate; leaflets oval, serrated, tomentose beneath; petioles and branchlets tomentose, covered with numerous bristles and prickles intermixed; stipulas linear-setaceous; flowers glomerate, racemosely corymbose. ♄. H. Native of Nipaul, at Hethaura, where it is called by the natives *toki swa*. R. flàvus, Hamilt. ex D. Don, prod. fl. nep. p. 234. Flowers white. Fruit yellow.

Elliptic-leafletted Bramble. Fl. July. Clt. 1827. Sh. trailing.

34 R. SULCA'TUS (Vest, ex Tratt. ros. 3. p. 42.) runners and stems costately furrowed and ringed, acute-angled, glabrous, branches pubescent, flattish on the sides; leaflets glabrous above, and pubescent beneath, the lower and larger ones cordate-ovate, of the flagella 5, ovate and acuminated, and of the floriferous branches obovate; prickles scattered, recurved; flowers racemose; sepals clothed with hoary tomentum on both surfaces, as well as the peduncles. ♄. H. Native of Styria. Fruit black, shining, composed of many akenia.

Furrowed-stemmed Bramble. Shrub straggling.

35 R. FOLIOLÒSUS (D. Don, prod. fl. nep. p. 256.) leaves with 3-5 leaflets; leaflets cuneate-obovate, serrated, clothed with white tomentum beneath; peduncles 3-flowered, and are as well as the petioles tomentose and prickly; calyx unarmed, densely tomentose; bracteoles simple; stems procumbent; prickles recurved. ♄. H. Native of Nipaul. R. microphýllus, D. Don, prod. fl. nep. p. 234. Very nearly allied to *R. parvifòlius*, but differs in the leaves of that plant being twice the size, more rounded and more profoundly serrated, in the peduncles being 1-flowered, in the calyxes being prickly, in the bracteoles being tripartite, and in the stem being erect.

Leafy Bramble. Fl. June, July. Clt. 1818. Sh. proc.

36 R. PUBE'SCENS (Vest, ex Tratt. ros. 3. p. 34.) branches furrowed, pubescent, prickly; leaves with 3-5 leaflets; leaflets obovate, acuminated, sharply and unequally serrated, clothed with white tomentum beneath; racemes simple; lower flowers solitary among the leaves. ♄. H. Native of Styria, among bushes on mount Plabutsch above Eggenberg.

Pubescent Bramble. Shrub straggling.

37 R. FLAGELLA'RIS (Willd. enum. 549.) stems terete, procumbent; prickles scattered, hooked, short; branches terete, glabrous; leaves trifoliate; leaflets glabrous, unequally serrated, intermediate one ovate and cuneated at the base, lateral ones rhomboid, with yellowish nerves. ♄. H., Native of North America. Flowers white.

Var. β, inérmis (D. C. prod. 2. p. 559.) stems pruinose, and are as well as the peduncles unarmed; leaflets tomentose beneath.

Runner Bramble. Fl. June, July. Clt. 1789. Sh. proc.

38 R. CORYLIFÒLIUS (Smith, fl. brit. p. 542. engl. bot. t. 827.) stem shrubby, angular; prickles straightish; leaves with 3-5 leaflets; leaflets roundish, cordate, firm, doubly serrated, pilose beneath; panicle nearly simple; calycine segments ovate, acuminated, at length reflexed. ♄. H. Native of Europe, in hedges and woods; plentiful in some parts of Britain. Flowers white. Akenia purplish blue, large. R. nemoròsus, Heyne ex Spreng. et Goldb.

Var. β, cànus (Wallr. sched. p. 231.) leaflets all about the same size, roundish cordate, and clothed with hoary tomentum on both surfaces.

Var. γ, glandulòsus (Wallr. l. c.) stems, petioles, and peduncles glandular. R. glandulòsus, Spreng. ex Wallr. l. c.

Hazel-leaved Bramble. Fl. June, July. Britain. Sh. tr.

39 R. AGRE'STIS (Waldst. et Kit. pl. rar. hung. 3. p. 297. t. 268.) stems suffruticose, procumbent, rather angular; prickles straight, setaceous; leaflets 3-5, roundish, lobately toothed, unequally serrated, pilose above, and tomentose beneath; calyx clothed with hoary tomentum, and beset with glandular bristles. ♄. H. Native of Hungary and Transylvania, in neglected parts of fields. Flowers white. Perhaps only a variety of *R. corylifòlius*.

Field Bramble. Fl. June, July. Clt. 1820. Sh. trailing.

40 R. SPECTA'BILIS (Pursh, fl. amer. sept. 1. p. 348. t. 16.) stem shrubby, glabrous, unarmed; leaflets 3, ovate, acute, unequally and doubly serrated, pubescent beneath; peduncles terminal, 1-flowered, solitary; calycine segments oblong, acuminated, shorter than the corolla. ♄. H. Native of North America, on the banks of the Columbia river, and on the shore of the western coast. R. ribifòlius, Willd. herb. ex Stev. Flowers of a beautiful purple colour.

Showy Bramble. Shrub.

41 R. BOGOTE'NSIS (H. B. et Kunth, nov. gen. amer. 6. p. 220.) branches and petioles beset with glandular hairs and prickles, as well as the nerves of the leaves; leaflets 3, ovate, acute, deeply cordate at the base, serrated, pubescent above, and canescent beneath; peduncles axillary, few-flowered, panicled. ♄. G. Native of South America, near Santa Fe de Bogota, at the height of 4200 feet above the level of the sea. Fruit blackish purple, like those of *R. fruticòsus*.

Bogota Bramble. Shrub.

42 R. PLICA'TUS (Weih. et Nees. rub. germ. p. 15. t. 1.) stem erectish, angular, and prickly, glabrous; prickles rather conical, recurved, and rather compressed at the base; leaflets 5, smoothish above, and pubescent beneath; panicle nearly simple, corymbose; calycine segments ovate, acuminated, naked at the base, and at length reflexed; bracteas jagged. ♄. H. Native of Germany and Britain, in hedges and woods. Engl. bot. suppl. t. 2714. Flowers white. Akenia large, dark, shining.

Var. β, glabriùsculus (D. C. prod. 2. p. 560.). R. plicàtus γ, Weih. et Nees. l. c. R. corylifòlius, Hell. fl. wurceb. suppl. p. 16.

Plicàte-leaved Bramble. Fl. June, Sept. Brit. Sh. strag.

43 R. BI'FRONS (Vest, ex Tratt. ros. 3. p. 28.) stem obsoletely angled, flat, glabrous; flowering branches beset with villous pubescence; lower leaves with 5 obovate, coarsely toothed leaflets, upper ones with 3 roundish leaflets, all glabrous above, and clothed with white tomentum beneath; panicle cymose; sepals clothed with hoary tomentum on both surfaces. ♄. H. Native of Syria. Fruit black, usually large.

Two-fronted Bramble. Shrub trailing.

44 R. AFFI'NIS (Weih. et Nees. rub. germ. p. 22. t. 3. and 36.) stems recurved, angular, prickly, and glabrous; prickles strong, recurved; leaves with 3 or 5 leaflets; leaflets ovate, cordate, cuspidate, sharply serrated, flat at the base, but somewhat undulated towards the apex, clothed with tomentum beneath; panicle compound, with the branches cymose; calycine segments ovate, acuminated, naked on the outside, reflexed. ♄. H. Native of Germany and Britain, in hedges. Flowers white. Akenia thick, bluish black.

Var. β, *bracteòsus* (D. C. prod. 2. p. 560.) bracteas broad, undivided. R. affinis γ et ε, Weih. et Nees. l.c. t. 36.

Allied Bramble. Fl. June, Sept. *Britain.* Sh. straggling.

45 R. FLORIBU'NDUS (H. B. et Kunth, nov. gen. amer. 6. p. 219. t. 557.) branches and petioles villously tomentose, and are as well as the nerves prickly beneath; upper leaves with 3 leaflets, and the lower ones with 5 leaflets; leaflets on long petiolules, elliptic-oblong, sharply serrated, clothed with adpressed pubescence on both surfaces; panicle terminal, branched, ♄. G. Native of South America, on the Andes about Loxa in Quito, at the height of 2100 or 5400 feet above the level of the sea. Petals white or rose-coloured, exceeding the calyx. Fruit like that of *R. fruticòsus.*

Bundle-flowered Bramble. Shrub straggling.

46 R. ULMIFÒLIUS (Schott. in isis. 1818. fasc. 5. p. 821. and Link. enum. 2. p. 61.) stems decumbent, very prickly; leaves with 3 or 5 leaflets; leaflets oval, rather cordate, acutely and doubly crenated, tomentose beneath and unarmed. ♄. H. Native of Gibraltar, on the mountains. Branches red. Flowers beautiful rose-coloured.

Elm-leaved Bramble. Fl. June, Sept. Clt. 1823. Sh. tr.

47 R. LINKIA'NUS (Ser. in D. C. prod. 2. p. 560.) stems prickly; leaves with 3 or 5 leaflets; leaflets unequal, ovate, acuminated, serrated, clothed with hoary tomentum beneath; flowers panicled. ♄. H. Native country unknown. R. paniculàtus, Schlecht. ex Link. enum. 2. p. 61. and Tratt. ros. 3. p. 92. but not of Smith. Flowers double, white.

Link's Bramble. Fl. June, July. Clt. 1821. Sh. trailing.

48 R. A'LBICANS (Kit. ex Tratt. ros. 3. p. 92.) leaflets 5, ovate, cordate, lateral ones almost sessile, all clothed with white tomentum beneath; stems angular, prickly; prickles recurved; petioles and peduncles scabrous from glands. ♄. H. Native of Hungary, in bushy places. Allied to *R. fruticòsus* or *R. tomentòsus.* Flowers white.

Whitish-leaved Bramble. Shrub trailing.

49 R. NUBÍGENUS (H. B. et Kunth, nov. gen. amer. 6. p. 220.) branches and petioles villous, and are prickly as well as the nerves of the leaves; leaflets beset with adpressed pili above, but clothed with canescent pubescence beneath; panicles terminal, nearly simple; calyxes prickly; fruit clothed with silky pili. ♄. H. Native of the Andes, about Quito, at Paramo de Puntas, at the height of 5100 feet above the level of the sea.

Cloud-born Bramble. Shrub straggling.

50 R. FRUTICÒSUS (Lin. spec. 707.) stems straggling, arched, angular, and rather tomentose; prickles recurved; leaves with 3 or 5 leaflets; leaflets petiolate, ovate-oblong, acute, glabrous above, greyish tomentose beneath; panicle decompound, narrow, and straight; calycine segments reflexed and unarmed. ♄. H. Native of Europe, in hedges and woods and by way-sides and in commons; plentiful in Britain. Smith, engl. bot. 826. Weih. et Nees, rub. germ. p. 25. t. 7. Flowers pinkish or white. Fruit dark purple, with a mawkish taste. The *bramble* may be useful in thickening hedges of white-thorn or briars, being of very quick growth. The green twigs will dye wool and silk black. Silkworms will eat the leaves; they are astringent, and a decoction of them may be used in gargarisms.

Var. β, *pompònius* (D. C. prod. 2. p. 561.) flowers semi-double; leaves pale green; leaflets obovate. R. fruticòsus, var. δ, Weih. et Nees. l. c.

Var. γ, *leucocárpus.* Fruit white.

Var. δ, *inérmis:* stem unarmed.

Var. ε, *cóncolor* (Wallr. sched. p. 233.) leaves pubescent beneath, the same colour on both surfaces. Native of Germany.

Var. ζ, *glandulòsus* (Wallr. sched. p. 233.) stems, petioles, and peduncles glandular. Native of Germany.

Shrubby or Common Bramble. Fl. June, Aug. Britain. Shrub straggling.

51 R. FAGIFÒLIUS (Schlecht. et Cham. in Linnæa. vol. 5. p. 571.) floral branches unarmed, angular, pubescent; leaflets 3-5, elliptic, acuminated, obtuse at the base, glabrous and shining above, but opaque beneath and puberulous on the nerves, sharply serrated; panicle large, terminal, clothed with silky tomentum. ♄. C. Native of Mexico, among bushes at Passantla. Flowers small, white.

Beech-leaved Bramble. Shrub.

52 R. ABRU'PTUS (Lindl. syn. brit. fl. p. 92.) stems arched, strong, angular, very glaucous, with very broad, equal, hooked prickles; leaflets 3 to 5, small, distant, undulated, shining, obovate, truncate, with an inflexed, cuspidate point, simply serrated, veiny, hoary beneath; panicles long, downy, armed with strong hooked prickles; the branches spreading and corymbose. ♄. H. Native of Scotland.

Abrupt-leaved Bramble. Fl. July, Aug. Scotland. Shrub straggling.

53 R. TOMENTÒSUS (Weih. et Nees. rub. germ. p. 27. t. 8.) stems erect, angular, prickly, glabrous; leaves with 3 or 5 leaflets; leaflets on short petiolules, obovate-cuneated, clothed with hoary pubescence above and white tomentum beneath; panicle compound, narrow, spreading; calycine segments nearly unarmed, reflexed. ♄. H. Native of Europe, in dry places. R. Thuillièri, Poir. dict. suppl. 4. p. 694. Flowers white or pink.

Var. α, *acutè-serràtus* (D. C. prod. 2. p. 561.) serratures of leaves serrated, approximate, and acute. R. tomentòsus, var. α, Weih. et Nees. l. c.

Var. β, *latè-serràtus* (D. C. l. c.) serratures of leaves remote and coarse, nearly simple. R. tomentòsus, var. β, Weih. et Nees. l. c.

Tomentose Bramble. Fl. June, Sept. Clt. 1818. Shrub.

54 R. SUBERE'CTUS (Anders. in Lin. trans. 11. p. 218. t. 16. Smith, fl. engl. bot. 2572.) smoothish; stem angular, ascending; branches terete; prickles deflexed; leaves with usually 3-5 or 7 ovate, cordate, pointed leaflets, which are minutely hairy beneath; upper leaves with only 3 leaflets; flowers in loose panicles; calycine segments ovate, lanceolate, acuminated, slightly hairy, at length reflexed. ♄. H. Native of Scotland, on the banks of Lochness, Highlands of Aberdeen and Perthshire; hills of Forfarshire; in England in Wales and Yorkshire; also of North America, between Lake Superior and

Lake Winepeg, and of Newfoundland. Tratt. ros. 3. p. 90. Flowers white. Fruit pale purple.

Erectish Bramble. Fl. June, Sept. Britain. Shrub 3 to 4 feet.

55 R. SA'NCTUS (Schreb. dec. p. 15. t. 8.) stems rather angular, pubescent; prickles recurved; leaves with usually 3 leaflets, rarely undivided; leaflets ovate, obtuse, serrated, tomentose beneath; flowers subpanicled, lateral ones few; calycine segments ovate, tomentose, short, reflexed. ♄. H. Native of the Levant. Desf. cor. 80. t. 61. R. obtusifòlius, Willd. enum. suppl. 38. ex Link. enum. 2. p. 61. Flowers pink.

Holy Bramble. Fl. June, July. Clt. 1823. Sh. straggling.

56 R. VELUTÌNUS (Vest, ex Tratt. ros. 3. p. 47.) stem prickly; prickles rather large, compressed, and rather recurved; leaves trifoliate; lateral leaflets ovate, terminal one obovate, acuminated, and sharply, deeply, and doubly serrated; floral leaves glabrous above, but clothed with hoary tomentum beneath; racemes compound; petals orbicular, on long claws. ♄. H. Native of Styria.

Velvety Bramble. Shrub straggling.

57 R. HOLOSERI'CEUS (Vest, ex Tratt. ros. 3. p. 48.) stem and branches terete and simple; leaflets for the most part obovate, sharply and unequally toothed, clothed with hoary tomentum beneath; peduncles very prickly; calyxes prickly; petals roundish, on very short claws. ♄. H. Native of Styria, not far from Greece, according to Vest.

Whole-silky Bramble. Shrub.

58 R. APPENDICULA'TUS (Tratt. ros. 3. p. 31.) stems decumbent, angular, glabrous; prickles scattered, rather recurved, strong; floriferous branches pubescent; leaves trifoliate and many simple; leaflets different in shape, sharply and unequally serrated, plicate, pubescent beneath; racemes simple; calyx appendiculated. ♄. H. Native of Hungary. Said to be nearly related to *R. plicàtus.*

Appendiculate-calyxed Bramble. Shrub decumbent.

59 R. COCHINCHINE'NSIS (Tratt. ros. 3. p 97.) stems procumbent, prickly; leaves with 5 leaflets, which are clothed with yellowish tomentum beneath; racemes terminal; akenia small. ♄. G. Native of Cochin-china, in woods and in hedges. R. fruticòsus, Lour. cochin. p. 325. Flowers white or pink?

Cochin-china Bramble. Shrub procumbent.

60 R. CANE'SCENS (D. C. cat. hort. monsp. p. 139. and fl. fr. 5. p. 545.) stem shrubby, tall; petioles and peduncles tomentose and prickly; leaves with 3 or 5 leaflets; leaflets obovate-oblong, coarsely but sparingly toothed, clothed with white velvety down on both surfaces; flowers panicled; calyxes tomentose. ♄. H. Native of the alps of Piedmont. Flowers white.

Canescent Bramble. Fl. June, Sept. Clt. 1820. Sh. tall.

61 R. RÒSEUS (Poir. dict. 6. p. 237.) branches flexuous, glabrous, prickly; leaves trifoliate; leaflets ovate-lanceolate, crenulated, large, glabrous on both surfaces; stipulas oval, obtuse, large; flowers usually solitary, on long peduncles; petals smaller than the glabrous calyx; calycine segments lanceolate, acuminated. ♄. G. Native of Peru. Corolla rose-coloured.

Rose-coloured-flowered Bramble. Shrub.

62 R. GLABRA'TUS (H. B. et Kunth, nov. gen. amer. 6. p. 221. t. 558.) shrubby, glabrous; branchlets, petioles, and nerves of leaves prickly; leaves trifoliate; leaflets oblong, acute, crenately serrated; flowers solitary; calyxes pubescent and prickly. ♄. G. Native of South America, in the high plains of De Los Pastos, near Guachucal, on the banks of Rio Blanco, at the height of 3060 feet. Petals fan-veined, red. Immature fruit pubescent.

Smoothish Bramble. Shrub.

63 R. ALTHÆÆFÒLIUS (Host, ex Tratt. ros. 3. p. 37.) stems angular, glabrous, with a few prickles; branchlets, petioles, and peduncles villously pubescent; leaves with 3 or 5 leaflets; upper leaflets rhomboid or obovate, lower ones ovate-deltoid, clothed with soft pubescence beneath, but sparingly above, deeply toothed and ciliated; racemes terminal, few-flowered; calyx tomentose, mucronate; petals obovate, larger than the calyx. ♄. H. Native of Austria, near Mauerbach.

Althæa-leaved Bramble. Shrub straggling.

64 R. COLLÌNUS (D. C. cat. hort. monsp. p. 139. and fl. fr. 5. p. 545.) stems shrubby, and are as well as the petioles prickly; leaves with usually 5 leaflets, rarely with 3 only; leaflets roundish, toothed, lateral ones almost sessile, white from tomentum beneath; flowers loosely panicled; panicle branched; calycine segments ovate, acuminated. ♄. H. Native on sterile hills about Montpelier. Nocca ex Balb. fl. ticin. t. 9.

Hill Bramble. Shrub straggling.

65 R. FASTIGIA'TUS (Weih. et Nees. rub. germ. p. 16. t. 2.) stems recurved, angular, glabrous, furnished with a few prickles; leaves with 3 or 5 leaflets, rarely with 7; leaflets ovate, cordate, lower ones ending in long points, sharply serrated, flat, glabrous above, but pubescent beneath; floriferous branches horizontal, simply panicled, fastigiate; calycine segments lanceolate, acuminated, glabrous, and unarmed on the outside, when mature reflexed. ♄. H. Native of Germany, Switzerland, and Britain. R. fruticòsus, Poll. pal. 2. p. 58. Flowers white. Fruit middle-sized. Carpels almost black, shining.

Fastigiate Bramble. Fl. June, Sept. Britain. Sh. strag.

66 R. CORDIFÒLIUS (Weih. et Nees. rub. germ. p. 21. t. 5.) stems recurved, angular, furrowed, prickly and glabrous; leaves with 3-5 leaflets; leaflets cordate-orbicular, cuspidate, clothed with canescent shining tomentum beneath; panicle compound, diffuse at the base; calycine segments spreading, prickly at the base. ♄. H. Native of Germany and Britain, in hedges. Flowers small, white. Fruit dark, covered with bloom.

Heart-leaved Bramble. Fl. June, Sept. Brit. Sh. straggl.

67 R. ME'NKII (Weih. ex Spreng. syst. 2. p. 528.) leaves with 3 or 5 leaflets; leaves ovate, rather cordate, clothed with tomentum beneath and on the calyxes; calycine segments at length reflexed. ♄. H. Native of Germany. R. velutinus, Vest, ex Spreng. l. c. Flowers white.

Menk's Bramble. Fl. June, Sept. Clt. 1816. Sh. straggl.

68 R. KÖHLE'RI (Weih. et Nees. rub. germ. p. 71. t. 25. Borr. engl. bot. suppl. 2605.) stems decumbent, rather angular, and furrowed, with scattered hairs, glands, and numerous hooked and straight unequal prickles; leaves of 5 stalked, ovate, elliptic, rather cordate pointed leaflets; panicle much divided, somewhat corymbose; calyx loosely reflexed. ♄. H. Native of Germany and England, in thickets and hedges. R. glandulòsus, Smith, engl. fl. 2. p. 403. Flowers pale pink; berries black.

Var. β, *fusco-àter* (Weih. et Nees. rub. germ. p. 72. t. 26.).

Var. γ, *pállidus* (Weih. et Nees. l. c. p. 75. t. 26.). R. affinis, Smith, engl. fl. 2. p. 405.

Kohler's Bramble. Fl. June, Jul. Britain. Sh. decumbent.

69 R. ECHINA'TUS (Lindl. syn. brit. fl. p. 94.) stems arched, angular, densely covered with glands and bristles, mixed with short, numerous, nearly straight prickles; leaflets 5, roundish, cordate, coarsely and unequally serrated, taper-pointed, green and velvety beneath; panicle spreading, prickly, and glandular, leafy at the base; the branches corymbose: bracteas 3-toothed and entire; prickles of the peduncle scattered, with very few setæ. ♄. H. Native of Britain, in hedges and woods.

Echinated Bramble. Fl. July, Aug. Brit. Sh. straggling.

70 R. RU'DIS (Weih. et Nees. rub. germ. ex. Lindl. p. 94.) stems somewhat arched, angular, slightly furrowed, without hairs, but with abundance of glands and bristles; prickles equal, recurved, scattered; leaflets 5, ovate or obovate, acuminated, coarsely and unequally serrated, between hoary and pubescent;

panicle open, rather downy, bristly, with corymbosely, racemose branches; bracteas lanceolate. trifid; prickles and setæ of the peduncles not numerous. ♄. H. Native of Germany and Britain, in hedges.

Rude Bramble. Fl. July, Aug. Britain. Shrub straggling.

71 R. Schlechtenda'lii (Weih. ex Spreng. syst. 2. p. 529.) leaves with 3 or 5 leaflets; leaflets oblong, acuminated, angular, serrated, pubescent beneath; prickles as well as branches deflexed; stems nearly terete, villous; racemes axillary, leafy; calyxes unarmed, reflexed. ♄. H. Native of Germany. Flowers white.

Schlechtendal's Bramble. Fl. Ju. Jul. Clt. 1823. Sh. proc.

72 R. tiliæfòlius (Weih. ex Spreng. syst. 2. p. 529.) leaves with 5 leaflets, disposed in a pedate manner; leaflets ovate, rather cordate, acute, serrulated, smoothish on both surfaces; prickles straightish; stems terete, glabrous; calyxes tomentose, spreading. ♄. H. Native of Germany. Flowers white.

Lime-tree-leaved Bramble. Fl. June, Sept. Clt. 1819. Sh. straggling.

73 R. macrophy'llus (Weih. et Nees, rub. germ. p. 35. t. 12.) stems arched, rather angular and furrowed, hairy, with thinly scattered small uniform prickles; leaves of 3 or 5 stalked elliptical or ovate leaflets; panicle repeatedly divided, somewhat corymbose; calyx at length reflexed. ♄. H. Native of Germany and England, in Sussex, in hedges and thickets. Borr. engl. bot. suppl. t. 2635. Flowers white. Fruit black.

Large-leaved Bramble. Fl. June, July. Britain. Sh. dec.

74 R. vulga'ris (Weih. et Nees, rub. germ. ex Lindl. syn. brit. fl. 93.) stem arched, angular, prickly, rather hairy; leaflets 5, elliptical or roundish, bluntly wedge-shaped or subcordate at the base, pubescent beneath; panicle compound, spreading, few-flowered. ♄. H. Native of Germany and of Britain, in North Wales in thickets, common.

Common Bramble. Fl. July, Aug. Wales. Sh. straggling.

75 R. Schleiche'ri (Weih. ex Spreng. syst. 2. p. 529. and Tratt. ros. 3. p. 22.) leaflets 5, oblong, acuminated, unequally serrated, hardly pubescent; stems angular, very prickly, and are as well as the branches villous; prickles recurved; panicle compound, with spreading branches, very prickly; calyxes prickly, reflexed. ♄. H. Native of Germany. Flowers white.

Schleicher's Bramble. Fl. Ju. Sept. Clt. 1818. Sh. trailing.

76 R. hórridus (Weih. ex Spreng. syst. 2. p. 529.) leaflets 5, roundish, serrated, wrinkled, villous beneath; stems and branches rather angular, and very prickly, glandular; racemes axillary; calyx adpressed when in fruit. ♄. H. Native of Germany. R. fèrox, Vest, et Tratt. ros. 3. p. 40. ex Spreng. l. c. Flowers white.

Horrid Bramble. Fl. June, Aug. Clt. 1818. Sh. prostrate.

77 R. leuco'stachys (Schlech. ex Smith, eng. fl. 2. p. 403. Borr. eng. bot. suppl. 2631.) stems arched, rather angular, and furrowed, hairy, with horizontal or deflexed, straight, uniform prickles; leaves of 3 or 5 stalked, roundish or ovate, rather cordate, flattish leaflets; panicle elongated, slender, its branches but little divided; calyx reflexed. ♄. H. Native of England, in hedges; Hampshire and Essex. Flowers red. Fruit large, black.

White-spiked Bramble. Fl. June, July. Britain. Shrub decumbent.

78 R. diversifòlius (Lindl. syn. brit. fl. p. 93.) stem arched, angular, hairy, as well as the scattered straight prickles; leaflets 3, orbicular, cordate, acute, wrinkled, equally serrated, velvety, and rather hoary beneath; panicle villous, contracted, with corymbose branches, and roundish entire or 3-lobed leaves at the base. ♄. S. Native of Britain, in hedges and thickets.

Diverse-leaved Bramble. Fl. July, Aug. Britain. Shrub straggling.

79 R. di'scolor (Weih. et Nees, rub. germ. ex Lindl. syn. fl. brit. p. 93.) stem arched, angular, prickly, silky, brownish purple; flowering branches hairy; leaflets 5, roundish, acuminated, finely and doubly serrated, naked above, hoary beneath, with reticulated veins; racemes dense, decompound. ♄. H. Native of Germany and Britain, in hedges and woods.

Two-coloured-leaved Bramble. Fl. July, Aug. Britain. Sh. straggling.

80 R. rhamnifòlius (Weih. in Nees, rub. germ. p. 22. t. 6.) stems arched, obsoletely angular, furrowed, with horizontal or deflexed, straight, uniform prickles; leaflets 5, stalked, nearly ovate or roundish, rather cordate, pointed, clothed with hoary tomentum beneath; panicle compound, spreading, with the branches divaricate; calyxes loosely reflexed, prickly at the base. ♄. H. Native of Germany and Britain, in hedges. Borr. engl. bot. suppl. 2604. R. fruticòsus, Spreng. grundz. p. 504. ex Weih. et Nees, l. c. R. rubricaùlis, Weih. ex Spreng. syst. 2. p. 528. R. Thuillèri, Poir. suppl. 4. p. 694. ex Tratt. ros. 3. p. 24. Flowers white, tinged with pink. Fruit black.

Buckthorn-leaved Bramble. Fl. June, July. Britain. Sh. straggling.

81 R. setòsus (Bigelow in litt. D. C. prod. 2. p. 563.) stem erect at the base, at length reclinate, hispid; branches bristly at the apex; leaves with 3-5 leaflets, on long petioles; leaflets obovate-cuneiform, simply serrated, glabrous, and the same colour on both surfaces; stipulas spatulate-linear; flowers racemose; peduncles filiform; calycine segments lanceolate, tomentose, and bristly; petals obovate, cuneated, longer than the calyx. ♄. H. Native of North America, about Montreal.

Bristly Bramble. Shrub.

82 R. ni'tidus (Weih. et Nees, rub. germ. 17. t. 4. ex syn. D. C.) stems shrubby, spreading, angular, prickly, and glabrous; prickles short, dilated at the base, and straightish; leaflets 3-5, ovate, acute, flat, glabrous above and shining, but pubescent beneath; panicle compound; calycine segments ovate, acuminated, reflexed, prickly at the base. ♄. H. Native of Germany and Britain, in thickets. Flowers red or white. Akenia small, black.

Shining-leaved Bramble. Fl. Ju. Sept. Britain. Sh. trailing.

83 R. carpinifòlius (Weih. et Nees, rub. germ. p. 36. t. 13.) stem decumbent or arched, rather angular and furrowed, hairy, with numerous deflexed and uniform prickles; leaves of 5 stalked, ovate, pointed, plicate, doubly serrated leaflets, pale beneath; panicle compound, hairy, its branches ascending and corymbous. ♄. H. Native of Germany and Britain, in Lancashire, Cheshire, North Wales. Borr. in engl. bot. suppl. t. 2664. Flowers pink. Fruit black, of few carpels.

Hornbeam-leaved Bramble. Fl. June, July. Britain. Sh. decumbent.

84 R. elli'pticus (Smith in Rees' cycl. vol. 30.) stems angular, shrubby, prickly, and villous; leaves trifoliate or simple; leaflets elliptic, toothed, clothed with soft white tomentum beneath; flowers glomerate, numerous, racemosely corymbose; nerves of leaves thick, parallel; calycine segments shorter than the corolla; akenia yellow, numerous. ♄. H. Native of Nipaul, where it is called *Toko-swa*. R. flàvus, Hamilt. mss. ex D. Don, prod. fl. nep. p. 234. Petioles and branchlets tomentose, intermixed with numerous bristles and prickles. Stipulas linear, setaceous. Flowers white.

Elliptic-leaved Bramble. Clt. 1827. Sh. trailing.

85 R. alpe'stris (Blum. bijdr. 1108.) leaflets 3 or 5, lateral ones the smallest, sessile, ovate-lanceolate, doubly serrated above the base, prickly on the middle nerve beneath, and strigosely pubescent on the veins; branches terete, beset with glandular pili, along with scattered recurved prickles; stipulas linear-lanceolate, rather cut; peduncles axillary or terminal, few-flowered;

calycine segments ovate, acuminated, setaceously jagged. ♄. S. Native of Java, on the mountains.

Alp Bramble. Shrub.

86 R. LINEA'TUS (Herb. Reinwdt. ex Blum. bijdr. 1108.) leaflets 3-5, oblong-lanceolate, acuminated, setaceously-serrated, lined from the veins, which are silky pubescent beneath; branches terete, tomentose; prickles scattered, minute; stipulas lanceolate, acuminated; flowers cymose, axillary, and terminal; calycine segments ovate, acuminated, clothed with white tomentum. ♄. S. Native of Java, on the higher mountains.

Lined-leaved Bramble. Shrub.

87 R. Thunbe'rgii (Blum. bijdr. 1109.) leaves trifoliate, terminal one a little 3-lobed; leaflets roundish, deeply toothed above the base, pubescent above, and clothed with white tomentum beneath; branches angular, subtomentose; prickles scattered, recurved; stipulas awl-shaped; pedicels axillary and terminal, prickly, 3-flowered at the apex; calycine segments ovate, acuminated, reflexed, densely clothed with tomentum, equal in length to the petals. ♄. H. Native of Japan. Like R. tomentòsus, Willd.

Thunberg's Bramble. Shrub.

88 R. Sello'i (Cham. et Schlecht. in Linnæa. 2. p. 15.) sterile branches pentagonal, finely pubescent: fertile ones terete, and tomentose, and are prickly, as well as the petioles and nerves of the leaves; prickles hooked; leaves of 5 leaflets, those of the fertile branches trifoliate, the same colour on both surfaces, rather pilose above, and somewhat velvety beneath; leaflets roundish-oval, cordate, ending in a short acumen; stipulas very narrow, short; panicle elongated, raceme-formed, terminal; calycine segments ovate, acuminated, clothed with hoary tomentum on both surfaces, shorter than the petals, when in fruit reflexed. ♄. S. Native of Brazil, in the provinces of Monte Video and Rio Grande do Sul. Fruit edible.

Sello's Bramble. Shrub.

89 R. Urticæfòlius (Poir. dict. 6. p. 246.) branches angular, rather compressed, bristly; prickles few, straightish, small; leaves trifoliate, upper ones undivided, clothed with silky tomentum on both surfaces; leaves ovate, cordate, elongated; branches of panicle very hairy; calyx white, hardly shorter than the petals. ♄. G. Native of Peru.

Nettle-leaved Bramble. Shrub.

90 R. Imperia'lis (Cham. et Schlecht. in Linnæa. vol. 2. p. 13.) sterile branches pentagonal, glabrous, fertile ones pubescent at the apex; both prickly, as well as the petioles, peduncles, and nerves of leaves; prickles strong, hooked, but those on the racemes are minute; leaves of 3 or 5 leaflets; leaflets ovate, acuminated, petiolate, finely serrated, green and puberulous on the under surface, but only on the nerves and veins above; stipulas lanceolate, mucronate, pubescent; calycine segments lanceolate, clothed with hoary tomentum on both surfaces, longer than the petals, when in fruit reflexed. ♄. S. Native of Brazil, on the Island of St. Catharine. Fruit eatable.

Imperial Bramble. Shrub.

91 R. ARGU'TUS (Link, enum. 2. p. 60.) stems prickly and hairy; prickles straightish, small; leaflets 3-5, oblong, acuminated, sharply and doubly serrated, somewhat attenuated at the base, and pubescent beneath; flowers panicled. ♄. H. Native of North America. Petals white, attenuated at the base.

Sharp-serrated Bramble. Fl. June, July. Clt. 1823. Shrub straggling.

92 R. HETEROPHY'LLUS (Willd. enum. suppl. p. 38. Spreng. grundz. p. 507.) stem pubescent, rather angular; prickles few, recurved; leaves trifoliate, smoothish; leaflets deeply serrated; calycine segments tomentose, reflexed. ♄. H. Native of Japan.

Variable-leaved Bramble. Shrub straggling.

93 R. CUNEIFÒLIUS (Pursh, fl. amer. sept. 1. p. 347.) branches, petioles, and peduncles tomentose; prickles scattered, recurved; leaflets 3-5, permanent; leaflets ovate-cuneated, plicate, unequally toothed above, with entire, revolute margins, clothed with tomentum beneath; flowers terminal, panicled; pedicels divaricate, nakedish. ♄. H. Native of Carolina and New York. R. parvifòlius, Walt. fl. car. 149. Tratt. ros. 3. p. 49. Flowers white.

Wedge-leafletted Bramble. Fl. June, July. Clt. 1811. Sh. tr.

94 R. SANGUINOLE'NTUS (Link, enum. 2. p. 61.) stems beset with numerous prickles and strigæ; leaflets 5, lanceolate, acuminated, serrulated, glabrous; peduncles axillary, few-flowered. ♄. S. Native of the Isle of France. Branches, base of prickles, strigæ, nerves, and spots of leaves red. Flowers white.

Bloody-veined Bramble. Clt. 1824. Sh. 3 to 4 feet.

95 R. VILLÒSUS (Ait. hort. kew. ed. 1. vol. 2. p. 210.) prickly; stem glabrous, angular; young branches, leaves, and racemes clothed with glandular pubescence; prickles scattered, small, recurved; leaflets 3-5; racemes elongated, loose, simple, many-flowered; pedicels long, slender, bracteate at the base; segments of calyx mucronate, tomentose. ♄. H. Native of North America, in the United States; also in Canada, near Montreal, and about Lake Huron. Flowers white.

Var. α, glandulòsus (Ser. in D. C. prod. 2. p. 563.) stem, peduncles, and petioles villous and glandular. R. glandulòsus, Bell. app. fl. pedem. p. 24. R. hybridus, Vill. delph. 3. p. 559.

Var. β, eglandulòsus (Ser. in D. C. l. c.) stem, peduncles, and petioles more or less glandless; leaflets ovate-lanceolate, clothed with hoary tomentum beneath. R. glandulòsus β, Bertol. in litt.

Var. γ, intermèdius (Ser. l. c.) stem, peduncles, and petioles villous and glandular; leaflets ovate-roundish, clothed with hoary tomentum beneath. R. glandulòsus β intermèdius, D. C. fl. fr. 5. p. 544.

Var. δ, monophýllus (Wallr. sched. p. 230.) leaves all simple, exactly cordate, rather tomentose beneath; peduncles corymbose.

Villous Bramble. Fl. June, Aug. Clt. 1777. Shrub.

96 R. Sprenge'lii (Weih. ex Link, enum. 2. p. 62. and Spreng. syst. 2. p. 528.) leaflets 3-5, ovate-oblong, acuminated, unequally toothed, pilose beneath; prickles scattered, slender, reflexed; stems prostrate, terete, villous; panicle corymbose; sepals spreading, unarmed, hairy. ♄. H. Native of Europe. R. vulpìnus, Desf. cat. hort. pars. p. 205. R. villòsus var. β, Vulpìnus, Ser. in D. C. prod. 2. p. 564. Flowers pink.

Sprengel's Bramble. Fl Ju. Sept. Clt. 1823. Sh. straggling.

97 R. Jamaice'nsis (Lin. mant. 75.) stem puberulous, very hispid; prickles recurved, scattered; leaflets 3, puberulous above, and villously tomentose beneath, ovate, long-acuminated, and sharply serrated; flowers numerous, panicled; calycine segments ovate, somewhat mucronate, clothed with white tomentum. ♄. S. Native of Jamaica. Sloan. jam. 2. p. 213. f. 1. Tratt. ros. 3. p. 51. Flowers white, small. Fruit small.

Jamaica Bramble. Sh. 4 to 6 feet.

98 R. HI'SPIDUS (Lin. spec. 706.) stems sarmentose, procumbent, terete, very hispid; prickles recurved, and are scattered as well as the bristles; leaflets 3-5, unequally toothed, cuneated at the base, smoothish; pedicels solitary, elongated; petals obovate; carpels black. ♄. H. Native of Canada.

Hispid Bramble. Fl. Aug. Clt. 1759. Sh. proc.

99 R. TRIVIA'LIS (Michx. fl. bor. amer. 1. p. 296.) stems procumbent, sarmentose, prickly; branches nearly unarmed; leaves trifoliate; leaflets oval, acute, unequally serrated, glabrous; stipulas linear, acuminated; flowers axillary, pedunculate, solitary, and terminal, racemose; calycine segments ovate, acute, clothed with white tomentum, one-half shorter than the calyx. ♄. H. Native of North America, Canada, near Quebec, and of New-

foundland. R. procúmbens, Muhl.? R. flagellàris, Willd.? Flowers white.

Trivial Bramble. Fl. July. Pl. proc.

100 R. ENSLE'NII (Tratt. ros. 3. p. 63.) stem slender, sarmentose, procumbent, terete, prickly, glabrous; leaves trifoliate; leaflets deeply and unequally toothed or serrated, acute, narrow at the base, smoothish, and ciliated; flowers solitary, on long peduncles; petals narrow, elliptic, unguiculate. ♄. H. Native of North America.

Enslen's Bramble. Sh. prostrate.

101 R. LANUGINÒSUS (Stev. obs. ined. in herb. Willd. D. C. prod. 2. p. 564.) floriferous stems a foot high; petioles and peduncles tomentose; prickles few, straight; leaves trifoliate; leaflets ovate, cordate, acuminated, sharply and mucronately toothed, villous on both surfaces; panicles terminal, many-flowered; calycine segments erect, villous on the outside, and clothed with white tomentum inside, ending in a short awn each; bracteas subulate. ♄. H. Native of Caucasus and Siberia.

Woolly Bramble. Fl. July, Aug. Clt. 1820. Sh. pros.

102 R. PARVIFÒLIUS (Lin. spec. 707. but not of Walt.) stems terete, tomentose; prickles recurved, scattered; leaves trifoliate; leaflets clothed with white tomentum beneath; flowers racemose; calycine segments tomentose, ovate, short; fruit globose. ♄. S. Native of the East Indies. Ker. bot. reg. t. 496. Thunb. fl. jap. 215. R. Mollúcus, Rumph. amb. 5. p. 88. t. 47. f. 1. Flowers red. Fruit red.

Small-leaved Bramble. Fl. Aug. Sept. Clt. 1818. Sh. 2 to 3 feet.

103 R. CANADE'NSIS (Lin. spec. 707. exclusive of the synonyme of Mill. fig.) stem purple, unarmed; leaflets 3-5-10, lanceolate, sharply serrated, naked on both surfaces; stipulas linear. ♄. H. Native from Canada to Virginia, among rocks in woods. Cycláctis montàna, Rafin. in Sill. journ. 1. p. 377. Flowers white.

Canadian Bramble. Fl. June, July. Clt. 1811. Sh. pros.

104 R. NU'TANS (Wall. in litt. ex herb. Lin. soc.) stem, petioles, and calyxes beset with brown bristles; leaves trifoliate, beset with bristles on the nerves beneath; leaflets cuneated, slightly lobed, rather pilose, sharply serrated; stipulas broad, membranous; sepals ovate, elliptic, cuspidate; peduncles 1-flowered, axillary, and terminal; flowers drooping; petals obovate, longer than the stamens, but about equal in length to the calyx. ♃. H. Native of Kamaon. Flowers apparently purple, large. Perhaps a species of *Dalibárda.*

Nodding-flowered Bramble. Sh. pros.

105 R. DIGITA'TUS (Spreng. pl. mon. cogn. pug. 1. p. 34. no. 62.) prickles recurved; leaves palmately pinnate, pilose; leaflets ovate, jagged; calyx tomentose. ♄. H. Native country unknown. Allied to *R. affinis.*

Digitate-leaved Bramble. Sh. trailing.

106 R. MONTA'NUS (Libert in Lejeune, fl. spa. 2. p. 317.) stem terete; prickles recurved; leaflets 3-5, acuminated, tomentose beneath; flowers panicled; peduncles 2-3-flowered; calycine segments tomentose. ♄. H. Native of Belgium, about Spa. Flowers white.

Mountain Bramble. Sh. trailing.

107 R. ARDUENNE'NSIS (Libert, l. c. 2. p. 317.) stem tetragonal; prickles recurved; leaflets 3-5, ovate-lanceolate, doubly serrated, tomentose beneath; panicle elongated; peduncles and calyxes elongated. ♄. H. Native of Belgium, about Spa. Flowers white.

Arduenn Bramble. Sh. trailing.

* * *Herbaceous. Stipulas ovate, rarely linear.*

108 R. SAXA'TILIS (Lin. spec. 708.) stem herbaceous, bluntly angular, bristly; leaves trifoliate, of the same colour on both surfaces, smoothish; leaflets ovate-rhomboid, deeply toothed, lateral ones sessile; stipulas oblong, broadish; flowers on short peduncles, either solitary or sub-corymbose; calycine segments ovate-lanceolate, rather tomentose, deflexed, equal in length to the corolla; carpels globose, few, red, pellucid, large. ♃. H. Native of Asia and Europe; plentiful in the north of England, Scotland, Wales, and Ireland, in shady places among stones. Smith, engl. bot. 2233. Plant sending out many long running barren stems, the flower-bearing stems about ½ foot high. Petals narrow, white. In some parts of Scotland they call the fruit *roebuck berries.* The Russians ferment them with honey, and extract a potent spirit from them.

Var. β, *Americànus* (Pers. ench. 2. p. 52.) leaflets lanceolate, acutish; peduncles elongated. ♃. H. Native of North America.

Var. γ, *spinulòsus* (Wallr. sched. p. 225. Jacq. hort. vind. 245.) R. Alpìnus hùmilis, Chabr. stirp. 109. f. 6.

Stone Bramble. Fl. June. Britain. Pl. creeping.

109 R. A'RCTICUS (Lin. spec. 708.) stems herbaceous, smooth, unarmed; leaves trifoliate, almost glabrous; leaflets obovate, obtuse, crenately serrated; stipulas ovate, very blunt; flowers solitary, terminal; calycine segments lanceolate-linear, downy, shorter than the corolla; petals emarginate. ♃. H. Native of Siberia and Canada; in Britain in the Isle of Mull. Smith, engl. bot. 1585. Oed. fl. dan. 488.—Lin. fl. lapp. t. 5. f. 2. Curt. bot. mag. 132. Root creeping. Flowers deep rose-coloured. Fruit large, purple or red, sweet-scented. Linnæus has accurately figured this species of *Bramble* in his Fl. Lapponica, out of gratitude, as he expresses himself, for the benefit he reaped from it in his Lapland journey; it having so frequently recruited his spirits when almost sinking with hunger and fatigue, by the vinous nectar of its berries. He informs us that the principal people in Norland make a syrup, a jelly, and a wine from these berries, which they partly consume themselves, and partly send to their friends at Stockholm, as a dainty of the rarest and most delicious kind; and he adds, of all the wild Swedish berries this holds the first rank.

Var. β, *subquinquélobus* (Ser. mss. in D. C. prod. 2. p. 265.) leaflets 3, lateral ones bipartite. Native of the Ural mountains.

Arctic Bramble or Dwarf Crimson Bramble. Fl. June, July. Britain. Pl. ½ foot.

110 R. ACAU'LIS (Mich. fl. bor. amer. 1. p. 298.) stem very short, unarmed, 1-flowered, herbaceous; radical leaves trifoliate; leaflets ovate-trapeziform, coarsely serrated; stipulas oblong, acute; peduncles puberulous; calycine segments lanceolate-linear, acutish, much shorter than the petals, which are oblong; filaments dilated; styles rather club-shaped, approximate. ♃. H. Native of North America, in swamps. R. pistillàtus, Smith, exot. bot. 2. p. 53. t. 86. Flowers rose-coloured. Root creeping.

Stemless Bramble. Fl. Ju. July. Clt. 1802. Pl. ½ foot.

111 R. MUCRONA'TUS (Ser. mss. in D. C. prod. 2. p. 565.) stem herbaceous, pilose, unarmed; leaves trifoliate, the same colour on both surfaces, pilose; leaflets rhomboid, acutely serrated; stipulas ovate-lanceolate, acuminated; flowers terminal, twin; calycine segments lanceolate, acute, puberulous, shorter than the corolla. ♃. H. Native of Newfoundland, Le Clerc. Flowers red.

Mucronate Bramble. Pl. ¼ to ½ foot.

112 R. TRIFLÒRUS (Richards in Frankl. 1st journ. ed. 2. append. p. 19. Hook, fl. bor. amer. 181. t. 62.) unarmed, erect, herbaceous; stolons suffruticose; leaflets 3, rarely 5, acutely serrated; stipulas obovate; panicle usually 3-flowered, glandular. ♃. H. Native of North America, throughout Canada from Lake Huron to the Saskatchawan, and on the shores of Hudson's Bay near York Factory. R. saxátilis β Canadénsis,

Michx. fl. bor. amer. 1. p. 298. R. ægopodioìdes, Ser. in D. C. prod. 2. p. 565. R. Canadénsis, Torrey, fl. unit. st. 1. p. 488. ? R. saxátilis, Bigelow in litt. Petals white. Fruit red.

Three-flowered Bramble. Fl. June, July. Clt. 1825. Pl. tr.

113 R. PEDA'TUS (Smith, icon. ined. t. 63. Hook, fl. bor. amer. p. 181. t. 61.) stems filiform, creeping, usually simple; leaflets 5, obovate, deeply serrated, smoothish; peduncles axillary, solitary, 1-flowered; segments of the calyx lanceolate, cut, about equal in length to the corolla; carpels few, large. ♃. H. Native of the north-west coast of America. Dalibárda pedàta, Steph. mem. soc. mosc. p. 92. Comarópsis pedàta, D. C. prod. 2. p. 555. Petals white. Fruit pulpy, red.

Pedate-leaved Bramble. Pl. proc.

114 R. OBOVA'TUS (Tratt. ros. 3. p. 94. Hook. fl. bor. amer. p. 180. t. 60.) stems weak, long, procumbent, beset with numerous bristly prickles; leaflets 3-5, evergreen, on short petioles, or almost sessile, obovate, coarsely and unequally serrated; flowers terminal, panicled, small; segments of the calyx ovate, acute, not half so long as the petals. ♃. H. Native of North America, from New York to Carolina, and about Montreal, in stagnant bogs. R. obovàlis, Michx. fl. bor. amer. 1. p. 298. R. sempervírens, Bigelow, fl. bost. ed. 2. p. 201. Petals obovate, white. Fruit small, black, and bitter, according to Bigelow.

Obovate-leafletted Bramble. Pl. proc.

115 R. NIVA'LIS (Dougl. mss. Hook. fl. bor. amer. p. 189.) plant small, frutescent; leaves cordate, 3-lobed, acutely toothed, glabrous; nerves and petioles beset with recurved prickles, stipulas ovate, acute; peduncles short, 2-flowered; calycine segments lanceolate, pilose. ♃. H. Native of North America, on the high snowy ridges of the Rocky Mountains.

Snow Bramble. Pl. ½ foot.

§ 3. *Leaves simple, lobed.*

* *Herbaceous plants.*

116 R. PARVIFLÒRUS (Nutt. gen. amer. 1. p. 308.) stem suffruticose, unarmed; leaves palmately lobed; peduncles usually 3-flowered; calycine segments ovate, acuminated, villous; petals ovate, oblong, shorter than the calyx. ♃. H. Native of the Island of Michillimakimak, in Lake Huron. Flowers small, white.

Small-flowered Bramble. Pl.

117 R. TRI'FIDUS (Thunb. fl. jap. 217.) stem herbaceous, flexuous, erect, glabrous, unarmed; leaves cordate, 3-lobed, glabrous; lobes cut, unequally serrated; flowers almost solitary; peduncles and petioles villous; calyx white from tomentum. ♃. H. Native of Japan. Fruit red, with a grateful taste.

Trifid-leaved Bramble. Pl. 1 foot ?

118 R. STELLA'TUS (Smith, icon. ined. fasc. 3. t. 64.) stem simple, 1-flowered, villous, unarmed; leaves nearly reniform, flat, serrated, 3-lobed; stipulas ovate, obtuse; calycine segments linear, elongated, deflexed; petals spatulate, distant, longer than the calyx. ♃. H. Native of North America and the Island of Unalaschka. R. chamæmòrus, Fisch. in litt. Flowers purple. Root creeping.

Starry Bramble. Fl. June, July. Clt. 1824. Pl. ½ foot.

119 R. CHAMÆMÒRUS (Lin. spec. 708.) stem simple, 1-flowered, puberulous, unarmed; leaves somewhat reniform, wrinkled, plicate, roundly lobed and toothed; stipulas oval, obtuse; flowers dioecious; calycine segments ovate, longer than the corolla; petals elliptical, rather incumbent; carpels nearly globose, large. ♃. H. Native of Europe, Siberia near Salair, and of North America; plentiful on the highest mountains of Scotland, north of England and Wales, in peat soil. Smith, engl. bot. 716. Oed. fl. dan. t. 1. Lin. fl. lapp. 208. t. 5. Root creeping. Flowers white. Fruit large, of a dull orange-colour, acid, mucilaginous, and pleasant to the taste. From their exalted situation they are called *cloud berries*, also *knot berries* or *knout berries* or *roe-buck berries*. The plant flowers in June soon after the snow is dissolved, and the berries are scarcely well ripened in August before the plant is again overwhelmed with its winter covering. The snow preserves the fruit, and is used by the Laplanders to keep it through the winter; for they, as well as the Scottish highlanders, esteem it one of their most grateful and useful fruits, especially on account of its long duration. Its taste is moderately acid and mucilaginous, with something of the flavour of tamarinds. They are held to be an excellent antiscorbutic. The Norwegians pack them up in wooden vessels, and send them to Stockholm, where they are served up in desserts, or made into tarts. The Laplanders bruise and eat them with the milk of the rein-deer. Neill observes, that they are the most grateful kind of fruit gathered by the Scotch Highlanders. On the sides and near the bases of the mountains, it may be collected for several months in succession. It is not cultivated without difficulty, and it seldom yields fruit in a garden. By crossing the flowers with those of the bramble or raspberry, and raising from the seeds so impregnated, in all probability this plant might become a valuable accession to the kitchen garden.

Dwarf-mulberry, Cloud-berry, or Mountain Bramble. Fl. June. Britain. Pl. ⅓ to ¾ foot.

120 R. FLÓRIDUS (Tratt. ros. 3. p. 73.) stems straight, rather angular, glabrous; prickles recurved; lateral branchlets clothed with glandular pubescence, and bearing the flowers; leaves on the branches trifoliate, the upper one simple, unequal; leaflets coarsely toothed, glabrous above, hoary beneath, and pubescent on the nerves; calyxes tomentose, reflexed. ♄. H. Native of North America. Flowers large, white.

Flowery Bramble. Pl. 1 foot.

121 R. CORIA'CEUS (Poir. dict. 6. p. 237.) stem herbaceous, compressed; prickles scattered; leaves coriaceous, glabrous, ovate-oblong, serrated; stipulas ovate, toothed; peduncles usually solitary, terminal, hispid; calycine segments lanceolate, acuminated, large, glabrous; petals roundish, crenated at the apex, shorter than the calyx. ♃. S. Native of Peru. Flowers yellow ?

Coriaceous-leaved Bramble. Pl. ½ foot.

* * *Shrubs.*

122 R. INCI'SUS (Thunb. fl. jap. 217.) stem frutescent, erect prickly; prickles spreading; leaves cordate, serrated, glabrous; petioles prickly; peduncles axillary, capillary, glabrous, solitary; calyx glabrous on the outside, but clothed with white tomentum on the inside. ♄. H. Native of Japan.

Cut-leaved Bramble. Shrub.

123 R. ODORA'TUS (Lin. spec. 707.) stem erect, beset with glandular pili; leaves 5-lobed, unequally serrated, more or less glandular beneath; corymbs compound; calyx beset with glandular bristles, having the segments cuspidate, rather shorter than the petals; stipulas free, deciduous. ♄. H. Native of North America, in woods. Curt. bot. mag. t. 150. Mill. fig. t. 223. Flowers large, rose-coloured. Fruit red, not palatable.

Sweet-scented Bramble or Canadian Raspberry. Fl. Ju. Aug. Clt. 1700. Sh. 4 to 6 feet.

124 R. DELICIÒSUS (Torrey, in ann. lyc. 2. p. 196.) stem branched, unarmed; branches and petioles pubescent; leaves roundish-cordate, slightly 3-5-lobed, downy, wrinkled; bracteas lanceolate, unidentate; flowers terminal, subcorymbose; calycine segments ovate-oblong, acuminate, foliaceous at the apex. shorter than the petals. ♄. H. Native of North America. among the Rocky Mountains. Flowers purple.

Delicious Bramble. Sh. 4 to 6 feet.

125 R. Natka'nus (Moc. pl. nutk. with a figure. D. C. prod. 2. p. 566.) stem erect, flexuous, stoloniferous, beset with glandular pili at the apex, and nakedish at the base; leaves 5-lobed, unequally toothed; corymbs simple; calyx unarmed, with equal cuspidate segments; stipulas connate, permanent. ♄. H. Native on the north-west coast of America, in Queen Charlotte's Sound, in lat. 51°, Nootka Sound, at Cape Oxford, in lat 43°, from New California to Nutka Sound, and from the coast throughout in woody hills to the head-springs of the Columbia, in lat. 52°, and in mountain woods on the east side of the Rocky Mountains. Lindl. bot. reg. 1368. Flowers white. Fruit red, insipid.

Natka Bramble. Fl. June, July. Clt. 1826. Sh. 3 to 6 ft.

126 microphy'llus (Lin. fil. suppl. 263.) stem shrubby; branches terete, flexuous, glabrous; prickles scattered, recurved; leaves cordate, trifid, unequally toothed, glabrous, but with the veins pubescent beneath; middle lobe elongated, lateral ones emarginate at the apex on the outside, peduncles solitary; calyxes villous. ♄. H. Native of Japan. R. palmàtus, Thunb. fl. jap. 217.? Flowers white. Fruit yellow, esculent, and sapid. Branches purple.

Small-leaved Bramble. Shrub 3 to 4 feet.

127 R. trílobus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 566.) stem erect, branched, glabrous; branches, petioles, and peduncles hispid; leaves 3-lobed, unequally serrated, villous; lobes acute, serrated, lateral ones diverging, middle one the longest; stipulas and bracteas lanceolate, villous; flowers solitary at the tops of the branches; calycine segments ovate, concave, spreading, rather foliaceous, and spatulate at the apex, longer than the petals; carpels numerous, subglobose. ♄. G. Native of Mexico. Flowers large, white. Fruit purple.

Three-lobed-leaved Bramble. Shrub 3 to 4 feet.

128 R. vitifòlius (Cham. et Schlecht. in Linnæa. 2. p. 10.) shrubby; branches prickly, pruinose, puberulous; peduncles, calyxes, petioles, and nerves of leaves prickly; prickles weak, straightish, somewhat reversed; leaves 3-lobed, unequally serrated, smoothish; lobes acute, lateral ones diverging, middle one the longest; stipulas setaceous, hairy; flowers terminal, corymbose; calycine segments lanceolate, each ending in a long acumen, longer than the petals, which are obovate. ♄. H. Native of California. Resembles *R. trílobus.*

Vine-leaved Bramble. Shrub 3 to 4 feet.

129 R. refle'xus (Ker. bot. reg. 461.) branches terete, clothed with rufous tomentum; prickles small, scattered; leaves oblong, cordate, 3-5-lobed, densely clothed with tomentum beneath; middle lobe elongated; veins numerous, reticulated; stipulas and bracteas lunate and fringed; racemes few-flowered, nearly sessile, reflexed; calycine segments ovate, bluntish, equal in length to the corolla. ♄. G. Native of China. R. Mollucànus, Ait. epit. 373. but not of Lin. Flowers white.

Reflexed Bramble. Fl. July, Aug. Clt. 1817. Sh. straggl.

130 R. ursìnus (Cham. et Schlecht. in Linnæa. 2. p. 11.) branches terete, tomentose; petioles, nerves of leaves, peduncles and calyxes silky; prickles numerous, slender, subulate, straight; leaves of the fertile branches simple and ternate, doubly serrated, pilose above, but clothed with hoary tomentum beneath; leaflets ovate, middle one cordate and slightly lobed; stipulas membranous, linear; flowers panicled; calycine segments ovate, acuminated; acumen usually foliaceous; petals obovate. ♄. H. Native of California, at St. Francisco. Allied to *R. vitifòlius.*

Bear's Bramble. Shrub trailing.

131 R. Hamiltonia'nus (Ser. in D. C. prod. 2. p. 566.) leaves cordate, 5-lobed, serrated, beset with pustulæ above, but densely villous beneath; petioles and branchlets densely tomentose, intermixed with prickles; stipulas denticulated; flowers in axillary, sessile clusters, and terminal; calyx villous, longer than the petals. ♄. H. Native of Upper Nipaul, at Suembu, where it is called by the natives *Fogi Ayshala*, and *Cumbuta.* R. rugòsus, Hamilt. ex D. Don, prod. fl. nep. p. 234. Wall. pl. rar. asiat. 3. t. 234. Flowers white. Berries red. It differs from *R. Mollucànus*, in the leaves being flat and nakedish above, less deeply lobed, and in being tomentose beneath.

Hamilton's Bramble. Fl. July. Shrub straggling.

132 R. Mollucànus (Lin. spec. 707.) branches hairy; prickles recurved; leaves cordate, 3-lobed, unequally clothed with silky tomentum beneath: flowers racemose and axillary, pedunculate; stipulas jagged; calycine segments ovate, acute, deeply toothed, tomentose. ♄. S. Native of Amboyna and the Moluccas. Rumph. amb. 5. t. 47. f. 2. Petals white. A decumbent plant.

Var. β, *ochràceus* (Blum. bijdr. p. 1109.) leaves ochraceous beneath.

Molucca Bramble. Fl. July, Aug. Clt. 1810. Sh. dec.

133 R. rugòsus (Smith, in Rees' cyclop. vol. 30.) stem unarmed; branches prickly; calyxes and under surfaces of leaves clothed with brown tomentum; leaves wrinkled, somewhat 5-lobed; lobes rounded; stipulas villous, denticulated; bracteas oval; flowers racemose, axillary; calycine segments oval, mucronate, a little denticulated. ♄. S. Native of the East Indies. Corolla white, shorter than the calyx. Carpels red. Link. enum. 2. p. 62. Allied to *R. alceæfòlius.*

Wrinkled-leaved Bramble. Shrub straggling.

134 R. tiliàceus (Smith, in Rees' cycl. vol. 30.) stem and branches tomentose; prickles scattered; leaves roundish-ovate, slightly lobed, crenated, hoary beneath and smoothish above; racemes axillary: bracteas dissected, serrated, small; calycine segments lanceolate, villous, rather deflexed; petals spatulate. ♄. H. Native of Upper Nipaul. Flowers white. Leaves like those of *Tília álba.*

Lime-tree-leaved Bramble. Shrub.

135 R. cordifòlius (D. Don, prod. fl. nep. p. 233.) leaves cordate, acuminated, serrated, flat, woolly beneath and on the branches, and furnished with a few prickles; stipulas cut; flowers disposed in brachiate panicles; calycine segments ovate-lanceolate, acute, tomentose. ♄. H. Native of Nipaul. R. Mollucànus, Wall. in litt. Leaves nearly entire, never lobed, rusty beneath. Perhaps the same as *R. tiliàceus.*

Cordate-leaved Bramble. Shrub.

136 R. alceæfòlius (Poir. dict. 6. p. 247.) branches villous, somewhat tetragonal, prickly; prickles scattered, recurved; leaves roundish, cordate, palmately lobed, scabrous above, but tomentose beneath and prickly on the middle nerve, acutely toothed; bracteas dissected; cymes of flowers axillary and terminal, nearly sessile; calyx inflated, woolly, with the segments length of tube. ♄. S. Native of Java. Flowers white.

Mallow-leaved Bramble. Shrub.

137 R. Siebóldi (Blum. bijdr. 1110.) leaves roundish, cordate, acute, angular, unequally and sharply toothed, with the veins prickly on both sides, pale, and pubescent beneath; branches terete, tomentose; prickles dense, straight; stipulas setaceously jagged. ♄. G. Native of Java.

Siebold's Bramble. Shrub.

138 R. pubine'rvis (Blum. bijdr. 1110.) leaves cordate, acuminated, 3-5-cleft, doubly serrated, pubescent on the veins on both surfaces; branches terete, smooth; prickles scattered, straight; stipulas semilanceolate; peduncles usually solitary, 1-flowered; calycine segments ovate, acuminated, villous. ♄. G. Native of Japan. Like *R. microphýllus*, Lin.

Downy-nerved Bramble. Shrub.

139 R. glomera'tus (Blum. bijdr. 1111.) leaves cordate, acute, obsoletely 3-5-lobed, sharply denticulated, hairy on both

surfaces, prickly on the middle nerve beneath; branches terete, tomentose; prickles scattered, recurved; stipulas jagged; racemes terminal, drooping, prickly; flowers glomerate; calycine segments ovate, acute, clothed with silky pubescence, nearly entire. ♄. G. Native of Java, on Mount Gede. Like *R. elongàtus*, Smith.

Glomerate-flowered Bramble. Shrub.

140 R. Sunda'icus (Blum. bijdr. 1111.) leaves cordate, acute, obsoletely angular, unequally toothed, smooth above, but covered with cobwebbed tomentum beneath, as well as on the branchlets, and with prickles on the middle nerve; prickles of branches scattered and recurved; racemes terminal; flowers sub-umbellate; calycine segments ovate, acuminated, rather serrated, tomentose. ♄. S. Native of the islands in the Malay Archipelago.

Var. β, díscolor (Blum. l. c.) leaves smaller, denticulated, clothed with grey tomentum beneath; segments of the calyx entire. ♄. S. Native of Java. Perhaps a proper species.

Sunda Bramble. Shrub.

141 R. elonga'tus (Smith, icon. ined. fasc. 3. t. 62.) branches clothed with cobwebbed tomentum; prickles scattered and recurved; leaves cordate, acuminated, acutely crenated, tomentose beneath; stipulas jagged; panicle drooping, prickly; peduncles tomentose; bracteas deciduous; calycine segments obtuse, hardly the length of the tube and shorter than the petals, which are obovate. ♄. S. Native of Java. Corolla white. Fruit red.

Elongated Bramble. Shrub.

142 R. panicula'tus (Smith, in Rees' cycl. vol. 30. but not of Schlecht.) branches terete, villous; prickles scattered, recurved; leaves cordate, acuminated, slightly lobed, and serrated, tomentose beneath; panicle villous, rather loose; calycine segments oval, acute, villous, but not silky; petals small. ♄. H. Native of Nipaul. Fruit black. Panicles terminal.

Panicled Bramble. Shrub.

143 R. pyrifòlius (Smith, icon. ined. fasc. 3. p. 61.) branches flexuous, hairy; prickles scattered; leaves oblong, acuminated, serrated, glabrous on both surfaces; panicle many-flowered, rather thyrsoid, with corymbose branches; bracteas cut, pubescent, deciduous; calycine segments lanceolate, acute, outer ones jagged; petals very minute, toothed at the apex. ♄. S. Native of Java.

Pear-leaved Bramble. Shrub.

144 R. corchorifòlius (Lin. fil. suppl. 263.) stem and branches tomentose; prickles recurved; leaves ovate, cordate, acute, slightly lobed, clothed with hoary tomentum, the middle nerve furnished with prickles above; peduncles axillary, solitary, 1-flowered, tomentose. ♄. G. Native of Japan. R. villòsus, Thunb. fl. jap. 218. but not of Ait. Petals hardly longer than the corolla.

Corchorus-leaved Bramble. Shrub.

145 R. Lambertia'nus (Ser. in D. C. prod. 2. p. 567.) branches nearly terete, rather pilose; prickles recurved; leaves cordate, acuminated, slightly lobed, serrulated; stipulas fringed; flowers panicled; peduncles pubescent; calycine segments puberulous, lanceolate, acuminated, with tomentose margins; petals obovate, cuneated, narrow, length of calyx. ♄. G. Native of China.

Lambert's Bramble. Shrub.

146 R. acumina'tus (Smith, in Rees' cycl. vol. 30.) leaves ovate, cordate, acuminated, smooth, unequally serrated, rounded at the base; stipulas minute, gland-formed; flowers sub-racemose; pedicels 2-6-together, naked as well as the calyxes; branches terete, glabrous, furnished with a few distant prickles as well as on the petioles. ♄. H. Native of Nipaul. R. betulìnus, D. Don, prod. fl. nep. p. 233. Leaves like those of the birch or hornbeam. Terminal flowers panicles.

Acuminated-leaved Bramble. Shrub 4 to 6 feet.

147 R. I'ndicus (Leschen. in litt. D. C. prod. 2. p. 568.) branches terete, tomentose; prickles scattered, short, compressed, reflexed; leaves elliptic, acuminated, regularly serrated, glabrous; middle nerve prickly; stipulas wanting or setaceously fringed; flowers small, numerous, panicled; bracteas setaceously fringed; calycine segments lanceolate, acute, puberulous, reflexed; petals very narrow, length of calyx; carpels 3-4, ovate-triquetrous. ♄. S. Native of the East Indies. R. hexágynus, Roxb. Panicle large, downy.

Indian Bramble. Shrub 4 to 6 feet.

Cult. The shrubby kinds of *bramble* are easily propagated by suckers from the root or by cuttings. The herbaceous species thrive best in peat soil, and are also increased by suckers.

IX. DALIBA'RDA (in honour of Denis Dalibard, a French botanist). Lin. spec. ed. 1. p. 431. Michx. fl. bor. amer. 1. p. 299. Richard in Nestl. pot. p. 16. t. 1. D. C. prod. 2. p. 568.

Lin. syst. *Icosándria, Polygýnia.* Calyx with a short, concave tube, and with a 5-6-cleft or toothed limb; lobes toothed. Petals 5, deciduous. Stamens numerous. Ovaries 3-12, ending in short terminal styles. Akenia involucrated by the calyx, seated on a dry villous receptacle, dry or fleshy. Seed pendulous. Herbs or shrubs with petiolate simple leaves, with scape-formed 1-flowered peduncles or panicles of flowers.

* *Herbaceous. Peduncles scape-formed, 1-flowered.*

1 D. re'pens (Lin. spec. ed. 1. p. 401.) stems creeping; leaves cordate, obtuse, crenated, pubescent; stipulas linear-setaceous; calyx pilose, reflexed. ♃. H. Native of Canada, about Quebec and Montreal, and about Lake Huron; New England, and Pennsylvania. Rùbus Dalibárda, Lin. spec. 708. Smith, icon. ined. t. 20. D. cordàta, Steph. act. soc. mosc. 1. p. 92. D. violæoìdes, Michx. fl. bor. amer. 1. p. 299. t. 27. Flowers white.

Creeping Dalibarda. Fl. May, June. Clt. 1768. Pl. cr.

2 D. calycìna (D. C. prod. 2. p. 568.) stems creeping, and are as well as the petioles villous and bristly; leaves orbicular, cordate, crenated, villous; stipulas ovate, serrated; calyx villous and bristly, with the segments foliaceous and deeply toothed, longer than the petals. ♃. H. Native of Nipaul, in Gosaingsthan. Rùbus calycìnus, Wall. in litt. ex D. Don, prod. fl. nep. 235. Petals obovate, yellow. Habit of the preceding species, but differs in the stems being more elongated, bristly, and villous.

Large-calyxed Dalibarda. Pl. creeping.

3 D. geoìdes (Pers. ench. 2. p. 53.) leaves usually trifid or ternate, the terminal lobe large and ovate, and irregularly serrated, the lateral ones small, usually wanting, or joined with the terminal one. ♃. H. Native of the Straits of Magellan. Rùbus geoìdes, Smith, icon. ined. t. 19. Flowers yellow.

Geum-like Dalibarda. Pl. creeping.

* * *Shrubs. Flowers disposed in panicles.*

4 D. pyrifòlia (Blum. bijdr. 1112.) leaves simple, oblong, acuminated, serrated, pubescent on the veins; prickles scattered, recurved; branches of panicles sub-corymbose; flowers 3-4-gynous. ♄. S. Native of Java. Rùbus pyrifòlius, Smith, icon. ined. fasc. 3. t. 61. Calycine segments jagged. Petals small, yellow? toothed at the apex.

Pear-leaved Dalibarda. Shrub creeping?

5 D. latifòlia (Blum. bijdr. 1112.) leaves simple, roundish-ovate, deeply serrated, pubescent beneath; prickles small, recurved; branches of panicle corymbose; flowers polygynous. ♄. S. Native of Java, in the province of Tjanjor. Flowers yellow?

Broad-leaved Dalibarda. Shrub creeping?

Cult. The herbaceous kinds of this genus do best in a border of peat soil, or to be grown in pots in a mixture of peat and sand, and placed among other alpine plants; they are easily increased by detaching the runners. The shrubby species, being natives of tropical islands, require to be grown in the stove or hot-house, and cuttings of them will root readily in heat, under a hand-glass.

X. FRAGA'RIA (from *fragrans*, fragrant; the perfumed fruit of the strawberry is well known). Tourn. inst. 152. Nestl. pot. 17. Duchesn. mon. frais. 1 vol. 8vo. Ser. in D. C. prod. 2. p. 569.

LIN. SYST. *Icosándria, Monogýnia.* Calyx with a concave tube; the limb 10-parted, the outer 5 segments accessory. Petals 5. Stamens numerous. Carpels numerous, at length falling from the fleshy and succulent polyphore. Styles lateral. Seeds appended.—Herbs, throwing out runners. Leaves trifoliate; leaflets coarsely toothed. Polyphore roundish, succulent, red, rarely white. In this genus what is called the fruit is a fleshy receptacle or polyphore, with carpels or seeds appended to it.

* *Carpels very numerous on the outside of the fleshy receptacle. Stamens numerous. Flowers hermaphrodite.*

1 F. VE'SCA (Lin. syst. 705.) stoloniferous; leaflets plicate, thin, pilose beneath; fruit pendulous; sepals at length reflexed; hairs on the peduncles adpressed. ♃. H. Native of Europe, in woods and on hills; north-west coast of America; plentiful in Britain. Smith, engl. bot. 1524.

Var. α, *sylvéstris* (Lin. spec. ed. 1. p. 495.) Duch. in Lam. dict. 2. p. 531. no. 2.) stoloniferous; receptacles egg-shaped; calyx short. ♃. H. Native of Europe, in woods; plentiful in Britain. F. vésca sylvéstris, Lin. spec. 709. F. vulgàris, Ehrh. beitr. 7. p. 21.—Blackw. herb. 77. There are varieties of this plant with red and white fruit.

Var. β, *semperflòrens* (Duchesn. l. c. 2. p. 531. no. 1.) stoloniferous; receptacle conical-oblong, shining. Native of the alps of Jura. Nois. jard. fr. t. 11. f. 2. There are varieties of this strawberry with red and white receptacles, viz.

1 *Red alpine strawberry, fr. des alpes à fruit rouge, fr. des alpes de tous les mois à fruit rouge, fr. des alpes de quatre saisons à fruit rouge, alpine rouge, scarlet alpine, prolific alpine.* Fruit conical, large for a wood strawberry, and of a first-rate quality, ripening from June to November.

2 *White alpine strawberry, fr. des alpes à fruit blanc, fr. des alpes de tous les mois à fruit blanc, fr. des alpes de deux saisons à fruit blanc, fr. des alpes de quatre saisons à fruit blanc, alpine blanc.* Fruit conical, large for an alpine strawberry. A first-rate kind, ripening from June to November.

3 *American alpine strawberry.* Fruit conical, large. A first-rate kind, like the *red alpine strawberry.*

4 *Danish alpine strawberry.*

Var. γ, *mìnor* (Duchesn. l. c. 2. p. 431. no. 3.) stoloniferous; stem and leaves short; receptacle spherical, shining, red or white. To this variety belong the following sorts of wood strawberry.

1 *Red wood strawberry, frasier d'Angleterre, fr. à chassis, fr. commun rouge, fr. commun à fruit rouge, fr. des bois à fruit rouge.* Fruit roundish, large for a wood strawberry. A first-rate kind, ripening from the end of June, through July.

2 *White wood strawberry, fr. commun blanc, fr. commun à fruit blanc, fr. des bois à fruit blanc.* Fruit roundish, size of the last, of a first-rate quality, ripening end of June and through July.

Var. δ, *horténsis* (Duchesn. l. c. 2. p. 532. no. 4.) stoloniferous; stem and peduncles longer; leaves pallid; receptacle elongated, rather compressed. There are varieties of this with red, white, and black fruit. To this belong the following sorts of strawberry.

1 *Frasier de Montreuil à fruit blanc.* Fruit ovate, large, of a first-rate quality, ripening about the beginning of July.

2 *Frasier de Montreuil à fruit rouge, fr. de Montreuil à Marteau, fressant, dent de cheval, de ville de bois.* Differing from the last only in the colour of the fruit. They are both only fugitive varieties of the *wood* or *alpine strawberries.*

Var. ε, *eflagéllis* (Duchesn. in Lam. dict. 2. p. 532. no. 5.) stolons very short or wanting altogether; receptacle elongated, roundish-ovate; leaves longer than the stem. To this variety belong the following sorts of strawberry.

1 *Red alpine bush-strawberry, frasier buisson, fr. buisson à fruit rouge, fr. commun sans filets, fr. sans coulans ordinaire, fr. sans filets ordinaire, fr. buisson des alpes rouge, fr. des alpes sans coulans à fruit rouge, fr. des alpes sans filets à fruit rouge, fr. de gaillon à fruit rouge.* Fruit roundish, ovate, middle-sized. A second-rate sort, ripening in the beginning of July.

2 *White bush alpine strawberry, frasier buisson des alpes blanc, fr. buisson à fruit blanc.* Only differing from the foregoing in the colour of the fruit.

Var. ζ, *múltiplex* (Duchesn. l. c. 2. p. 532. no. 7.) stoloniferous, pale; receptacle small. Blackw. herb. t. 77. f. 3. *Double-blossomed strawberry, frasier à fleurs doubles, fr. à fleurs semidoubles.* This variety is worthless as to its fruit.

Var. η, *botryfórmis* (Duchesn. l. c. 2. p. 532. no. 7.) stoloniferous; stamens transformed into flowers. Commonly called in France *Frasier couronné.*

Var. θ, *muricàta* (Duchesn. l. c. 2. p. 533. no. 8.) receptacle small; styles elongated, echinated; petals wanting; sepals foliaceous. Commonly called in France *Frasier arbrisseau à fleurs vertes.*

Fertile, Wild, Wood, or Alpine Strawberry. Fl. April, May. Pl. ½ to 1 foot.

2 F. CALYCÌNA (Lois. fl. gall. 1. p. 299.) leaves ternate, pilose; leaflets sessile, cuneated, roundish, coarsely toothed; flowers corymbose; peduncles longer than the scapes; calyx about equal in length to the corolla. ♃. H. Native of France, in woods. F. grandiflòra, Thuil. fl. par. ed. 2. p. 264. F. vésca grandiflòra, D. C. fl. fr. 4. p. 468. Flowers white. Fruit red.

Large-calyxed Strawberry. Fl. Apr. May. Clt. ? Pl. ½ to ¾ ft.

3 F. COLLÌNA (Ehrh. beitr. 7. p. 26.) stoloniferous; leaflets plicate, thin, silky above and pilose beneath; fruit erect? sepals after flowering erect; hairs on peduncles erect. ♃. H. Native of Switzerland and Germany. Flowers white. Fruit green. Perhaps only a variety of *F. vésca.* To this species belong the strawberries called

1 *Green strawberry, green pine, pine apple, green alpine, green wood, powdered alpine, frasier vert d'Angleterre, frasier vert.* Fruit roundish or depressed, globular, large, solid; flesh greenish, very juicy, with a peculiar and somewhat pine apple flavour. A second-rate sort, ripening middle of July.

2 *Williams's green pine.* Fruit roundish, middle-sized. A second-rate sort, ripening end of June.

Hill Strawberry. Fl. April, May. Clt. 1798. Pl. 1 foot.

4 F. PLATANOÌDES (Ser. in D. C. prod. 2. p. 570.) leaves palmately 5-lobed, pilose; lobes lanceolate, acute, obsoletely toothed; sepals lanceolate, acute, pilose. ♃. H. Native of North America? Petals red.

Platanus-like Strawberry. Fl. April, June. Clt. ? Pl. ¾ ft.

* * *Carpels few, immersed in little pits in the receptacle* (f. 71. *d.*). *Stamens few* (f. 71. *c.*). *Flowers usually dioecious from abortion.*

5 F. MAJAU'FEA (Duchesn. in Lam. dict. 2. p. 533.) stoloniferous; leaflets plicate, thin, pilose beneath; flowers herma-

phrodite; stamens long; receptacle middle-sized; carpels numerous; calyxes erectly adpressed after flowering. ♃. H. Native of France. To this species belong the following *strawberries.*

1 *Frasier de Bargemont, fr. en étoile, Majaufe.* Fruit roundish, ovate, reddish, small. A second-rate sort, ripening beginning and middle of July.

2 *Frasier vineux de champagne, fr. de champagne, fr. vineux, Majaufe de champagne.* Fruit conical, small, green. A second-rate sort, ripening in the beginning of July.

Majaufe Strawberry. Fl. Apr. Jun. Clt.? Pl. $\frac{3}{4}$ foot.

6 F. Bresli'ngea (Duchesn. in Lam. dict. 2. p. 533.) leaflets plicate, rather coriaceous, green; pili long and firm; petals narrow, whitish, yellow; sepals erectly adpressed after flowering; receptacle adherent; carpels rather turgid.

Var. α, *abortiva* (Duchesn. l. c. p. 534. no. 11.) almost sterile; leaves thin, less pilose; branches elongated; receptacle depressed, greenish, red; carpels hardly adhering. Commonly called *Frasier coucou* and *fr. aveugle.*

Var. β, *nìgra* (Duchesn. l. c. p. 535. no. 12.) very sweet-scented, usually sterile; branches short; leaves usually 5-lobed; stolons numerous. Commonly called *Breslinge d'Allemagne.*

Var. γ, *péndula* (Duchesn. l. c. no. 13.) receptacle pear-shaped, adpressed, red, without any carpels at the base. Native of France. Commonly called *Frasier marteau* and *Breslinge de Bourgogne.*

Var. δ, *híspida* (Duchesn. l. c. p. 14.) plant humble, robust; stolons numerous; branches rather prostrate; receptacles elongated, purple. This variety of *strawberry* is known in France under the names of *Breslinge de Longchamp* and *Frasier de Longchamp.*

Var. ε, *viridis* (Duchesn. l. c. p. 536. no. 15.) leaves late, greyish; petioles usually appendiculate; peduncles long; receptacle roundly turbinate, greyish green, hardly coloured. Nois. et jard. fr. t. 13. f. 2. There is a kind of this with yellowish and shorter petals. To this variety belong the following *strawberries.*

1 *Breslinge d'Angleterre, frasier de Pennsylvanie.* Fruit small, green, roundish, ovate. A worthless sort, ripening in the beginning of July.

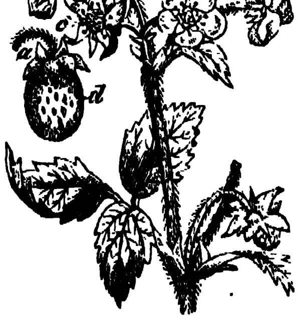
2 *Caucasian strawberry.* Fruit roundish, middle-sized. A second-rate sort, ripening in the middle of July.

Var. ζ, *praténsis* (Duchesn. l. c. p. 536. no. 16.) plant humble; branches short; stolons short; leaves small; receptacle round, adhering to the calyx; pulp rather brittle, very tumid. F. vésca praténsis, Lin. spec. 709.? Flowers usually rising before the leaves. This *strawberry* is called in France *Frasier de Brugnon* and *Breslinge de Suede.*

Breslinge Strawberry. Fl. Apr. May. Clt.? Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

7 F. ela'tior (Ehrh. beitr. 7. p. 23.) leaflets plicate, rather coriaceous, green; flowers usually dioecious from abortion; sepals at length reflexed on the peduncle; petals snow white, roundish; entire; receptacle firm, adhering but little to the calyx. ♃. H. Native of North America; in the south of England, in groves, but rare. Smith, engl. bot. 2197. Caperonniers, Duchesn. in Lam. dict. 2. p. 534. The *hautbois* are the most variable of all *strawberries,* but they retain a general character from which they naturally do not depart; the fruit sometimes changes from globular to ovate, and from ovate to globular, while fertile plantations will produce runners that may perhaps be sterile, and seedlings many of which will prove so. The latter ought to be extirpated. In all the sorts of *hautbois* there exist prolific and sterile plants, which last have long stamens, and are commonly called males; these ought in all cases to be destroyed. The varieties of *hautbois strawberries* are as follow:

FIG. 71.



1 *Black hautbois, new hautbois.* Fruit ovate, large. A first-rate sort, ripening end of June and beginning of July.

2 *Brown hautbois.* Fruit large. A second-rate sort, ripening the same time as the last.

3 *Caperon framboise, frasier framboise, frasier d'apricot.* Fragària elàtior β, dioìca, Duchesn. in Lam. dict. 2. p. 536. no. 18. F. mágna, Thuill. fl. par. p. 254. Flowers always dioecious from abortion. There is a variety of this with curled leaves.

4 *Common hautbois, hautbois, original hautbois, old hautbois, dioecious hautbois, hautbois* or *musky, frasier de Bruxelles.* Fragària elàtior α, moschàta, Duchesn. in Lam. dict. 2. p. 536. no. 17. Fragària moschàta, West, bot. 2. p. 327.—Nois. jard. fr. p. 40. t. 13. f. 1. Fruit roundish or ovate, middle-sized. A second-rate sort, ripening end of June and beginning of July.

5 *Globe, caperon ordinaire, Antwerp* or *musk, Danish.* Fruit roundish, middle-sized. A second-rate sort, ripening in the end of June and beginning of July.

6 *Large flat, white, Bath, Salter's, Formosa, Lowder's, Weymouth.* Fruit roundish, large. A first-rate sort, retains its character better than any of the other sorts of *hautbois.* It ripens in the end of June or beginning of July.

7 *Long-fruited muscatelle.* Fruit oblong, small. A second-rate sort, ripening about the beginning of July.

8 *Prolific* or *conical, double-bearing, hermaphrodite, Hudson's Bay, musk, Regent's, dwarf, sucombe, Sir Joseph Banks's, spring grove, caperon royal, caperon hermaphrodite, caperonnier royal.* Fruit large, conical. One of the best of the *hautbois,* ripening end of July or beginning of August. Flowers the largest of the class. Receptacle broad. Stamens long, permanent round the base of the fruit, even to the period of its maturity.

9 *Round-fruited muscatelle.* Fruit roundish-ovate, small. A first-rate sort, ripening beginning of July.

10 *Russian.* Fruit ovate, small. A worthless sort, ripening beginning of July.

11 *Swedish.* Fruit roundish, small. Habit dwarf. Unworthy of cultivation.

Taller or Hautbois Strawberry. Fl. Apr. May. Brit. Pl. 1 ft.

8 F. Virginia'na (Mill. dict. ed. 8. Ehrh. beitz. 7. p. 25.) flowers late, dioecious from abortion, rather campanulate; petals ovate; leaflets coriaceous, not plicate; petioles short; peduncles and pedicels length of leaves; receptacle very tumid, pendulous; styles very long. ♃. H. Native of Virginia. Duchesn. in Lam. dict. 2. p. 539. no. 24. Nois. jard. fr. p. 46. t. 12. f. 2. Flowers white. Fruit deep red when ripe. To this species belong the following kinds of *strawberry;* they are commonly called *scarlet strawberries.*

1 *American scarlet, black American, new American scarlet, new roseberry, Thomson's roseberry.* Fruit conical, middle-sized. Requires plenty of room. Leaves tall. Fruit rich and sweet, coming in late.

2 *Autumn scarlet.* Fruit ovate, middle-sized. A second-rate sort, ripening beginning of July.

3 *Bishop's seedling.* Fruit round, middle-sized, ripening end of June or beginning of July. A great bearer and almost of first quality.

4 *Black cone.* Fruit conical, middle-sized. A worthless sort, ripening end of June.

5 *Black Hudson's Bay, black pine, Hoisie's seedling.* Fruit conical, middle-sized. A second-rate sort, ripening beginning of July.

6 *Black roseberry, black round-fruited roseberry.* Fruit roundish, large. A first-rate sort, of a fine dark shining colour, and a good bearer; ripens about the end of June or beginning of July.

7 *Carmine scarlet, carmine roseberry.* Fruit roundish-ovate, middle-sized. A second-rate sort and a bad bearer; ripens beginning of July.

8 *Charlotte, Princess Charlotte, Wilmott's early scarlet.* Fruit round, middle-sized. A first-rate sort but an indifferent bearer, ripening middle and end of June.

9 *Cinnamon scarlet.* Fruit roundish, middle-sized. A second-rate sort, but a good bearer, ripening end of June.

10 *Clustered scarlet, clustered wood pine.* Fruit small, roundish. A sort of no value. Ripens about the end of June.

11 *Cockscomb scarlet.* Fruit large, compressed. A second-rate sort, ripening end of July.

12 *Copper-leaved roseberry.* Fruit conical, middle-sized. A second-rate sort, ripening end of June.

13 *Coul late scarlet, Sir George Mackenzie's late scarlet.* Fruit ovate, large. An excellent late sort, and a good bearer. Ripens beginning and middle of July.

14 *Diack's seedling, new Aberdeen.* Fruit roundish, large. A second-rate sort but a great bearer. Ripens end of June and beginning of July.

15 *Dudson House scarlet.* Fruit roundish, large. A second-rate sort but an abundant bearer. Ripens end of June.

16 *Duke of Kent's scarlet, globe scarlet, prolific scarlet, early prolific scarlet, Nova Scotia scarlet, cluster scarlet, Austrian scarlet, Oatlands scarlet, Duke of York's scarlet.* Fruit small, roundish. An early sort, but too small for general cultivation. It ripens about the middle of June.

17 *Early globe.* Fruit roundish, middle-sized. A second-rate sort, rather acid. Ripens end of June.

18 *Garnstone scarlet.* Fruit large, roundish. A first-rate sort, ripening in the end of June and beginning of July.

19 *Globular Hudson's Bay.* Fruit roundish, small. A worthless sort, ripening in the end of June.

20 *Golden lemon scarlet.* Fruit roundish, middle-sized. A second-rate sort, ripening in the end of June.

21 *Grange Hudson's Bay.* Fruit small, oblong. A worthless sort, ripening in the end of July.

22 *Grimstone scarlet.* Fruit small, conical. A second-rate sort, and a very bad bearer.

23 *Grove-end scarlet.* Fruit large, depressed, spherical. A first-rate sort, very handsome, and a most abundant bearer.

24 *Hudson's Bay, York river scarlet, American scarlet, late scarlet, Hudson's pine* (of Scotland), *Atkinson's scarlet, Hopewood's scarlet, velvet scarlet.* Fruit ovate, large. A second-rate sort, ripening in the end of June. Requires to remain till it assumes a dark colour, otherwise it is acid.

25 *Knight's large scarlet, Knight's scarlet, American scarlet, great American scarlet, hairy-leaved scarlet, large scarlet*, female parent of the *Downton.* Fruit roundish, large. A second-rate sort, and a moderate bearer. Ripens in the end of June.

26 *Lewisham scarlet, scarlet cluster.* Fruit roundish-ovate, small. A worthless sort, ripening about the end of June.

27 *Lynedock seedling.* Fruit ovate, middle-sized. A second-rate acid sort. Ripens in the beginning of July.

28 *Melon.* Fruit roundish, middle-sized. A first-rate sort, and a good bearer. Ripens in the end of June.

29 *Methven scarlet, Methven castle, Southampton scarlet.* Fruit large, roundish. A coarse sort, ripening in the end of June.

30 *Morrisania scarlet, Hudson's.* Fruit small, round. A worthless sort, ripening in the middle and end of June.

31 *Nairn's scarlet.* Fruit ovate, middle-sized. A second-rate sort, ripening in the end of June.

32 *Narrow-leaved scarlet, Knight's.* Fruit conical, middle-sized. A second-rate sort, ripening in the end of June.

33 *Oblong scarlet, long scarlet, long-fruited scarlet, Padley's early scarlet, Padley's large scarlet.* Fruit oblong, middle-sized. A second-rate sort, ripening in the middle and end of June.

34 *Old scarlet, scarlet, early scarlet, original scarlet, Virginian, scarlet Virginian, old Bath scarlet* of some, *orange* or *Irish* of the Dutch, *ecarlate, ecarlette de Virginie, de Virginie.* Fruit roundish, middle-sized. A first-rate sort, valuable for its earliness, but more especially for its excellence in preserving.

35 *Orange Hudson's Bay, Hamilton, Bishop's pine, orange pine.* Fruit conical, middle-sized. A rather acid second-rate sort, ripening in the end of June.

36 *Pine roseberry.* Fruit conical, middle-sized. A second-rate sort, inferior to the *roseberry.* Ripens in the end of June.

37 *Pitmaston black scarlet, early Pitmaston black.* Fruit oblong, small. A sort of no merit, ripening in the beginning of July.

38 *Red finger.* Fruit conical, large. A second-rate sort, ripening in the end of June.

39 *Roseberry, rose, Scotch scarlet, Aberdeen, Aberdeen seedling, prolific pine, Brickley scarlet.* Fruit conical, large. A first-rate sort, well known as a very abundant bearer, and continuing late in succession. Ripens in the end of June and beginning of July.

40 *Round-fruited scarlet, late round-fruited scarlet, Knight's* (no. 18. hort. trans.). Fruit round, middle-sized. A second-rate sort, but a good bearer. Ripens in the end of June and beginning of July.

41 *Scone scarlet.* Fruit round, middle-sized. A second-rate very acid sort, ripening in the end of June.

42 *Sir Joseph Banks's scarlet.* Fruit roundish, small. A worthless sort, ripening in the middle and end of June.

43 *Slough scarlet, Brown's scarlet.* Fruit roundish, small. A second-rate sort, resembling the *duke of Kent.* Ripens in the middle and end of June.

44 *Solid scarlet, solid fleshed.* Fruit roundish, middle-sized. A second-rate sort, ripening in the beginning of July. It is a hybrid between the *Hautbois* and *scarlet.*

45 *Southborough, Marshall's seedling.* Fruit roundish, large. A coarse sort, but a good bearer. Ripens in the beginning of July.

46 *Vernon's scarlet, White's scarlet.* Fruit round, middle-sized. A second-rate sort, ripening in the end of June.

47 *Wilmot's late scarlet, Wilmot's scarlet, Wilmot's new scarlet, Wilmot's seedling, Wilmot's imperial, large Virginian, late Virginian.* . Fruit bluntly conical, large. A second-rate sort, ripening in the end of June.

Black strawberries.

1 *Downton, Knight's seedling, Knight's strawberry.* Fruit ovate, large, ripening beginning and middle of July. The best of the *black strawberry.*

2 *Elton seedling.* Fruit large, ovate. A first-rate sort, ripening middle of July. A great bearer, valuable as a very late sort.

3 *Gibb's black seedling.* Fruit conical, small. A second-rate sort, and a bad bearer, ripening beginning of July.

4 *Knight's scarlet fleshed.* Fruit conical, middle-sized, more red inside than out. A first-rate sort, ripening end of June.

5 *Pitmaston black, late Pitmaston black.* Fruit ovate, mid-

dle-sized, ripening in July. Although an excellent sort, it is so tender as almost entirely to die off in the winter, consequently it is unfit for general culture.

6 *Old black, black Canterbury, black pine, Turkey pine, black beacon, mulberry.* Fruit conical, middle-sized. A first-rate sort, ripening beginning of July.

7 *Sweet cone, Knight's sweet cone.* Fruit ovate, large, ripening end of June. Of excellent flavour, but not so prolific as the *Downton.*

Virginian Strawberry. Fl. April, May. Clt. 1620. Pl. 1 ft.

9 T. GRANDIFLÒRA (Ehrh. beitz. 7.) late; flowers always dioecious from abortion; leaflets glaucous, coriaceous, broadly crenated, glabrous above, and pilose beneath; peduncles thick; sepals reflexed; hairs on petioles and peduncles spreading. ♃. H. Native of Surinam. F. mágna, Thuil. fl. par. p. 254? F. calycìna, Mill. fig. 288. F. Chilénsis β ananássa, Duchesne in Lam. dict. 2. p. 538. Flowers white. Fruit red. Called in English *pine strawberries*, and in French *frasier ananas.* The following are the varieties.

1 *Bath scarlet, Bath, new Bath scarlet, Liverpool, golden drop, Devonshire, North's seedling, Milne's seedling, imperial scarlet, Austin's, Carolina pine, Surinam* of some, *scarlet fleshed Caroline, Chili.* Fruit ovate, middle-sized. A second-rate sort, ripening beginning of July. F. Caroliniénsis, Duchesne in Lam. dict. 2. p. 539.

2 *De Bath.* Fragària Chilénsis γ calyculàta, Duchesne in Lam. dict. 2. p. 538. Noisette, jard. fr. t. 11. f. 1. and t. 14. f. 4.

3 *Black prince, Wilmot's black imperial.* Fruit roundish, middle-sized. A second-rate shy bearing kind, ripening end of June.

4 *Bostock, Rostock, Rostock seedling, Rostock pine, Rostock scarlet, Wellington, cone, Byram, Caledonian, Vernon's, Montague's, prolific Bath, new Bath, Whitley's pine, Beattie's seedling, English globe, red Chili, Devonshire, Devonshire Chili, red Bath, new scarlet.* Fruit large, roundish. A good bearer, but the fruit is rather coarse and hollow. Ripens end of June.

5 *Bullock's blood.* Fruit roundish, large. A worthless sort, ripening beginning of July.

6 *Chinese, North's seedling, red Chili, North's large scarlet, Bourbon* (of the Americans), *chapelizod, Carolina* of some, *large Chili, pine apple, Frasier ananas.* Fruit large, roundish. This and the *Surinam* were formerly much cultivated on account of their bearing, but are now giving way to the superiority of *Keen's seedling.* It ripens end of June and beginning of July.

7 *Dutch.* Fruit roundish, large. A worthless sort, ripening beginning of July.

8 *Dwarf white Carolina.* Fruit roundish, ovate, large. A worthless sort, ripening end of June and beginning of July. The synonyms attached to the *round white Carolina* are also applicable to this, with the exception of the last.

9 *Glazed pine, Knott's pine, scarlet pine-apple, Chinese* of some, *Carolina* of some, *red Chili* of some. Fruit conical, large. A second-rate sort.

10 *Keen's imperial, imperial, black imperial, large imperial black, imperial pine, black Isleworth, Keen's black, Keen's large fruited, Isleworth pine, large black, Keen's black pine, nectarine.* Fruit roundish, large. A second-rate tender and shy bearing kind, ripening end of June.

11 *Keen's seedling, Keen's new seedling, Keen's new pine, Keen's black pine, Murphy's child.* Fruit large, roundish. A first-rate sort, ripening middle and end of June. It is very productive, and one of the best for forcing.

12 *Knevett's new pine.* Fruit, large, roundish. A second-rate sort, ripening end of June. It is a shy bearer, and will not grow in many soils.

13 *Large black seedling.* Fruit roundish, large. A second-rate sort, ripening beginning of July.

14 *Mulberry, Mahone, King, Cherokee, Surinam* of Scotland. Fruit ovate, middle-sized. A worthless sort, ripening beginning of July.

15 *Old pine* or *Carolina pine, Carolina, scarlet pine, old scarlet pine, old Carolina, common Carolina, Carolina pine, large Carolina, blood pine, Pyne hill, grandiflora, black pine, Borsdorf, Surinam* or *scarlet fleshed, superior, Shew's scarlet.* Fruit ovate, large. A first-rate sort, ripening end of June and beginning of July. As a solid, juicy, and peculiarly rich fruit, this kind is exceeded by none. *Keen's seedling* is earlier, more productive, and profitable for the market, but its cultivation on these accounts ought not to supersede that of the *old pine strawberry*, the superior quality of which entitles it to be strongly recommended.

16 *Red cone.* Fruit ovate, middle-sized. A second-rate sort, ripening end of June.

17 *Round white Carolina, Carolina, white Carolina, white pine, large blush pine, white Bath, red and white Bath, large white, Chili, white Chili, large white Chili, large pale Chili, large flesh-coloured Chili, cone, globe, conical white Carolina.* Fruit roundish or irregularly ovate, large. A worthless sort, ripening end of June and beginning of July.

18 *Surinam, red pine, red pine apple, Sutton's large, Oldaker's new pine, red Chili, Chinese, Devonshire scarlet, North's seedling, ananas* or *apricot* of the Dutch, *De Carolina.* Fruit roundish, ovate, large. A worthless sort, ripening beginning of July. The cultivation of this sort is on the decrease, and is likely to be soon lost altogether.

19 *Taylor's new emperor.*

20 *Variegated pine, striped-leaved scarlet.* Leaves variegated with white. A tender and worthless sort with regard to its fruit.

21 *Westbere.* Fruit ovate, middle-sized. A second-rate sort, ripening end of June and beginning of July.

Great-flowered Strawberry. Fl. April, May. Clt. 1759. Pl. 1 foot.

10 F. CHILÉNSIS (Ehrh. beitz. 7. p. 26.) late; flowers always dioecious from abortion; leaflets obovate, obtuse, coarsely serrated, coriaceous, wrinkled, clothed with silky villi beneath; calyx and peduncles silky; peduncles thick; fruit pendulous; sepals erect. ♃. H. Native of South America, in Chili and Peru; and west coast of North America. Duchesn. in Lam. dict. 2. p. 537.—Dill. hort. elth. t. 20. f. 140. Nois. jard. fr. 51. t. 12. f. 1. Hairs on peduncles and petioles spreading. Fruit rose-coloured; flesh white. Called *Chili strawberry.* The varieties are as follow.

1 *Black Chili.* Fruit large, of an irregular shape. A coarse kind, ripening beginning and middle of August.

2 *Large blush Chili.* Fruit large, ovate, of indifferent quality, ripening beginning and middle of July. It is hardly distinguishable from the true *Chili.*

3 *Pine Chili.* Fruit large, ovate. A worthless sort, ripening beginning and end of July.

4 *Scarlet Chili.* Fruit large, ovate. As a *Chili strawberry* one of the best. Ripens beginning of July.

5 *True Chili, Patagonian, Greenwell's, Greenwell's French, Greenwell's new giant, du Chili, Frutiller.* Fruit large, ovate, ripening beginning and middle of July. It may be said of the *Chilis* generally, that they are tender bad bearers, and of indifferent quality.

6 *Wilmot's superb.* Fruit large, roundish, hollow, and woolly. As a *Chili strawberry* one of the best. Ripens beginning of July.

7 *Yellow Chili.* Fruit large, of an irregular shape. One of the best of the *Chilis.* Ripens beginning of July.

8 *Quoimio de Canterberi, Canterbury.* Fruit ovate, with red flesh and juice. Fragària Chilénsis var. δ tíncta, Duchesne in Lam. dict. 2. p. 539.

Chili Strawberry. Fl. April, May. Clt. 1727. Pl. 1 foot.

11 F. BONARIE'NSIS (Juss. herb. ex Pers. ench. 2. p. 53.) leaflets broadly ovate, oblique at the base, villous beneath; stem villous. ♃. H. Native of Monte Video and Buenos Ayres. Calyx villous. Petals white, large. Perhaps referrible to *F. grandiflòra.*

Buenos Ayrean Strawberry. Fl. April, June. Pl. 1 foot.

12 F. CANADE'NSIS (Mich. fl. bor. amer. 1. p. 299.) large; leaflets ample, oval, manifestly petiolate; pedicels long, recurved, pendulous; receptacle globose, scrobiculate, villous. ♃. H. Native of North America, in woods and hilly places from Hudson's Bay to the United States. Flowers white.

Canadian Strawberry. Fl. April, May. Pl. 1 foot.

13 F. SUNDA'ICA (Blum. bijdr. 1106.) calycine segments spreading, entire; down on petioles and peduncles spreading; leaves ternate and quinate; leaflets simply and bluntly serrulated, pubescent on the nerves beneath. ♃. H. Native of Java, on Mount Gede. Flowers not described.

Sunda Strawberry. Pl. ¾ foot.

* * * *Leaves simple.*

14 F. MONOPHY'LLA (Willd. spec. 1093. Uster. neue ann. fasc. 8. p. 40. t. 1. Curt. bot. mag. t. 63.) stoloniferous, weak; leaves simple, crenately toothed; fruit pendulous; receptacles elongated, red; sepals at length reflexed; hairs on peduncles adpressed. ♃. H. Native of Europe. F. vésca var. ζ monophýlla, Duchesn. in Lam. dict. 2. p. 532. no. 6. F. abnórmis, Tratt. ros. 3. p. 166. Flowers white, hermaphrodite. Fruit round, small, worthless. Called *one-leaved Alpine strawberry, Frasier de Versailles, Frasier à feuilles simples.*

One-leaved Strawberry. Fl. May. Clt. 1773. Pl. ½ foot.

The greater part of the varieties of strawberries are furnished with stolons or runners. By some botanists the species have been considered only varieties, but generally are distinguished as species. T. A. Knight (Hort. trans. 3. p. 207.) considers the *F. Chilénsis* or *Chili*, the *F. grandiflòra* or *pine*, and the *F. Virginiàna* or *scarlet*, (the first supposed to be a native of Surinam, the second of Chili, and the third of Virginia,) to be varieties only of one species, as all may be made to breed together indiscriminately. The fruit has received its name from the ancient practice of laying straw between the rows, which keeps the ground moist and the fruit clean. They are natives of temperate or cold climates, as of Europe and America, and on the higher mountains of Asia. The fruit, though termed a berry, is in correct botanical language, a fleshy receptacle or polyphore studded with the carpella, commonly called seeds.

Use.—The fruit is fragrant, whence the generic name *Fragària*, delicious, and universally esteemed. It consists almost entirely of matter soluble in the stomach, nor neither there nor when laid in heaps and left to rot, does it undergo the acetous fermentation. Hence it is very nourishing, and may be safely eaten in quantity. In addition to its grateful flavour, the subacid juice has a cooling quality, particularly acceptable in summer. Eaten either alone or with sugar and cream, there are few constitutions with which strawberries, even when taken in large quantities, are found to disagree. Further, they have properties which render them in most conditions of the animal frame positively salutary; and physicians concur in placing them in their small catalogue of pleasant remedies. They dissolve the tartarous incrustations of the teeth. They promote perspiration. Persons afflicted with the gout have found relief from using them very largely; so have patients afflicted with the stone; and Hoffmann states he has known consumptive people cured by them. The bark of the root is astringent.

Of species and varieties.—The classification of strawberries by Mr. James Barnet, published by the Horticultural Society, has been adopted with some little variation in the foregoing enumeration of varieties. In regard to the size it will be necessary to state that the comparisons are made between the individual varieties of which each species is composed, and do not extend to those of other species. The general estimation of many of the sorts is not so high as had been formerly stated, owing to their having been found tender or indifferent bearers, compared with others which experience has proved to be superior.

Modes of propagation.—The plants multiply spontaneously every summer, as well by suckers from the parent stem as by numerous runners, all of which, rooting and forming a plant at every joint, require only to be removed to a bed where there is room for them to flourish. Each of these separately bears a few fruit the following season, and will bear in full perfection the second summer. A plantation of the *Alpine* yields fruit the same year that it is made. The *woods* and the *Alpines* come regularly from seed, and bring a finer fruit than from offsets, except the intention be to try for new varieties. Knight, in making experiments with a view of ascertaining whether most of the sorts would not breed together indiscriminately, raised about 400 varieties, "some very bad, but the greater part tolerably good, and a few very excellent." The fruit of above a dozen of the sorts were sent to the Horticultural Society in August, 1818, and found of various degrees of excellence. The seeds, if sown immediately after being gathered, will produce plants which will come into bearing the following year.

Soil and site.—Neill says, "Strawberries are generally placed in a quarter of the garden by themselves, and it should be one which is freely exposed to sun and air. They are sometimes, however, planted in single rows, as edgings to borders, and in this way they often produce great crops. In either case care must be taken to replant them every fourth or fifth year at the farthest. The *alpine* and *wood* varieties may be placed in situations rather cool and shady; perhaps as an edging in the shrubbery. In such places they produce their fruit perfectly well, and late in the season, which is desirable."

General culture.—The following excellent instructions for cultivating strawberries are given by Mr. Keen of Isleworth, one of the best growers of that fruit. He says, "I will commence with a general detail of my practice; this may be considered as applicable to all the varieties of the *strawberry*, and afterwards, in noticing each kind that I cultivate, I will specify such peculiarities of treatment as are exclusively applicable to each.

"In preparing the soil for strawberries, if it be new, and as is frequently the case, very stiff, it should be trenched, but if the bottom spit of the soil, as sometimes happens, be of inferior quality, I then recommend only a simple digging, placing dung at the bottom underneath the mould so dug; on the contrary, should the land have been kept in a high state of cultivation or be good to the full depth, it will be adviseable for the bottom spit to be brought up to the top, placing the dung between the spits. The best way to obtain new plants is by planting out runners in a nursery for the express purpose in the previous season; for it is a very bad plan to supply a new plantation from old plants. With respect to the time of planting, I have always found the month of March better than any other. Sometimes when my crops have failed I have had runners planted in the autumn for the following year, but these have always disappointed my expectations. I plant them in beds containing 3 or 4 rows, and the plants in each row, at a certain distance from each other, leaving an alley between each bed, the distance of the rows and of the plants in the rows, as well as the width of the alleys, depending on the kind of *strawberry* planted. The width of the alleys, as it will afterwards be stated, may appear considerable, but I am satisfied that allowing this space for the workmen to stand on when they water the plants or gather the fruit is beneficial, because I have observed in other persons' grounds, where less space is allotted for this purpose, that great damage is done to the plants and fruit by the trampling of the people.

" After the beds are planted I always keep them as clear of weeds as possible, and on no account allow any crop to be planted between the rows. Upon the growing of the runners, I have them cut when necessary; this is usually three times in each season. In the autumn I always have the rows dug between; for I find it refreshes the plants materially, and I recommend to those persons to whom it may be convenient to scatter in the spring very lightly some loose straw or long dung between the rows. It serves to keep the ground moist, enriches the strawberry, and forms a clean bed for the trusses of fruit to lie upon; and thus by a little extra trouble and cost a more abundant crop may be obtained. A short time before the fruit ripens I always cut off the runners to strengthen the root, and after the fruit is gathered I have what fresh runners have been made taken off with a reaping hook, together with the outside leaves around the main plant, after which I rake the beds, then hoe them, and rake them again. In the autumn, unless the plants appear very strong, I have some dung thrown in between the rows, but if they are very luxuriant the dung is not required, for in some rich soils it would cause the plants to turn nearly all to leaf. I also have to remark, that the dung used for manure should not be too far spent; fresh dung from the stable door is preferable to that dung, which many persons are so fond of. The duration of the beds must be determined by the produce of the plants, which varies much according to the different sorts; it always varies with the same sort in different soils, so that the precise time of the renewal of the beds must be regulated by the observation of the gardener in each particular case.

" I commence my observations on the different sorts with the *pine strawberry*. The best soil for it is a light loam, though no other kind of *strawberry* will bear a strong loam better than this. It is likewise to be noticed, that this is of all others the most difficult *strawberry* from which to procure a good crop. Particular care must be taken that they are planted in open ground; for in all gardens they grow very strong, but seldom bear fruit, in consequence of being so much shaded by standard trees; and I have observed the shade of the walnut tree to be much more injurious to these than to others, for under it they seldom bear at all, but run entirely to leaf. In planting the beds of *pine strawberries* I keep the rows two feet apart, and put the plants 18 inches from each other in the row, leaving alleys of three feet wide between each bed; these large distances I find necessary, for the trusses of fruit in my garden ground are frequently a foot long. The duration of this *strawberry* with me is three years; the first year it bears the best; the second year the crop is very good, and the third year it is less.

" The *imperial strawberry*, which was raised by myself from seed, may be treated in a similar way with respect to planting, distance, &c. as the *pine*; but I have to remark, that it requires rather a lighter and richer soil, and is not so liable to run to leaf when planted under trees.

" The *scarlet strawberry* must also be treated like the *pine*. With respect to distance for planting the beds of *scarlets*, I put each row 21 inches apart, and each plant 18 inches distant in the row, and make the alleys 2 feet 6 inches wide. The duration of this *strawberry* with me seldom exceeds three years.

" The *hautbois* I have always found to thrive best in a light soil, and it must be well supplied with dung, for excess of manure does not drive it into leaf like the *pine strawberry*. In planting the beds each row must be 2 feet apart, and from plant to plant in the rows must be 18 inches, leaving the alleys between the beds 3 feet wide. There are many different sorts of *hautbois*; one has the male and female organs in the same blossom, and bears very freely; but that which I most approve is the one which contains the male organs in one blossom, and the female in another; this bears fruit of the finest colour, and of far superior flavour. In selecting these plants care must be taken that there are not too many of the male plants among them, for as these bear no fruit they are apt to make more runners than the females. I consider one male to ten females the proper proportion for an abundant crop. I learned the necessity of mixing the male plants with the others by experience in 1809; I had before that period selected female plants only for my beds, and was entirely disappointed in my hopes of a crop. In that year, suspecting my error, I obtained some male blossoms, which I placed in a bottle on the bed of female *hautbois*. In a few days I perceived the fruit near the bottle to swell; on this observation I procured more male blossoms, and in like manner placed them in bottles in different parts of the beds, removing the bottles to fresh places every morning, and by this means obtained a moderate crop where I had gathered no fruit the preceding year. The duration of the *hautbois* with me seldom exceeds three years.

" The *wood strawberry* is best raised from seed, which I obtain from fruit just gathered, sowing it immediately in a bed of rich earth. When the plants are of a proper size, I transplant them into other beds, where I let them continue till the March following. They are then planted in rather a moist soil in beds as the others, each row being 2 feet apart, and the plants in each row 18 inches distant, the alley between each bed being 3 feet wide; in this way I produce abundant crops of very fine fruit. I have propagated this *strawberry* from runners, but never with such good success as from seeds, particularly if the runners were taken from old roots. The duration of this *strawberry* with me seldom exceeds 2 years.

" The *alpine strawberry* must always be raised from seed, which should be sown in a bed of rich earth in spring. When the plants are of a proper size, which will be in July and August, I plant them in rows at the back of hedges, or walls, in a rich or in a very moist soil; the rows should be 2 feet apart, and the distance from plant to plant in the rows 12 inches. My alpines, thus managed, bear most abundantly, so much so that in gathering them there is not room for the women to set their feet without destroying many. The alpines differ from all other strawberries in quickness of bearing; for no other sort sown in the spring of the year will produce fruit under 2 years, whereas this yields a crop at the end of one year. Its duration with me seldom exceeds 2 years."—*Hort. trans.* 4. *p.* 2.

Mr. Atkinson (Hort. trans. 5. p. 189.) describes a method of making strawberry beds, which he saw in a garden at Chatham, and which he thought excellent. The beds were upon flat ground, each about 3 feet wide, and between them were trenches 9 inches wide, and 4 inch walls of brick on each side of the trenches to keep up the earth, these trenches were about the depth of 2 or 3 layers of bricks and were for the purpose of holding water, which was supplied from a pump, whenever the ground was dry while the plants were in fruit. By this means a much greater crop of fruit was obtained, and the plants continued bearing much longer than in beds where there were no trenches for water. According to this plan considerable extent of strawberry ground is watered with very little labour, and it has the advantage of letting the water to the roots of the plants, so as to keep the ground moist without hardening the surface, as is the case when the tops of the beds are watered with watering pots.

Mr. Knight (Hort. trans. 6. p. 103.) considers half the distance allowed by Mr. Keen to be sufficient space for strawberry plants. His beds also are wholly expended at the end of 16 or 17 months after being formed, and the ground is then applied to other purposes. He has consequently the trouble of renewing his beds every year; but he finds his trouble much less than properly managing old beds, and he is quite certain that he obtains a much larger quantity of fruit, and of a very superior quality, than he ever did obtain by retaining the same beds in bearing during 3 successive years, from the same extent of ground. By employing heat to *strawberry* plants raised from seed in spring, he has obtained abundant crops from yearly plants of every species.

Taking the crop.—The fruit ripens from June to August and September, but the main crop is usually over in July. Gather when the weather is dry, and the same day that the fruit is to be sent to table, otherwise it will soon lose its flavour. Pinch off the calyx and a quarter of an inch of the pedicel, along with the fruit.

Forcing the strawberry in hothouses, pits, and hot beds.—This fruit is forced in every description of forcing house, and also in the pinery, though the heat of the latter often prevents the setting of the blossoms. Where they are forced in large quantities, it is a good method to apply a pit to their sole cultivation. M‘Phail says, “ They will occasionally do well in a hot-house for growing the pine, but a heat sufficient to force peaches and nectarines is more natural and likely to secure the obtaining of good crops of fine fruit. A good way of forcing the *strawberry,*” he adds, “ is to bring them forward in a gentle heat, in melon frames, till the fruit be nearly about half swelled, and then to give them a stronger heat to ripen them” (Gard. rememb. 29.). Nicol thinks “ the climate of the cherry-house most suitable to the nature of the *strawberry ;* they will do well in a hot-bed, but the best method is to force them in flued pits, such as those for raising pines.”

Soil.—*Strawberries,* to be forced in pots, require a strong and very rich loamy earth. *Nicol.*

Choice of sorts.—Abercrombie and Nicol recommend the *alpine* and *scarlet Virginia,* to which Nicol adds the *wood strawberry.* William Morgan (Hort. trans. 2. p. 376.) begins with the *alpines,* next he takes the *Bath scarlets* and *common scarlets,* and after these the *pines.* But it is allowed by all that Keen's *seedling* and the *old pine* are the best for forcing.

Potting and preparing the plants.—Abercrombie says, “ the plants selected should be 2 years old, having attained a full bearing state. It conduces to the perfection of the fruit to put as many plants as are intended to be forced, into pots, that they may be previously nursed for a longer or shorter time, according to the age of the stool.—1st New runners of the present summer may be potted in July and August, and nursed in pots for 2 seasons, having the blossoms pinched off in the second. This course of preparation is attended with most trouble, but the crop repays it. Three offsets may be planted in one large pot. 2d Runners made last year may be potted in April, and then plunged in the earth, to be nursed throughout the growing season, with a view to forcing, having such blossoms as appear pinched off, while the roots are carefully watered.—3d Stools of 2 years old standing, which have borne one crop, may be put into pots in August, September, or October. They may also be put into pots during any mild interval from the beginning of November till the end of the year; but they will not be so strong and well rooted. The method of potting established bearers is this: the pots should be twenty-fours or thirty-twos; provide at the same time some fresh and good rich loam. Put some of the earth, well broken with the spade and free from grubs or hurtful worms, into each pot, to the depth of 3 or 4 inches. Then take up the plants, with a ball of earth to the root of each; pare the ball with a knife till it is pretty round, and having cleared the stem of the plant from any withered or rotten leaves, place it in a pot, which fill up to the surface of the ball with the prepared earth. Water the plants as they are potted, and remove them to a warm situation. On the approach of winter, all the potted plants, whether established bearers or runners, should be placed under a frame or other sufficient shelter, till the hot-bed or forcing house is ready to receive them.”—Abercrombie. M‘Phail says “ *strawberry* plants, intended for forcing, should be planted in pots eight or ten months before they are set into the forcing house, or strong plants may be taken up with balls of earth about their roots, and be potted and set into the forcing house immediately.” Nicol says, “ some force old roots or stools, and others the runners only. Those who force the old roots generally lift and pot them about October or November, lifting a bulk from the bed, nearly sufficient to fill a 9 or 10 inch pot of plants 3 or more years old. Others plant runners of the former year in April, 3 or 4 in a large pot, or 2 in a middle-sized one, and plunge them in the earth all summer, giving them occasional waterings, and taking proper care of them. These succeed better than old roots, treated as above. But when I was in the practice of forcing *strawberries,* I used to prepare my plants in the following manner:—In July or August I planted runners of that season, 3 in a 9 or 10 inch pot, watered them and placed them in the shade for a few days; then plunged them to the brim in a freely exposed situation. In October their leaves were dressed off and the plants trimmed, and before winter they were covered with a little dry litter, in order to preserve the pots from the effects of the frost. The following spring any flowers that made their appearance were pinched off, and throughout the summer the plants were occasionally refreshed with water, and kept clear from weeds. In autumn the leaves were again dressed off as before; and when taken up for forcing, the pots were dressed and fresh earthed at top, previous to being placed in the forcing house. This method of preparing the plants is no doubt more troublesome than either of the above mentioned, but the plants, by being completely established and of a proper age, produce better crops. I have tried all the three ways repeatedly, and prefer the last.”

Morgan raises his *alpines* from seed, sowing in January, in frames or boxes, to be placed in a gentle heat; he hardens them after they are come up by removal to a colder situation; pot in May, in pots 6 inches in diameter and 6 inches deep. In October they are in flower, when he puts them under shelter, and in the latter end of November he places them in the forcing house or pinery, where they bear fruit through the winter. The *scarlets* he pots 3 plants in a pot, of the same size as those used for the *alpines ;* in May or early in June, taking the runners of the previous year, he picks off the blossoms as they appear, and keeps them in a shady place till January, when he places them in the forcing house on shelves, 18 inches from the glass, each pot in a pan. The *pine strawberry* he pots in the same manner, and takes them into the forcing house in February or March. T. A. Knight (Hort. trans. 5. p. 433.) prepares his *strawberry* plants for early forcing as follows:—he manures a small piece of ground very highly but very superficially, just covering the manure with mould. The ground being prepared, the strongest and best rooted runners of the preceding year are selected and planted in the beginning of March, in rows 1 foot apart and 8 inches between the plants in one half of the rows, and 4 inches in the other half, the thickly and thinly planted rows occurring alternately. In July all the plants of the thickly planted rows are removed to ground that has produced an early crop of peas or potatoes; and these, having the roots well preserved, always afford an abundant crop of fruit in the following summer. The other plants remain unnoticed till the end of November, when the mould between the rows is removed with the spade, and the most widely extended lateral roots detached from it. The spade is also made to pass under each plant, and between it and the plant adjoining, so that each plant becomes capable of being removed at a subsequent period, without having any of the roots ruptured. As each plant becomes detached from the surrounding soil, the ground is closed around it, and it remains till it is wanted, but it should be placed in its pot as early as the middle of February, if it be not sooner removed. In potting *strawberry* plants, Mr. Knight always employs soil of the richest quality and very finely reduced, and a good deal of water, holding manure in solution, is employed to occasion the newly introduced soil to occupy all space previously vacant in the pots. The plants are then in a state to be subjected immediately to artificial heat.

Time of beginning to force.—If the fruit be wanted very early, the plants are put into hot-beds or pits in October, but the crops from *strawberries* so forced Nicol thinks hardly worth the trouble. Abercrombie says " begin to force *strawberries* about nine weeks before you want to gather fruit. Plants excited before the first of January seldom repay the trouble, and in proportion as the time of beginning to force approaches the vernal equinox the returns are more abundant. Have reserve sets of potted plants for removal into a house or frame every three weeks till the middle of March:" he adds, " *strawberries*, taken into the house in March, fruit in higher perfection than those forced earlier." M'Phail and Nicol begin in January. The latter observes, " those who force *strawberries* to a considerable extent, perhaps 1000 pots, bring them in in different successions, perhaps 100 or 200 at a time; that is in places where there are several forcing houses. M'Phail says " when the weather begins to get cold in September, *strawberries* of the alpine kind in pots may be set in a forcing house or brick frame, and if they be in good health, they will produce fruit for a considerable time. They require only a gentle heat of from 50° to 60°; give them water occasionally, but as there is constantly blossom and fruit on them, they need not be watered all over broad-cast. Give them great plenty of air; they only require protection from heavy rains and cold weather." Morgan, as has been already noticed, begins to force *alpines* in November, the *scarlets* in January, and the *pines* in February and March. Thus ensuring, as he says, a successional supply of fruit from October till June.

Temperature.—Abercrombie says, begin at 40° and raise the heat as in the cherry-house. When a pit is employed, Nicol directs the pots to be plunged in a mild bark-bed, and the temperature, by the aid of the flues, to be kept at 50°, and 55° or 66° in sunshine. Such treatment will make the plants thrive and the fruit set freely. Morgan prefers beginning with the heat of a frame on dung, or a pit, and then moves to the peach-house, and after the fruit is set removes his plants to ripen in the vinery or stove. *Scarlets* he finds bear more heat than the other sorts.

Air and water.—Air is to be freely admitted in good weather, and water plentifully supplied at all times, until the fruit begins to ripen off. Then it is to be withheld, lest the flavour become insipid. Morgan prefers supplying water from pans, in order not to rot the hearts of the plants. He gives as little water as possible when the plants are nearly ripe, this being essential to have good-flavoured fruit.

Treatment of the plants after the fruit is gathered.—The *strawberry*, it is generally considered, will not force the year after like fruit trees, but must be rested by plunging in the open ground for one or two years, pinching off all blossoms as they appear. Williams states that " the *scarlet strawberry*, after affording a crop of fruit in a hot-house early in the spring, if carefully removed out of the pots or boxes, and placed in the open ground, will yield another crop of fruit in September. This second crop is very abundant, the warm rains in July and August proving highly favourable to the growth of the fruit; and as there is no other *strawberry* to be had at this season of the year except the *alpine*, the addition of the *scarlet* makes a pleasing variety in the dessert." (Hort. trans. 2. p. 93.) Morgan observes, without limiting his observations to any one sort, that " after the fruit has been gathered from the plants, the pots should be plunged in a shady border, giving them a good watering, and at the same time cutting off all the leaves; when thus treated, they will in the year following, produce as good crops in forcing as fresh potted plants. If not wanted for this purpose, they may be turned out into the natural ground, and will then bear a crop in the autumn of the same year, as described by Williams above."

XI. DUCHE'SNEA (in honour of Ant. Nicholas Duchesne, author of Manuel de Botanique, contenant les propriétés des plantes utiles, 1 vol. 12mo. Paris, 1798, and Histoire Naturelle des Frasiers, 1 vol. 8vo. Paris, 1766.). Smith, in Lin. trans. 10. p. 373. D. Don, prod. fl. nep. p. 236.

Lin. syst. *Icosándria, Polygýnia.* Calyx 10-parted, the outer 5 segments accessory, large, foliaceous, tridentate at the apex and spreading. Petals 5. Stamens numerous. Carpels numerous, adhering to an elevated fleshy receptacle. Styles lateral. Seed pendulous. A herb, with habit of the strawberry, furnished with stolons which extend widely. Leaves trifoliate; leaflets cuneate-ovate, deep green, shining, coarsely crenated towards the apex, and hairy beneath. Peduncles axillary, solitary, 1-flowered. Flowers golden yellow. Fruit like that of the strawberry, red, and insipid.

1 D. FRAGARIOÌDES (Smith, l. c.). ♃. H. Native of the mountains of Nipaul. D. fragifórmis, D. Don, prod. fl. nep. p. 233. Fragària I'ndica, Andr. bot. rep. 479. Ker. bot. reg. 61.

Strawberry-like Duchesnea or Indian Strawberry. Fl. May, Oct. Clt. 1805. Pl. creeping.

Cult. This plant will grow in any common soil, and is easily increased by the stolons or runners. It prefers a dry warm situation.

XII. POTENTI'LLA (from *potens*, powerful; supposed medical quality of some species). Lin. spec. gen. no. 865. Nestl. pot. diss. 4to. Lehm. pot. diss. 4to. D. C. prod. 2. p. 571.

Lin. syst. *Icosándria, Polygýnia.* Calyx 10-parted, the 5 outer segments accessory (f. 72. *a.*). Petals 5 (f. 72. *b.*). Stamens numerous. Carpels numerous, with lateral styles, seated on a dry, permanent, elevated receptacle. Seeds pendulous.—Herbs or sub-shrubs, with compound leaves, and with the stipulas adnate to the petioles. Flowers white, yellow, rarely red.

§ 1. *Leaves ternate.*

* *Flowers yellow.*

1 P. NI'VEA (Lin. spec. 715.) stems ascending, few-flowered; leaves ternate; leaflets obovate-cuneiform, with flat, deeply serrated margins, rather hairy above, but clothed with white tomentum beneath; petals broad, obcordate, a little longer than the calyx. ♃. H. Native of Switzerland, Lapland, and Siberia;

in America, Labrador, the mountains and alpine prairies from Carlton House to the Rocky Mountains, and to the shores of the Arctic sea. Vahl. fl. dan. 1035. Hook, in bot. mag. 2982. Lodd. bot. cab. 460. Flowers yellow.

Var. β, *macrophýlla* (Ser. mss. in D. C. prod. 2. p. 571.) petioles elongated; leaflets larger; flowers larger. P. nìvea β, pallídior, Swartz, ex Lehm. pot. 184. P. leucophýlla, Pall. itin. 3. p. 194. ex Bieb. fl. taur. suppl. 359.—Gmel. sib. 3. t. 37. f. 1.

Var. γ, *cóncolor;* leaves the same colour and rather villous on both surfaces.

Var. δ, *prostràta* (Retz. prod. ed. 1. p. 97. ex Lehm. pot. 184.) flowers glomerate.

White-leaved Cinquefoil. Fl. Ju. Aug. Clt. 1816. Pl. asc.

2 P. ANGUSTIFÒLIA (Schlecht. berl. mag. ann. 7. p. 296. and Lehm. pot. p. 186. t. 19. but not of D. C.) stems ascending, few-flowered; leaves ternate; leaflets oblong-lanceolate, smoothish above and densely clothed with white tomentum beneath, with pectinately-serrated, revolute edges; serratures piliferous at the apex; calyx white; the segments about equal in length to the petals. ♃. H. Native of Eastern Siberia. P. leucophýlla, Fisch. in litt. Flowers yellow.

Narrow-leaved Cinquefoil. Fl. May, June. Clt. 1820. Pl. ascending.

3 P. MACRA'NTHA (Led. in act. nov. soc. petr. 5. p. 541. no. 30. fl. alt. 2. p. 260.) stems oblique, few-flowered; leaves ternate; leaflets ovate-oblong, deeply serrated, beset with spreading pili above and on the flat margins, but clothed with white villi beneath; petals obcordate, twice the length of the calyx; stipulas green. ♃. H. Native of Siberia, beyond the Baikal and in subalpine places at the river Tscharysch, and of Kamtschatka. P. nìvea γ, Camtschátika, Schlecht. et Cham. in Linnæa. 2. p. 21. Flowers yellow.

Var. β, *uniflòra* (Led. l. c.) stem erect, 1-flowered; leaflets obovate, rather retuse. ♃. H. Native of Dahuria.

Large-flowered Cinquefoil. Fl. April, May. Clt. 1820. Pl. ½ foot.

4 P. MI'NIMA (Hall. fil. in Schleich. cent. exsic. 1. no. 59.) stems diffuse, filiform, 1-flowered; leaves ternate, smoothish above but pilose beneath; leaflets obovate, short, crenated, and rather retuse; calycine segments obtuse, shorter than the corolla. ♃. H. Native of the alps of Switzerland, and Salisburg. Ser. mus. helv. 1. p. 51. t. 8. Lodd. bot. cab. 480. P. Brauniàna, Nestl. in litt. but not in mon. pot. t. 10. f. 4. Hoppe in Sturm, deutschl. fl. with a figure. P. vérna γ, nàna, D. C. fl. fr. 5. p. 542.—P. vérna α, alpéstris, Wallr. sched. p. 228. P. frígida β, D. C. fl. fr. 4. p. 462. Flowers yellow. Perhaps only a small variety of *P. aùrea*, Lin.

Var. β, *Brauniàna* (Ser. mss.) leaflets cuneated, toothed; flowers larger; calycine segments acute. P. Brauniàna, Nestl. pot. 70. t. 10. f. 4. but not of Hoppe, exclusive of nearly all the synonymes.

Smallest Cinquefoil. Fl. May, June. Clt. 1818. Pl. ¼ foot.

5 P. E'LEGANS (Cham. et Schlecht. Linnæa. vol. 2. p. 22.) stem erect, 1-flowered; leaves petiolate, smoothish, ternate; leaflets deeply lobed; lobes linear, obtuse, entire, and trifid; stipulas membranous, acute; petals obcordate, longer than the calyx. ♃. H. Native of Kamtschatka. Flowers yellow.

Elegant Cinquefoil. Pl. ½ foot.

6 P. GE'LIDA (Meyer, verz. pfl. 146.) plant rather pilose; radical leaves ternate; leaflets obovate-roundish, toothed; stipulas obovate, obtuse, almost quite entire; stems filiform, decumbent, usually 3-flowered; petals obcordate, twice the length of the calyx, outer segments of the calyx elliptic, obtuse, inner ones longer, lanceolate, acute. ♃. H. Native of Caucasus. P. granditlòra, Bieb. fl. taur. 1. p. 409. Allied to *P. Brauniàna* and *P. glaciàlis.* Flowers yellow.

Var. α, *glàbrior* (Meyer, l. c.) leaflets smoothish, bluntly toothed; stipulas very blunt.

Var. β, *pilòsior* (Meyer, l. c.) leaflets more or less pilose, acutely toothed; stipulas bluntish or acutish. ♃. H. Native on the alps of Kasbek, at the height of 2300 feet.

Cold Cinquefoil. Pl. decumbent.

7 P. HELVE'TICA (Schleich. cat. 1897. p. 20.) plant very pilose; root thick; stems tufted, rather diffuse, few-flowered; leaves ternate; leaflets ovate, pectinately toothed; the teeth rather imbricated; calycine segments bluntish, shorter than the corolla. ♃. H. Native of Vallais and Switzerland, on the mountains. P. frígida α, D. C. fl. fr. 4. p. 3748. P. Norvégica, Sut. fl. helv. 1. p. 310. but not of Lin.

Swiss Cinquefoil. Fl. April, June. Clt. 1819. Pl. ¼ foot.

8 P. FRI'GIDA (Vill. dauph. 3. p. 563. ex Nestl. pot. 70. t. 10. f. 3. exclusive of the synonymes) plant very pilose; root thick; stems tufted, rather diffuse; leaves ternate; leaflets ovate, crenated; calycine segments lanceolate, longer, or equal in length to the petals, which are obcordate. ♃. H. Native of the alps of Dauphiny. Flowers yellow.

Frigid Cinquefoil. Fl. April, June. Clt. 1819. Pl. ¼ foot.

9 P. GRANDIFLÒRA (Lin. spec. 715.) stem ascending, few-flowered; leaves ternate; leaflets obovate, cuneated at the base, deeply serrated, pilose; stipulas large; petals obcordate, twice the length of the calyx; receptacle pilose. ♃. H. Native of the alps of Europe and Siberia. Lehm. pot. 164. Curt. bot. mag. 75. Hall. hist. no. 1114. t. 20. f. 1.—Gmel. sib. 3. p. 183. no. 83. t. 36. f. 1. Flowers large, yellow.

Var. β, *Pyrenàica* (Ser. in D. C. prod. 2. p. 573.) leaflets 3 and 5. ♃. H. Native of the Pyrenees. P. Pyrenàica, Ram. in D. C. fl. fr. 4. p. 459. and 5. p. 452.

Var. γ, *minor* (Venetz, in litt.) stem and leaves smaller. ♃. H. Native of Vallais.

Great-flowered Cinquefoil. Fl. Ju. Jul. Clt. 1640. Pl. asc.

10 P. FRAGIFÓRMIS (Willd. in mag. der. gesell. nat. freunde, p. 294. Lehm. pot. p. 165. t. 15.) stem erect, few-flowered; leaves ternate; leaflets roundish-obovate, bluntly toothed, beset with spreading pili on both surfaces, and having the margins villous; petals obcordate, a little longer than the calyx. ♃. H. Native of the Aleutian Islands. Flowers yellow.

Strawberry-like Cinquefoil. Fl. Ju. Jul. Clt. 1800. Pl. 1 ft.

11 P. RETU'SA (Oed. fl. dan. 799.) hairy; stems erect, few-flowered; leaves ternate; leaflets cuneiform, tridentate at the apex, pilose; stipulas entire; petals obovate, longer than the calyx. ♃. H. Native of Denmark. Flowers yellow.

Retuse-leaved Cinquefoil. Pl. ¼ foot.

12 P. VILLÒSA (Pallas, ex Pursh, fl. amer. sept. 1. p. 353.) stem ascending, few-flowered; leaves ternate; leaflets roundish-cuneiform, serrated, clothed with silky villi above, and with hoary tomentum beneath; petals obcordate, twice the length of the calyx. ♃. H. Native of North America, on the west coast, Dundas Island, Unalaschka and about Behring's Straits, Kotzebue's Sound, &c. Lehm. pot. p. 166. t. 16. P. lùcida, Willd. in berl. mag. ann. 7. p. 296. Corolla large, golden yellow.

Villous Cinquefoil. Fl. June, July. Clt. 1820. Pl. ½ foot.

13 P. NORVE'GICA (Lin. spec. 715.) stem erect, dichotomous at the apex; leaves ternate, petiolate; leaflets oblong, acutely serrated, beset with spreading pili; pedicels axillary; petals obovate, shorter than the calyx. ♂. H. Native of Lapland, Norway, Siberia; North America, throughout Canada, Hudson's Bay, Labrador, shores of the Columbia, at Fort Vancouver, and towards the mouth of the river. Lehm. pot. 153. Oed. fl. dan. t. 171. P. millegràna and P. gróssa, Dougl. in herb. hort. soc. P. dichótoma, Mœnch. Flowers small, pale yellow.

Norwegian Cinquefoil. Fl. Ju. Jul. Clt. 1764. Pl. ½ to 1 ft.

14 P. NA'NA (Schlecht. in berol. mag. ann. 7. p. 296. and

Lehm. pot. 181.) stem erect, usually 1-flowered; leaves ternate; leaflets roundish-obovate, bluntly toothed, pilose on both surfaces, canescent beneath; petals obcordate, 3-times the length of the calyx. ♃. H. Native of the Aleutian islands, and of North America on the most elevated of the Rocky Mountains, Labrador, Kotzebue's Sound, &c. Outer calycine segments roundish and very obtuse. Corolla large, pale yellow.

Dwarf Cinquefoil. Pl. 2 inches.

15 P. HIRSU'TA (Michx. fl. bor. amer. 1. p. 303.) plant beset with loose hairs; stem erect, few-flowered; leaves ternate, petiolate; leaflets obovate, profoundly serrated; teeth blunt; petals shorter than the calyx. ♃. H. Native of North Canada, from Quebec to St. Lawrence; plains of the Saskatchawan, &c. Nestl. pot. p. 67. t. 9. f. 1. P. Morisòni, D. C. cat. hort. monsp. p. 135. P. Montpeliénsis, Lin. spec. 704. Fragària parviflòra, Lam. fl. fr. 3. p. 112. Corolla yellow.

Hairy Cinquefoil. Fl. July, Aug. Clt. 1680. Pl. ½ to ¾ ft.

16 P. ELA'TIOR (Schlecht. in berl. mag. ann. 7. p. 295. Lehm. pot. p. 157. t. 14.) stem erect, tall; leaves ternate, petiolate; leaflets oval, acutely serrated, veiny, almost glabrous on both surfaces; petals obovate, entire, a little longer than the calyx. ♃. H. Native of Siberia. Flowers yellow.

Taller Cinquefoil. Fl. June, July. Clt. 1824. Pl. 1½ foot.

17 P. VAHLIA'NA (Lehm. pot. p. 172.) stem erect, usually 1-flowered; leaves ternate; lateral leaflets cuneiform and trifid at the apex, middle one rhomboid, all very hairy, clothed with shining, yellowish, or white down beneath; petals reniform, twice the length of the calyx. ♃. H. Native of Greenland and North America, on the dry and elevated ridges of the Rocky Mountains; shores and islands of the Arctic Sea. P. hirsùta, Vahl. in litt. Horn. fl. dan. t. 1390. but not of Michx. P. Jamesoniàna, Grev. in mem. soc. wern. 3. p. 417. t. 20. Flowers yellow.

Vahl's Cinquefoil. Pl. 2 to 3 inches.

18 P. SUBACAU'LIS (Lin. spec. 715.) stems prostrate, few-flowered; radical leaves as well as those of the runners ternate, but the cauline ones are simple; leaflets obovate-cuneated, serrated to the middle, densely clothed with hoary tomentum; petals round, obcordate, about twice the length of the calyx. ♃. H. Native of Germany, Switzerland, Vallais, Piedmont, and of Siberia. Jacq. icon. rar. vol. 3. t. 491. P. cinèrea, Poir. P. glaucéscens, Willd. P. vèrna, Kunth, fl. berol. p. 142. P. ovàta, Poir. P. incàna, Mœnch. P. arenària, Borck. P. opàca, Vill.—All. fl. pedem. t. 24. f. 2. Gmel. sib. 3. t. 36. f. 2. Flowers yellow.

Var. β, *latiloba* (Ser. in D. C. prod. 2. p. 573.) leaflets broader and shorter. Native of Siberia, about Barnaoul.

Almost stemless Cinquefoil. Fl. Apr. May. Clt. 1820. Pl. pr.

19 P. VELUTI'NA (Lehm. pot. 170.) stem ascending, few-flowered; leaves ternate; leaflets cuneiform, truncate, bluntly toothed at the apex, canescent on both surfaces from fascicles or tufts of velvety hairs; petals roundish, quite entire, a little longer than the calyx. ♃. H. Native of Provence, on the mountains. P. subacaùlis, D. C. fl. fr. 4. p. 465. P. grandiflòra, Scop. fl. carn. 1. no. 626. t. 22. but not of Lin. P. incàna, Lam. fl. fr. 3. p. 112. Flowers yellow.

Velvety Cinquefoil. Fl. Apr. May. Clt. 1820. Pl. 2 to 3 inc.

20 P. EMARGINA'TA (Pursh, fl. amer. sept. 1. p. 353.) stems assurgent, few-flowered; leaves ternate; leaflets deeply toothed, hairy on both surfaces; pedicels terminal, elongated; petals oblong-cuneate, emarginate, twice the length of the calyx. ♃. H. Native of Labrador. Flowers large, yellow.

Emarginate-petalled Cinquefoil. Pl. 2 inches.

21 P. DENTICULÒSA (Ser. mss. in D. C. prod. 2. p. 573.) hairy; stems creeping, filiform; leaves ternate, petiolate; leaflets broadly obovate, of the same colour on both surfaces, doubly toothed, petiolate; stipulas denticulated; flowers axillary, solitary; petals obovate, about equal in length to the calyx. ♃. H. Native of Nipaul. Flowers yellow.

Toothletted-stipuled Cinquefoil. Pl. creeping.

22 P. WALLICHIA'NA (Ser. in D. C. prod. 2. p. 574.) hairy; stem creeping, filiform; leaves ternate; leaflets obovate, sessile, toothed; flowers axillary, solitary; petals obovate, longer than the calyx. ♃. H. Native of Nipaul. Flowers yellow.

Wallich's Cinquefoil. Pl. creeping.

23 P. MONA'NTHES (Lindl. in Wall. cat. no. 1025. Lehm. pug. 3. p. 33.) stem erect, 1-2-flowered; leaves ternate, rather pilose on both surfaces, and somewhat ciliated; leaflets cuneiform, truncate, crenately toothed; teeth roundish, obtuse; stipulas short, entire; outer calycine segments the largest, roundish, and obtuse; petals nearly orbicular, quite entire, length of calyx. ♃. H. Native of Sirmore. Flowers small, yellow.

One-flowered Cinquefoil. Pl. ¼ to ½ foot.

24 P. CUNEA'TA (Wall. cat. no. 1015. Lehm. pug. 3. p. 34.) stem ascending, but erect and leafless at the apex; leaves ternate, on very long petioles, pilose; leaflets obovate, rounded at the base, truncate at the apex, deeply tridentate, acute; flowers terminal, crowded, sub-cymose. ♃. H. Native of Gosainsthan. Flowers yellow.

Wedge-leaved Cinquefoil. Pl. ½ foot.

25 P. ERIOCA'RPA (Wall. cat. no. 1012. Lehm. pug. 3. p. 35.) plant glabrous; stem ascending, simple, few-flowered, almost leafless; leaves on long petioles, ternate; leaflets petiolate, obovate-rhomboid, deeply 5-toothed at the apex; outer calycine segments larger, ovate, nerved; petals obcordate, twice the length of the calyx. ♃. H. Native of the mountains of Kamaon and Gosainsthan. Flowers large, yellow.

Hairy-fruited Cinquefoil. Pl. ½ foot.

26 P. ARGYROPHY'LLA (Wall. cat. no. 1020. Lehm. pug. 3. p. 36.) stem erect, nearly simple; leaves ternate, almost sessile, distant; leaflets oblong, serrate-toothed, densely clothed with white tomentum beneath; teeth apiculated; stipulas ovate-lanceolate, deeply serrated; petals broad, obcordate, longer than the calyx. ♃. H. Native of Gosainsthan. Flowers large, yellow.

Silver-leaved Cinquefoil. Pl. 1½ foot.

* * *Flowers white or red.*

27 P. CATHA'CLINES (Lehm. pug. 3. p. 37.) stems prostrate, usually 1-flowered; leaves ternate, distant; leaflets roundish, deeply serrated, densely clothed with silky pili above, but with white tomentum beneath; stipulas ovate, almost entire; petals obcordate, longer than the calyx. ♃. H. Native of Gosainsthan. Flowers blood-coloured.

Reclining Cinquefoil. Pl. prostrate.

28 P. ATROSANGUI'NEA (Lodd. bot. cab. 786.) plant clothed with silky villi; stems decumbent; leaves ternate, petiolate; leaflets obovate, deeply serrated, clothed with white tomentum beneath; stipulas ovate-lanceolate, entire, or bifid; petals obcordate, longer than the calyx. ♃. H. Native of Nipaul and Gosainsthan. Sims, bot. mag. 2689. Peduncles few, 1-flowered at the tops of the branches. Corolla dark blood-coloured.

Dark-bloody-flowered Cinquefoil. Fl. May, Sept. Clt. 1822. Pl. decumbent.

29 P. MICRA'NTHA (Ram. in D. C. fl. fr. 4. p. 3760.) stems prostrate, hairy, 1-flowered; leaves ternate; leaflets ovate, obtuse, serrated, unequal at the base, silky; outer calycine segments a little toothed; petals obcordate-cuneated or nearly entire, shorter than the calyx. ♃. H. Native of the Pyrenees; of Italy, on Mount Generoso; in Calabria, on Mount Polleno. Lehm. pot. 158. Ser. mus. helv. 1. p. 60. t. 5. P.

fragària β, micrántha, Nestl. pot. 158. P. brevíscapa, Vest. in flora, 1821. p. 158. Fràga stérilis β, parviflòra, Lapeyr. fl. pyr. 287. P. parviflòra Clairville. Flowers small, white.

Small-flowered Cinquefoil. Fl. May, June. Clt. 1820. Pl. tr.

30 P. FRAGA'RIA (Poir. dict. 5. p. 599.) stems decumbent, 2-flowered; leaves ternate; leaflets roundish-obovate, acutely serrated, hairy, canescent beneath; petals obcordate, about equal in length to the calyx. ♃. H. Native of Europe, in woods; in Britain in dry pastures. Lehm. pot. 160. Ser. mus. helv. 1. p. 59. t. 4. f. 2. Fragària stérilis, Lin. spec. 709. Smith, engl. bot. 1785. Curt. fl. lond. t. 30. P. fragariástrum, Ehrh. beitz. Fragària præcox, Kit. P. prostràta, Walt. P. fragarioìdes, Vill. Fràga stérilis, Lapeyr. fl. pyr. p. 287. Habit of the strawberry. Flowers white, spreading.

Strawberry Cinquefoil. Fl. May, June. Britain. Pl. prost.

31 P. HY'BRIDA (Wallr. sched. p. 247.) stems procumbent; leaves ternate; leaflets obovate-oblong, closely serrated beneath the apex, smoothish above, glaucescent beneath, and silky; calycine segments ovate, acuminated, about equal in length to the petals, which are obcordate. ♃. H. Native of Germany.

Hybrid Cinquefoil. Pl. pros.

32 P. SPECIÒSA (Willd. spec. 2. p. 1110.) stems erect, subcorymbose at the apex; leaves ternate; leaflets elliptic, serrated at the apex, pubescent above, and clothed with white tomentum beneath; petals spatulate, entire, a little longer than the calyx. ♃. H. Native of Crete, on the mountains. Nestl. pot. p. 74. t. 11. Smith, fl. græc. t. 484. Corolla white.

Showy Cinquefoil. Fl. June, July. Pl. ¾ foot.

33 P. SPLE'NDENS (Poir. suppl. 4. p. 541.) stems decumbent, rooting; leaves usually ternate; leaflets oval-oblong, retuse at the apex, closely serrated in front, silky, hoary beneath; petals obcordate, twice the length of the calyx. ♃. H. Native of France and the Pyrenees. P. Vaillántii, Nestl. pot. p. 75. P. emarginàta, Desf. P. nítida, Thunb. P. montàna, Schrad. Brot. Fràga Vaillántii, Lapeyr. fl. pyr. p. 287.—Vaill. par. t. 10. f. 1. Flowers white.

Splendent Cinquefoil. Fl. May, June. Pl. creeping.

34 P. NÍTIDA (Lin. spec. 714.) stems ascending, usually 1-flowered; leaves ternate; leaflets obovate-cuneiform, toothed at the apex, clothed on both surfaces with silvery silky down; petals oboval, emarginate, longer than the calyx. ♃. H. Native of the mountains of Dauphiny and Savoy. Lehm. pot. 187. Ser. mus. helv. 1. p. 62. t. 5. f. *a*, *b*, *c*, *d*. Jacq. fl. austr. app. t. 25. Sturm, deutsch. fl. fasc. 12. with a figure. P. Terglovénsis, Vittm. summ. 3. p. 270.—Bocc. mus. t. 9. f. 4. Flowers white or peach blossom coloured. Plant tufted.

Shining Cinquefoil. Fl. May, June. Clt. 1815. Pl. 2 to 3 inches.

35 P. APENNÌNA (Tenor. cat. hort. neap. 1815. p. 50. fl. neap. 1. p. 30. t. 46.) plant shining; stems tufted, 1-4-flowered; leaves ternate; leaflets oval, obtuse, somewhat 2-3-toothed at the apex, teeth connivent; stipulas broad; petals obovate, longer than the calyx. ♃. H. Native of the Apennines.—Bocc. mus. t. 8. f. 4. Flowers white.

Apennine Cinquefoil. Fl. May, June. Clt. 1821. Pl. 1 to 3 inches.

36 P. BOCCÒNI (Nestl. pot. 73. t. 10. f. 2.) stems ascending, few-flowered; leaves ternate; leaflets elliptic, clothed with silky hoary down on both surfaces, retuse and closely tridentate at the apex. ♃. H. Native of the Apennines.—Bocc. mus. t. 8. Flowers white or red.

Bocconi's Cinquefoil. Fl. May, June. Clt. 1823. Pl. ¼ ft.

37 P. TRIDENTA'TA (Sol. in Ait. hort. kew. ed. 1. vol. 2. p. 216. t. 9.) root creeping; stem ascending; leaves ternate; leaflets oblong-cuneiform, tridentate at the apex, smoothish above, but pubescent and glaucescent beneath. ♃. H. Native of Greenland, Labrador, Canada, and Newfoundland. In Scotland on Werron hill near Brechin. Smith, engl. bot. 2389. Flowers corymbose, white, tinged with red.

Tridentate-leaved Cinquefoil. Fl. June, July. Scot. Pl. ¼ ft.

38 P. BIFLÒRA (Lehm. pot. p. 192. t. 20.) stem erect, 2-flowered at the apex; leaves ternate, finely pilose; lateral leaflets deeply tripartite, terminal one bipartite, with the segments linear, entire, and ciliated on the margins. ♃. H. Native of Eastern Siberia and North America, in barren grounds from lat. 64° to the shores of the Arctic sea and Kotzebue's Sound. Richards in Frankl. first journ. ed. 2. app. p. 21. Flowers white or red.

Two-flowered Cinquefoil. Pl. ¼ foot.

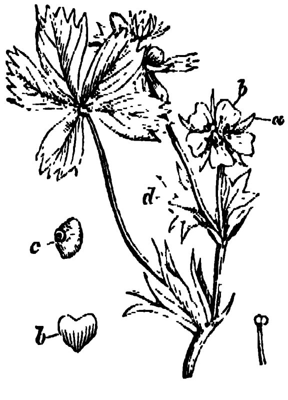
§ 2. *Leaves digitate, with usually 5-7-9 leaflets.*

* *Flowers yellow.*

39 P. UMBRÒSA (Stev. in Bess. cat. hort. crem. ann. 1816. p. 110. Bieb. fl. taur. suppl. 357.) stems erectish, naked from the base to the bifurcations; radical leaves with 5-6 obovate-oblong, bluntly serrated leaflets, cauline leaves ternate; stipulas falcate; petals obcordate, rather longer than the calyx. ♃. H. Native of the south of Tauria, in shady places. Allied to *P. réptans*, but abundantly distinct. Petals of a golden yellow inside, but brownish yellow on the outside.

Shaded Cinquefoil. Fl. June, July. Clt. 1818. Pl. 1 foot.

FIG. 72.



40 P. RE'PTANS (Lin. spec. 714.) stem creeping; leaflets 5, obovate-cuneiform, sharply serrated, pilose; pedicels axillary, solitary, longer than the leaves; bracteas (f. 72. *d.*) 3-lobed; petals obcordate, longer than the calyx. ♃. H. Native of Europe; plentiful in Britain in hedges and by road sides, particularly near London. Smith, engl. bot. 862. Fl. dan. 1164. Curt. lond. 1. t. 37. Flowers yellow.

Creeping Cinquefoil. Fl. June, Sept. Britain. Pl. creeping.

41 P. FLAGELLA'RIS (Lehm. pot. p. 141. t. 12.) stems filiform, prostrate; leaflets 5, lanceolate, serrated, nearly glabrous; pedicels axillary, solitary, filiform, elongated; petals obovate, quite entire, a little longer than the calyx. ♃. H. Native of Eastern Siberia. Corolla yellow.

Rod Cinquefoil. Fl. June, July. Clt. 1820. Pl. trailing.

42 P. SI'MPLEX (Nestl. mon. p. 40. t. 9. f. 2. Lehm. pot. p. 142.) stems trailing: leaflets 5, oblong-oval, serrated, rather pilose beneath; pedicels axillary, solitary, length of leaves; petals roundish, hardly emarginate, a little longer than the calyx. ♃. H. Native of fields and dry woods in Canada about Quebec, Pennsylvania, and Carolina. P. sarmentòsa, Poir. suppl. 4. p. 543. P. Caroliniàna, Pers. ench. 2. p. 55. Flowers yellow.

Simple-stemmed Cinquefoil. Pl. trailing.

43 P. NEUMAYERIA'NA (Tratt. ros. 4. p. 75.) stems decumbent; radical leaves quinate, cauline ones ternate; leaflets roundish-cuneated, deeply toothed at the apex, pubescent on both surfaces; flowers solitary, supra-axillary, on long pedicels; petals 3 times the length of the calyx. ♃. H. Native of Austria.

Neumayer's Cinquefoil. Pl. decumbent.

44 P. CANADE'NSIS (Lin. spec. 713.) stem ascending, weak; radical leaves quinate; leaflets sessile, obovate-cuneiform, acutely serrated above, clothed with silky white down; petals orbicular, almost entire, length of calyx. ♃. H. Native of Canada and

Carolina. Nestl. pot. p. 58. t. 10. f. 1. P. pùmila, Lam. P. sarmentòsa, Muhl. Flowers yellow. Pedicels axillary, solitary, 1-flowered, filiform, elongated. Flowers yellow.

Canadian Cinquefoil. Fl. June, July. Clt. 1800. Pl. ½ ft.

45 P. DISSE'CTA (Pursh, fl. amer. sept. 1. p. 355.) plant erect, branched, smoothish; leaflets 5, pinnatifid, with the segments entire and acute; flowers terminal, subcorymbose. ♃. H. Native near Hudson's Bay. Flowers yellow.

Dissected Cinquefoil. Pl. 1 foot.

46 P. VE'RNA (Lin. spec. 712.) stems declinate; lower leaves quinate; leaflets obovate-cuneiform, deeply serrated at the apex, pilose on the nerves, with the teeth blunt; flowers subpanicled; petals obcordate, longer than the calyx. ♃. H. Native of Europe and the north of Asia, in dry places. In Britain in elevated pastures and barren hilly ground, near Kippax, Yorkshire; about Bury, Suffolk; Cambridgeshire; on St. Vincent's Rocks, Bristol; and in the King's Park, Edinburgh. Smith, eng. bot. t. 37. Sturm, deutsch. fl. fasc. 17. with a figure. P. débilis, Schleich. cat. 1815. Flowers yellow. There are several slight varieties of this plant.

Spring Cinquefoil. Fl. April, May. Britain. Pl. declinate.

47 P. PA'TULA (Waldst. et Kit. pl. hung. 2. p. 218. t. 199.) stems tufted, rather declinate, beset with adpressed pili; radical leaves with 7-9 leaflets; leaflets cuneiform, deeply toothed at the apex, naked above, but pilose beneath; petals retuse, longer than the calyx. ♃. H. Native of the Carpathian mountains. Nestl. pot. 56. Flowers yellow.

Spreading Cinquefoil. Fl. May, July. Clt. 1818. Pl. tufted.

48 P. OPA'CA (Lin. spec. 713.) stems decumbent, filiform; leaflets 5-7 on the lower leaves, lanceolate-cuneiform, deeply serrated, pilose on both surfaces; petals obcordate, about equal in length to the calyx or a little longer; stipulas entire, bifid or trifid. ♃. H. Native throughout Europe, Siberia, and of Labrador. In Scotland on the hills of Clova, Angusshire, as also in Perthshire. Jacq. icon. rar. t. 91. Smith, engl. bot. 2449. P. dùbia, Sut. fl. helv. 1. p. 308. P. Galiciàna, Pohl. et Bess. Flowers yellow, disposed in a leafy corymb; pedicels filiform; stems purplish.

Opaque Cinquefoil. Fl. May, June. Britain. Pl. ascending ⅓ foot.

49 P. AU'REA (Lin. spec. 712.) stems ascending; radical leaves quinate; leaflets oblong-cuneiform, middle one stalked, serrate-toothed at the apex, rather silky, with silky ciliated margins; petals obcordate, nearly twice the length of the calyx. ♃. H. Native of the Alps of Europe. P. Hallèri, Ser. mus. helv. 1. p. 75. P. maculàta, Gilb.—Hall. enum. t. 6. f. 4. hist. no. 1122. t. 21. f. 6. Flowers yellow.

Golden-flowered Cinquefoil. Fl. May, June. Scotland. Pl. declinate ½ foot.

50 P. ALPE'STRIS (Hall. fil. in Ser. mus. helv. 1. p. 53. Smith, engl. fl. 2. p. 419.) stems ascending; radical leaves of 5, rarely 7, wedge-shaped, rather hairy leaflets, deeply cut in their upper half; upper stipulas ovate; pedicels axillary and terminal, long; petals heart-shaped; calycine segments acute. ♃. H. Native of Switzerland, Denmark, and Lapland. In England in the county of Durham, and on rough stony ground at Hafod, Cardiganshire. In Scotland on Ben Lawers, and other mountains of Breadalbane. R. Salisburgénsis, Hænke in Jacq. coll. vol. 2. p. 68. icon. rar. t. 490. P. aúrea, Smith, fl. brit. 549. engl. bot. 561. Fl. dan. 114. Ser. mus. helv. 1. p. 72. t. 8. P. vérna β, Wahl. fl. lapp. 146. P. vérna γ, Nestl. pot. 52. Corolla of an orange or tawny yellow-colour.

Alp Cinquefoil. Fl. July. Britain. Pl. ½ to 1 foot.

51 P. CRÒCEA (Hall. fil. in Schleich. cat. 1807. p. 20.) stems ascending; lower leaves quinate; leaflets oblong-cuneated, bluntly rounded at the apex, rather hairy, deeply serrated at the top; the teeth obtuse; petals obcordate, twice the length of the calyx. ♃. H. Native of the Alps of Switzerland and Salisburg. P. filifórmis, D. C. fl. fr. 6. p. 542. P. Pyrenàica, Poir. suppl. 4. p. 539. P. heterophýlla, Nestl. pot. 56. P. vérna, Wahl. P. adscéndens, Lapeyr. P. rotundifòlia, Vill. P. Sabaúda, D. C. fl. fr. 4 and 5. no. 3738. P. rùbens, Horn. hort. hafn. 2. p. 447. Corolla large, copper-coloured.

Copper-coloured-flowered Cinquefoil. Fl. May, July. Clt. 1816. Pl. ascending ½ foot.

52 P. GERANIOÌDES (Willd. spec. 1101.) stem decumbent; lower leaves with 5-7 leaflets; leaflets cuneiform, somewhat palmately pinnatifid, pilose, with the segments linear; petals obcordate, a little longer than the calyx. ♃. H. Native of Armenia and Syria. Nest. pot. 47. t. 5. f. 1. Corolla yellow.

Geranium-like Cinquefoil. Fl. May, July. Clt. 1820. Pl. decumbent.

53 P. LINDACKE'RI (Tauch. ex Spreng. syst. 2. p. 538.) leaves quinate, silky beneath; leaflets cuneiform, deeply toothed, the teeth oblong and roundish; stems filiform, procumbent; petals exceeding the calyx. ♃. H. Native of Bohemia.

Lindacker's Cinquefoil. Pl. proc.

54 P. RANUNCULOÌDES (Humb. et Bonpl. in Nestl. pot. 56. t. 3. f. 1. H. B. et Kunth, nov. gen. amer. 6. p. 216.) stems erect, few-flowered; radical leaves with 5-7 obovate, roundish, bluntly toothed, nearly glabrous leaflets; petals obcordate, a little longer than the calyx. ♃. F. Native of Mexico, at the bottoms of the mountains called Cerro de las Cruces. P. macrorhìza, Schlecht. consp. pot. in berol. mag. 7. p. 292. Lehm. pot. 114. Flowers yellow.

Ranunculus-like Cinquefoil. Pl. ½ foot.

55 P. HYEMA'LIS (Schlecht. et Cham. in Linnæa. 5. p. 572.) root thick; radical leaves quinate; leaflets ovate, obtuse, crenate-toothed, green and pilose above, but clothed with white tomentum beneath; stems ascending, corymbose at the apex, 7-15-flowered, very hairy, as well as the calyxes; calycine segments lanceolate, acute; receptacle villous. ♃. G. Native of Mexico, at Cruz Blanca. Flowers yellow, about the size of those of *P. álba*.

Winter Cinquefoil. Fl. Nov. Pl. ½ foot.

56 P. THOMA'SII (Tenore, prod. 2. suppl. 1. p. 61. fl. neap. 1. p. 285. t. 44.) stem erectish, corymbiferous; radical leaves with 5, rarely with 7 leaflets; leaflets obovate, coarsely toothed, clothed on both surfaces with silky villi, greenish above, but hoary beneath; petals obcordate. ♃. H. Native of Italy. Flowers yellow.

Thomas's Cinquefoil. Pl. 1 foot.

57 P. ARGE'NTEA (Lin. spec. 712.) stems ascending; leaves quinate; leaflets cuneiform, deeply cut at the top, clothed with white tomentum beneath, the margins revolute; petals retuse, longer than the calyx. ♃. H. Native of Europe; plentiful in Britain, and of Canada. Smith, engl. bot. t. 89. Fl. dan. t. 865. Flowers yellow.

Var. β, dentàta (Wallr. sched. 237.) leaflets almost entire, only with 2 or 3 teeth at the apex, tomentose beneath. ♃. H. Native of Germany and America. P. cinèrea, Rafin. in litt.

Var. γ, dissécta (Wallr. sched. 237.) leaflets more or less deeply divided into linear segments, tomentose beneath. ♃. H. Native of Germany and France.

Var. δ, minùta (Ser. mss. in D. C. prod. 2. p. 577.) stems few-flowered, and are, as well as the leaves, very small, tomentose beneath. ♃. H. Native about Geneva.

Silvery Cinquefoil. Fl. June, Aug. Britain. Pl. 1 foot.

58 P. GUNTHE'RI (Pohl. tent. 2. p. 185. Lehm. pot. 97. t. 10.) stems weak, diffuse; lower leaves quinate, upper ones ternate; leaflets cuneated, acutely serrated at the top, canescent beneath, with flat margins; petals retuse, a little longer than the

calyx. ♃. H. Native of Silesia and Bohemia, in arid places. P. Weimanniàna, Gunther. Flowers yellow.

Gunther's Cinquefoil. Fl. Ju. July. Clt. 1818. Pl. ½ to 1 foot.

59 P. CALA'BRA (Tenor. suppl. 2. p. 67. fl. neap. 1. p. 287. t. 45.) stems prostrate; leaves quinate, tomentose on both surfaces, very white beneath; leaflets cuneiform, multifid; petals longer than the calyx. ♃. H. Native of Calabria, on the mountains. Flowers yellow.

Var. β, impolìta (Wahl. fl. carp. p. 507.) stems ascending, firm; leaflets pectinately toothed, tomentose on both surfaces.

Calabrian Cinquefoil. Fl. June, July. Clt. 1820. Pl. pros.

60 P. DECLINA'TA (Horn. hort. hafn. p. 56.) stems prostrate; lower leaves quinate; leaflets lanceolate, deeply cut; cauline leaves ternate; petals shorter than the calyx. ♃. H. Native country unknown. Flowers small, yellow.

Declinate Cinquefoil. Fl. June, July. Clt. 1817. Pl. pros.

61 P. PETRÆ'A (Schlecht. berol. mag. ann. 7. p. 292. Lehm. pot. 119. t. 11.) stems ascending; leaves quinate; leaflets cuneiform-rhomboid, deeply serrated at the apex, clothed with hoary silky down on both surfaces; corollas small; petals roundish-obcordate, exceeding the calyx. ♃. H. Native of France, about Dijon, in rocky stony places.

Rock Cinquefoil. Fl. May, July. Clt. 1819. Pl. ½ to 1 ft.

62 P. COLLÌNA (Wibel. prim. fl. werth. 2. p. 267. ex Lehm. pot. 99.) stems ascending; lower leaves quinate, upper ones ternate; leaflets cuneiform, bluntly toothed at the apex, clothed with canescent tomentum beneath, with flat margins; petals rather retuse, longer than the calyx. ♃. H. Native of Wertheim, in fields. Flowers yellow.

Hill Cinquefoil. Fl. June, July. Clt. 1816. Pl. 1 foot.

63 P. INTERME'DIA (Lin. mant. 76.) stems erect, dichotomous; lower leaves with 7 leaflets, cauline ones quinate or ternate; leaflets obovate-oblong, nearly glabrous; panicle leafy; petals obcordate, a little longer than the calyx. ♃. H. Native of Switzerland, Dauphiny, and the Pyrenees, Nestl. pot. 49. t. 8. Ser. mus. helv. 1. p. 76. P. Nestleriàna, Tratt. ros. 4. p. 91. P. alchemilloìdes, Schlecht. P. vàrians, Mœnch. Flowers yellow.

Var. β, macropétala (Ser. in D. C. prod. 2. p. 577.) flowers large; leaves small; stipulas ovate. P. intermèdia, Thom. cat. 1818. p. 24.

Var. γ, elongàta (Ser. l. c.) leaflets smaller and narrower; stem elongated. P. elongàta, Goldb. ex Fisch. gor. in litt.

Intermediate Cinquefoil. Fl. May, Sept. Clt. 1786. Pl. 1 to 1½ foot.

64 P. INCI'SA (Desf. cat. hort. par. ex Nestl. pot. 51. t. 4. f. 1. but not of Lag.) stems decumbent, dichotomous; lower leaves quinate, upper ones ternate; leaflets oblong-cuneiform, deeply cut at the apex, pilose; petals cuneated, retuse, a little longer than the calyx. ♃. H. Native country unknown. Corolla pale yellow.

Cut-leaved Cinquefoil. Fl. June, July. Clt. 1818. Pl. dec.

65 P. GRA'CILIS (Dougl. mss. Hook. fl. bor. amer. 192.) stems erect, tall, beset with soft hairs, corymbosely panicled at the apex; leaves quinate, lower ones on long petioles, upper ones almost sessile; leaflets lanceolate, deeply and pinnatifidly serrated, clothed with white tomentum beneath; stipulas large, lanceolate, entire; petals obcordate, longer than the calyx, which is silky. ♃. H. Native of North America, on the banks of the Columbia and the plains of the Mulnomak river. Hook. bot. mag. t. 2984. Flowers golden yellow. 23. Pl.

Slender Cinquefoil. Clt. 1826. Pl. 1 to w. ed. 1. 2 feet.

66 P. LODDIGE'SII (Spreng. syst. ap ; leaves p. 199.) stems erect,
hoary, pilose; leaves with 5-7 leaflets, apex
rated, hairy above, hoary and pilose eath. ; leaflets pinnatifidly ser-
bose; petals retuse, exceeding the beneath; flowers corym-
1 calyx. ♃. H. Native of

Siberia. P. vinòsa, Lodd. bot. cab. with a figure. Flowers yellow.

Loddiges's Cinquefoil. Fl. June, July. Pl. 1 foot.

67 P. NORMA'LIS (Bess. ex Spreng. syst. append. p. 199.) stem erect, densely woolly as well as the leaves; leaves quinate; leaflets pinnatifid, white beneath; stipulas oblong, cut; peduncles corymbose; petals exceeding the calyx. ♃. H. Native of Podolia, at Tyra. Flowers yellow.

Normal Cinquefoil. Pl. 1 foot.

68 P. FLABELLIFO'RMIS (Lehm. pug. 2. p. 12.) stem erect, slender; leaves with 7-9 leaflets; leaflets deeply pinnatifid, beset with adpressed pili above, but with white hoary tomentum beneath, with the segments linear, distant, and revolute at the margins; flowers corymbose; petals obcordate, exceeding the calyx. ♃. H. Native of North America, in the plains of the Saskatchawan. Hook. fl. bor. amer. p. 192. t. 64. Corolla golden yellow.

Fan-formed-leaved Cinquefoil. Pl. 1½ foot.

69 P. CHRYSA'NTHA (Trev. ind. sem. hort. wratisl. 1828.) stems ascending, beset with spreading pili; leaves with 5, rarely with 7 leaflets, upper ones ternate, pubescent; leaflets oblong-cuneated, deeply serrated; upper stipulas rather cut; petals obcordate, twice the length of the calyx. ♃. H. Native of Siberia, in dry grassy places and on the sides of hills; of North America in moist prairies near the Rocky Mountains, and of Germany. Led. fl. ross. alt. illust. t. 338. P. Thuringiaca, Bernh. ex Link. enum. pl. hort. berol. 2. p. 64. Flowers golden yellow, loosely corymbose.

Golden-flowered Cinquefoil. Fl. Ju. July. Clt. 1827. Pl. 1 ft.

70 P. DESERTÒRUM (Bunge, in Led. fl. ross. alt. ill. t. 337. fl. alt. 2. p. 257.) stems erect, clothed with viscid glandular hairs, as well as the leaves; leaflets obovate, bluntly toothed; stipulas entire; panicle dichotomous; petals obcordate. ♃. H. Native of Altaia, on the Arkat mountains in the Soongarian desert. Stems purplish at the base. Corolla yellow. Very like *P. geoìdes.*

Desert Cinquefoil. Fl. July. Pl. 1 foot.

71 P. DEALBA'TA (Bunge in Led. fl. ross. alt. ill. t. 326. fl. alt. 2. p. 250.) stems ascending, pubescent; leaves with 5 or 7, rarely with 9 leaflets, upper ones ternate, all smoothish above, but clothed with white tomentum beneath; leaflets oblong, cuneated at the base, pectinately pinnatifid, with revolute margins; stipulas nearly entire; petals obovate, hardly exceeding the calyx. ♃. H. Native of Altaia, at the rivers Irtysch, Bekun, Kurtschum, in meadows, and near Loktewsk. Flowers yellow, panicled.

Whitened-leaved Cinquefoil. Fl. May, June. Pl. 1 foot.

72 P. CONCI'NNA (Richards in Frankl. first journ. ed. 2. app. p. 20.) stem short, few-flowered; radical leaves with 7 leaflets, and cauline ones ternate; leaflets obovate-cuneated, serrated at the apex, densely clothed with white tomentum beneath; petals obcordate, exceeding the calyx. ♃. H. Native of North America, on the plains of the Saskatchawan about Carlton House. Hook. fl. bor. amer. p. 193. t. 67. Petioles and peduncles woolly. Flowers golden yellow.

Neat Cinquefoil. Pl. 2 to 3 inches.
